- **Universe Design Tool** -- Lets you modify the universe for CA SDM, Knowledge Management, CMDB, and Support Automation, which is a metalayer between CA SDM schema, and reporting tools.

- **CA SDM Security and Role Management** -- Lets you set up data partitions security to determine what data users can access.

Add the CA SDM Privileged User to CMC

The universe connection is configured by default to use the Service Desk Privileged User and Password when accessing data. This user should be added to the CMC as a new CA Business Intelligence user. There are two purposes for adding this user. First, you need this user if you plan to set up data partition security for reporting and second, it allows you to use this user when initially testing reports from the CA SDM Reports tab. The Reports tab requires a user who is defined to both CA SDM and CA Business Intelligence.

Use the instructions provided in the *CA Business Intelligence Documentation* to add your CA SDM users to the CMC and configure the CA SDM Privileged User account.

Define Universe Database Credentials

The universe must use the database credentials associated with the BusinessObjects user account.

Note: Verify that you sign on to the Universe Design Tool using the Privileged User account and not the Administrator User account.

To define universe database credentials

1. From the Start menu, browse to All Programs, BusinessObjects, BusinessObjects Enterprise, Universe Design Tool.
2. Log on to the Universe Design Tool.
   The Universe Design Tool window appears.
3. Select File, Import.
   The Import Universe dialog appears.
4. Select the CA SDM, Knowledge Management, CMDB, or CA ServiceDesk folder from the drop-down list.

   Note: If this is the first time you are using the Universe Design Tool, select Browse, CA Universes.

5. Verify the file path for the import folder in the Import Folder box.
6. Click OK.
   The universe window appears.
7. Select File, Parameters.
   The Universe Parameters dialog appears.
8. On the Definition tab, click Edit.
   The Login Parameters dialog appears.
9. Select the Use database credentials associated with Business Objects user account check box.
10. Click Next, Test Connection, and step through the universe connection dialogs that appear.

11. Click OK to finish.

12. Select File, Export.
    The Export Universe dialog appears.

13. Select the universe that you want to use from the Domain drop-down list.

14. Select Everyone from the Groups list

15. Click OK to export universe changes.

Establish Data Partitions

In Security and Role Management, create a data partition constraint that will restrict the database record access for all report users assigned to the data partition.

Note: For information on establishing data partitions constraints, see Data Partitions Setup.

Write CA Business Intelligence Reports

Contents

You can write CA Business Intelligence reports for CA SDM.

CA SDM ODBC Driver

Business Objects reporting applications (Crystal Reports and Web Intelligence) access data using an ODBC driver that connects directly with the CA SDM object engine named the domsrvr.

This connection provides a number of benefits:

- SELECT statements used by BusinessObjects reports reference objects and attributes using their CA SDM names (in other words, their Majic names). For example, a SELECT statement for a report on contacts could be written:

```
SELECT combo_name FROM cnt WHERE last_name LIKE 'smith%'
```

- The CA SDM ODBC driver maps attributes like combo_name and objects like cnt to their corresponding DBMS name or names.

- All CA SDM security, including data partition and tenancy restrictions, is automatically applied to reports. All connections between BusinessObjects and CA SDM are associated with a CA SDM contact, and the CA SDM ODBC edits input SELECT statements to enforce the security restrictions associated with the end-user reporting role. BusinessObjects does not connect directly to the database.

- The CA SDM Attribute Alias feature "flattens" or de-normalizes the CA SDM database. Attribute aliases are additional attributes in CA SDM objects that allow a query to reference attributes in joined tables without an explicit join, allowing the base table to be used as if it were a reporting view.

- The CA SDM ODBC driver supports date literals in queries, and automatically translates values in CA SDM internal date format to a standard DBMS date.

Important! The CA SDM ODBC driver is supported only for BusinessObjects reporting (Crystal and Web Intelligence). CA SDM does not provide a standalone ODBC client, and does not recommend use of the ODBC driver with applications other than BusinessObjects.

Write SQL for BusinessObjects Reports

All SQL statements used by BusinessObjects reports are processed by the CA SDM ODBC driver. The ODBC driver supports standard SQL 92 SELECT statements with the following changes and extensions:

- CA SDM object names are used in place of DBMS table names, and CA SDM attribute names are used in place of DBMS column names.

- A CA SDM attribute alias name can be used anywhere in the query where a column name is valid. The ODBC driver replaces the attribute alias reference with one or more joins.

  Note: For more information, see Attribute Aliases (see page 3217).

- CA SDM DERIVED attributes (such as combo_name) can be used in the selection list only. They are not supported in any other part of the query, including in the WHERE clause.

  Note: Many Combo Name With Userid objects have been provided in the universe, such as the Customer Combo Name With Userid object used as a filter in the sample ad hoc report provided in the *CA Business Intelligence Documentation*. These objects allow Combo Name to be used as filter prompts in ad hoc queries with Web Intelligence, to overcome the limitation of including Combo Name in the WHERE clause. They present both Combo Name and Userid in the filter prompt, but use only the selected Userids in the resultant SQL query.

- Queries can contain date literals in either of the forms:

```
d'yyyy-mm-dd hh:mm:ss xm' (where xm is either am or pm)

ts'yyyy-mm-dd hh:mm:ss'
```

These literals can be used anywhere in the query. The ODBC driver automatically converts them to CA SDM internal date format (the number of seconds from midnight January 1, 1970).

PDM Functions

To assist in working with specialized CA SDM features and data types, the ODBC driver extends SQL to support a number of additional query functions. All driver-supported functions begin with the string "Pdm", and are known as PDM functions as described in the following table:

PDM Functions	Description
PdmAddDays([date,] count)	When used with one argument, adds the number of days in its argument to today's date and returns the result. When used with two arguments, adds the number of days in its second argument to the value of the date column specified in its first argument and returns the result. This function may be used anywhere in the query
PdmAddMonths([date,] count)	When used with one argument, adds the number of months in its argument to today's date and returns the result. When used with two arguments, adds the number of months in its second argument to the value of the date column specified in it first argument and returns the result. The single argument form can be used anywhere in the query. The two-argument form can be used only in the selection list
PdmDay ([date])	When used with no arguments, returns the current day as an integer. When used with one argument, returns the day associated with the value of the date column specified in its argument. The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.
PdmDownTime(slaName, workshift, startDate, endDate)	Calculates the downtime between two dates under the specified SLA and workshift. This function can be used only in the selection list.
PdmMonth ([date])	When used with no arguments, returns the current month as an integer from 1 to 12. When used with one argument, returns the month associated with the value of the date column specified in its argument. The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.
PdmMonthName ([date])	When used with no arguments, returns the localized name of the current month ("January", "February", and so on). When used with one argument, returns the localized name of the value of the date column specified in its argument. The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.
PdmDay ([date])	When used with no arguments, returns the current day as an integer. When used with one argument, returns the day associated with the value of the date column specified in its argument. The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.
PdmSeconds(date)	Returns the value of the date column specified in its argument in its raw form as the number of seconds from midnight January 1, 1970. This function can be used only in the selection list. The argument is required.

PDM Functions	Description
PdmString (column)	Returns the string equivalent of value of the column specified in its argument. This function can be used with UUID, date, or string columns. It can be used only in the selection list.
PdmToday()	PdmToday() [timeAdj [, day [, month [, year]]]]) Evaluates to today's date (in seconds from 1/1/1970), adjusted according to the arguments: timeAdj: -1 -- adjust time to beginning of day (0:00:00); +1 -- adjust time to end of day (23:59:59) day: negative -- adjust date by number of days specified positive -- set day to absolute value specified (or to last day of month, whichever is less) month: negative -- adjust date by number of months specified positive -- set month to absolute value specified (or to December (12), whichever is less) year: negative -- adjust date by number of years specified positive -- set year to absolute value specified Adjustments are applied in the order year, month, day. A zero or omitted argument is ignored.
PdmYear ([date])	When used with no arguments, returns the current year as a four-digit integer. When used with one argument, returns the year associated with the value of the date column specified in its argument. The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.

Attribute Aliases

Attribute aliases are additional attributes in CA SDM objects that reference data from joined tables using Majic dotted join syntax (where the syntax srelname.attrname is a reference to attribute attrname in the table referenced by foreign key srelname. A large number of predefined attribute aliases are provided with CA SDM Release 12.9, with names that typically are the same as the corresponding Majic join, with underscores replacing the dots that indicate the join. For example, the following SELECT statement might be used for a report that lists information about the request assignees:

```
SELECT ref_num, assignee_combo_name, assignee_organization_name
   FROM cr WHERE customer_last_name LIKE 'smith%'
```

The CA SDM ODBC driver automatically builds joins as required to access the tables referenced by attribute aliases. A user in the CA SDM administrator role can easily add new attribute aliases online, providing a column-at-a-time way to extend the view corresponding to an object.

To access the Attribute Alias table, select the Administration tab, and browse to CA SDM, Codes, Attribute Aliases.

pdm_isql Interactive SQL

A command line utility, pdm_isql, is provided with CA SDM to allow interactive entry of SQL SELECT statements. SELECT statements entered into pdm_isql are sent to the CA SDM ODBC driver, allowing you to test SQL SELECT statements outside of BusinessObjects.

To use pdm_isql

1. Ensure that $NX_ROOT/bin is in your path.

2. Enter the command:
   pdm_isql

3. At the pdm_isql prompt, enter the command:
   connect *username*password@casd_hostname*
   (Where *username* and *password* are valid CA SDM login credentials, and the host name is the host name of a CA SDM server with a web engine.)

4. Enter SQL select statements followed by a semicolon.

Key Performance Indicators

Contents

Key Performance Indicators (KPIs) are metrics you can use to identify areas of your service management environment that can require administrative attention or configuration tuning.

Use the CA SDM web interface to configure your KPI definitions. The data they produce is stored in the CA SDM database and is available for producing web-based reports (see page 3201).

Note: In addition to defining KPI queries, you can configure the KPI daemon to retrieve CA SDM ticket data whenever a ticket is opened, closed, or certain fields are modified.

By defining and monitoring a planned set of KPIs, you can measure progress toward your organization's performance-related goals, and gather valuable data for driving strategic decisions about your IT environment.

Note: For information about the KPI database tables, see Technical Reference (see page 3821).

KPI Types

CA SDM supports three KPI types:

- **System KPIs** are installed with the product. You can customize them to meet your needs, but you cannot create new System KPIs.
- **Stored Query KPIs** call a stored query to retrieve metrics from the database. You can create custom Stored Query KPIs, or modify the predefined examples installed with the product.
- **SQL KPIs** allow you to incorporate a complete SQL query directly into the KPI. You can create custom SQL KPIs, or modify the predefined examples installed with the product.

Note: KPIs, whether predefined or user-created, cannot be deleted. When a KPI is no longer needed, you can deactivate it by setting the Record Status to inactive.

Predefined KPIs

Several KPIs of each type are installed with CA SDM. You can use the predefined Stored Query and SQL KPIs with their original definitions, or as models for your custom definitions.

You can use the predefined System KPIs with their original definitions, or modify some of their fields to meet your needs.

All predefined KPIs are installed as Inactive. For a KPI to begin functioning in your system, it must be set to Active. Navigate to Service Desk, KPIs on the Administration tab and search for the inactive KPI. Open the KPI and click Activate.

Important! Multiple versions of a KPI with the same name cannot be active at the same time.

Create a KPI

You can create custom Stored Query KPIs to produce Count metrics, and SQL KPIs to produce Count, Sum, Max, or Duration metrics.

Important! You cannot create new System KPIs; however, you can edit the predefined System KPIs to meet your needs.

Note: If multi-tenancy is installed, select the appropriate tenant from the drop-down list. The public (shared) option creates the object for all tenants.

Follow these steps:

1. Click CA SDM, KPIs on the Administration tab.
   The KPI List page appears.

2. Click Create New.
   The Create New KPI page appears.

3. Enter a name for the KPI and select either Stored Query or SQL from the dropdown list. Click Continue.
   The Create New KPI page displays the KPI fields. The following table describes the KPI fields. The Sys. S.Q. and SQL columns indicate the KPI types each field belongs to (System, Stored Query, or SQL).

Field	Sys.	S. Q.	SQL	Description
KPI Name	X	X	X	Identifies the display name for the KPI. Not editable.
Type	X	X	X	Defines the record as a System, Stored Query, or SQL KPI. Not editable.
Keep Existing Version	X	X	X	Specifies that the current version of the KPI record will be retained if the record is updated. Editable when the @NX_ALWAYS_KEEP_KPI_VERSIONS setting in the NX.env is set to No.
Version	X	X	X	Identifies the version number of the KPI record. The version number is incremented automatically each time the record is updated. Not editable.
Record Status	X	X	X	Specifies whether the KPI is active (gathering data) or inactive (not gathering data). Editable only by using the "Edit in List" feature on the KPI List page.
Metric Type	X	X	X	

Field	Sys.	S. Q.	SQL	Description
				Specifies the type of calculation the KPI will perform: Stored Query KPIs are always Count. System KPIs can be Count or Duration. SQL KPIs can be Count, Sum, Max, or Duration. Editable for SQL type KPI only. **Note:** The calculated duration is based on a change to values in a ticket in real time, not in business hours.
Refresh Time	X	X	X	Specifies the time interval for retrieving KPI metrics from the database. The value is editable. Refresh time is specified in HH:MM:SS format.
Process Type	X			System KPI (see page 3222) metrics can be derived from the following CA SDM processes: **domsrvr** -- Object Manager **bpvirtdb** -- BOP Virtual Database Server **db_agents** -- Database agents **webengine** -- The CA SDM web client
System Name	X			The internal name of the System KPI. Not editable.
User Context		X	X	(Optional) Specifies the userid of a CA SDM contact. The contact's role and tenant assignments are used to determine data partitioning for the metrics produced by the KPI. The value is editable.
Stored Query		X		The name of the stored query called by this KPI. The value is editable. **Note:** The stored query definition must be active and have the KPI Usage option enabled.
SQL Query			X	The SQL code for the query. The value is editable. **Note:** When you save a SQL KPI record, the syntax of your SQL query is validated. An error message appears when the code is invalid. If your SQL code does not include an aggregate, the KPI daemon logs error messages and does not return data to the kpi_data table.
Description	X	X	X	(Optional) Provides a detailed description of the KPI. The value is editable.

4. Click Save.

Note: When you save the initial definition for a SQL KPI, the syntax of your SQL query is validated. An error message is displayed if the code is invalid.

KPI Daemon

The KPI daemon manages the retrieval, organization, and storage of KPI metric data. The daemon runs continuously, and collects data at specified intervals from various system resources.

When the refresh time of a KPI is reached, the KPI daemon interacts with other system components as follows:

- **System KPI** -- Sends a request to a target daemon (webengine, domsrvr, bpvirtdb, or db_agents) to retrieve count or duration data.
- **Stored Query KPI** -- Sends a request to the domsrvr to collect count data.
- **SQL KPI** -- Sends a request to the domsrvr to collect count, sum, max, or duration data.

When the KPI daemon receives the requested data, it stores the resulting metrics in the database.

Note: The calculated duration is based on a change to values in a ticket in real time, not in business hours.

System KPIs

System KPIs enable you to collect metric data related to the operation of CA SDM processes.

The following process types are supported:

- **domsrvr** -- The CA SDM Object Manager (server process). The Object Manager also caches various records and tables for clients.
- **bpvirtdb** -- The BOP Virtual Database server enables operation of multiple Object Managers in the CA SDM environment. The Object Managers connect to the virtual database which arbitrates their access to database agents. For example, when retrieving a new range of ticket reference numbers, the virtual database ensures that only one Object Manager at a time accesses the table containing the reference numbers.
  Depending on your CA SDM configuration, the Object Managers connect to the virtual database of the following servers:
- Conventional: All Object Managers running on primary or secondary server connect to the virtual database of the primary server.

- Advanced availability: All Objects Managers connect to the virtual database of the same server that it is running on. For example, object managers running on the application server connect to the virtual database of the application server only.

The virtual database also performs caching of database information for Object Managers.

- **db_agents** -- Database agents perform SQL queries, and handle other interactions between CA SDM and the database management system (DBMS). Database Agents adhere to the CA SDM database schema, and translate the SQL code to the form required by the particular DBMS (for example, Oracle).

- **webengine** -- The CA SDM component that connects web browsers to an Object Manager through a pdmweb cgi running on a Microsoft IIS or Apache Tomcat web server.
Depending on your CA SDM configuration, there must be a web engine for WSP on the following servers for WSP Schema Designer to write schema files:

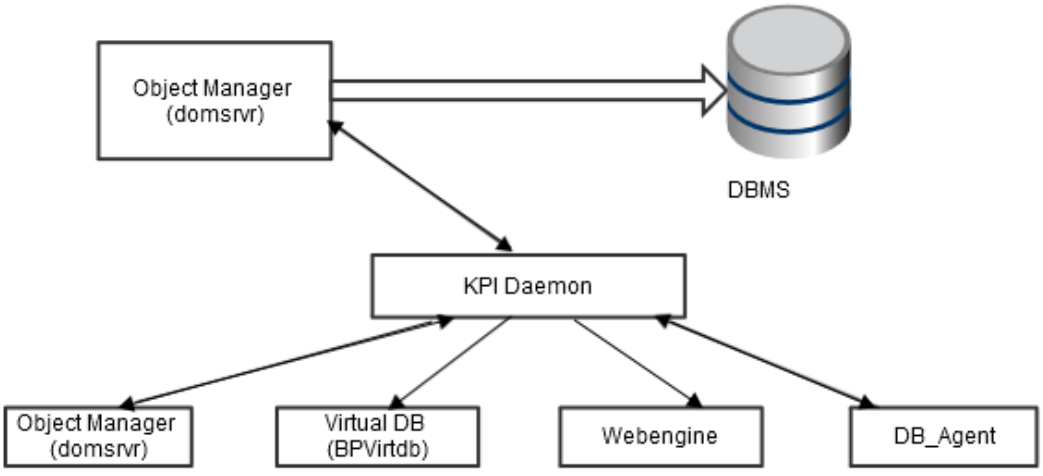
- Conventional: Primary server

  - Advanced availability: Background server

  Web engines are the true client of an Object Manager for user client web browsers. Web engines cache .htmpl web forms for connected users. You can manipulate the cache using the pdm_webcache utility and see client connection statistics using the pdm_webstat utility.

Note: For more information about these processes, see the *Implementing CA Service Desk Manager (see page 398)*.

The following diagram illustrates data flow for System KPIs.



Each system KPI produce one of the following metric types:

- Count
- Duration

System KPI Examples

- This example produces a count of the update requests sent to BOP Virtual Database:

```
updateCt
```

- This example reports how long requests for updates, inserts, and deletes to BOP Virtual Database took to complete:

```
virtdbUpdateResponseDt
```

Stored Query KPIs

With Stored Query KPIs you can generate reports based on count metrics retrieved from the CA SDM database.

CA SDM provides a set of predefined stored queries. Many of them are useful just as they are. You can also customize them to meet your needs, or use them as models for writing your own queries.

All Stored Query KPIs have a Count metric type.

Note: You can use stored queries to produce counter fields for your web interface Scoreboard, or KPI metrics, or both. To use a stored query in a KPI definition, the query must be enabled for KPI usage. For more information, see Stored Query Setup.

Stored Query KPI Examples

- This example produces a count of the open change orders at the assignee's location:

```
@cnt.location.name Changes
```

- This example produces a count of the workflow tasks that will violate an SLA before midnight of the current day:

```
Issue Workflow Tasks that will Violate an SLA today
```

SQL KPIs

SQL KPIs provide more flexibility than Stored Query KPIs. With SQL KPIs you can write your own queries to the CA SDM database to produce the following types of metrics:

- Sum
- Count

- Max
- Duration

> **Note:** Your SQL code must comply with SQL92 syntax.

The following considerations apply to SQL KPIs:

- To see the SQL code for these example queries, open the query definitions from the KPI List page.

  > **Note:** For instructions, see the *Online Help*.

- The @ symbol is not supported in SQL KPIs. Instead, use syntax as shown in the following example and an attribute alias:

  ```
  SELECT * FROM cr WHERE assignee_last_name = "Smith"
  ```

  For this example, you could use a predefined attribute alias. The Attribute Alias Detail page appears as follows:
  " Object Name = cr
  " Alias Name = assignee_last_name
  " Status = Active
  " Alias Value = assignee.last_name

Examples: SQL Query KPI

- This predefined example produces the sum of the estimated costs of all pending change order workflow tasks:

  ```
  Est Cost Sum of Pending Change Workflow Tasks
  ```

- This predefined example produces a count of the active change orders that have been closed and reopened:

  ```
  Count of Reopened Change Orders
  ```

Retrieve Ticket Data

To allow reporting on how long tickets remain in the various processing states, you can configure the KPI daemon to retrieve CA SDM ticket data whenever a ticket is opened or closed, and whenever any of the following fields values are changed:

- Active
- Assignee

- Area or Category
- Group
- Impact
- Organization
- Priority
- Root Cause
- Status
- Service Type

To enable ticket retrieval, install the KPI Ticket Data Table option available in Options Manager KPI folder.

The collection of data from new and updated tickets is enabled. The ticket data is written into the usp_kpi_ticket_data database table, and is available for generating web-based reports.

Note: For instructions, see the *Online Help*.

The following considerations apply to ticket retrieval:

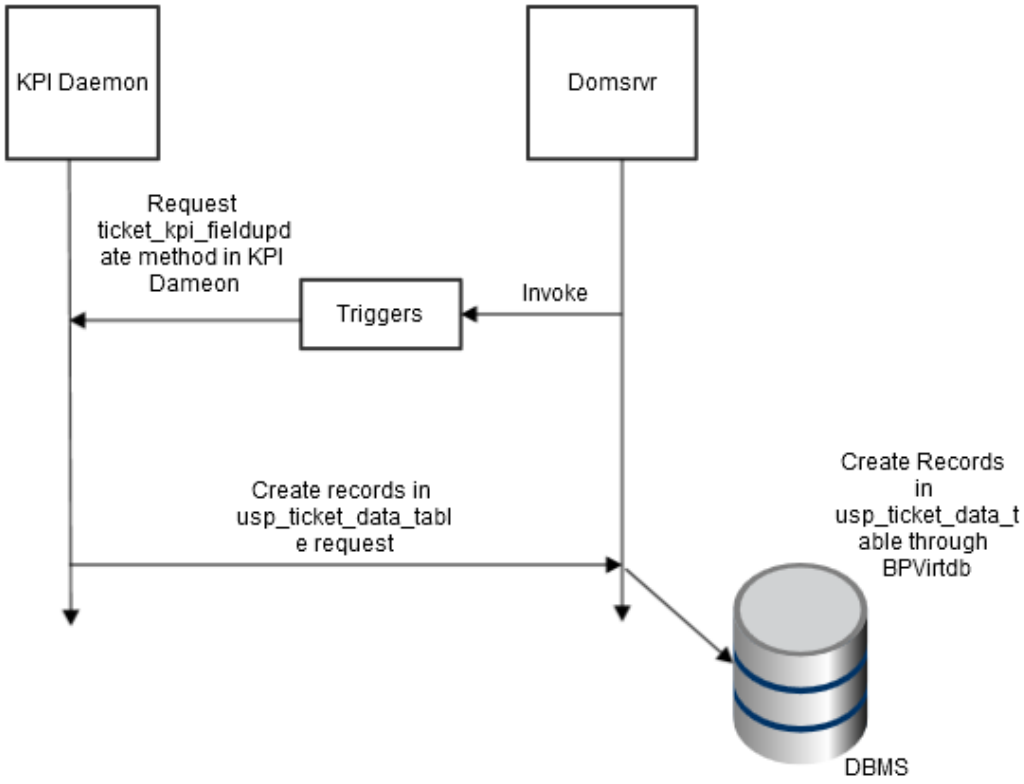
- The KPI daemon may take up to 30 minutes to populate the ticket information to the usp_kpi_ticket_data table.
- The support_lev field allows tracking of Service Type processing when the classic_sla_processing option is installed. The classic_sla_processing option enables the Service Type processing from CA SDM version 6.0 and earlier.
- Enabling this feature may result in degraded CA SDM performance.

KPI Ticket Data Flow

The KPI Ticket Data Table feature works on a trigger mechanism. When the kpi_ticket_data_table option is installed, the KPI daemon begins monitoring CA SDM ticket objects to track the following events:

- Open new ticket
- Check in changes to one or more monitored fields
- Close ticket

When one of these events occurs, a POST_CI trigger fires. The trigger sends a BPMessage with a trigger attribute list to KPI daemon, and adds the returned data to the usp_kpi_ticket_data table, as illustrated in the following data flow diagram.



KPI Ticket Data Table Record Types

There are five operation types in the usp_kpi_ticket_data table:

- INIT (0)
- NO_INIT_REC (1)
- REOPEN (2)
- UPDATE (3)
- CLOSE (4)

The type value (integer value shown in parentheses) is stored in the operation field. The end_time of the previous record is stored in the prev_time field. The ktd_duration field stores the duration, which is calculated as end_time minus prev_time. The previous record is defined in the following rules:

1. The INIT record indicates a ticket has been created.
2. An UPDATE record is created for each update to a ticket. It gets prev_time from a previous UPDATE record to the same ticket field if a previous UPDATE record exists. Otherwise, it gets prev_time from the INIT, NO_INIT_REC or REOPEN record, depending on which record has an end_time value closest in time to the UPDATE record.

3. The CLOSE record is the same as UPDATE.

4. If a ticket is reopened, a single REOPEN record is created to show the Active field value. The REOPEN record gets prev_time from a previous CLOSE record for the same Active field.

5. If a ticket was created before turning on the Options Manager option, it may have records for updates but without an INIT record. The program in this case creates a NO_INIT_REC record and gets prev_time from the first non-INIT record it encounters.

Note: For complete documentation of the table fields, see the *Technical Reference (see page 3821)*.

Troubleshooting

You can diagnose problems you might experience with KPI usage.

Verify that the KPI Daemon is Running

To verify that the KPI daemon is running, run the pdm_status command-line utility as follows:

```
pdm_status
```

Examine the output for for the following:

```
KPI Daemon myserver  Running  myserver 3568  Wed Feb 06 07:23:53
```

NX.env File

Review the $NX_ROOT/NX.env file to verify that the basic KPI configuration is correctly set.

If you have installed the KPI Ticket Data Table option, the NX.env file includes the following:

```
#########################################################################
# NX_KPI_TICKET_DATA_TABLE
# Enable the collection of changed fields from ticket objects
# (like Requests, Issues and Change Orders) to write record entries
# into the usp_kpi_ticket_data table.
#########################################################################
@NX_KPI_TICKET_DATA_TABLE=Yes

#########################################################################
# NX_KPI_FUZZ_TIME
# Specifies a tolerable delay for each KPI within which kpi_daemon
# sends a request to retreive KPI data when this kPI's refresh time
# is timeout
#########################################################################
@NX_KPI_FUZZ_TIME=20
```

Note: The default value of @NX_KPI_FUZZ_TIME is 20 seconds. You can modify this value within the range of 0 to 40 seconds. If you set this variable to a value higher than 40, 40 seconds will be used.

```
########################################################################
# NX_ALWAYS_KEEP_KPI_VERSIONS
# The keep_version attribute in Kpi table is displayed on the KPI
# Detail Edit form as a checkbox. The NX_ALWAYS_KEEP_KPI_VERSIONS
# option specifies that checkbox is read-only and is always checked.
########################################################################
@NX_ALWAYS_KEEP_KPI_VERSIONS=Yes
```

Turn on KPI Daemon Tracing

Use the pdm_logstat utility to turn on trace logging to monitor KPI daemon activity.

To turn on KPI daemon tracing, run the following command:

```
pdm_logstat -f cache_table_mgr.c VERBOSE
```

To turn off KPI daemon tracing, run the following command:

```
pdm_logstat -f cache_table_mgr.c
```

Examine the stdlog.0 file for entries pertaining to KPI daemon activity.

The following example shows normal KPI daemon connections to the host computer and the domsrvr:

```
02/06 05:42:14.58 garbo-2k3-bb kpi_daemon 2432 SIGNIFICANT kpi_daemon.c  117
KPIDaemon ready for action!
02/06 05:42:14.80 garbo-2k3-bb domsrvr 792 SIGNIFICANT connmgr.c 2314 Connecting
client kpi_daemon:garbo-2k3-bb
02/06 05:42:14.81 garbo-2k3-bb kpi_daemon 2432 SIGNIFICANT main.c 220 KPI daemon
connected with domsrvr
```

The following example indicates an error in a KPI named webSessionCT:

```
01/16 13:24:46.74 jed web:local 2152 ERROR sys_kpi.c 96 Invalid KPI metric type:
1382180215 (KPI name:webSessionCT)
```

The following examples show KPI daemon activity:

```
02/06 07:23:50.47 garbo-2k3-bb  kpi_daemon 3568 TRACE cache_table_mgr.c 427 Cache
Table manager created Kpi_Obj (KPI dob record_id:9003) (KPI type:2)
02/06 07:23:50.53 garbo-2k3-bb kpi_daemon 3568 TRACE cache_table_mgr.c  427 Cache
Table manager created Kpi_Obj (KPI dob record_id:9103) (KPI type:1)
```

Note: For information about KPI types, see KPI Ticket Data Table Record Types (see page 3227).

Summary and Detail Reports

CA Service Desk Manager has built in summary and detail reporting options. To print or view summary and detail reports, you must first select the records you want to include in the report. You can select specific records for a report using the search feature of the list windows. To generate the report, select Summary or Detail from the Reports drop-down menu.

For example, from the Request List page you can enter search criteria to create a list of requests that you can then use to generate a report.

You can also print a single page detail report for each record by choosing Print Form from the File menu within any detail window. To print a report for a newly created record, you must first save the record.

Generate Analysis Reports

The Administration Tab provides built-in analysis reports for a global and detailed perspective on the service desk process

- Request Area or Issue Category reports provide you with the number of requests or issues opened in the specified period for each request area or issue category. This report is sorted alphabetically by request area or issue category.
- Request or Issue reports provide you with statistics, such as number of requests or issues opened, number of requests or issues closed, average time open, and average time until closed, for a specified period. This report is sorted by date, oldest to newest.
- Request Area Priority or Issue Category Priority reports provide you with the number of requests or issues opened by priority in the specified period for each request area or issue category. This report is sorted by priority (highest to lowest) and then alphabetically by request area or issue category.

You can display the analysis report for today, for the past thirty days, year-to-date, and much more.

Follow these steps:

1. Choose the Administration tab.
2. Expand the Service Desk and Analysis nodes.
3. Choose Request or Issue.
4. Choose the appropriate report based on the time frame you want.

Reporting Using CA Service Catalog

Administrators use data objects, data views, and layouts to retrieve, format, and publish data, in both reports and other facilities, including forms, as follows:

1. Understand how data objects, data views, and layouts comprise reports:

   - The *data object* is the lowest layer. The data object defines the source of the data, the fields that make up each row of data, and the selection criteria.
     The data object produces a set of rows and columns of data that other facilities can use. These facilities include data views, forms, and runtime variables for other data objects.
     You can set permissions on a data object by business unit, functionality, and role.

   - The *data views* define the format of a data object for a report. You can present the rows and columns of a data object in a table, chart, or both. You can highly customize tables and charts.

   - The *layout* is a combination of data views, text, and images. The layout is best suited for presenting an overall view of business data.
     You can publish layouts as reports to the catalog. Users and accounts can request and subscribe to them.
     You can set permissions on a layout by business unit, functionality, and role.

2. Create and edit data objects (see page 3232), including these tasks:

   - Retrieve and display data from a data source.

   - Specify dynamic selection criteria that are based on system variables or user input.

   - Set up access to data objects according to role or business unit.

3. Create and edit data views (see page 3239), including these tasks:

   - Create custom charts and tables, including three-dimensional (3D) ones.

   - Provide summary level reports with drill-down capabilities to report details.

   - Combine views from multiple data sources, text, and images in the report layout.

4. Create and edit layouts (see page 3241), including these tasks:

   - Publish reports to the catalog (see page 3242), where they can be requested or subscribed to by users or accounts.

   - Publish reports to the dashboard library.

   - Set up access to reports according to role or business unit.

Note: Building reports requires knowledge of both the MDB schema and SQL syntax.

CA Service Catalog includes several predefined data objects, data views, and layouts to use as-is or as models.

This section contains the following articles:

- Manage Data Objects (see page 3232)

Manage Data Objects

This article contains the following topics:

Administrators can use data objects to define the data to use for a chart, table, or other facility, including a field in a form. A data object can have the following data sources:

- An ODBC-connected or JDBC-connected database management system (DBMS). Examples include SQL Server or Oracle database.
- A delimiter-separated value file.
- Any other data source that a Java report plug-in can access.

Note: When you create reports, ODBC-type data objects do not retrieve nvarchar-type fields. To retrieve nvarchar fields in the objects in your reports, use JDBC as the database connection type.

You perform the following tasks to manage data objects:

- View the data objects and organize them in folders.
- Become familiar with the runtime variables (see page 3232) in data objects.
- Add a query runtime variable (see page 3234) for use in a data object.
- Add a data object (see page 3234) or edit one.
- Use predefined data objects. (see page 3237)
- Delete a data object.

Runtime Variables

Data objects can use *runtime variables* to alter behavior and selection criteria dynamically.

For Query data objects, you can use runtime variables in the SQL query. As a prerequisite, define these runtime variables in the Variables list. That list includes default Query variables, and you can add your own.

For example, consider a report that is based on a SQL query that displays a list of users. The data object can take a Last_Name value as a runtime variable to indicate the starting characters of the last name. Users of the data object are prompted for the Last_Name value. You can use the runtime variable of type String that is named %Last_Name% in the SQL statement. Use this variable to restrict the results to user records that start with the value entered by the user. The following SQL statement provides a sample query:

```
SELECT first_name,middle_name,last_name FROM ca_contact WHERE (ca_contact.las
```

Note: Users are prompted for only the runtime variables in the SQL query.

For plug-in data objects, you can pass runtime variables to the Java class as name-and-value pairs. As a prerequisite, verify that the Java report plug-in class takes the name-and-value pairs for the plug-in data object.

For example, consider the com.ca.usm.reporting.Plugins.RequestFulfillmentReport plug-in class. This plug-in class takes a parameter of Date type named START_DATE. Therefore, START_DATE is required in the data object that uses this plug-in class. In this case, perform either of the following actions:

- Hard-code START_DATE as a constant.
- Prompt the user for the date START_DATE value and pass that value to the plug-in.

You can use contextual *system variables* with runtime variables:

- As default values when you prompt the user.
- As constant values to pass to the plug-in.
- As values to use in a query.

The contextual system variables are as follows:

Name	Variable
Current Day	%TODAY%
Previous Day	%TODAY%-Days(1)
Next Day	%TODAY%+Days(1)
First Day Of Month	%START_OF_CURRENT_MONTH%
Last Day of Month	%END_OF_CURRENT_MONTH%
First Day Of Year	%START_OF_CURRENT_YEAR%
Last Day Of Year	%END_OF_CURRENT_YEAR%
User Domain (Business Unit)	%USER_DOMAIN%
User ID	%USER_ID%

Add a Query Runtime Variable

You can add a custom runtime variable to use with a Query data object. An example is adding a query runtime variable that is a drop-down variable.

Follow these steps:

1. Click **Administration**, **Report Builder**.
2. Perform *one* of the following actions:
   - Add a data object
   - Edit an existing data object
3. Click **Create Data Object**.
   The Create Runtime Variable or Edit Runtime Variable dialog appears.
4. Specify the **Name**, **Datatype**, and other data in the fields provided.
5. Click **Create Variable**.
   The Catalog system saves your variable definition.

You can use the variable in an SQL query for a Query data object. Users are prompted to enter a value when they run the data object.

Note: When you add a query runtime variable that is a drop-down variable, the number of values in the resulting drop-down list is limited to 1000. If the report query returns more than 1000 values, the system truncates these additional values. So, the user cannot view them in the drop-down list. For more information about how to increase this value, see the Modify XSL, XML, JavaScript, and Image Files (see page 2018) section.

Add a Data Object

You can add and edit data objects to define the source and content to retrieve for a report.

Follow these steps:

1. Click **Administration**, **Report Builder**.
2. Click **Create Data Object**.
   The Data Object Properties page appears.
3. Perform the following actions:
   a. Select the Type of data object to create.

b. Complete the fields, specifying the detailed options for the data object (see page 3235). The exact fields that appear vary according to your selections for Type and Show Advanced.

4. Set the permissions for the data object, as follows:

   a. Click **Permissions**.

   b. Set the access levels according to role, business unit, and CA EEM user groups, as applicable.

   c. Click **OK**.

5. Click *one* of the following options:

   - **Save**
     Saves the new data object without displaying any data.

   - **Save & Test**
     Saves the new data object and displays the first 25 rows of the resulting data.

The Catalog system saves the new data object.

Note: You can also click Create Data View to create a data view from this data object.

Detailed Options for Data Objects

When you add or edit a data object, you complete the fields, specifying the detailed options for the data object. The exact fields that appear vary according to your selections for **Type** and **Show Advanced** on the page for adding or editing a data object. The following fields require explanation. These fields appear according to your selection for Type: Query, CSV File, or Plugin.

- **Query**
  Specifies the data to retrieve from a database query, as follows:

  - **Database**
    Specifies the name of the database connection. The default is mdb.
    Using the Query Builder, you can create a database connection definition that can use JDBC or an existing ODBC data source on the Catalog Component server. For ODBC, administrators must define this data source identically on each Catalog Component computer in your implementation. This requirement does not apply to JDBC. Therefore, we recommend JDBC.

  - **Table**
    Specifies a comma-separated list of tables for use in the SQL query. Use English characters *only* .

  - **Fields**
    Specifies the names of the database table fields to produce as data object columns.
    Use the Search icon to populate these names that are automatically based on the query in the

Query field. As a prerequisite, save the data object before you do so.
If you use an alias for a field in the query, you can use either name for the value of Fields. Use English characters *only*.

- **Query**
  Specifies the SQL query to use.
  Optionally click Query Builder for help defining the query.

  > **Note:** You can use the Query Builder to define new ODBC or JDBC data sources.

- **Pivot, DB Locking, *and* the Create Variables and Manage Variables buttons**
  See Advanced Fields at the bottom of this topic.

- **CSV File**
  Specifies the data to retrieve from a file in delimiter-separated value format, as follows:

  - **Fields**
    Specifies the names of the CSV file fields to produce as data object columns.

  - **CSV file**
    Specifies the path name of the CSV file. The path can be relative to %RPT_HOME% folder on the Catalog Component server.

    > **Note:** If you use multiple Catalog Component computers, this file must exist in the same folder on all of them.

  - **Delimiter**
    Specifies the delimiter that separates the values in the file. Select a value from the drop-down list.

  - **Pivot**
    See Advanced Fields at the bottom of this page.

- **Plugin**
  Specifies the data to retrieve from the output of a Java plug-in, as follows:

  > **Note:** For more information about plug-ins, select Administration, Tools, Links, and see the Plug-In Documentation.

  Enter the values for the fields that are shown for this type:

  - **Fields**
    Specifies the names of the plug-in output fields to produce as data object columns.

  - **Class Name**
    Specifies the full class name of the plug-in.

- **Arguments**
  Specifies the arguments for the plug-in.

- **Pivot *and* DB Locking**
  See Advanced Fields at the bottom of this page.

- Advanced Fields
  Selecting the Advanced check box exposes the following fields:

- **Pivot**
  Presents subtotals and counts of selected data.
  Select Pivot to display the Select Pivot Fields dialog and configure the parameters.
  This field applies to *all* selections for Type.

- **DB Locking**
  Specifies the type of database locking to use when reading from the database.
  Select a value from the drop-down list.
  For assistance, click the Help (question mark) icon next to this field.
  This field applies when the Type is Query or Plugin.

- **Manage Variables and Create Variable buttons**
  Manage existing variables and add new ones. You can use these variables in SQL queries.
  This field applies *only* when the Type is Query.

Pre-Defined Data Objects

CA Service Catalog has many predefined report data objects (data objects) that you can use in your reports. F

Note: Data objects in this list that mention CA CMDB, CA Service Desk Manager, or CA APM are applicable *only* if the named product is integrated with CA Service Catalog. Otherwise, the data object returns irrelevant data. For information about the integrations with these products, see the Integrating CA Service Catalog (see page 3425) section.

- **Requests associated to assets**
  Returns the requests that are associated to assets in the business unit that you specify.

- **Requests associated to change orders and configuration items, by business unit**
  Returns CA Service Desk Manager change orders and CA CMDB configuration items that are associated to CA Service Catalog requests in the business unit you specify.

- **Requests associated to change orders and configuration items, by user**
  Returns CA Service Desk Manager change orders and CA CMDB configuration items that are associated to CA Service Catalog requests for the user ID that you specify.

- **Requests by business unit**
  Returns all requests for the business unit and date range that you specify.

- **Requests by status**
  Returns all requests for the status and date range that you specify.

- **Requests by year and month**
  Returns the total number of requests for each month in the year that you specify.

- **Request fulfillment**
  Returns the amount of time that is taken to approve, fulfill, and complete all requests within the date range that you specify.

- **Request item fulfillment**
  Returns the following values:

  - The time that is used to approve, fulfill, and complete the request for the specified service option element.

  - Request SLA violation data for each request.

- **Request item fulfillment averages**
  Returns the following values:

  - The total number of requests that include the specified service option element.

  - The total time and the average time that is used to approve, fulfill, and complete the requested service option elements.

  - Request SLA violation data for each request item average.

- **Request item fulfillment by request ID**
  Returns the following values:

  - The amount of time that is taken to approve, fulfill, and complete each service option of the specified request.

  - Request SLA violation data for each service option

- **Request SLA Instances**
  Returns all request SLA instances, with their SLA warning and violation thresholds.

- **Services associated to asset models**
  Returns the CA APM asset models associated to services and service options in the business unit that you specify.

- **Services associated to configuration items**
  Returns the CA CMDB configuration items that are associated to service in the business unit that you specify.

- **Total requests by business unit**
  Returns the total number of requests that are created per business unit for the date range that you specify.

- **Total requests by month**
  Returns the total number of requests that are grouped by month for the year that you specify.

- **Total requests by status**
  Returns the total number of requests that are grouped by status for the date range that you specify.

Note: CA Service Catalog also provides predefined data objects for accounting, data mediation, financial reports, and metric events. For more information, see the comments that are supplied with the related data objects.

Manage Data Views

Administrators use data views to format the data from a data object and present it in tables and charts.

- Add, edit, delete, or view data views and assign them to folders.
- Export a data view in PDF or CSV (delimited) format.
- Manage off-line data views based on a data view.
- Set permissions to specify the level of access to a data view for each role.

You can add or edit a Data View.

Follow these steps:

1. Click Administration, Report Builder.
2. Click Data Views in the left menu.
3. Create a data view or edit an existing one.
4. Complete the fields and click Save. Use the Choose Data Object icon to select a data object to use for this data view.
5. (Optional) Configure how each field in the data object appears in a report: Click Column Rules to configure the presentation of a data view that appears as columns in a report. Select the column that you want in the Settings for Column field. Complete the fields and configure the settings on each tab.
   - Select Show Help to display help text for the tab.
   - Click Advanced to specify advanced settings.

Linking Tab

- **Link Items in Column *column-name* To Other Pages**
  Specifies whether to link the values in the column to another web page, either within or outside CA Service Catalog.
  Select this field to activate it and to open the fields under it for editing.

  - **Special**
    Specifies a link within CA Service Catalog to another data view, a report layout, or a GUI node.

  - **Link Address**
    Specifies one of the following options:

    - Another data view, a report layout, or a GUI node, if you used the Special link to add one.

    - A URL to a website or file share, if you did *not* use the Special field. Enter the URL manually.

    Also, the Link Address field optionally specifies a variable from the data object on which the data view is based. Click the Insert Variables icon to add a variable to this field.

Formulas Tab

- **Apply Formula to Column *column-name***
  Specifies whether to apply a JavaScript formula to the column value.
  Select this field to activate it and to open the fields under it for editing.

  - **Special**
    Specifies an image formula to apply on the data for the column. Use the formula to format a cell or row that is based on a value. Use the following format:

    ```
    IMG:image_file_path
    ```

    image_file_path specifies the folder and file name *under* the USM_HOME\view\webapps\usm folder.
    For example, the following line displays the add.gif image in the cell for the column:

    ```
    IMG:images/add.gif
    ```

    To include the cell text also, enter the column name variable within the single quotes. An example follows:

    ```
    IMG:images/add.gif]%Col1%
    ```

    If you use multiple Catalog Component servers, verify that this file resides in the same folder location on all servers.

  - **Column Formula**
    Specifies variable from the data object to use in the column formula. To use a variable, click the Insert Variables icon.
    Examples of formulas using JavaScript follow:

    ```
    100*%name%

    Math.max(%Col1%,%Col2%)
    ```

```
(10*%Col1%)+(20/%Col2%))+' Units'

%name%'.toUpperCase()
```

Translations Tab

- **Apply Translations to Column *column-name***
  Specifies whether to apply a translation formula to the column value.
  Select this field to activate it and to open the fields under it for editing.

  - **Translations**
    Substitutes a translated value for each data object value. You can optionally apply the translation before applying a formula to the column value.
    For example, a column can return data as integer value *1* which means opened, and *2* which means closed. You can apply translations that:

    - Display *Opened* in place of all values of type *1* in a column.
    - Display *Closed* in place of all values of type *2.*

Formatting Tab

- **Apply Formatting Settings to Column *column-name***
  Applies formatting to a column. Examples include font, justification, highlighting, and color.
  Select this field to activate it and to open the fields under it for editing.

Summary Tab

- **Summary**
  Adds summary information for the column.
  Select this field to activate it and to open the fields under it so that you can select them. The fields that you select appear in the summary of the report.

Manage Layouts

Administrators use layouts to present multiple report elements as one report. You can design custom layouts using data views, text, images, URLs, and other objects. You can specify positions, sizes, colors, borders, styles, and other settings.

- View layouts and organize them in folders.
- Manage off-line layouts that are based on a layout.
- Add or edit a layout. When you add or edit a layout, you can set its status. You can also set the permissions to specify the level of access of each role to the layout.

A layout defines the presentation of multiple report elements. Create and configure layouts to obtain the format you want for reports. You can use one of several sample layouts as a starting point. You can set permissions for the layout and optionally propagate those permissions to the underlying data views and data objects.

Follow these steps:

1. Click Administration, Report Builder, and select Layouts in the left menu.

2. Create or edit a layout.

3. Click one of the options to add the new element you want to the layout. For example, New Text or New Data View.

4. Drag the object to the location you want on the layout.

5. Configure the properties of the object by clicking the properties (i) icon and completing the fields.

6. Click Permissions and set the access levels according to role, business unit, and CA EEM user groups, as applicable, and click OK.
   The Set Permissions dialog closes, and you return to the Edit Custom Report Layout page.

7. Click Save and specify the status from one of the following options:

   - **Created**
     Specifies that the layout is visible *only* to the user who created it (the creator). No other user is permitted to view the layout, regardless of the permissions set for it. This option enables the creator to complete it before anyone else can access it.

   - **Available**
     Specifies that the layout is visible to the owner and to any user who is granted permissions to it.

8. Continue editing the layout as needed; save it periodically and when you are finished. Exit the Edit Custom Report Layout page by clicking Cancel.

Publish and View Reports

If you are using CA Service Catalog, you can publish a report to a catalog. After you do so, you can add the report to a service as a service option so that users can request the report. You can publish a report only if its status is *Available*.

Follow these steps:

1. Click Administration, Report Builder.

2. Select Layouts in the left menu.

3. Expand the folders by clicking the folder names or by clicking List View under Report Layout Objects.

4. Find the report that you want and click the Publish Report to the Catalog icon in the Action column.
   The Catalog system adds the layout as a service option to the Published Reports service option group.

5. View reports, as follows:

   a. Click Administration, Report Builder.

b. Expand the folder by clicking the folder names or by clicking List View.

c. Find and display the report that you want.

You can optionally add the service option for the report to a service when you define the service (see page 3001). As a result, users can request the report in the service.

After you have published a report, you and other users can view it. To view reports, you require access to the Reports menu option.

Follow these steps:

1. Click Administration, Report Builder.
2. Expand the folder by clicking the folder names or by clicking List View.
3. Find the report that you want and display it.

You have viewed the published report.

View the Business Value Dashboards

Business value dashboards aggregate smaller chunks of data into higher-level actionable information that enables IT Managers to make informed decisions. The dashboards correlate information across incident and request management that is required for executives users/mangers whose responsibilities span multiple functions.

CA Service Management provides two dashboards namely, Service Demand Dashboard and Operational Effectiveness Dashboard. Information that these business value dashboards provide is as follows:

- Service support metrics categorized by parameters such as time period, location, and organization unit. This information helps IT managers understand the prevailing pattern and plan capacity for upcoming months/quarters.
  For example, as an IT executive, you may want to understand the volume pattern of incidents or requests over the past three months to help you manage resources better. Also, you may want to identify the category of services which involved the maximum cost and cost pattern over the last six months.
  You can access the Service Demand dashboard to view this information.

- Demand for services categorized by parameters such as time period, location, and organization unit that provide insight into consumption of services in a specific category.
  For example, as an IT manager, you may want to know the categories (software, hardware, network and so on) which had the maximum number of incidents in the last one month and the category's incident/request volume of a team in a particular location.
  You can access the Service Demand dashboard to view this information.

- Functional effectiveness information that helps process managers analyse the performance of a support group the impact on cost.
  For example, as a process manager, you may want to analyse the performance of an L1 function (number of services resolved) in different locations and identify the reason for varying

performances of the teams. Also, in a support group, you may want to understand the number of incidents that were transferred from L1 to L2. If the number of escalations is high, the time and effort spent increases and thus results in a significant impact on cost and customer satisfaction. The information in the dashboard helps you identify any process changes/resource requirement /knowledge gaps required to enhance the performance of the various support groups and the functions.
You can access the Operational Effectiveness dashboard to view this information.

To understand how cost, effort, and volume of incident/request are calculated, see Important Metrics (see page 791). Each dashboard is a service offering that is exposed through CA Service Catalog and accessible through the Unified Self-Service interface.

Follow these steps:

1. Log in to Unified Self-Service as a user with permissions to access the dashboards. For example, Executive User.
   If Unified Self-Service is not installed, you can access the service offerings from the CA Service Catalog user interface.

2. In the Home page, click Request a Service.
   The Request Page Appears.

3. Under Categories, click Service Management Dashboards.

4. Click an appropriate service offering to see the related information.
   Note: The Service Demand dashboard displays only information based on products you installed. For example, if CA Service Catalog is installed the dashboard displays information related to requests only. Contact your administrator for more information.

Unified Self-Service

Unified Self-Service (formerly CA Open Space) is a community-based communication tool, which lets you connect and share knowledge with the people in your organization. Using this communication tool, you can post questions, get answers, share information, solutions, and ideas. A powerful search capability offers results from community conversations, SharePoint content, and external search engines, such as Google.

As part of CA Service Management, Unified Self-Service is integrated with CA SDM and CA Service Catalog as a self-service front end. If the community cannot provide the answer, you can open a request. You can also monitor the progress of requests in Unified Self-Service.

You can use shortcut keys to perform some basic navigation tasks quickly or to work without a mouse. The following table describes the available keyboard shortcuts:

TO DO THIS	PRESS
Go to Home page	CTRL+1
Go to Communities	CTRL+2
	CTRL+3

TO DO THIS	PRESS
Ask a Question	
Go to My Profile	CTRL+4
Reply to a Question	CTRL+5 **Note:** To use the keyboard shortcut to reply to a question (CTRL+5), you must be viewing the entire conversation.
Go to Questions	CTRL+6
Display Help	F1

Using the Unified Self-Service Home Page

The **Home** page displays an overview of the activity in Unified Self-Service.

You can view the following details:

- Requests you created that are currently not resolved. You can click a request to view more details about the request.
- Important announcements such as a scheduled maintenance activity.
- Recently posted or answered questions in the community. You can click a question to view or reply to the question.

You can also perform the following tasks:

- Report issues that require assistance from IT.
- Create requests when you need software, hardware, or any other service.
- Post a question in the communities to seek advice from others in the community.

Collaborate Using Communities

Communities are the different forums that your organization creates to help people connect and share information. You can perform the following tasks in the Communities page:

- View the communities that you are currently part of and the communities that your organization created for you to explore.
- Post or reply to questions in the communities that you have joined.
- Join communities that you are not a member of. Access to communities may require approval from your Administrator.

Follow these steps:

1. Log in to Unified Self-Service.
2. In the Menu bar, click My Communities.
3. To post a question in communities, complete the following steps:
    a. Click New Question and enter the question.
    You can alternatively click the Ask a Question tile on the Home page.
    b. At the bottom of the page, click Change to select the community that you want to post your question in.
4. Select a community to view the questions in the community.
5. To reply to a question, select the question and the click Reply.
6. To join a community, complete the following steps:
    a. Click All Communities.
    A list of communities is displayed.
    b. In the community that want to join, click Join.

Manage User Profile

Personalize your profile to enrich the community experience. You can perform the following tasks in the **My Profile** page:

- Add a photo to help connect with your community.
- Set your preferred display language. The Unified Self-Service user interface is displayed in the selected language but the user-generated content remains in the language in which it was entered.
- Set your notifications preferences to specify when you want to receive email and application notifications about Unified Self-Service activity.
- Add words that describe your interests and skills. These tags help Unified Self-Service alert you with questions that interest you or that you are qualified to answer.

Follow these steps:

1. Log in to Unified Self-Service.
2. Click My Profile from the drop-down list in the top right of the page.
3. Click Edit My Profile.
4. Specify the details and click Save.

Create a Request or Issue

Through Unified Self-Service you can view the details of requests and issues you created from a single location. The Requests page allows you to perform the following tasks:

- View the requests and issues you created.
  The My Recent Requests section displays requests and issues based on when a request/issue was last updated.

- Filter requests and issues based on their status.

When you face an issue, you can report it to IT help desk by creating a new issue. Also, if you need hardware, software, or any other service, you can create a request and select from a catalog of services available to you.

Follow these steps:

1. Log in to Unified Self-Service.

2. In the left Menu, click Create.

3. To create an issue, complete the following steps:

    a. Select Create New Issue. You can alternatively click the Report an Issue tile on the Home page.
    The Report an Issue page opens.

    b. Specify the required information and click Submit.

4. To create a request, complete the following steps**:**

    a. Select Create New Request. You can alternatively click the Request a Service tile on the Home page.
    The Request a Service page opens.

    b. Specify the required information and click Submit.

Explore Questions in Community

Through Unified Self-Service, you can view and post questions in community to learn from the community. You can also reply to questions posted from others in the community. The **Questions** page lets you do the following:

- Explore the latest questions posted, or those answers that the community has identified as the most helpful, or the questions that have been answered.

- Look through the unanswered questions that match the interests and skills in your Unified Self-Service profile. Unified Self-Service displays questions based on the tags (words that describe your interests and skills) you specify in your profile. For more information, see Manage Your Profile (see page 3246).
  Note: The **Recommended** section displays only the top 10 recommended questions.

You can perform the following actions on the questions:

- Reply to a question.
- In response to a question, create a request or report it as an issue. The details of the request are automatically filled based on the question.

Search for Information

Using the Unified Self-Service search, you can search for information from different data sources (as configured by the administrator) along with community message boards. For example, you can search for knowledge base articles in your organization or information from external knowledge stores like Google, organization knowledge stores like SharePoint.

View Resources that You Own

Through Unified Self-Service, you can view the resources such as software or hardware that you currently own.

Note: If you do not see the Resources page in the Unified Self-Service user interface, it is because your administrator has not configured it for you. Please contact your administrator for more information.

Follow these steps:

1. Log in to Unified Self-Service.
2. In the Menu bar, click My Resources.
   The Resources page lists the resource you currently own.

Manage User Password in Unified Self-Service

You can reset your password after expiry, from the Unified Self-Service (USS) console.

Note: This feature is supported only when USS is integrated with CA EEM.

Follow these steps:

1. Log in to the USS console using your current password.
   If your password has expired, the Change Password page is displayed.

2. Enter your old password, and then your new password in the respective fields.

3. Click **Save**.
   You are redirected to the login page after the password reset is successful. You can login using the new password.

Problem Management

Problems are difficulties encountered when following normal procedures. Records of problems are saved, along with the steps taken to correct the problems.

Note: Depending on your role, you may not have access to all the functionality described in this section. For example, some predefined roles can edit records but cannot create records.

Troubleshooting

The section contains the following articles:

Troubleshooting CA Service Management

Customization

Perform Customization

Any “modifications” or “adaptions” or “configurations” that are done administratively through the interface (web browser, command-line, Web Screen Painter) are “supported”, meaning CA Support can assist with the basic suggestions and troubleshooting. CA Support do NOT perform any changes for the customer. The customer is responsible for the changes made. For example, adding a field to a table and putting the field on a form through Web Screen Painter is a fully supported “modification”. Similarly, installing or uninstalling a feature through the Options Manager administration is a fully supported “configuration”. Anything to do with SPEL code, Java scripting (or any language scripting), or a customer-specific change to the underlying base code-line (done by CA Services or a Partner), is NOT supported by CA Support. The customer can perform these actions, but is responsible for the support, maintenance, and troubleshooting when an issue occurs. If such “customization” affect expected out-of-the-box behavior, CA Support will ask the customer to remove the customization and see if the behavior persists.

Retain Customization

When any form is modified, the customer changes are overwritten and has to be recreated. There is a process in the upgrade that attempts to detect and identify the differences in the forms, and reports it to the customer for their investigation. However, it is highly recommended to document your customization BEFORE you perform any upgrade. In some cases, a new feature may be similar to the user customization, so the user changes must be removed.

Unable to Install CA Service Management

If the CA Service Management installation fails, check the log files, take corrective actions, and retry the installation. If the installation still fails, proceed to integrate the required products or common components manually.

- Integrate CA Service Catalog with CA Service Desk Manager Manually (see page 3255)
- Integrate CA Service Desk Manager with Common Components Manually (see page 3262)
- Integrate CA Service Catalog with Common Components Manually (see page 3292)

Integrate CA Service Desk Manager with CA Asset Portfolio Management Manually

Important! Review the following section only if you want to manually integrate CA Service Desk Manager with CA Asset Portfolio Management when the automatic integration between the two has failed.

To manually integrate CA APM and CA SDM, follow these steps:

1. Enable Single Sign-On (SSO) from CA Asset Portfolio Management to CA Service Desk Manager (see page 3251)
2. Verify Single Sign-On (see page 3254)
3. Launch CA Asset Portfolio Management in Context From CA Service Desk Manager (see page 3255)

Enable Single Sign-On (SSO) from CA Asset Portfolio Management to CA Service Desk Manager

CA Service Management provides the following ways to enable SSO from CA Asset Portfolio Management (CA APM) to CA Service Desk Manager.

- Use the Web Service Access Policy File (see page 3252)
- Use the CA Service Desk Manager Administrator Credentials (see page 3252)

Both the mechanisms internally use the CA Service Desk Manager SOAP Web Services to achieve the SSO from CA APM to CA SDM. You can configure either one or both the mechanisms to achieve SSO from CA APM to CA SDM.

Important! Ensure that CA APM and CA Service Desk Manager are installed on the same database.

Note: CA APM uses the fallback mechanism during the Single-Sign On process. If both the mechanisms are configured, the Policy File mechanism is used. If the Policy file does not work, then CA Service Desk Manager Administrator credentials are used. If neither of these are successful, then the CA Service Desk Manager login screen is displayed on clicking the respective hyperlink in CA APM. If the CA APM user does not have valid access rights (role /group) in CA Service Desk Manager, the Single Sign-On login screen is displayed on clicking the CA Service Desk Manager links on the CA APM page

Use the CA Service Desk Manager Administrator Credentials

The CA Service Desk Manager admin credentials are used from CA APM to login to CA Service Desk Manager through the CA Service Desk Manager Web Services.

Follow these steps:

1. Log in to CA APM as an Administrator. Default user name is *uapmadmin*.
2. Click Administration, System Configuration, Service Desk Manager.
3. Enter the complete URL for CA Service Desk Manager SOAP Web Services in the following format:

   ```
   http://<ServiceDeskHostName>:<PortNum>/axis/services/USD_R11_WebService
   ```

4. Enter the CA Service Desk Manager Administrator login user name and password.
5. Click Save.

Note: Do not perform IISReset on the CA APM Web Server or CA APM Application Server.

Use the Web Service Access Policy File

You create the Access Policy file in CA Service Desk Manager and then use this file in CA APM. The Access Policy file contains encrypted policy details that are assigned to a CA Service Desk Manager user who has access to various capabilities in the CA SDM application.

Follow these steps:

1. Log in to the CA Service Desk Manager as an Administrator. Use the Administration tab to perform the following tasks:
   a. Create the Web Services Access Policy using the SOAP Web Services Policy option. Complete the following:
      i. Assign a name. The default name and code are CASM_POLICY; however, you can use any name as per your requirements.

ii. Assign a proxy user to this policy.

> **Note:** This proxy user must have administrative access to CA Service Desk Manager.

iii. Verify that the Allow Impersonate property of CA Service Desk Manager is set to Yes.
CA Service Desk Manager checks the access type of the CA APM user to be impersonated against the access type of the proxy user of the policy. If the access level of the CA APM user access type is less than or equal to the grant level of the proxy user access type, CA SDM replaces the CA APM user with the proxy user.

b. Generate the policy key file with the help of pdm_pki tool for the Web Services policy that you created.
In the Service Desk environment, open the Command Prompt and enter:

```
C:\>pdm_pki  - p CASM_POLICY  - f
```

The policy file CASM_POLICY.p12 is generated in the same folder.
The default/recommended name is CASM_POLICY.p12, but you can use any name as per your requirement.

c. Verify that the HashKey property is set to Yes in the newly created Web Services access policy. The system typically configures this setting automatically when you generate the policy key file.

d. Copy and save the policy key file to the CA APM default installation directory of the CA APM Web Server.

```
C:\Program Files (x86)\CA\ITAM
```

> **Note:** If you are using application clustering, copy the policy key file to the CA APM installation directory of every CA APM Webserver Component cluster node. If you re-configure the Policy in CA SDM, then you must re-generate the policy file and copy it to CA APM Web Server installed directory.

2. Log in to CA APM as an Administrator.
Default:*uapmadmin*.

3. Click Administration, System Configuration, Service Desk Manager.

4. Enter the complete URL for CA Service Desk Manager SOAP Web Services in the following format:

```
http://<ServiceDeskHostName>:<PortNum>/axis/services/USD_R11_WebService.
```

5. Copy the CA Service Desk Manager SOAP Policy file from CA Service Desk Manager Server to the CA APM web server installation folder. Default installation directory :

   ```
   C:\Program Files (x86)\CA\ITAM
   ```

6. Enter the file name of CA Service Desk Manager policy file that is copied on the CA APM Web server component installation folder.

7. Enter the CA Service Desk Manager policy code that is the policy name as configured in the CA Service Desk Manager Administration SOAP Web Services policy configuration page.

8. Click Save.

Note: Do not perform IISReset on the CA APM Web Server or CA APM Application Server.

Verify Single Sign-On

To verify that Single Sign-On from CA APM to CA Service Desk Manager has been enabled, click on any *one* of the following CA Service Desk Manager hyperlinks in the CA APM page:

- Log in to CA APM, Asset Details page and click on the CA Service Desk Manager link on the top
- Click Asset Relationships (menu on the left), CA Service Desk Manager Tickets links. A Criteria and Results page with Service Desk Ticket ID Column values in hyperlink is displayed in the results section. The hyperlinks are the entry point to CA SDM and display ticket details after you have successfully logged into CA SDM.
- Click on the Launch CA Service Desk Manager link in the Asset Viewer page. This launches the CA Service Desk Manager application.

View the Contact Update Details

You can view the contact update details for existing or new assets (known as configuration items in CA Service Desk Manager) in the following ways:

- Contact Update Details for existing Contacts in CA APM
  Ensure that you have enabled Single Sign-On from CA APM to CA Service Desk Manager (see page 3251) for existing contact details to be updated and reflected in CA Service Desk Manager Contact's Quick Profile.
- Contact Update Details for new Assets in CA APM
  In this release, if you have integrated CA APM and CA Service Desk Manager, new Assets that are created have the Contact details automatically saved and reflected in CA Service Desk Manager Contact's Quick Profile.

Launch CA Asset Portfolio Management in Context From CA Service Desk Manager

To launch CA APM in context from CA SDM, you need to add a Management Data Repository (MDR) in CA SDM to point to the proper CA APM URL.

Follow these steps:

1. Create an MDR in CA SDM with the following properties:
    a. Button Name: CA APM
    b. MDR Name: CA APM
    c. MDR Class: GLOBAL
    d. Hostname: CA APM Server Name
    e. Path: ITAM/Pages/Asset.aspx
    f. Parameters: assetid={federated_asset_id}
2. Click the CA APM button.
   The corresponding asset record opens in CA APM.

Integrate CA Service Catalog with CA Service Desk Manager Manually

Important! Review the following section only if you want to manually integrate CA Service Catalog with CA Service Desk Manager when the automatic integration between the two has failed.

CA Service Catalog integration with CA Service Desk Manager is achieved through catalog request fulfillment, which can be configured to automatically open CA Service Desk Manager requests or change orders.

If you are integrating CA Service Catalog and CA Asset Portfolio Management, the associated assets become configuration items on the related change order. The CA Service Desk Manager request and change orders can be viewed in the CA Service Catalog request's Related Tickets column.

Using the integration with CA Service Desk Manager, when a user requests a service from the catalog and it is approved, the fulfillment process could include identifying the correct existing asset and a CA Service Desk Manager change order could be opened assigning a configuration and delivery task to a technician for the asset.

Finally, you can also integrate CA Service Catalog and CA Service Desk Manager by configuring them to use the same common multi-tenant administration.

Set up the CA Service Catalog - CA Service Desk Manager Integration

The major tasks to integrate CA Service Catalog and CA Service Desk Manager follow. These tasks are explained in detail in the sections that follow.

1. Verify the Prerequisites for CA Service Catalog - CA Service Desk Manager Integration (see page 3256)

2. Understand the Key Terms (see page 3257)

3. Configure communication between CA Service Catalog and CA Service Desk Manager by ensuring that a CA Service Desk Manager primary server is properly defined to CA Service Catalog.
   A CA Service Desk Manager primary server is always required to view or open tickets or change orders. To configure CA Service Catalog so that a user can view a CA Service Desk Manager ticket (change order or request) while viewing a CA Service Catalog request, define the CA Service Desk Manager host specified when you select Administration, Configuration, Service Desk.
   In those configuration options, you must also update configuration details for the CA Service Desk Manager primary server.

4. You can optionally bypass user login by configuring CA Service Catalog and the CA products with which it integrates to use single sign-on.
   To configure CA Service Desk Manager to use single sign-on, configure it to use either CA SiteMinder or NTLM authentication on Windows.
   Similarly, to configure CA Service Catalog to use single sign-on, configure it to use either CA SiteMinder (see page 3425) or NTLM authentication on Windows.

5. (Optional) Configure the integrating products to open CA Service Desk Manager change orders during request fulfillment (see page 3258).

6. (Optional) Configure the integrating products to open CA Service Desk Manager service requests during request fulfillment.

7. (Optional) Synchronize notes and attachments (see page 3260).

Step 1 - Verify the Prerequisites for CA Service Catalog - CA Service Desk Manager Integration

To enable the integration between CA Service Desk Manager and CA Service Catalog, meet the following prerequisites:

- You must be familiar with the basic functions and administration of CA Service Desk Manager and CA Service Catalog.

> **Important!** Ensure that CA Service Catalog and CA Service Desk Manager share the same installation of the MDB, CA EEM, and CA Process Automation (if you are using CA Process Automation).

- Both CA Service Catalog and CA Service Desk Manager must be installed, configured, and running. Verify that CA Service Desk Manager has the latest service packs and patches applied.

- If you are using CA Process Automation as the process automation tool for CA Service Catalog and CA Service Desk Manager, verify that you:

  - Install and configure CA Process Automation.
    Verify that CA Process Automation has the latest service packs and patches applied.

  - Install and configure a CA Process Automation-CA Service Desk Manager connector on the CA Process Automation domain orchestrator computer. For more information, see your CA Process Automation administrator.

  - Integrate CA Service Catalog with CA Process Automation Manually (see page 3305). If your implementation of CA Service Desk Manager uses CA Process Automation and the ITIL content pack, review the Pre-Built CA Process Automation Workflows (https://wiki.ca.com/display/CASM1401/Pre-Built+CA+Process+Automation+Workflows) section.

  - Integrate CA Service Desk Manager with CA Process Automation manually (see page 3281).

Step 2 - Understand the Key Terms

This section describes several key terms that you should know when implementing an integration between CA Service Desk Manager and CA Service Catalog. In CA Service Desk Manager, requests, change orders, and related items are the types of tickets that you can open. CA Service Desk Manager defines requests, change orders, and related terms from both an ITIL and non-ITIL perspective.

For a CA Service Desk Manager customer who is *not* running ITIL, the possible ticket types to open up are as follows:

- Requests are requests for service from internal customers, or in the non-ITIL case could also represent a failure.

- Issues are same as the above except they are meant for external customers.

- Change orders are a request for some type of change to the environment.

For a CA Service Desk Manager customer who *is* running ITIL, the possible ticket types to open up are as follows:

- Requests are requests for service for internal customers.

- Issues are requests for service from external customers.

- Change orders are a request for some type of change to the environment.

- Incident is a disruption in service, meant to be restored as quickly as possible.

- Problem is for getting to the root cause.

The following is a typical scenario to distinguish between these ticket types on an ITIL installation:

1. An end user opens up an incident with the helpdesk because of problems connecting to email.

2. At the same time, other end users also open up incidents complaining of the same.

3. To restore service as quickly as possible, the email server is rebooted.
   End users can now connect to email. The incident(s) is resolved. Although rebooting the email server got the end users up and running, we still need to determine and fix the root cause. From here a problem is opened and attached to the incident(s) for additional research.

After research, the root cause looks to be that there is not enough RAM on the email server, so a change order is opened for the proper approvals to go through to add the additional RAM, this change order is then linked to the problem.

Step 3 - Open Change Orders During Request Fulfillment

During the fulfillment phase of the request life cycle, CA Service Catalog can open a CA Service Desk Manager change order. Be careful when activating rules to understand the full implications of your changes. For more information about the CA Service Catalog request life cycle, see the section Request Management from an Administrator Perspective (see page 2115).

To configure CA Service Desk Manager so that CA Service Catalog request fulfillment can open CA Service Desk Manager change orders, complete the following tasks:

1. If you are using CA Process Automation, update CA Process Automation-related settings (see page 3258).

2. Enable rule actions (see page 3259).

Update CA Process Automation Settings

Update these CA Process Automation-related settings to complete the process of configuring CA Process Automation to support the opening of change orders in CA Service Desk Manager during request fulfillment.

Follow these steps:

1. In CA Process Automation, perform these steps:

   a. Access the Service Desk SRF folder (CA SDM/SRF).

   b. Edit the HWSW_FilledFromInventory SRF.

   c. Add the <chgcat> tag to this SRF.

   This step updates the SRF to process change orders in CA Service Desk Manager.

2. In CA Process Automation, perform these steps:

   a. Click Configuration, Domain, Modules, and click Lock.

   b. Double click Edit CA ServiceDesk Module.

c. Enter the ServiceDeskWebService URL, for example, http://hyderabad129:8080/axis/services/USD_R11_WebService.

d. Enter the user name and password of the CA Service Desk Manager administrator.

e. Save and click Unlock.

3. In CA Service Desk Manager, perform these steps:

a. Select Options Manager, Change order Manager, Category_Defaults.

b. Install the Category_Defaults option.

c. Restart CA Service Desk Manager.

This step updates CA Service Desk Manager to process change orders from CA Service Catalog according to your specifications.

You have updated the CA Process Automation-related settings.

Enable Rule Actions

To cause CA Service Catalog to open a CA Service Desk Manager change order during request fulfillment, you must enable several rule actions that are disabled by default.

Follow these steps:

1. Select **Administration**, **Events-Rules-Actions**.

2. Click the Event Type named **Request/Subscription Item Change**.

3. Click the rule named **When Category is Hardware and Status is Filled from Inventory**.
The list shows the CA Process Automation actions that you can use with this rule. Use the remaining steps as a model to modify your start request forms (SRFs) and processes.

4. To enable the CA Service Desk Manager change orders, disable the **Launch FilledFromInventory SRF for Hardware** action and enable the **Launch HWSWFilledFromInv_SDM SRF** action.

a. Click the Edit icon for the action named **Launch FilledFromInventory SRF for Hardware** .

b. Select **Disabled** from the **Status** drop-down list and click OK.

c. Click the Edit icon for the action named **Launch HWSWFilledFromInv_SDM SRF**.

d. Select **Enabled** from the **Status** drop-down list and click OK.

The Rule Action screen is displayed showing the **Launch FilledFromInventory SRF for Hardware** action disabled and the **Launch HWSWFilledFromInv_SDM SRF** action enabled.

5. Repeat the previous steps for the rule named **When Category is Software and Status is Filled from Inventory**.

Activate all rules (see page 562) except **When Status is Pending Fulfillment** for the entire complex request life cycle involving CA Service Desk Manager to work correctly.

Step 4 - Synchronize Notes and Attachments

If you have configured CA Service Catalog to create a ticket (change order or incident) in CA Service Desk Manager when a catalog user submits a request for certain services, each ticket is associated with a specific service option in the requested service. You can enhance the integration by synchronizing notes and attachments to be copied from a service option its related ticket. You can specify this synchronization to occur both before and after the ticket is created. This synchronization helps provide the latest information about the request to the CA Service Desk Manager staff (for example, the analysts) who process the related ticket.

Follow these steps:

1. Enable the CA SDM options, as follows:

    a. Log in to the CA SDM web UI from the following server, depending on your CA SDM configuration:
    Conventional: Primary server
    Advanced availability: Background server

    b. Select Options Manager, CA Service Catalog from the Administration tab.

    c. To enable the integration, install the following options:
    casc_aty_sync

    Specifies the type of activity logs to be synchronized from CA SDM to CA Service Catalog. If this field is left blank, Log Comment activity logs are synchronized. To synchronize other activity log types, (such as, Escalate, Update Status) enter the respective log type codes, separated by comma.

    casc_endpoint

    Specifies the CA Service Catalog Web Services URL.

    Format: http://<CA_Service_Catalog_hostname>:<CA_Service_Catalog_portnum>/usm/services.

    (Optional) **casc_session_timeout**

    Specifies the time in minutes for which the CA Service Catalog web services session will be cached.

    Range: 20 to 60 mins.

    casc_user

Specifies the CA Service Catalog administrator username that is responsible for making the web service calls to CA Service Catalog. This user must exist in EEM against which CA SDM is configured.

casc_user_password

Specifies the password of the CA Service Catalog user as entered in the casc_user option.

(Optional) **casc_ws_retry**

Specifies the number of retries to synchronize a CA SDM ticket update (activity logs/ attachments/status) with CA Service Catalog, if there is a failure. Enter -1 to try indefinitely, until the synchronization succeeds. As a system administrator you can define the time interval after which you want the failed ticket update to be retried again.

Run the following command to define the time interval:

```
pdm_options_mgr -c -a pdm_option.inst -a option.inst -s NX_CASC_RETRY_INTERVAL -
v [time interval in minutes]
```

By default this time interval is set to 15 minutes. If you do not set any value or provide a non-numeric value to this variable, the failed update is retried according to the default time interval (15 mins.).

Range: -1 to 50

casc_integrated

Enables the self-service integration.

Important! Restart CA SDM services for the options to work.

The options are installed successfully.

2. From CA Service Catalog, click the Event Type named Request/Subscription Item Change, and proceed as follows:

    a. Click the rule named When Category is Hardware and Status is Filled from Inventory.

    b. Select the action named Launch HWSWFilledFromInv_SDM SRF and click the Disable button on the Actions bar.
    This step disables the default fulfillment action, which does *not* support the synchronization of notes and attachments.

    c. Select the action named Launch HWSWFilledFromInv_SDM_SYNC SRF and click the Enable button on the Actions bar.
    This action synchronizes both notes and attachments between service options and tickets *before* the ticket is created.

d. Click Done.
You return to the Event Details page.

3. Perform these actions, using the previous step as a model:

   a. Open the Document Create Event Type.

   b. Enable the rule named When attachment is added to Service Catalog request.

   c. Enable the action named Launch PAM SRF to sync attachments.

   This action synchronizes attachments between service options and tickets *after* the ticket is created. That is, if a catalog user adds an attachment to a service option after submitting the request, this action passes the attachment to the related ticket.

4. Perform these actions:

   a. Open the Notes Create Event Type.

   b. Enable the rule named When note is added to Service Catalog request.

   c. Enable the action named Launch PAM SRF to sync notes.

   This action synchronizes notes between service options and tickets *after* the ticket is created. That is, if a catalog user adds a note to a service option after submitting the request, this action passes the note to the related ticket.

Integrate CA Service Desk Manager with Common Components Manually

This article contains the following topics:

Integrate CA Service Desk Manager with CA Embedded Entitlements Manager Manually

Complete the following steps if you are not able to integrate CA SDM and CA EEM through the CA Service Management installer:

1. Ensure that you have installed CA EEM (see page 283).

2. Depending on the CA SDM configuration, log in to the following server:

   - Conventional: Primary server

- Advanced availability: Background server

3. Install the following options:

   - **use_eiam_authentication**
     Allows use of EEM authentication when users log in to CA SDM / Knowledge Management and the access type authentication is set to OS.

   - **use_eiam_artifact**
     Allows EEM artifact to be used when users log in to CA SDM / Knowledge Management using URL.

   - **eiam_hostname**
     Specifies the hostname of the server where EEM is running. Required for EEM user name and password or artifact authentication.

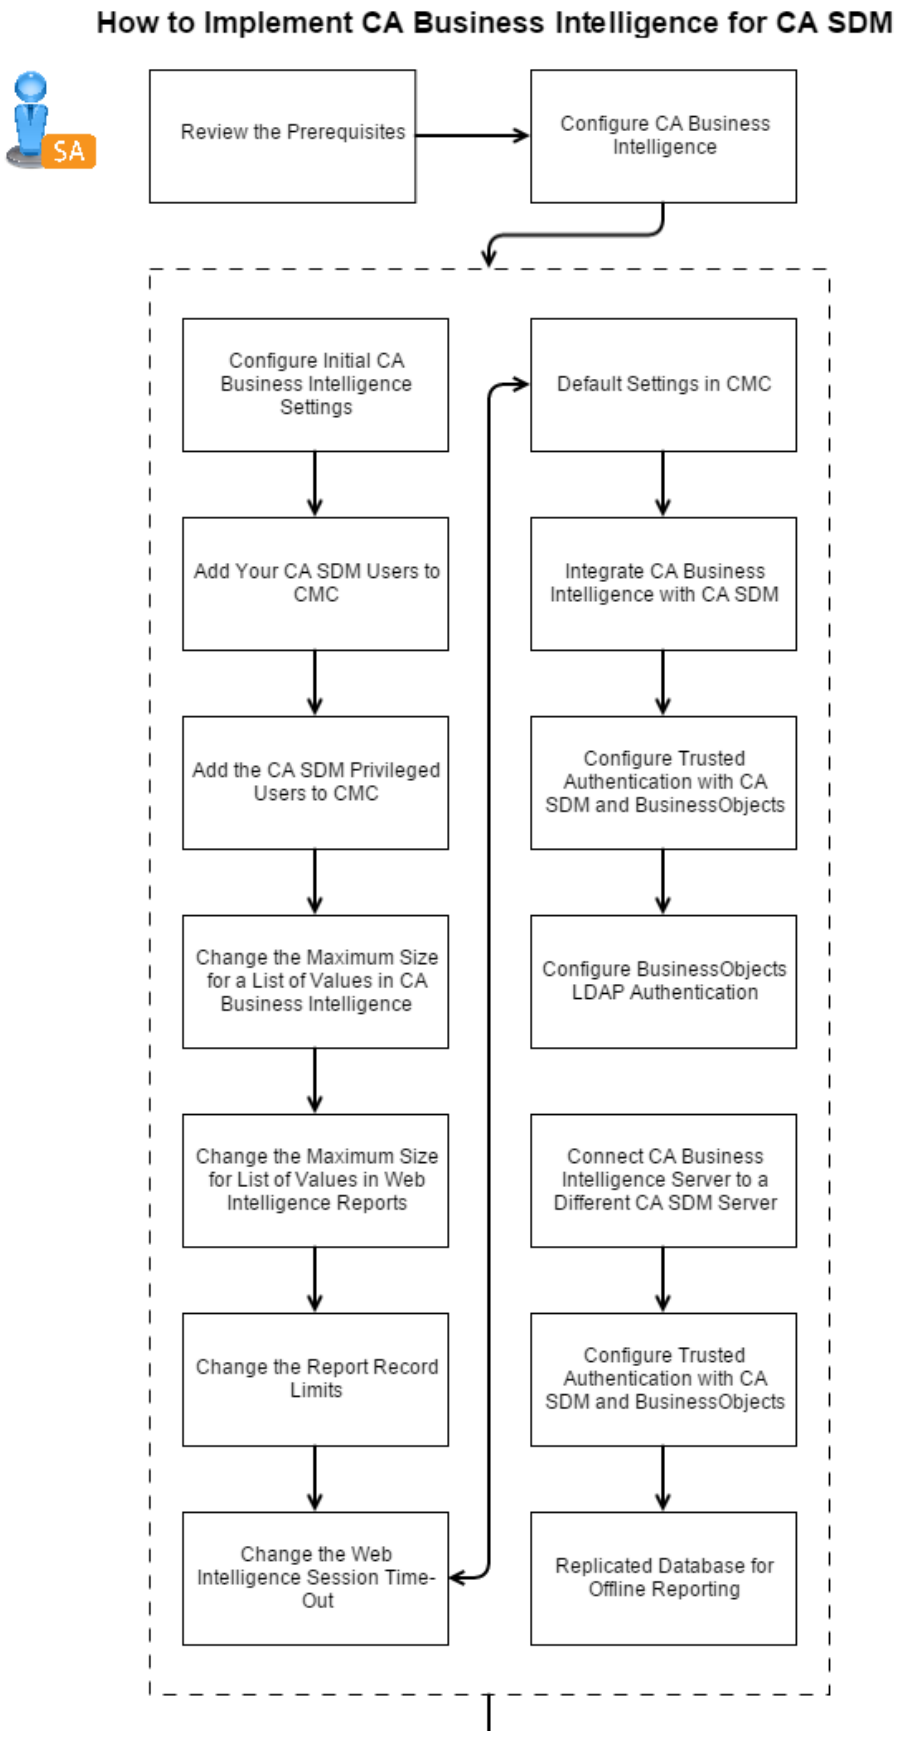
4. Restart CA SDM services (see page 913) and add the CA SDM privileged user in EEM.

At the end of this topic, you have successfully integrated CA EEM with CA SDM.

Integrate CA Service Desk Manager with CA Business Intelligence Manually

CA Business Intelligence is a set of reporting and analytic software that CA SDM uses to present information and support business decisions. CA SDM uses CA Business Intelligence to integrate, analyze, and then present the information through various reporting options. To generate reports from CA SDM, an administrator must install, configure, and integrate CA Business Intelligence with CA SDM.

The following diagram shows how you can implement CA Business Intelligence for CA SDM:



How to Implement CA Business Intelligence for CA SDM
SA
Review the Prerequisites
Configure CA Business Intelligence
Configure Initial CA Business Intelligence Settings
Add Your CA SDM Users to CMC
Add the CA SDM Privileged Users to CMC
Change the Maximum Size for a List of Values in CA Business Intelligence
Change the Maximum Size for List of Values in Web Intelligence Reports
Change the Report Record Limits
Change the Web Intelligence Session Time-Out
Default Settings in CMC
Integrate CA Business Intelligence with CA SDM
Configure Trusted Authentication with CA SDM and BusinessObjects
Configure BusinessObjects LDAP Authentication
Connect CA Business Intelligence Server to a Different CA SDM Server
Configure Trusted Authentication with CA SDM and BusinessObjects
Replicated Database for Offline Reporting

Follow these steps:

Verify Prerequisites

Review the following prerequisites before you plan to implement CA Business Intelligence for CA SDM:

- CA SDM uses CA Business Intelligence 4.1 SP3.
- The installation of CA Business Intelligence requires Central Management Server (CMS) installed on port 6400.
- The CA SDM users requiring access to reports must be added to the CMS Administrator list before using the reports.
- We recommend the SAP BusinessObjects users having an existing installation of BusinessObjects, to install and configure the CA Business Intelligence.

- If you are using Firefox to view the reports, see the CA Business Intelligence documentation (https://docops.ca.com/display/CABI41SP3/Hardware+and+Software+Requirements+for+Installation) to verify the recommended version.
- See the CA Business Intelligence documentation (https://docops.ca.com/display/CABI41SP3/Upgrade+JDK+and+JRE+in+CABI+4.1+SP3) for the supported version of JRE.
- If you are using advanced availability configuration, you have a separate server to install CA Business Intelligence.

Configure CA Business Intelligence

You can configure CA Business Intelligence after a successful installation. You perform mandatory settings to be able to generate reports from CA SDM. You require some mandatory configurations like Adding users and setting security parameters before integrating CA Business Intelligence with CA SDM.

Configure Initial CA Business Intelligence Settings

This step loads the CA SDM universe and reports and creates groups. The step also optionally creates one user for each group and establishes group authorizations.

Note: (For Linux/ UNIX/ AIX/ Solaris) After CA SDM installation, you need to create srvcdesk user in CA Business Intelligence Release 4.1 SP3 and assign it to the following groups manually:

- Change Manager
- Customer Service Manager
- Incident Manager
- Knowledge Analyst
- Knowledge Manager
- Problem Manager
- Service Desk Manager
- Support Automation Admin
- Support Automation Analyst

Follow these steps:

1. Launch the CA Service Management installer.

2. Select **CA Business Intelligence (CA BI) Configuration for CA Service Desk Manager** option from the **Select the required Installer** screen.

   Note: Depending on the server where you run CA Business Intelligence configuration, the configuration performs the following tasks and you need the following DNS:

   - (Server where CA Business Intelligence 4.1 SP3 is only installed) Configuration imports the OOTB Universe, Reports, Groups/Users and installs 32 bit ODBC or 64 bit ODBC Client. Create 32bit/64bit DSNs pointing to the CA SDM machine.
   - (Server where CA Business Intelligence 4.1 SP3 and CA SDM are installed) Configuration imports the OOTB Universe, Reports, Groups/Users and installs 64 bit ODBC Client. Create 64bit DSN pointing to CA SDM machine.
   - (Server where CA Business Intelligence 4.1 SP3 and Client Tools are installed) Configuration imports the OOTB Universe, Reports, Groups/Users and installs 32 bit ODBC/64 bit ODBC Client. Create 32bit/64bit DSNs pointing to CA SDM machine.
   - (Server where CA Business Intelligence 4.1 Client Tools is installed) Configuration installs 32 bit ODBC Client. Create 32bit DSN pointing to CA SDM machine.
   - (Server where CA Business Intelligence 4.1 Client Tools and CA SDM are installed) Configuration does not perform any action. Required 32 bit ODBC Client and DSN are already available.

3. Complete the fields on the CA Business Intelligence configuration UI. If you installed CA Business Intelligence on a different computer than CA SDM, the following fields appear on the CA Business Intelligence configuration:

   Service Desk Primary Server: Provide the host name of the CA SDM server depending on your configuration:

   - **For conventional:** primary server
   - **For advanced availability:** application server

   ODBC Port: Specifies the port number of the CA SDM ODBC driver. **Recommended:** 19987.
   ODBC Install Location: Specifies the custom location for the ODBC installation when it is different from the default location.

4. Verify the CA Business Intelligence configuration.

Configure Failover Settings

This process is only applicable for advanced availability configuration. If multiple application servers are configured, you can configure failover settings. You configure failover to redirect active user sessions to the other application server. You can also configure load balancing between multiple application servers.

Follow these steps:

1. Invoke the command prompt as an administrator.
2. Execute odbcad32.exe from the following location on the CA Business Intelligence server:
   - (For 32but DSN) C:\Windows\System32
   - (For 64bit DSN) C:\Windows\SysWOW64

   The DataDirect OpenAccess SDK ODBC Driver Setup dialog opens
3. Enter the application server details in the **General** tab.
4. Enter the alternate application server details in the **Failover** tab with the following syntax: (Host=AppServer1:Port=19987,Host=AppServer2:Port=19987,..)
5. Select **Load Balancing** to distribute the load among the server. The load is balanced between servers whose details are provided in the **General** tab and the **Failover** tab. The servers are picked randomly.

   Note: Select Force SQL_DRIVER_NOPROMPT for failover or load balancing configuration.

6. Click **Apply** and **OK**.
   You have configured the post configuration settings for the advanced availability configuration.

How to Configure Date Range Values and Join Parameters

After you install CA Business Intelligence, complete the following tasks:

- Configure the date range values so that the date range filters in CA Business Intelligence work correctly.
- Configure the join parameters so that universe outer joins are supported.

Follow these steps:

1. On the computer on which CA Business Intelligence server has been installed, navigate to the following location:

   ```
   C:\Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0\dataAccess\connectionServer\odbc\extensions\qt
   ```

2. Using a text editor, open the odbc.prm file and navigate to the <Configuration> section. Locate the following line to configure date range values:

   ```
   <Parameter Name="USER_INPUT_DATE_FORMAT">{\d 'yyyy-mm-dd'}</Parameter>
   ```

3. Modify the line to include "hh:mm:ss am/pm" as shown in the following example:

   ```
   <Parameter Name="USER_INPUT_DATE_FORMAT">{\d 'yyyy-mm-dd hh:mm:ss am/pm'}<
   /Parameter>
   ```

4. Open odbc.prm from the Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0\dataAccess\connectionServer\odbc directory.

5. Locate the following line to configure join parameters:

   ```
   <Parameter Name="EXT_JOIN">YES</Parameter>
   ```

6. Locate the following and replace NO with YES:

   ```
   <Parameter Name="FULL_EXT_JOIN">YES</Parameter>
   <Parameter Name="LEFT_EXT_JOIN">YES</Parameter>
   <Parameter Name="RIGHT_EXT_JOIN">YES</Parameter>
   ```

7. Update OUTERJOINS_GENERATION" "NO" to "FULL_ODBC" in odbc.prm file located at \extenstions\qt. Add the following three lines after the OUTERJOINS_GENERATION parameter:

   ```
   <Parameter Name="LEFT_OUTER"></Parameter> <Parameter Name="RIGHT_OUTER"><
   /Parameter> <Parameter Name="OUTERJOINS_COMPLEX">Y</Parameter>
   ```

8. Save the odbc.prm file.

9. Restart the Business Objects Enterprise services.
   Date range values and join parameters are configured. Date range filters work with CA Business Intelligence and universe outer joins are supported.

Update the Custom Universe Link

Important! This step applies only if you are migrating from CA Business Intelligence 3.3 to CA Business Intelligence 4.1.

If you have Custom Universe based on the OOTB Universe, refresh the link with CA Service Management 14.1 Universe.

1. Launch Universe Design Tool from the machine where CA Business Intelligence Release 4.1 SP3 client tools are installed.

2. Copy the backup Custom Universe to this machine.

3. Click File, Open.

4. Click File, Parameters.
5. Click the Links Tab
6. From the Name column, click the universe of your product,
   The Change Source button is enabled.
7. Click the Change Source button.
8. Select the location of the universe file.

   Note: The .unv file is typically located in the CA Universes folder.

9. Click Open, OK.
   The universe link is updated.
10. Export the custom universe.

Add Your CA SDM Users to CMC

The CMC is an administrative utility that lets you control users access to Business Intelligence Launch Pad and other BusinessObjects applications. With CMC, you can assign security and user access permissions to folders and documents.

Note: During the configuration phase, an optional check box indicates whether sample users are added to the CMC. If you selected this option, your CMC contains several sample users. You can use these samples as models when defining user permissions and authentication options for your reporting environment. For more information about sample users, see Security and Authorization (see page 3205).

Follow these steps:

1. From the **Start** menu on the **CA Business Intelligence server**, select **CA Business Intelligence 4.1**, **Central Management Console**.
   The **CMC Management Console** page opens.
2. Type the privileged user name and password.
3. Click **Log On**.
   The **CMC Home page** opens.
4. Click **Users and Groups** in the **Organize** section of the CMC home page.The time-out value determines how long the IEnterpriseSession.logon() lasts.
5. Click **Manage, New, New User**.
   The **New User** dialog opens.

6. Select **Enterprise** from **Authentication Type** drop down list from the **CMC** home page. Access the Central Management Console (CMC) to enable Trusted Authentication.

7. Under **Account Name**, specify the CA SDM User ID.

8. On the **Properties** tab, specify your password information and settings as follows:

   - **Password**
     Enter the password and confirm. The maximum password length is 64 characters. This password must be mixed-case, at least six characters long, and cannot contain the word administrator in any form. The password should also contain at least two of the following character types:

     - Uppercase
     - Lowercase
     - Numeric
     - Punctuation

   - **Password never expires**
     Select the check box.

   - **User must change password at next logon**
     This check box is selected by default. If you do not want to force users to change the password the first time they log in, clear the check box.

9. To restrict data access for the reports with data partition or tenancy constraints, select the **Enable Database Credentials for Business Objects Universes** check box. In the fields that display, specify the CA SDM account name and password of the user, and then confirm the password.

10. Click the **Actions, Members Of** to specify the groups that the user must belong to.

11. Click the **Join Group** to view the available groups. By default the user is a member of the Everyone group.

12. In the **Available groups** area, select one or more groups.

13. Click the **>** arrow to add the group(s).

14. Click **OK**.
    The **Members Of** dialog appears and lists the groups in which the user is a member.

Change the Maximum Size for a List of Values in CA Business Intelligence

When you install CA Business Intelligence, the maximum number of values that can be returned in a batch for a list of values in the Crystal reports is set to 5,000 records. For performance reasons, you can change the size so that the list of values is in several batches of this size or less.

Note: For information about improving the performance of the Web Intelligence Report Server, see your BusinessObjects documentation.

Follow these steps:

1. Create the following registry key:

   ```
   HKEY_CURRENT_USER\Software\SAP BusinessObjects\Suite XI 4.0\Crystal Reports\DatabaseOptions\LOV
   ```

   Note: The created registry key overrides the settings of the HKEY_CURRENT_USER\Software\SAP BusinessObjects\Suite XI 4.0\Crystal Reports\DatabaseOptions registry key.

2. Add a string value as **MaxRowsetRecords**.

3. Set the value of MaxRowsetRecords to the maximum number of values that you want for the report. For example, a value of 2000 returns up to 2000 values in the lowest level of a cascading parameter.

   Note: The value zero (Unlimited) does not work with BusinessObjects Enterprise or Crystal Reports Server. If MaxRowsetRecords is set to zero, whenever Crystal Report is accessed from Business Intelligence Launch Pad it takes more time to populate the values. Setting the value to zero displays the maximum list of values.

4. Restart the affected service or application, as required.

Note: These registry keys do not affect the **List of Values** that are returned when a report is based on a Universe.

Change the Maximum Size for a List of Values in Web Intelligence Reports

When you install CA Business Intelligence, the maximum number of values that can be returned in a batch for a list of values in the Web Intelligence reports is set to 50,000 records. For performance reasons, you can change the size so that the list of values is in several batches of this size or less. For information about improving the performance of the Web Intelligence Report Server, see your BusinessObjects documentation.

Follow these steps:

1. Log in to **Central Management Console**.

2. Click **Servers**.
3. Right-click **Web Intelligence Processing Server** and select **Properties**.
4. Increase the value of **Maximum List Of Values Size** (entries).
5. Save and restart the Web Intelligence Processing Server.

> **Note:** Setting large number for **Maximum List Of Values Size** (entries) may affect the performance of Web Intelligence. We recommend to set the appropriate number according to the system performance.

Change the Report Record Limits

When you install CA Business Intelligence, the number of records that the server retrieves from the database when a user runs a query or report in Crystal reports is automatically set to 20,000 records. You can change the setting so users running reports receive the record sets they expect. For complete details about administrative tasks you can complete for the Crystal Reports Page Server, see your BusinessObjects documentation.

Follow these steps:

1. Using BusinessObjects Enterprise, log in to the **Central Management Console**.
2. Navigate to the page displaying the servers.
3. Click **Crystal Reports 2013 Processing Server**.
4. On the **Properties** tab, change the setting for the **Database Records To Read When Previewing or Refreshing a Report** field to either unlimited records, or specify a specific record limit.
5. Click **Apply**.
6. Restart the Crystal Report Page Server.
   The report record limit changes and is used when running reports.

Change the Web Intelligence Session Time-Out

Users have Full Control access to the Web Intelligence application by default.

The Web Intelligence application has a session time-out of 20 minutes by default. Unsaved reports are lost when the session times out and the user must log in again to use the application.

Administrators can modify the connection session time-out value using the Central Management Console (CMC).

Follow these steps:

1. Select **Servers** from the **CMC Home** page.
   The **Servers** window opens.

2. Select **Web Intelligence Processing Server** in the **Server Name** column.

3. Type the appropriate time-out value (number of minutes) in the **Connection Time Out** field.

4. Click **Apply**.
   Your changes take effect after the server is restarted.

5. Click **OK**
   The session time-out value is set.

Default Settings in CMC

Most of the reporting configuration is performed silently during the CA Business Intelligence installation. Reporting configuration involves the following actions:

- Setting up security
- Deploying reports
- Deploying universes
- Deploying program objects
- Configuring Web Intelligence settings

The administrator can log in to the BusinessObjects CMC and modify the default settings at any time. Users are authorized access based on the CA SDM group to which they belong.

Note: For more information about the BusinessObjects CMC, see the CABI documentation (http://wiki.ca.com/CABI).

Integrate CA Business Intelligence With CA SDM

After you install CA Business Intelligence, update the Web Reporting options so CA SDM is properly integrated with CA Business Intelligence.

Follow these steps:

1. On the **Administration** tab, select **Options Manager, Web Report**.
   The Option List appears.

2. Set the correct values to the following **Web Report** options:

   - **bo_server_auth**
     Specifies which type of authentication you want to use for reporting. You can specify the following types of authentication:

- **secEnterprise --** (Default) Specify Enterprise Authentication as your authentication type when you prefer to create distinct accounts and groups in **BusinessObjects for use with CA Business Intelligence**, or when a user hierarchy has not been set up in a Windows NT user database, an LDAP server, or a Windows AD server.

  Note: Before you use the **secEnterprise option**, add your CA SDM report users (see page) to the **BusinessObjects Central Management Console** (CMC). In the CMC, enter the same user names and passwords that are configured in CA SDM.

- **secLDAP --** Specify LDAP Authentication as your authentication type if you have already set up an LDAP directory server and you want to use your LDAP user accounts and groups in **BusinessObjects for use with CA Business Intelligence**.
  When you map LDAP accounts to BusinessObjects, users can access CA Business Intelligence with their LDAP user name and password. This setup eliminates the need to recreate individual user and group accounts within BusinessObjects.

- **secWinAD --** Specify Windows AD Authentication as your authentication type if you are working in a Windows 2000 environment and you want to use your existing Active Directory user accounts and groups in BusinessObjects for use with CA Business Intelligence.

- **secExternal --** Specify **External Authentication** as your authentication type when you integrate the BusinessObjects authentication solution with a third-party authentication solution. For example, using JCIFS with Tomcat. This authentication type requires setting up Trusted Authentication in BusinessObjects to allow users to log in without providing their passwords. For complete details about administrative tasks you can complete for the Crystal Reports Page Server, see your BusinessObjects documentation.

- **bo_server_cms**
  Specifies the name of the Central Management Server (CMS) that maintains a database of information about your BusinessObjects that you use with CA Business Intelligence.
  For the **bo_hostname**, use the hostname of the computer where CA Business Intelligence is installed. The default bo_cms_port is 6400.

- **bo_server_location**
  Specifies the hostname of the computer where CA Business Intelligence is installed. Specify bo_hostname. CA SDM uses this URL for report URLs for requesting reports from the BusinessObjects server. The CMS location is specified by hostname and port. For more information, see the CA Business Intelligence installation documentation (https://wiki.ca.com/display/CABI41SP3/CABI+Installation+on+Windows).

3. Make changes to the options, if any of them have been specified incorrectly.

   a. Click **Save, Refresh**.

   b. The **Options Detail** page is updated with your selection.

   c. Click **Close Window**.

d. Stop and start the service named CA SDM Server.

After confirming the correct web reporting options, you can now set up web-based reports. For more information about setting up web-based reports, see the Web-Based Reports (see page 3201) topic.

How to Configure Trusted Authentication with CA SDM and BusinessObjects

Trusted Authentication lets you use a simple form of Single Sign On when integrating CA SDM and CA Business Intelligence.

Follow these steps:

1. Install and configure CA SDM.
2. Install and configure CA Business Intelligence.
3. Log in to the CMC as Administrator.
4. Access the **Central Management Console** (CMC) to set up Trusted Authentication.
5. Create CA SDM contacts and BusinessObject users.
6. Install the CA SDM web report options and set the **bo_server_auth** option to **Enterprise**. For more information about *bo_server_auth*, see the Web Report Options topic.
7. Cycle the BusinessObjects Apache Tomcat.
8. Cycle the CA SDM server in Windows Services.

Configure Trusted Authentication in CA Business Intelligence

You configure trusted authentication for CA Business Intelligence by first editing the web.xml file.

Follow these steps:

1. Log in to CMC as Administrator and go to the **Authentication management** area.
   The **Enterprise** page appears.
2. At the bottom of the page, select the **Trusted Authentication is enabled** option.
3. Click **New Shared Secret, Download Shared Secret** to download a shared secret. The shared secret is used to create a trusted authentication password.
4. Save the TrustedPrincipal.conf file.
5. Enter a time-out value for your trusted authentication requests.

Note: The time-out value determines how long the CMS waits for the IEnterpriseSession.logon() call from the client application.

6. Click **Update**.
   The trusted authentication is configured.

Configure Trusted Authentication in CA SDM

Configuring Trusted Authentication in CA SDM requires editing the TrustedPrincipal.conf file.

Follow these steps:

1. Open the NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd directory.
2. Replace TrustedPrincipal.conf with the one downloaded from the Central Management Console. For more information, see Configure Trusted Authentication in CA Business Intelligence.
3. (Applicable for advanced availability configuration only) Repeat the steps 1-2 for all configured application servers.
4. Recycle the CA Business Intelligence Tomcat server.
   The trusted authentication in CA SDM is configured.

Note: You must configure the trusted authentication in the CA SDM background server to launch reports from the background server URL.

Configure BusinessObjects LDAP Authentication

When configuring the LDAP authentication, use the fully qualified name (First Name, Last Name) for the LDAP Server Administration Credentials “cn”. Configuring the LDAP authentication allows you to map LDAP attributes to use the end-user logon name.

Important! The user Account Name for BusinessObjects must match the CA SDM contact User ID when configuring LDAP authentication.

Follow these steps:

1. Access the Authentication management area of the Central Management Console (CMC).
2. Double-click **LDAP**.
3. Enter the name and port number of your LDAP hosts in the **Add LDAP host** (hostname:port) field. For example, "myserver:123".
4. Click **Add** and then **OK**.
5. Select **Custom** for the server type from the **LDAP Server Type** list.

6. Follow the prompts in the CMS configuration wizard and complete the configuration.
   The BusinessObjects LDAP authentication is configured. For more information about configuring LDAP Authentication, see this (https://wiki.ca.com/display/CABI41SP3/Integrate+with+Open+LDAP+Directory+Server) topic.

Connect CA Business Intelligence Server to a Different CA SDM Server

This is required to generate reports from another instance of CA SDM installed on a different server.

Follow these steps:

1. Create an ODBC DSN for the CA SDM server (see page).
2. Connect the CA SDM universe to this CA SDM server (see page).

Create an ODBC DSN for the CA SDM Server

Use the ODBC Data Source Administrator to create 32 bit ODBC DSN and 64 bit ODBC DSN for the CA SDM server on CA Business Intelligence server.

Follow these steps:

1. Start the Windows ODBC Data Source Administrator (Data Sources (ODBC)).
2. On the **ODBC Data Source Administrator** form, select the **System DSN** tab, and select **Add**.
3. On the **Create New Data Source** form, select the **DataDirect OpenAccess** driver, and select **Finish**.
4. On the **DataDirect OpenAccess ODBC 32 Setup** form, assign an ODBC Name and select **Advanced**.
   The naming convention to use is casd_hostname. For example, if the hostname of the CA SDM server is MyServer, you would use casd_MyServer.
5. On the **OpenAccess Database Configuration** form, select **Add**.
6. On the **OpenAccess Database Setup** form, enter the following information:
   - **Name** -- Specify casd_hostname.
   - **IP Address** -- Specify the IP address of the CA SDM server.
   - **Port** -- Specify 19987.
   - **Type** -- Select **SQL**.
7. Click **OK**.
8. On the **Open Access Database Configuration** form, select **OK**.

9. On the **DataDirect OpenAccess ODBC 32 Setup** form, select **casd_hostname** from the **Database** drop-down list, and select **OK**.
   The 64 bit DSN is created.

10. Launch odbcad32.exe from C:\Windows\SysWOW64 directory and follow steps 2 - 9 to create 32 bit DSN.
    The 32 bit DSN is created.

Connect the CA SDM Universe to the Server

Use the Universe Design Tool in BusinessObjects Enterprise to establish a connection.

Follow these steps:

1. Log in to the server where the CA Business Intelligence Client Components are installed.

2. From the **Start** menu, browse to **CA, CA Business Intelligence 4.1 Client Tools, Universe Design Tool**.

3. Log in to the **Universe Design Tool** with the following credentials.

   - **System** -- Specify the hostname of the server where CA Business Intelligence was installed.
   - **User name** -- Specify the name of the CA Business Intelligence administrative user (typically Administrator).
   - **Password** -- Specify the password of the CA Business Intelligence administrative user.
   - **Authentication** -- Select **Enterprise**.

   The **Universe Design Tool** window appears.

4. Click **File, Import**.
   The **Import Universe** dialog appears.

5. Select the **CA Universes** folder from the drop-down list and then select the CA SDM universe and click **OK**.

   Note: If you are using Universe Design Tool for the first time, you may first need to select **Browse** to select the **CA Universes** folder.

6. Click **OK** to the **Universe successfully imported** message.
   The U**niverse** window appears.

7. Select **File, Parameters**.
   The **Universe Parameters** dialog appears.

8. On the **Definition** tab, click **Edit**.
   The **Login Parameters** dialog appears.

9. Select **Edit**.

10. Select the **ODBC DSN** you created (casd_hostname) from the **Data source name** drop-down list. Specify the CA SDM Privileged User and Password for **User name** and **Password**.

11. Click **Next, Test Connection**, and step through the **Universe Connection** dialogs that appear.

12. Click **OK** to finish.

13. Select **File, Export**
    The **Export Universe** dialog appears.

14. Select **CA Universes** from the **Domain** drop-down list.

15. Select **Everyone** from the **Groups** list.

16. Click **OK**.
    The universe is exported and the connection to the server is established.

> **Note:** If CA Business Intelligence server and Client Tools are installed on separate computers then create 32 bit DSN on the client computer. For more information, see the **Create an ODBC DSN for the CA SDM Server** topic.

Replicated Database for Offline Reporting

To manage potential performance issues that may affect the reporting components that are installed with CA SDM, create a replicated database for offline reporting purposes. For more information about creating a replicated database for offline reporting, see the sample documentation and scripts delivered in the NX_ROOT\samples\reporting directory.

Verify Reports

To ensure that the reports are generated without any problem, verify the CA Business Intelligence configuration.

Follow these steps:

1. Click the **Reports** tab.
   The **Web Report** page opens.

2. Click **BI Launchpad**.
   The Business Objects Business Intelligence Launch Pad window opens.

3. Click the **Documents** link.

4. Expand **Folders, Public Folders, CA Reports, CA Service Management, CA Service Desk**.

5. Select the **Asset** folder in the left pane.

6. Double-click the **Asset List** report.
   The report returns with zero or more Results Found. CA Business Intelligence is now configured for CA SDM.

Integrate CA Service Desk Manager with CA Process Automation Manually

CA Process Automation is a stand-alone CA product with features for automating and tracking hardware and software administration tasks in enterprise IT environments. CA Process Automation automates tasks and manages user interactions, such as approvals and notifications for compliance and accuracy within production environments.

When you integrate CA SDM and CA Process Automation, you can leverage the benefits of CA Process Automation workflow capabilities from key points within CA SDM. An effective integration between CA SDM and CA Process Automation requires you to understand both products.

CA Process Automation Components

CA Process Automation offers multiple capabilities and structures that facilitate a wide range of activities as part of CA Process Automation process management. For the integration with CA SDM, however, only the following CA Process Automation components are critical for CA Process Automation integration:

- **Process Definition --** Identifies a collective series of tasks, steps, and conditions that are structured in a specific order to be initiated, and completed by various individuals or parties. This component is the central building block of all CA Process Automation content.

- **Start Request Form --** An object containing descriptive information for end users. The Start Request Form presents a process definition to users while hiding the technical details of the process definition.

- **Keywords --** A list of pre-defined words or phrases to attach to Start Request Forms.

- **Automation Library --** An area within CA Process Automation that stores and shows Process Definitions and Start Request Forms.

- **Library Path or Reference Path --** A folder structure that organizes and describes Process Definitions and Start Request Forms within the automation library.

- **Process Instance --** An active entity that executes the rules that are defined in a process definition. The process instance progresses until the process definition state is complete.

- **Process Instance Log Messages --** A configurable, running record that details the progression of activities of the process instance. Log message categories are useful to the CA SDM integration with CA Process Automation.

Note: The scope of the definitions of CA Process Automation components is limited to the usage within CA SDM. For information about CA Process Automation components and capabilities, see the CA Process Automation documentation.

Complete the following steps only if you are not able to integrate CA Process Automation and CA SDM through the CA Service Management installer:

Verify the Integration Requirements

You can integrate CA Process Automation and CA SDM to coexist on a single server when the server architecture supports both products. When CA Process Automation or CA SDM components cannot integrate on the same server, consider installing each product on separate servers.

Important! If CA Process Automation is configured in FIPS mode, you must also configure EEM server and EEM SDK in FIPS mode. For more information about configuring the EEM SDK in FIPS mode, see the CA EEM documentation.

Before you configure CA Process Automation and CA SDM, confirm that both products are installed and are working independently.

Follow these steps:

1. Open a browser on the server that hosts CA SDM and verify that a CA Process Automation user can log in to CA Process Automation. Change the place holders to match the target CA Process Automation installation.

   ```
   http(s)://<server>:CA Portal/itpam
   ```

2. Enter the following URL. Change the place holders to match the target CA Process Automation installation.

   ```
   http(s)://<server>:CA Portal/itpam/JNLPRequestProcessor?processType=startUI
   ```

   The CA Process Automation product is accessible from the CA SDM host.

Install the CA Process Automation Workflow Options

When you install the CA Process Automation Workflow options, you specify connectivity between CA SDM and CA Process Automation. If you are using CA EEM for authentication, you also specify the CA EEM host name.

Follow these steps:

1. On the Administration Tab, select Options Manager, CA IT PAM Workflow.
   The Option List appears.

2. Right-click the name of each option and select Edit from the context menu. Install the following options:

   - **caextwf_eem_hostname**
     Specifies the name of the CA EEM server. For example, *<wf_hostname> (http://pam.host.com/)* identifies the authentication host. You install caextwf_eem_hostname only if you configured CA Process Automation to use CA EEM as an authentication server. CA SDM uses this value to transform a user name and password into a CA EEM token. Then, the user name and password do not pass in plain text over HTTP.

     Note: If the CA Process Automation installation is not using CA EEM, do not place a value in the caextwf_eem_hostname option, and do not install the caextwf_eem_hostname. Placing a false value or installing caextwf_eem_hostname when it is not necessary causes the integration to fail.

   - **caextwf_endpoint**
     Specifies the URL that points to the CA Process Automation web services by including the CA Process Automation host name, port, and the mandatory /itpam/soap path. For example, http://<wf_hostname>:<wf_tomcat_port>/itpam/soap identifies the endpoint. If your implementation uses CA EEM, installing the caextwf_eem_hostname option is required for the integration between CA Process Automation and CA SDM to operate properly.

   - **caextwf_log_categories**
     Specifies a comma-separated list of CA Process Automation process instance log category names to appear on the CA SDM Request, Change Order, and Issue Workflow Tasks tab. For example, *Operator,Response,MyOwnCategory* supplies three log categories.
     You install caextwf_log_categories based on business decisions from the CA SDM and CA Process Automation process design personnel. This option adjusts the default data that appears on the Workflow Tasks tab for requests, change orders, and issues.
     When you install the caextwf_log_categories option, all CA Process Automation process instance log messages from the Process category and the categories that you specify appear on the Workflow Tasks tab. When you do not install caextwf_log_categories, only the CA Process Automation process instance log messages from the Process category appear on the Workflow Tasks tab.

   - **caextwf_processdisplay_url**
     Specifies how to launch a graphical snapshot of a CA Process Automation process instance by supplying the host name and the mandatory /itpam/Web.jsp?page=runtimeeditor&ROID path. For example, http://<wf_hostname>:<wf_tomcat_port>/itpam/Web.jsp?page=runtimeeditor&ROID= launches a snapshot of a process instance. On the Workflow Tasks tab of a request, change order or issue, the user selects View Process to see the snapshot.
     Installing the caextwf_processdisplay_url option is required for the integration between CA Process Automation and CA SDM to operate appropriately.

- **caextwf_worklist_url**
  Specifies the process instance path by supplying the host name and the mandatory /itpam?page=tasklist path. For example, http://<wf_hostname>:<wf_tomcat_port> /itpam?page=tasklist enables CA SDM users to see a list of CA Process Automation process instances that require attention. The list appears in CA Process Automation when the CA SDM user selects a link associated with any listed task in the request, change order, or issue Workflow Tasks tab.
  Installing the caextwf_worklist_url option is required for the integration between CA Process Automation and CA SDM to operate properly.

- **caextwf_ws_password**
  Specifies the administrative password associated with the CA Process Automation user name from the caextwf_ws_user option. CA SDM uses the user name and password to access the CA Process Automation web service functions to perform integration activities such as selecting start request forms, process definition information, and process instance information.
  Installing the caextwf_ws_password option is required for the integration between CA Process Automation and CA SDM. The password and user name that you specify requires the appropriate access to CA Process Automation. However, it is not necessary the CA Process Automation user name and password to exist within the CA SDM contact records.

- **caextwf_ws_user**
  Specifies the CA Process Automation administrative user name associated with the CA Process Automation user name from the caextwf_ws_password option. CA SDM uses the user name and password to access the CA Process Automation web service functions. These services perform integration activities such as selecting start request forms, selecting process definition information, selecting process instance information, or launching process instances.
  Installing the caextwf_ws_user option is required for the integration between CA Process Automation and CA SDM to operate. The user name and password that you specify requires the appropriate access to CA Process Automation. However, it is not necessary the CA Process Automation user name and password to exist within the CA SDM contact records.

- **caextwf_retry_count**
  Specifies the number of times an event is triggered if CA Process Automation is unavailable. CA Process Automation Workflows can be attached to CA SDM tickets (for example,Change Orders) through CA SDM Events and Macros. The attached events are triggered by CA SDM at the specified retry interval duration. During retry, if the CA Process Automation is unavailable, the attached event is marked as Unknown and the process is not executed. CA SDM retry mechanism automatically re-triggers the attached Unknown events when CA Process Automation is unavailable. Default value is 3 and can be set in the range [1 – 20].

- **caextwf_retry_interval**
  Specifies time interval after which the event is again triggered in case CA Process Automation is unavailable.

3. Click Install.

4. Restart the CA SDM service.
   The CA SDM and CA Process Automation can communicate even though there is no process instance data. CA SDM and CA Process Automation are ready for you to create CA Process Automation process definitions and CA Process Automation start request forms.

Set Up SSL Communications with CA Process Automation

For security reasons, CA Process Automation implementers may have chosen to install or reconfigure CA Process Automation to require SSL communications. If CA Process Automation is configured to require SSL communications, integrated applications such as CA SDM require a certificate from the CA Process Automation keystore for communication.

Follow these steps:

1. Configure CA SDM options to use the CA Process Automation HTTPS address.
2. Export the CA Process Automation keystore certificate to a file and copy the file to CA SDM.
3. Load the certificate file into CA SDM using the CA SDM pdm_keystore_mgr utility.
4. If applicable to your CA SDM architecture, update the version control files to deliver the CA SDM keystore to all secondary servers.
5. Restart CA SDM.

Enable Communications When CA Process Automation is SSL Enabled

When CA Process Automation communicates with SSL, configure the CA SDM servers to communicate with CA Process Automation.

To enable communications when CA Process Automation is SSL enabled, do the following tasks:

1. Verify that you can use CA Process Automation in a browser, without launching CA SDM. Record the CA Process Automation URL and use it for reference when you configure the CA Process Automation Workflow options in Options Manager.
2. Log in to CA SDM and install or modify the CA Process Automation Workflow options in Options Manager. For each of the following options, use the syntax *https://server:8443 (https://server:8443/)* instead of http://server:8080 (http://server:8080/) for reaching the SSL enabled CA Process Automation application. If the CA Process Automation installation uses another port instead of the 8443 SSL port, specify the appropriate port number.
   - caextwf_endpoint
   - caextwf_processdisplay_url
   - caextwf_worklist_url

> **Note:** If the values do not match the actual CA Process Automation installation values, CA SDM cannot communicate with CA Process Automation. A runtime error occurs. Verify that the values match the actual CA Process Automation installation values, because the CA Process Automation installer might have selected a different port instead of port 8443.

3. On the CA Process Automation server, locate the KEYSTOREID and itpam.web.keystorealias entries in the following file:

   ```
   C:\Progra~1\ITPAM\server\c2o\.config\OasisConfig.properties
   ```

4. Copy the KEYSTOREID. Be prepared to paste the KEYSTOREID value as the password after you issue the keytool command.

5. On the CA Process Automation server, issue the following keytool command as one line on the command line:

   ```
   C:\Progra~1\ca\sc\jre\1.6.0_00\bin\keytool.exe -keystore C:
   \Progra~1\ITPAM\server\c2o\.config\c2okeystore -export -alias <keystorealias> -
   file itpam.cer
   ```

   The keytool utility prompts you for a password.

6. Paste or type the KEYSTOREID value as the password.
   The keytool utility uses the final parameter (-file itpam.cer) to create a file that is named *itpam.cer*. The *itapm.cer* file contains the necessary certificate information for communications with CA SDM.

7. Move the *itpam.cer* file to one of the following locations on the CA SDM server:

   - (Windows) %NX_ROOT%\bin
   - (UNIX) $NX_ROOT/bin

8. Import the CA Process Automation certificate information into CA SDM by entering the following command:

   ```
   (Windows) pdm_perl %NX_ROOT%\bin\pdm_keystore_mgr.pl -import %NX_ROOT%
   \bin\itpam.cer
   (UNIX) pdm_perl $NX_ROOT/bin/pdm_keystore_mgr.pl -import $NX_ROOT/bin itpam.cer
   ```

   The *pdm_keystore_mgr.pl (http://pdm_keystore_mgr.pl/)* script generates the keystore file in the following locations:

   - (Windows) %NX_ROOT%\pdmconf\nx.keystore
   - (UNIX) $NX_ROOT/pdmconf/nx.keystore

9. The *nx.keystore* must be delivered to the following CA SDM servers, depending on the CA SDM configuration:

- Conventional:Secondary server.
- Advanced Availability: Application and standby server.

Open the *server_secondary.ver* file from one of the following locations:

- (Windows) %NX_ROOT%\site\server_secondary.ver
- (UNIX) $NX_ROOT/site/server_secondary.ver

10. Modify the *server_secondary.ver* for version control by adding the following information:

```
[SSL_Keystore]
filename = "nx.keystore"
directory = "$NX_ROOT/pdmconf"
component_type = "file"
O_mode = "RW"
g_mode = "RW"
w_mode = "RW"
file_ctl
```

11. Restart CA SDM.
    The CA SDM server can communicate with the SSL enabled CA Process Automation application.

Configure the Integration

Both CA Process Automation and CA SDM, as stand-alone products, have individual requirements for authentication and authorization. To support a unified Service Oriented Architecture (SOA) strategy, you can configure both products to use CA EEM for authentication.

When you install CA Process Automation with CA EEM as the authentication server, the installer creates several policies and eight essential entities by default:

- Four application users: pamadmin, pamuser, pamproduser, and pamdesigner.
- Four application groups: PAMAdmins, PAMUsers, Designers, and Production Users.

CA SDM users who also use CA Process Automation can be divided between PAMAdmins and PAMUsers as follows:

- CA SDM analysts must be members of PAMUsers when their duties entail:
  - Approving, rejecting, or otherwise responding to CA Process Automation Interaction Request Forms.
  - Listing CA Process Automation process instances assigned to the user.
  - Viewing the graphical display by clicking the View Process button of CA Process Automation's process status screen. The CA Process Automation PAMUsers group requires an additional CA Process Automation policy to grant access the graphic.
- CA SDM analysts are members of PAMAdmins when their duties entail:

- Creating and checking in CA Process Automation process definitions and/or start request forms.
- Terminating process instances directly within CA Process Automation. Terminating process instances are an administrative exception to expected integration procedures.
- Delegating CA Process Automation process instance tasks.
- If the user is the user name defined in CA SDM Options Manager.

- CA SDM users require no access to CA Process Automation when their duties entail:
  - Creating requests, change orders, and issues that launch CA Process Automation instances.
  - Reviewing the Workflow tab which shows CA Process Automation process instance status and task information.
  - Changing the status of a request, change order, or issue which causes the termination of a CA Process Automation process (such as canceling a change order).
  - Selecting a CA Process Automation process definition on a CA SDM request area, change category, issue category.

Finalize the Integration

If you have CA SDM and CA Process Automation integration, set up the Single Sign-On (SSO).

Follow these steps:

1. Verify that the following requirements have been met:
   - CA SDM and CA Process Automation are configured to use the same CA EEM installation.
   - The user that logs in to CA SDM is also a user in CA Process Automation.
   - When CA EEM uses the internal database as a user store, the users must have either global permissions or belong to the same folder. Otherwise, if CA EEM references an external user store like an external directory or CA Siteminder, the users must be of the same store to access single sign-on.
2. Install CA EEM from CA Service Management installation (see page 293) or use any existing CA EEM install (for example, CA EEM for CA Process Automation).
3. On the CA SDM Administration tab, install the following options from under the Options Manager, Security folder:
   - eiam_hostname
   - use_eiam_authentication

> **Note:** You do not need to install the option caextwf_eem_hostname under Options Manager, CA Process Automation folder. But if you do install it, the value must be the same as eiam_hostname option.

4. Restart CA SDM.

5. To create a user in CA Process Automation, perform the following:

   a. Log in to CA EEM using the CA Process Automation application context using the EiamAdmin userid or any other administration user.

   b. Select the Manage Identities tab and click the icon next to the Users folder.

   c. On the New User page, the Name field at the top is the userid that must match the userid in the CA SDM contact table.

   d. Click the Add Application User Details button and complete the following:

      - Add any of the groups that are listed. Add at least one of these groups in order to be able to log in to CA Process Automation.

      - Complete the New User fields, such as First Name, Last Name, Display, and Password.

6. Create a user in the CA SDM contact table with the same userid. Verify that the Access Type Validation Type field for the user is set to CA EEM.
   You can log in to CA EEM and CA SDM with this user and the password specified in CA EEM.

CA Process Automation Integration with CA SDM at Run Time

When you enable the integration, CA SDM users experience the following:

- On a new Request, Change Order, or Issue, a CA Process Automation process instance initiates based on the ticket category or area. Summary information immediately appears on the Workflow Tasks tab.

- When a Request Area, Change Category, or Issue Category changes, an attached CA Process Automation process instance terminates and a new process instance initiates.

- When a CA SDM user attempts to close a Request, Change Order, or Issue where the CA Process Automation process instance is not yet complete, the user cannot close the ticket. Instead, the user must first cancel the ticket. The Cancel status terminates the CA Process Automation process instance before the ticket closes.

- When a user wants to understand the state of the process instance without navigating away from the ticket, the user can click the ticket Workflow Tasks tab. The Workflow Tasks tab shows the process instance start date, end date, current state, and a current audit trail of messages indicating the path of the process instance.

- When a user wants to see the current path of the process instance relative to the entire process, the user selects the View Process button on the Workflow Tasks tab. The View Process button launches a graphical snapshot of the entire process instance, and shows the current path.

- When a user wants to see CA Process Automation interaction request forms that are waiting for user action, the user can select any entry in the Workflow Tasks tab. The Workflow Tasks tab contains an audit trail of process instance messages that appear on the CA Process Automation task list.

Note: When a user selects the CA SDM View Process button or CA Process Automation process instance messages, the system prompts for a CA Process Automation user name and password for a single browser session. After the initial prompt, the system does not prompt the user again until the CA SDM browser closes.

How to Create a Process Definition

When you create the process definition, you populate CA Process Automation with content to appear in CA SDM. You use the CA Process Automation graphical process designer to create, test, and check in a process definition. From CA SDM, you can also create macros to initiate CA Process Automation processes. To create a process definition in CA Process Automation, perform the following:

Follow these steps:

1. Log in to the CA Process Automation client as an administrative user.

2. Use the CA Process Automation graphical process designer to create, test, and check in a process definition. When you work with the process definition, use the instructions in the CA Process Automation user documentation.

Note: If you fail to check in the process definition before attempting to use it, the workflow cannot operate properly in CA SDM.

The following process definition items are available in CA SDM:

- **Process Name**
  Appears on the Request Area, Change Category, and Issue Detail page. The process name also appears on the Workflow Tasks tab of a ticket. The process name describes the process definition to CA SDM to Analysts and other users who manage tickets.

- **Process Reference Path**
  Appears on the Request Area, Change Category, and Issue Detail pages. The Process Reference Path also appears on the ticket Workflow Tasks tab. The Process Reference

Path can be useful to describe the purpose of the process to end users. For example, " /Processes/Approval" is not helpful. Instead, a reference path like "/Office Supplies /Approvals/Over-200-CA SDM" describes the workflow to manage orders that exceed $200 US dollars.

- **Process Log Messages**
  Appears on the CA SDM ticket Workflow Tasks tab. By default, a record of activities stores with the process instance. Process log messages have the Process category. A process designer can create custom messages to appear on the Workflow Tasks tab of a CA SDM ticket.

Create a Start Request Form

When you create a Start Request Form, you associate it with the process definition and check it in. You include the appropriate keywords in the Start Request Form properties. If the appropriate keyword is missing from the Start Request Form properties, the Start Request Form and its associated process definition fail to appear in CA SDM.

Follow these steps:

1. Log in to the CA Process Automation client as an administrative user.
2. Open the CA Process Automation Library and navigate to the path Start Request Form.
   The Start Request Form appears in the right pane of CA Process Automation library.
3. Select the Start Request Form from the list.
   A shortcut menu appears.
4. Select Properties.
   The Library Object Properties page appears.
5. (Optional) Click the General tab and modify the description of the Start Request Form. Add a description that identifies the proper usage of the Start Request Form and the associated Process Definition to the CA SDM Administrator.
6. Click the Keywords tab.
   The Keywords tab is active.
7. Click the ab+ icon.
   A row adds to the empty list.
8. Click the row.
   A blinking cursor highlights the row and indicates the row is ready for typing.
   a. Enter one of the following values to associate a keyword to the appropriate ticket area or category.
      For example, to make a Start Request Form available for a CA SDM request area, enter the pcat keyword.
   b. Add a row to the list for each applicable keyword.
      For example, to make the Start Request Form appear on both request areas and change categories, add one row for the chgcat keyword and another row for the pcat keyword.

c. Click OK.
CA Process Automation saves the keywords and description and closes the Library Object Properties dialog.

d. Check in the Start Request Form.

Ticket	Use Keyword
request area	pcat
change category	chgcat
issue category	isscat

Note: If you fail to check in the Start Request Form, the form fails to appear in CA SDM.

The CA Process Automation Start Request Form information appears on the CA SDM Start Request Form List. The CA SDM administrator can associate the CA SDM Start Request Form with the Process Definition, on a Request Area, Change Category, or Issue Category Detail page.
The following Start Request Form items appear in CA SDM:

1.
- **Start Request Form Name**
Appears on the Request Areas, Change Categories, and Issue Categories list pages.

- **Start Request Form Reference Path**
Appears on the Request Areas, Change Categories, and Issue Categories list pages.

- **Start Request Form Description**
Appears on the Request Areas, Change Categories, and Issue Categories list pages. The text in this field describes how the Start Request Form is appropriate for selection on a particular Request Area, Change Category, or Issue Category.

Integrate CA Service Catalog with Common Components Manually

This section contains the following articles:

Integrate CA Service Catalog with CA EEM Manually

Important! Review the following section only if you want to manually integrate CA Service Catalog with CA EEM when the automatic integration between the two has failed.

Ensure that both the CA EEM server and CA Service Catalog server are up and running.

Follow these steps:

1. Log in to the setup utility and click Security on the left menu.
2. Perform *one* of the following actions, whichever applies:
   - If CA EEM is installed on one computer only, enter its host name.
   - If CA EEM is installed on multiple computers as a cluster *without* a Proxy, enter the host names of the CA EEM computers. Separate the names with commas.
     (*Proxy* here means load balancer.)
   - If CA EEM is installed on multiple computers as a cluster *with* a Proxy, enter the host name of the Proxy computer.
3. For the CA EEM application instance name, perform *one* of the following actions, whichever applies:
   - If you upgraded CA EEM during this CA Service Catalog upgrade or if you are using an existing version of CA EEM, specify the existing application instance name.
   - If you installed CA EEM for the first time during this CA Service Catalog upgrade, specify the application instance name of your choice.
4. Enter the CA EEM administrator (EiamAdmin) password.
5. Click Save.
   The utility creates the required CA Service Catalog objects in CA EEM. Examples include the *Service Catalog* application, policies, and users (including spadmin).

Integrate CA Service Catalog with CA Business Intelligence Manually

Important! Review the following section only if you want to manually integrate CA Service Catalog with CA Business Intelligence when the automatic integration between the two has failed. If you have any other earlier version of CA Business Intelligence, install CA Business Intelligence 4.1 SP3 and migrate the data from your earlier version (see page 285) for the reports to work.

CA Business Intelligence is a set of reporting and analytic software. You can use CA Business Intelligence to integrate, analyze, and then present through various reporting options, vital information that is required for effective enterprise IT management. CA Business Intelligence is a flexible, scalable, and reliable business intelligence reporting system that can be integrated into your information technology infrastructure.

CA Service Catalog supplies the data that you require to get started with CA Business Intelligence reports. After you have installed CA Service Catalog and CA Business Intelligence, you perform required setup tasks before running reports.

Follow these best practices when maintaining and using CA Business Intelligence:

- Install and maintain one universe per CA product.
- Do *not* modify the default universe. Instead, copy it and modify the copy. Otherwise, your changes can be erased when you apply service packs, patches, and other updates. Back up all your changes and then apply the patches to your customized universe.
- Reports:
  - Verify that the services in Central Configuration Manager (CCM) is running, when the reports stop running.
  - Do not overwrite predefined reports.
  - Always use a predefined report as a base to build a custom report and maintain consistent formatting in all reports.
  - Administrators *can modify all the reports and can create* new reports that are based on the existing universe. However, administrators must not add any reports to the existing folders.
  - Both administrators and end users *must not* change pre-defined reports. Any changes to those reports are applied to all other users using the same CA Business Intelligence instance. Instead, both administrators and end users must create their own custom folders, copy the reports there, rename them, and customize them.
  - Both administrators and end users must add new reports that they create to their custom folders.

Follow these steps:

- Step 1 - Verify that CA Business Intelligence Is Installed (see page 3295)
- Step 2 - Import the BIAR File (see page 3295)
- Step 3 - Set Up the User Database in CA Business Intelligence (see page 3295)
- Step 4 - Set the Administration Configuration Parameters (see page 3296)
- Step 5 - Configure Trusted Authentication (see page 3297)
- Step 6 - Run Pre-Defined Reports (see page 3298)

Note: If you plan to use Secure Socket Layer between CA Service Catalog and CA Business Intelligence, ensure that you:

- Configure CA Business Intelligence for Secure Socket Layer (SSL)
- Configure CA Business Intelligence to communicate with CA Service Catalog using SSL

Step 1 - Verify that CA Business Intelligence Is Installed

You obtain best system performance by installing CA Business Intelligence and CA Service Catalog components on separate computers.

For more information about installing CA Business Intelligence 4.1 SP3, see CA Business Intelligence 4.1 SP3 documentation (https://wiki.ca.com/display/CABI41SP3/CABI+Installation+on+Windows). To verify that CA Business Intelligence is installed and running, access CA Business Intelligence and start it.

Step 2 - Import the BIAR File

Importing the Business Intelligence Archive Resource (BIAR) file is a required task to set up CA Business Intelligence reports for CA Service Catalog.

For more information, see how to import the BIAR file (see page 3299).

Step 3 - Set Up the User Database in CA Business Intelligence

CA Service Catalog users can access *only* the CA Business Intelligence reports that their role authorizes them to.

Follow these steps:

1. Verify that a matching user name exists in CA Business Intelligence for each CA Service Catalog user.

   Note: The BIAR file automatically provides the CA Service Catalog default administrative user named spadmin and CASMAdmin.

   Optionally, import the users from your CA Service Catalog user database into your CA Business Intelligence user database. For example, in LDAP or Active Directory. Alternatively, create the users with matching user names directly in your CA Business Intelligence user database.

2. Assign those users to the CA Business Intelligence user groups that provide the access rights you want.
   Typically, you assign the users to groups that match their roles in CA Service Catalog. For example, you typically assign CA Service Catalog administrators to administrator groups in CA Business Intelligence.

   Important! All CA Service Catalog users who need access to CA Business Intelligence reports must exist in the CA Business Intelligence user database. Also, these users must belong to the CA Business Intelligence user group that provides the appropriate level of access rights.

   The CA Service Catalog Administrator groups are as follows:

- SLCM Catalog Administrators
- SLCM Administrators
- SLCM Service Managers
- SLCM Super Business Unit Administrators
- SLCM Service Delivery Administrators

The CA Service Catalog End User groups are as follows:

- SLCM End Users
- SLCM Catalog End Users
- SLCM Request Managers

Step 4 - Set the Administration Configuration Parameters

If you are running multiple instances of CA Business Intelligence, the configuration settings apply to all instances.

Follow these steps:

1. Click **Administration**, **Configuration** in the CA Service Catalog section.
2. Click the Modify icon to next to each property that you want to update:
   - **CMS Host Name**
     Specifies the computer name on which Central Management Server is installed.
   - **CMS Port Number (1 - 65535)**
     Specifies the port number on which the Central Management Server is running.
   - **Enable HTTPS**
     Specifies a web protocol, as follows:
     Select No (the default) to use HTTP to communicate with CA Business Intelligence.
     Select Yes to use HTTPS to communicate with the CA Business Intelligence.

     Important! If you select Yes, verify that CA Business Intelligence is also using HTTPS. For more information about how to configure CA Business Intelligence to use HTTPS, see the CA Business Intelligence documentation.
   - **Host Name**
     Specifies the computer name on which CA Business Intelligence web application server is hosted.
   - **Port Number** (1 - 65535)
     Specifies the port number on which CA Business Intelligence web application server is running.

3. Click the **Launch** button to test the connection between CA Service Catalog and Launch Pad.

4. Recycle Catalog Component.

The CA Business Intelligence configuration information is updated with the values that you specified.

Step 5 - Configure Trusted Authentication

Configure CA Service Catalog and CA Business Intelligence to use trusted authentication for the integration between the two products. Trusted authentication provides Single Sign-On. Single Sign-On enables CA Service Catalog users to access the Launch Pad application of CA Business Intelligence directly from the CA Service Catalog GUI.

CA Service Catalog uses standard CA Business Intelligence login if trusted authentication is not set up or if it is not working properly.

Note: The following login methods do *not* apply to CA Business Intelligence: CA EEM token, CA SiteMinder Integration, and NTLM authentication on Windows.

Follow these steps:

1. Log on to the CA Business Intelligence Central Management Console as a user with administrative rights.

2. Go to **Manage**, **Authentication** area of the Central Management Console.

3. Click the **Enterprise** tab.

4. Check **Trusted Authentication is Enabled** to enable trusted authentication.

5. Click **New shared secret** and you see that **Download Shared Secret** is enabled.

Note: The CA Business Intelligence client and the Central Management Console use the shared secret password to create a trusted authentication password. The value of this password and the frequency with which you update it meet your password security standards.

6. Click **Download Shared Secret** to generate TrustedPrincipal.conf file.

7. Perform the remaining steps on *every* Catalog Component computer.

8. Open the file that is named USM_HOME\reporting\CABI\TrustedPrincipal.conf using a text editor.

9. Scroll to the following line and specify the same shared secret password that you downloaded on the CA Business Intelligence Central Management Console.

```
SharedSecret=password
```

10. Save the TrustedPrincipal.conf file.

11. Restart the Catalog Component computer.

Important! Whenever you update the password on the CA Business Intelligence Central Management Console, make the same change to the password in the TrustedPrincipal.conf file on every Catalog Component computer.

Step 6 - Run Pre-Defined Reports

The **BI Launch Pad** button enables you to run the pre-defined reports quickly and easily from within CA Service Catalog.

Optionally view the pre-defined reports in localized format. To do so, set the language configuration in the **Preferences**, **Locales and Time Zone**, **Preferred Viewing Locale** section of CA Business Intelligence.

Note: Some fields remain in English even when you view reports in localized format. These fields include Request Status, Billing Status, Account Status, Account Type, and fields related primarily to payment and adjustment. In addition, in both English and localized reports, custom status values do appear in the reports; however, their descriptions do not.

Follow these steps:

1. Select **Home**, **DashBoards**, **Administration Quick Start**, **BI Launch Pad** in CA Service Catalog.

2. Click **Documents**, **Folders**, **Public Folders**, **CA Reports**, **CA Service Management, CA Service Catalog**.

3. Click **Admin Reports** or **User Reports**, as required.
   The Admin Reports folder and its reports are visible only to users who are members of the Administrator groups.
   The User Reports folder and its reports are visible only to users who are members of either the Administrator groups or the End User groups.

4. Double-click the report which you want to run.

5. Specify the parameters for your report.

6. Click Run Query.

7. View the report.

Note: In a multi-tenant (business unit) implementation, your reports display only the data of tenants to which you have access.

If you run a report for an integrated product (such as CA Service Desk Manager or CA Asset Portfolio Management), but that product has not been integrated with CA Service Catalog, then the report typically fails.

Import the BIAR File

This article contains the following topics:

The Business Intelligence Archive Resource (BIAR) file includes several required components and CA Service Catalog-specific content for use with CA Business Intelligence. The file includes CA Service Catalog universe, default objects, pre-defined reports, user groups, database schemas, locale strings, and data that helps you customize your CA Business Intelligence implementation, especially your reports.

To import the BIAR file, verify that a data source name (DSN) and ODBC connection exists for the DBMS used by the MDB. If necessary, create a Data Source Name and ODBC Connection for the MDB on SQL Server or Oracle. Then you use the biconfig utility to Import the BIAR file

Create a Data Source Name and ODBC Connection for the MDB on SQL Server

If you are using Microsoft SQL Server as your DBMS for the MDB, a data source name (DSN) and ODBC connection for the MDB on SQL Server are prerequisites for setting up your CA Business Intelligence implementation. If necessary, create them now.

Follow these steps:

1. From the Windows Control Panel, open ODBC.
2. Click Add on the System DSN tab.
3. Select SQL Server as the driver and click Finish.
4. Enter the following information and click Next:
   - Data source name (DSN)

     Note: Ensure that you create the DSN with the name "caslcm_cabi_dsn".

   - Description

- Name of the SQL Server server

5. Perform the following actions and click Next:
   a. Select SQL Server Authentication
   b. Select the option to Connect to SQL Server to obtain default settings for configuration options. Enter the user ID and password to connect to the database.
6. Perform the following actions and click Next:
   a. Change the default database to the SQL Server database.
   b. Select the option to use ANSI quoted identifiers.
   c. Select the option to use ANSI nulls, paddings, and warning.
7. (For localized environments *only*) Check the option to use regional settings for currency, numbers, dates, and times.
8. Click Finish.

You have created the DSN and ODBC connection for SQL Server.

Note: For more information about creating DSNs and ODBC connections, see your Windows or SQL Server documentation.

Create a Data Source Name and ODBC Connection for the MDB on Oracle

If you are using Oracle as your DBMS for the MDB, a data source name (DSN) and ODBC connection for the MDB on Oracle are prerequisites for setting up your CA Business Intelligence implementation. If necessary, create them now.

Follow these steps:

1. From the Windows Control Panel, open ODBC.
2. Click Add on the System DSN tab.
3. Select Oracle client /server for Oracle as the driver and click Finish.
4. Enter the following information and click OK:
   - Data source name (DSN)

     Note: Ensure that you create the DSN with the name "caslcm_cabi_dsn".

- Description
- DBMS user name
- One of the following values:
  - SID of the Oracle database, if you are using a standalone Oracle setup.
  - Local Net Service Name, if you are using a distributed Oracle setup.

You have created the (DSN) and ODBC connection for Oracle.

Use biconfig to Import the BIAR File

Importing the BIAR file is a required task to set up your CA Business Intelligence implementation. We recommend that you use the CA Business Intelligence biconfig batch utility to import the BIAR file.

Note: Delete the CA SLCM Connection from Central Management Console before you import the BIAR file.

Follow these steps:

1. Go to the CA Service Management Install path and locate the \filestore\BOXI\biconfig folder.
2. Copy the contents of the biconfig folder on to the CA Business Intelligence computer.
3. Create an XML file (with the contents of Example file for SQL server (see page 3303) or Oracle (see page 3304)) and update the appropriate file, according to your requirements.

   Set the following parameters in your BIAR file:

   - Networklayer: ODBC
   - RDBMS:
     - For Microsoft SQL Server (SQL Server): MS SQL Server 2008 or MS SQL Server 2012
     - For Oracle: Generic ODBC datasource
   - User name and password parameters for your database:
     - For SQL Server: Use *sa* for the user name.
     - For Oracle: Use *mdbadmin* for the user name.

     Note: These users have access to all required tables in the MDB.

- Path name of the SLCM_universe.biar file on the CA Business Intelligence computer
- Name of the DSN created previously in the datasource parameters. **Value:** caslcm_cabi_dsn
- Server parameter: Computer name of your Oracle or SQL Server server

4. Open a Windows command prompt and navigate to the biconfig folder on the CA Business Intelligence computer and enter the following command:

   ```
   biconfig -h "host" [-n "port"] -u "user" [-p "password"] -f "XML-config
   ```

   The quotation marks (" ") *are* required as shown in the command. However, the brackets [ ] are *not* required; the brackets signify optional parameters.
   The following parameters are required, unless noted otherwise.

   - **host**
     Specifies the CA Business Intelligence Central Management Server (CMS) host.
   - **port**
     (Optional) Specifies the CA Business Intelligence CMS port. The default is 6400.
   - **user**
     Specifies the CA Business Intelligence CMS user.
   - **password**
     Optional. Specifies the CA Business Intelligence CMS password.
   - **XML-config-file-name**
     Specifies the path name of the XML file you modified.
     If the file resides in the biconfig folder, you can specify the file name only. Otherwise, specify the complete path name.
   - **help**
     Optional. Displays the help for the biconfig utility.
     Enter *two* dashes to display the help.

   Note: For more information about using biconfig, see the biconfig-readme.txt file in the biconfig folder.

5. (Only for Oracle and if both your CA Service Catalog and CA Service Desk Manager are configured to use the same instance of CA Business Intelligence server, and the date format in odbc.prm file is changed to the CA SDM date format) Update the oracle.prm file at <CABI_Home>\SAP BusinessObjects Enterprise XI 4.0 \dataAccess\connectionServer\odbc\extensions\qt as follows:

6. a. Replace <Parameter Name="USER_INPUT_DATE_FORMAT">'dd-Mmm-yyyy'< /Parameter> with existing USER_INPUT_DATE_FORMAT tag.

Note: The CA SDM date format is **mm/dd/yyyy hh:mm:ss AM/PM**

b. Restart the Apache Tomcat for BI 4 and Server Intelligence Agent services in Central Configuration Manager.

7. Verify the import, as follows:

   a. Review the biconfig.log file in the biconfig folder.
   This file lists the status of the import. This file also includes error messages if the BIAR file is not imported successfully. A return code of zero (0) indicates a successful import.

   b. Log in to BI launch pad as a CA Business Intelligence administrator.

   c. Verify that you can view the CA Service Catalog Reports under Public Folders/CA Reports/CA Service Management/CA Service Catalog.

8. Specify a password for the spadmin user in CA Business Intelligence. This password is empty by default.

Note: If you must import the BIAR file again, delete the following elements from the CA Business Intelligence Central Management Console *before* you import the BIAR file again:

- CA SLCM folder
- CA SLCM Universe
- CA SLCM Groups
- SLCM Connection

Example XML File (SQL Server) to Import BIAR

```
<?xml version="1.0"?>
<biconfig version="1.0">
<!-- Import BIAR file -->
<step priority="1">
<add>
<biar-file name="Specify path of the SLCM_universe.biar file on the CA Business
Intelligence computer">
<networklayer>ODBC</networklayer>
<rdbms><Specify the MS SQL Server version></rdbms>
<username>sa</username>
<password><Specify the sa password></password>
<datasource>caslcm_cabi_dsn</datasource>
<server><Specify the Database Server name></server>
</biar-file>
</add>
</step>
<step priority="2">
<add-if-missing>
<user name="spadmin">
<password mode="normal"><Specify the password for the spadmin user in CA Business
```

Example XML File (Oracle) to Import BIAR

Important! If both your CA Service Catalog and CA Service Desk Manager are configured to use the same instance of CA Business Intelligence server, and the date format in odbc.prm file is changed to the CA SDM date format, specify your version of Oracle within the <rdbms> and </rdbms> tags.

```
<?xml version="1.0"?>
<biconfig version="1.0">
<!-- Import BIAR file -->
<step priority="1">
<add>
<biar-file name="Specify path of the SLCM_universe.biar file on the CA Business
Intelligence computer">
<networklayer>ODBC</networklayer>
<rdbms>Generic ODBC datasource</rdbms>
<username>mdbadmin</username>
<password><Specify the mdbadmin password></password>
<datasource><caslcm_cabi_dsn></datasource>
<server>abcdef-xp</server>
</biar-file>
</add>
</step>
<step priority="2">

Integrate CA Service Catalog with CA Process Automation Manually

Important! Review the following section only if you want to manually integrate CA Service Catalog with CA Process Automation when the automatic integration between the two has failed.

CA Process Automation uses graphical processes that system administrators create to execute operational processes automatically. CA Process Automation supports an integrated development and administrative environment to manage, create, and configure CA Process Automation components on your system. CA Process Automation also supports client applications that allow operators and other personnel to schedule and monitor automated processes. CA Process Automation includes efficient graphical tools for viewing, monitoring, and debugging process at run-time.

In CA Process Automation, operators define policies and rules for self-managed processes. These processes include configuration, monitoring, optimization, repair, and protection. By integrating the people, processes, and technology of an organization in an end-to-end, automated fashion, organizations can reduce operational expenses, increase staff productivity, and can deliver higher service level metrics. Examples of processes that CA Process Automation automates and manages include:

- Applications Monitoring and Restart
- Disaster Recovery
- Virtual Infrastructure Management
- ITIL compliance
- Security

For ITIL-based implementations, see Pre-Built CA Process Automation workflows (https://wiki.ca.com/display/CASM1401/Pre-Built+CA+Process+Automation+Workflows). Such implementations use *both* the basic predefined CA Process Automation that is supplied with CA Service Catalog and other ITIL-based CA Process Automation content.

To configure your implementation of CA Service Catalog, CA Process Automation, and any other integrated CA Technologies products primarily for an ITIL-based environment, review and follow all applicable instructions in thePre-Built CA Process Automation Workflows (see page 4905)Pre-Built CA Process Automation workflows (https://wiki.ca.com/display/CASM1401/Pre-Built+CA+Process+Automation+Workflows) . Use this section as a secondary reference tool for any information.

To configure your implementation of CA Service Catalog, CA Process Automation, and any other integrated CA Technologies products primarily for an environment that is not ITIL-based, review all applicable instructions in this section. Use the Pre-Built CA Process Automation workflows (https://wiki.ca.com/display/CASM1401/Pre-Built+CA+Process+Automation+Workflows) section as a secondary reference tool if any ITIL-related questions arise.

Do *not* combine, substitute, or interchange procedures from this section and the Pre-Built CA Process Automation workflows (https://wiki.ca.com/display/CASM1401/Pre-Built+CA+Process+Automation+Workflows)for performing a specific task. Doing so can produce unpredictable or inconsistent results.

Set Up the CA Process Automation - CA Service Catalog Integration

Important! Review the following section only if you want to manually integrate CA Process Automation with CA Service Catalog.

To Integrate CA Service Catalog with CA Process Automation, follow this process:

- Step 1 - Perform Setup Tasks (see page 3306)
- Step 2 - Set Up Rules, Actions, and Processes for Approval and Fulfillment (see page 3316)
- Step 3 - Assign Users to Required CA Process Automation User Groups (see page 3328)

Step 1 - Perform Setup Tasks

Perform these tasks after installing CA Service Catalog and CA Process Automation:

1. Become familiar with CA Process Automation so that you become a knowledgeable administrator and user of it. You must also be able to write basic CA Process Automation processes that include reusable operators. These operators enable communication between CA Process Automation and the products with which it integrates, including CA Service Catalog.

2. Verify that CA Process Automation is running. Install CA Process Automation either before or after you install CA Service Catalog.

   Important! Do *not* install the CA Process Automation domain orchestrator and CA Service Catalog components on the same computer.

3. Verify that you have:

   - Installed the DBMS client (Oracle client or SQL Server client) locally, unless the local computer is the DBMS server. For more information about how to install the DBMS client, see your DBMS documentation.

   - Implemented CA Service Catalog clustering, if you have installed two or more instances of CA Service Catalog. For more information about how to implement CA Service Catalog clustering, see the Implement Clustering (see page 604)section.

   - Met the following naming requirements:

     - The CA Service Catalog computer name must *not* begin with a number.

- If you are using a load balancer for CA Service Catalog or CA Process Automation, the computer name of the load balancer must *not* begin with a number.

If you do not meet these requirements, web service calls for the integration can result in errors, for example:

```
Caused by: com.sun.xml.messaging.saaj.util.JaxmURI$MalformedURIException: Host is not a well formed address!
```

4. If you plan to use Secure Socket Layer, perform the following tasks:
   - Configure CA Process Automation for Secure Socket Layer (SSL).
   - Configure CA Process Automation to communicate with CA Service Catalog using SSL**.**
5. Perform one of the following actions to specify your login method:
   - If you plan to log in using standard login credentials, skip the next step.
   - If you plan to log in using a CA EEM token instead of standard login credentials, set up certificate-based login (see page 3307).
6. Set and test the administration configuration parameters (see page 3311) for CA Process Automation.
7. Load and configure content in CA Service Catalog (see page 3313).
8. Configure content in CA Process Automation (see page 3314).

Set Up Certificate-Based Login in CA Service Catalog

To enhance security, you can set up CA Service Catalog to use certificate-based login to communicate with CA Process Automation. Otherwise, CA Service Catalog uses user name and password login to communicate with CA Process Automation.

The CA Process Automation integration with CA Service Catalog requires CA EEM certificates for certificate-based login. If you are upgrading CA Service Catalog and you already have a .p12 certificate for connecting to CA Process Automation, convert it to .pem format. Similarly, if you are installing CA Service Catalog for the first time, generate a new .pem file.

Follow these steps:

1. Configure CA Service Catalog and CA Process Automation to use SSL, if other CA products integrated with CA Service Catalog are configured with SSL. These tasks include creating and merging keystore files and adding self-signed certificates to the keystore.
2. Edit the USM_HOME\build.xml file, as follows:

```
<sysproperty key="javax.net.ssl.trustStore" value="${env.USM_HOME}/keystore/.
keystore" />
```

3. Verify that the file name and path name of the keystore file are correct. If necessary, update them.
   For example, if the keystore is located in USM_HOME and the keystore file name is . mykeystore, update this line as follows:

   ```
   <sysproperty key="javax.net.ssl.trustStore" value="${env.USM_HOME}/.mykeystore"
   />
   ```

4. Locate the following line:

   ```
   <sysproperty key="javax.net.ssl.trustPass" value="changeit" />
   ```

5. Verify that the keystore password is correct. If necessary, update it.
   For example, if the keystore password is mykeystorepw, update this line as follows:

   ```
   <sysproperty key="javax.net.ssl.trustPass" value="mykeystorepw" />
   ```

6. Verify that both CA Service Catalog and CA Process Automation are using the same CA EEM server. Typically, you completed this action when you set up the integration. However, see the eiam.backend property in USM_HOME\config.properties file in CA Service Catalog to verify the name of the CA EEM server.

7. Access the USM_HOME\scripts\eiam folder on any Catalog Component computer and edit the file that is named issue ITPAMCertificatePEM.xml, as follows:

   a. Replace __USMHOME_ (a placeholder value) with the actual value of USM_HOME, for example, C:\Program_files\CA\CA Service Catalog.

   b. Replace ITPAMContext (a placeholder value) with the actual value of the application context name that CA Process Automation uses to connect to CA EEM. For example, ITPAM.

   c. Comment or Uncomment the GroupMembership command line depending on the CA Process Automation version.

8. Locate the following Safex section and the group membership lines.
   For example:

   ```
   <Safex>
   <Attach label="ITPAM" />
   <IssueCertificate certtype="pem" certfile="C:/Progra~1/ca/servic~1
   /ITPAMCertfile.pem" keyfile="C:/Progra~1/ca/servic~1/ITPAMCertfile.key"/>
     <AddOrModify>
       <!--Add user and assign them to appropriate groups-->
       <User folder="/Users" name="CERT-ITPAM">
         <GroupMembership>ITPAMAdmins</GroupMembership>
         <GroupMembership>ITPAMUsers</GroupMembership>
     </User>
     </AddorModify>
   <Detach/>
   </Safex>
   ```

9. Update the values in the group membership lines, as follows:

```
<GroupMembership>PAMAdmins</GroupMembership>
<GroupMembership>PAMUsers</GroupMembership>
```

10. Save and close the file.

11. Verify that *filename* is the same in *filename*.key and *filename*.pem, for example, ITPAMCertfile.key and ITPAMCertfile.pem.

12. (Upgrades) Perform the following actions to convert your existing .p12 file (if you have one) to a .pem file:

    a. Open the Windows command prompt on the computer where CA EEM is installed. Change to the folder named *drive*:\Program Files\CA\SharedComponents\iTechnology.

    b. Run the following command:

```
igwCertUtil -version 4.6.0.0 -conv  -cert "<Certificate><certType>p12<
/certType><certURI>ITPAMCertfile.p12</certURI><certPW>ca</certPW><
/Certificate>" -target "<Certificate><certType>pem<
/certType><certURI>ITPAMCertfile.pem</certURI><keyURI>ITPAMCertfile.key<
/keyURI></Certificate>"
```

    This action converts the existing .p12 file to a .pem file.

13. (New Installations) Perform the following actions to create a .pem file:

    a. Open the CA Service Catalog command prompt by entering USM_HOME\usm.cmd at the Windows command prompt.

    b. Change to the USM_HOME\bin\safex folder, and run the following command at the CA Service Catalog command prompt:

```
safex.exe -u EiamAdmin -p <password> -h <eemserver> -f
USM_HOME\scripts\eiam\issueitpamcertificatepem.xml -
sdkconfig  USM_HOME\eiam.config
```

    This action creates the ITPAMCertfile.pem and ITPAMCertfile.key files. Both files are necessary for the .pem file authentication to work.

14. Log in to CA Service Catalog. Click Administration, Configuration, CA Process Automation and do the following actions:

    a. Enter the name of the .pem file in the PEM Certificate File Name column. The .pem file is stored in USM_HOME.

    b. Select Yes for the option that is named *Use Certificate for Authentication*.

    c. Set the other configuration parameters (see page 3311) for the properties.

15. Click Test to test the two-way web service connection between CA Service Catalog and CA Process Automation.

16. Load and Configure Content in CA Service Catalog (see page 3313).

17. Click the Launch button to start the CA Process Automation Server web URL with the updated properties.

18. Update the user password (see page 3314) for CA Service Catalog in the CA Process Automatior SLCM_GlobalDataset.

You have set up certificate-based login between CA Service Catalog and CA Process Automation.

Set Up Certificate-Based Login in CA Process Automation

To enhance security, you can set up CA Process Automation to use certificate-based login to communicate with CA Service Catalog. If you do not use this feature, CA Process Automation uses user name and password login to communicate with CA Service Catalog.

Important! This procedure applies *only* if you are using a CA Process Automation version that also supports certificate-based login for CA Service Catalog.

Follow these steps:

1. Access the USM_HOME folder of the CA Service Catalog computer and verify that the following certificate files exist:

   - USMcertfile.key
   - USMcertfile.pem
   - USMcertfile.p12

   The CA Service Catalog installation program creates these files automatically.

2. Decide the files to use with CA Process Automation:

   - If CA EEM is using FIPS mode, select USMcertfile.pem.
   - If CA EEM is using non-FIPS mode, select USMcertfile.p12.

   To verify whether CA EEM is using FIPS mode, log in to CA EEM. Click the About link on the top right corner of the page. An information dialog appears. Review the FIPS-related details on this dialog.

3. Log in as an administrator to CA Process Automation from the CA Service Catalog computer.

4. Perform the following actions:

   a. Click Configuration.

b. Click Manage User Resources at the left bottom portion of the page.
The User Resource folder is selected in the Repository tree, and the User Resource page appears on the right pane.

5. Perform the following actions for the file or files that you selected in Step 2. If you selected USMcertfile.key and USMcertfile.pem, perform these actions individually, once for each file.

   a. Click New.

   b. Click Browse in the Resource File field and navigate to the USM_HOME folder on the CA Service Catalog computer.

   c. Select the file and specify the resource name. You can specify an arbitrary name of your choice.

   d. Record the path names of the file or files. You require this information when you set the related administration configuration parameters.

6. Save your changes.

7. If you are using multiple CA Process Automation domain servers with CA Service Catalog, repeat these steps on each one.

You have set up CA Process Automation to use certificate-based login to communicate with CA Service Catalog.

Set Administration Configuration Parameters

If you are running multiple instances of CA Process Automation, the following settings apply to all instances.

Follow these steps:

1. Log in to CA Service Catalog.

2. Click **Administration**, **Configuration**.

3. Click **CA Process Automation** and complete the configuration options, as follows:

   - **Certificate File Path on CA Process Automation**
     Applies only when you are using certificate-based login in CA Process Automation (see page 3310) with USMcertfile.pem (for FIPS mode) or USMcertfile.p12 (for non-FIPS mode). If this condition exists, specify the path name of the appropriate file on the CA Process Automation server.

   - **Enable Automatic Retry**
     Applies in cases when a request is created in CA Service Catalog that is not processed in CA Process Automation due to connectivity issues between CA Service Catalog and CA Process Automation. The request is placed in queued state. Retry manually to process the request to CA Process Automation. Specify Yes for automatic retry or No for manual retry. When the Automatic Retry is selected as Yes, the CA Service Catalog connection is established. The ITPAM_QUEUE_FAILURE automatically gets deleted from the Home,

Messages, Alerts, List All Failed Actions list.
When the message disappears from the List All Failed Actions, verify that the request has changed to the appropriate status. For example, if the original status was Submitted (Queued) then the updated status must be Pending Approval.

- **Key File Path on CA Process Automation**
  Applies only when you are using certificate-based login in CA Process Automation (see page 3310) with the USMcertfile.key file.
  If this condition exists, specify the path name of the USMcertfile.key file on the CA Process Automation server.

- **Password for Certificate on CA Process Automation**
  Applies only when you are using certificate-based login in CA Process Automation (see page 3310) with the USMcertfile.p12 file.
  If you are using CA Process Automation 4.0 SP1 CP2, obtain the password from the USM_HOME\scripts\EIAM\issueCertificateP12.xml file. The password is a random-generated number that is specified in the IssueCertificate tag of the password attribute, as follows:

```
<IssueCertificate certfile="C:/Program Files/CA/Service Catalog/USMcertfile.p12" password="password"/>
```

- **Enable HTTPS**
  Indicates whether CA Service Catalog uses HTTPS when communicating with CA Process Automation. Specify Yes or No.

- **Host Name**
  Specifies the host name of CA Process Automation computer (the Domain Orchestrator).

  Note: After the integration has been configured and in use, do *not* change the host name of the CA Process Automation computer or the CA Service Catalog computer. The only exception occurs when the two host computers use the same MDB. For information about the MDB, see the MDB documentation included on the CA Service Catalog installation media.

- **PEM Certificate File Name**
  Applies only when you are using a CA EEM certificate for authentication. That is, when the setting named *Use Certificate for Authentication* is Yes. If that setting is Yes, then PEM Certificate File Name specifies the name that you specified earlier when set up certificate-based login for CA Process Automation.

- **Port Number**
  Specifies the port number on the CA Process Automation computer that listens for incoming calls from CA Service Catalog.

- **Retry Count**
  Specifies the number of retry attempts. This value indicates the number of times for CA Service Catalog to try again to perform a failed CA Process Automation action. The default retry count value is 3.
  If all retry attempts fail, CA Service Catalog logs a queue alert as ITPAM_FAILED, and ITPAM_QUEUE_FAILURE in Home, Messages, Alerts. You can manually retry the failed action by viewing the queue alerts in List All Failed Actions. Click the Retry button.

- **Retry Interval**
  Specifies the number of seconds between the retry attempts described for the previous item, Retry Count. The default retry interval is 15 seconds.

- **Use Certificate for Authentication**
  Indicates whether to use a CA EEM certificate for authentication. This certificate is used for communication from CA Service Catalog to CA Process Automation. Specify Yes or No.

- **User ID and User Password**
  Specifies the user ID and password for accessing the CA Process Automation computer. This user ID and password apply *only* when you are using standard login credentials. It does *not* apply when you are using a CA EEM certificate for authentication.

  Important! Verify that the user ID you specify has administrative access to *all* CA Process Automation processes. The user ID requires the right to execute a CA Process Automation process.

The new parameter settings are in effect. Verify that the request flow for a service that uses a CA Process Automation process works properly from approval to fulfillment.

Load and Configure Content in CA Service Catalog

The CA Process Automation *content* refers to the processes, SRFs, rules, actions, and related items that are supplied with CA Service Catalog. You load and configure this content in CA Service Catalog to activate it. Afterwards, you configure this content in CA Process Automation (see page 3314).

Follow these steps:

1. Log in to CA Service Catalog.
2. Click **Administration**, **Configuration**.
3. Click **CA Process Automation** in the Options section.
4. Click **Load**.
   The Load Configuration Dialog appears with two options.
5. Select one or both options (as applicable) and click **Load** in the Load Configuration Dialog.
   The loading process typically requires a few minutes. This process loads the CA Process Automation content for use with CA Service Catalog.
   If the loading process completes successfully, a confirmation message appears. A successful load imports the CA Process Automation content, including processes, and related CA Service Catalog rules, actions, and services.
   If an error message appears, verify that the CA Process Automation server is available and that the configuration parameters are valid.
6. Click **Configure**.
   The CA Service Catalog configuration properties SLCM_GlobalDataset and SDM_GlobalDataset are configured.

You have loaded and configured the content in CA Service Catalog.

Configure Content in CA Process Automation

The CA Process Automation content refers to the processes, SRFs, rules, actions, and so forth, supplied with CA Service Catalog.

Follow these steps:

1. Log in to your CA Process Automation client.
2. Navigate to the CA SLCM folder in the Library Browser, and open the data set named SLCM_GlobalDataset.
3. Open the Login Parameters tab In the Value Definition palette of the data set and perform the following actions:
   a. Verify that the values of the following options are correct for your implementation. Update these values as needed.
      - userID__ - Specifies an administrative user ID with the Service Delivery administrator role.
        As a best practice, create an administrative user in CA Service Catalog exclusively for this integration.
      - Password__ - Specifies the password for this administrative user.

      Important! This field is empty by default; therefore, enter a valid value.

   b. Record these values for use in a later step.
   c. Open the APP URLs tab in the global data set. Verify that the values of the following options are correct for your implementation. Update these values as needed.
      - SLCM_URL - Specifies the URL to launch CA Service Catalog, in the format http: *//hostname:portnumber*.
        If CA Service Catalog runs in a clustered environment, enter the host name and port number of the load balancer.
      - SLCM_CONTEXT - Specifies the URL of the CA Service Catalog context, in the format */usm*.
        For example, http:*//m:port/usm*

      Note: You can deploy CA Service Catalog in Tomcat web server, where the context name would be usm. If you deploy CA Service Catalog on other supported web servers, you can rename the context.

d. Record these values for use in a later step.

4. To save your changes to SLCM_GlobalDataset, perform the following actions:

5. Click Save.

6. Click the checkin icon to update and save your changes to SDM_GlobalDataset.

7. Perform the following steps, If, you have integrated CA Service Catalog with service desk:

   a. Select the CA SDM folder in the Library Browser, and open the data set named SDM_GlobalDataset.

   b. Open the Login Parameters tab In the Value Definition palette of the data set. Verify that the values for its parameters match the values you specified earlier for the Login Parameters tab of the SLCM_GlobalDataset. Update these values as needed.

   c. Open the SoapCallPaths tab In the Value Definition palette of the data set. Verify that the values for its parameters match the values you specified earlier for the APP URLs tab of the SLCM_GlobalDataset. Update these values as needed.

8. Save your changes to SDM_GlobalDataset.

You are now ready to set up rules, actions, and processes for approval and fulfillment.

Test the Web Service Connection to CA Process Automation

You can test the connection at any time when an issue is detected with processing CA Service Catalog requests. If the test connection fails, verify the view.log or error.log information for the possible reasons for failure.

Follow these steps:

1. Log in to CA Service Catalog.

2. Click **Administration**, **Configuration**.

3. Click **CA Process Automation** in the Options section.

4. Click **Test**.
   The two-way connection is tested between CA Service Catalog and CA Process Automation, using the CheckSLCMConnectivity SRF and the new values specified. If the connection fails, verify the configuration values provided.

Add Multiple CA Process Automation Instances in CA Service Catalog

There can be many rules that are written between departments in a business unit depending on the various services offered. When a rule is created, an action is allocated to the rule for the CA Process Automation instances to process. Multiple CA Process Automation instances can be added in CA Service Catalog for different services and different users. Add multiple CA Process Automation instances in CA Service Catalog to each domain for approval and fulfillment phases based on the category id and domain id. Adding multiples CA Process Automation instances support you to share work between multiple departments.

Follow these steps:

1. Log in to CA Service Catalog.
2. Click **Administration**, **Configuration**.
3. Click **CA Process Automation** in the Options list.
4. Click **Add**.
   The Explorer User Prompt appears:
5. Enter a configuration name for the new CA Process Automation instance.

   Note: You can only enter alphanumeric characters to add a CA Process Automation instance. All the properties that are associated with the default CA Process Automation instance are imported into the new CA Process Automation instance. Configure the property values.

6. Click OK.
7. (Optional) Click the Modify icon and update the values of each property.

   Note: Each instance that you add accepts the same configuration parameters as the original instance. Typically, for best performance, configure a maximum of ten CA Process Automation instances.

You have added a CA Process Automation instance to CA Service Catalog.

You can also delete a CA Process Automation instance. For example, if the instance it is corrupted, or if you want to replace the existing instance with a different instance. All requests must be in a canceled or completed state before deleting a CA Process Automation instance.

Important! The default CA Process Automation instance cannot be deleted.

Step 2 - Set Up Rules, Actions, and Processes for Approval and Fulfillment

This article contains the following topics:

To use CA Process Automation for approval and fulfillment of CA Service Catalog requests, you set up rules and actions in CA Service Catalog. You also set up CA Process Automation processes for the actions that you select.

1. Verify that your service is set for workflow-driven approval.

2. Review the important information about CA Service Catalog events, rules, and actions in the Manage Events-Rules-Actions (see page 3040) section. Events are always enabled. For events, certain rules are enabled by default, and other rules are disabled by default. If enabled, rules are triggered and executed when the event occurs. You specify whether to keep or change the default settings for which rules are enabled or disabled. For rules, certain actions are enabled by default, and other actions are disabled by default. If enabled, actions are triggered and executed when the conditions specified by the rule occur.

3. The rules and actions that you use depend on the CA Process Automation content that you load for use with CA Service Catalog. CA Process Automation actions apply only to the rules for the event named Request/Subscription Item Change. By default, for the event *Request /Subscription Item Change*, for the rule *When Status is Canceled*, an action is enabled that terminates CA Process Automation instances when a request is canceled. For best product performance, keep this default setting.

4. Review and decide the rules, actions, and CA Process Automation process that you want to use for *approval*. For more information, see CA Process Automation-Driven Approval (see page 3318).

5. Review and decide the rules, actions, and CA Process Automation processes that you want to use for *fulfillment*. For more information, see CA Process Automation-Driven Fulfillment (see page 3319).

6. In addition, you can create or customize rules or processes that are used in approval and fulfillment. Some customization is permitted for built-in rules, but you can optionally create and customize new rules.
   Similarly, you can optionally create or customize CA Process Automation processes. For more information, see your CA Process Automation documentation.

Processes and Start Request Forms

Each CA Process Automation action that you use with a CA Service Catalog rule invokes a start request form (SRF). The SRF starts a CA Process Automation process that aligns to one or more business process or processes. For more information about processes and SRFs, see your CA Process Automation documentation.

CA Process Automation-Driven Approval

CA Service Catalog supplies a pre-defined rule that fires once for each service when a request is submitted for approval.

In each rule, you specify a CA Process Automation action to initiate an approval CA Process Automation start request form . Each start request form or an SRF initiates a CA Process Automation process that manages approval of requests.

Approval Rule, Condition, and CA Process Automation Action

The approval-related rule is associated with the Request/Subscription Item Change event. This event is launched when any service option element in any service in a request changes.

Because approvals are done at the service level, assign a rule to "act on" the status changes for every service in a request. You specify the conditions in the rule to help ensure that the rule actions are performed only for the first service option element in the first row of the first service option group in each service in the request. Thus, the rule launches only once for each service, regardless of the number of service options and service option elements in the service.

The rule that is associated with the approval process is as follows:

When Status is Submitted and Approval Process is driven by Workflow is launched when these conditions are satisfied:

- 100 <= old status < 200 - The old status is in the not submitted range.
- 200 <= new status < 400 - The new status is in the submitted range.
- approval_process = 2 - The approval process for the service is workflow-driven approval. Workflow drives a service approval.
- sd_row = 1 - This service option element is the first service option element in the service.
- rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.

Note: This rule is launched regardless of the category of any of the service option elements in a service.

Define a CA Process Automation action for approval and associate it with this rule. This action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your approval SRF from the list.
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation and create the process instance.

- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

The action launches the SRF, passing the information necessary to assign an approval task to the approvers defined in your CA Process Automation approval process. Typically, you use the CA Process Automation process that the SRF calls to set the status of the requested item to Pending Approval (400).

CA Process Automation-Driven Fulfillment

CA Service Catalog supplies rules, conditions, and actions that you can associate with CA Process Automation start request forms (SRFs). These SRFs initiate CA Process Automation processes that handle various fulfillment processes. While approval is handled at the service level, fulfillment is handled at the service option level. The characteristics of the first service option element in a service option determine the fulfillment process to use. The distributed rule conditions are based on the service option element Category field with separate rules for Hardware, Software, None, and all other Category values.

A set of rules is associated with a complex fulfillment process and a simple fulfillment process. Another set of rules opens a CA Service Desk Manager request. The fulfillment process is then left to the CA Service Desk Manager workflow processes.

You can alter the distributed components to fit your business processes more accurately.

Note: Enabling all the rules that are related to all three options is not recommended, because the three fulfillment options overlap.

- **Complex Fulfillment Overview**
  The complex fulfillment process takes into account the current service option element status value to determine the next step in the fulfillment process. The major fulfillment phases related to:
  - Checking availability of the requested item when initially requested or when the item status is Received.
  - Optionally opening a CA Service Desk Manager Change Order (for Hardware or Software). Or notifying appropriate fulfillment personnel when the item is found in available inventory.
  - Notifying the Procurement personnel of the requested item when it is not found in available inventory. The Procurement personnel marks the item as Received when it arrives.
- **Simple Fulfillment Overview**
  The simple fulfillment process notifies the appropriate fulfillment personnel that the item must be fulfilled with no special regard for fulfillment phases.

CA Process Automation Fulfillment Rules, Conditions, and Actions

The fulfillment-related rules are associated with the Request/Subscription Item Change event. This event is launched when any service option element in any service in a request changes.

Use the rule condition to help ensure that the rule actions are performed only at the appropriate time.

The fulfillment process takes different paths that are based on the category and status of the first service option element in the service option. The categories are Software (0), Hardware (1), None (-1), and any custom categories that you define.

The list of categories and their associated numeric values are defined in the following line:

```
USM_HOME\view\webapps\usm\locale\icusen\billing\category.xml
```

The list of statuses and their associated numeric values are defined in the following line:

```
USM_HOME\view\webapps\usm\locale\icusen\request\requestshared.xml
```

CA Process Automation Simple Fulfillment

Simple fulfillment consists of notifying the appropriate department that the requested item must be fulfilled. The assigned fulfillment users change the status of the requested item as appropriate until the status is changed to Fulfilled or Fulfillment Cancelled.

CA Process Automation Simple Fulfillment Rule and Actions

The rule that is associated with the simple fulfillment process used for CA Process Automation is *When Status is Pending Fulfillment*.

Important! If you enable this rule, verify that *all other* fulfillment rules are disabled. Otherwise requests pending action can be duplicated.

- **When Status is Pending Fulfillment Rule**
  This rule is launched when a request item status change and these conditions are satisfied:
  - 800 <= old status <= 999 - The old status is in the approved range.
  - new status = 1000 - The new status is Pending Fulfillment (1000)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.

  This rule condition ensures that the rule is used only when a request first enters the fulfillment phase.
  Define CA Process Automation Action
  Define a CA Process Automation action for simple fulfillment and associate it with this rule.
  This action uses the following values:
  - Type - CA Process Automation
  - Start Request Form (SRF) - click the Search icon and select your simple fulfillment SRF from the list.

- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance.

- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

When this action starts the Fulfillment, it passes the information necessary to assign a fulfillment needed task to the appropriate fulfillment user or group. Typically, you also use the CA Process Automation process that the SRF calls to set the status of the requested item to Pending Fulfillment (1000).

CA Process Automation Complex Fulfillment

The first step of complex fulfillment is for the appropriate department to check the availability of the requested item. For example, for hardware and software this department can be the IT Services department.

For hardware and software items, if the requested item is found in available inventory, then you can optionally perform one of the following actions:

- Notify the IT Services department to fulfill the request.

- Integrate with another product, such as CA Service Desk Manager. You can now open CA Service Desk Manager change order.

For items that are neither hardware nor software, if the requested item is found in available inventory, then the appropriate department is notified to fulfill the request.

For all items, if the requested item is not found in available inventory, then the Procurement department is notified that the requested item must be purchased. After the status of the requested item is set to Received, it is assumed that the item is then available in the inventory. The appropriate department must check the inventory.

If the appropriate department is notified that fulfillment is needed, the user assigned the fulfillment task sets the request item status to Fulfilled. When all request item statuses are set to Fulfilled, the system changes their statuses to Completed, as appropriate. This action allows billing from Service Accounting Component.

If you have integrated with another product, then you can configure an associated CA Process Automation process in that product to manage the rest of the fulfillment process. For example, if you configure the CA Process Automation process to create a CA Service Desk Manager change order, then, after the change order is closed, the associated CA Process Automation process in CA Service Desk Manager sets the request item status to Fulfilled.

If for some reason, the requested item cannot be fulfilled, then the status is set to Fulfillment Cancelled. The system changes the status to Cancelled when all of the request item statuses are set to Fulfilled or Fulfillment Cancelled. This status change marks the end of the fulfillment phase.

CA Process Automation Complex Fulfillment Rules and Actions

The following rules are associated with the complex fulfillment process:

Check Availability Rules for CA Process Automation

The Check Availability rules for use with CA Process Automation are as follows:

- **When Category is Hardware and Status is Pending Fulfillment** is launched when these conditions are satisfied:
  - 800 <= old status < = 999 - The old status is in the approved range.
  - new status = 1000 - The new status is pending fulfillment (1000)
  - category = 1 - The service option element category is Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.
- **When Category is Software and Status is Pending Fulfillment** is launched when these conditions are satisfied:
  - 800 <= old status < = 999 - The old status is in the approved range.
  - new status = 1000 - The new status is pending fulfillment (1000)
  - category = 0 - The service option element category is Software (0)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.
- **When Category is neither Hardware nor Software and Status is Pending Fulfillment** is launched when these conditions are satisfied:
  - 800 <= old status < = 999 - The old status is in the approved range.
  - new status = 1000 - The new status is pending fulfillment (1000)
  - category > 1 - The service option element category is not Hardware (1) or Software (0) or None (-1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.

Define CA Process Automation Action

For each Check Availability rule, define a CA Process Automation action and associate it with the rule.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your Check Availability SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance

- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

When this action starts the Check Availability SRF, it passes the information necessary to assign a check availability task to the appropriate fulfillment user or group. Typically, you use the CA Process Automation process that the SRF calls to set the status of the requested item to Check Availability (1001).

Fulfillment Rules and Actions for CA Process Automation

The fulfillment rules are as follows:

- **When Category is Hardware and Status is Filled From Inventory** is launched when these conditions are satisfied:
  - old status <> 1002 - The old status is not Filled From Inventory (1002)
  - new status = 1002 - The new status is Filled From Inventory (1002)
  - category = 1 - The service option element category is Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

If you use the When Category is Hardware and Status is Filled From Inventory rule, define a CA Process Automation action and associate it with the rule. Define this action to pass the information to doone or more tasks, for example:

- Assign a fulfillment needed task to the appropriate fulfillment user.
- Integrate with another product; for example, open a CA Service Desk Manager change order.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your Fulfillment SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance.
- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

Typically, you use the CA Process Automation process the SRF calls to set the status of the requested item to Notified IT Services (1015).

- **When Category is Software and Status is Filled From Inventory** is launched when these conditions are satisfied
  - old status <> 1002 - The old status is not Filled From Inventory (1002)

- new status = 1002 - The new status is Filled From Inventory (1002)
- category = 0 - The service option element category is Software (0)
- rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

If you use the When Category is Software and Status is Filled From Inventory rule, define a CA Process Automation action and associate it with the rule. Define this action to pass the information to doone or more tasks, for example:

- Assign a fulfillment needed task to the appropriate fulfillment user.
- Integrate with another product; for example, open a CA Service Desk Manager change order, associating any assigned assets.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your Fulfillment SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance.
- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

Typically, you use the CA Process Automation process called by the SRF to set the status of the requested item to Notified IT Services (1015).

- **When Category is neither Hardware nor Software and Status is Filled From Inventory** is launched when these conditions are satisfied:
  - old status <> 1002 - The old status is not filled from inventory (1002)
  - new status = 1002 - The new status is filled from inventory (1002)
  - category > 1 - The service option element category is not None (-1), Software (0) or Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

If you use the When Category is neither Hardware or Software and Status is Filled From Inventory rule, If you use the When Category is Software and Status is Filled From Inventory rule, define a CA Process Automation action and associate it with the rule. Define this action to pass the information to doone or more tasks, for example:

- Assign a fulfillment needed task to the appropriate fulfillment user.
- Integrate with another product; for example, open a CA Service Desk Manager change order, associating any assigned assets.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your Fulfillment SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance.
- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

Typically, you use the CA Process Automation process called by the SRF to set the status of the requested item to Notified IT Services (1015).

- **When Category is None and Status is Pending Fulfillment** is launched when these conditions are satisfied:
  - 800 <= old status <=999 - The old status is in the approved range
  - new status = 1000 - The new status is Pending Fulfillment (1000)
  - category = -1 - The service option element category is None (-1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

If you use the When Category is None and Status is Pending Fulfillment rule, Define a CA Process Automation action for simple fulfillment and associate it with this rule.

This action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your simple fulfillment SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance.
- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

When this action starts the Fulfillment (SRF), it passes the information necessary to assign a fulfillment needed task to the appropriate fulfillment user or group. Typically, you also use the CA Process Automation process called by the SRF to set the status of the requested item to Pending Fulfillment (1000).

Procurement Rules for CA Process Automation

The procurement rules for use with CA Process Automation are as follows:

- **When Category is Hardware and Status is Not Filled From Inventory** rule is launched when these conditions are satisfied:
  - old status <> 1003 - The old status is Not Filled From Inventory (1003)
  - new status = 1003 - The new status is Not Filled From Inventory (1003)
  - category = 1 - The service option element category is Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements
- **When Category is Software and Status is Not Filled From Inventory** rule is launched when these conditions are satisfied:
  - old status <> 1003 - The old status is not Not Filled From Inventory (1003)
  - new status = 1003 - The new status is Not Filled From Inventory (1003)
  - category = 0 - The service option element category is Software (0)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements
- **When Category is neither Hardware nor Software and Status is Not Filled From Inventory** rule is launched when these conditions are satisfied
  - old status <> 1003 - The old status is Not Filled From Inventory (1003)
  - new status = 1003 - The new status is Not Filled From Inventory (1003)
  - category > 1 - The service option element category is not None (-1), Software (0) or Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

For each procurement rule, define a CA Process Automation action and associate it with the rule.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - click the Search icon and select your procurement SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance

- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

When this action starts the Check Availability SRF, it passes the information necessary to assign a procurement task to the appropriate procurement user or group. Typically, you use the CA Process Automation process called by the SRF to set the status of the requested item to Pending Procurement (1012).

Received or Order Cancelled Rules

The Received or Order Cancelled rules for use with CA Process Automation are as follows:

- **When Category is Hardware and Status is Received or Order Canceled** rule is launched when these conditions are satisfied:
- old status <> 1007 - The old status is not Received (1007)
- old status <> 1008 - The old status is not Order Cancelled (1008)
- new status = 1007 OR new status = 1008 - The new status is Received (1007) or Order Cancelled (1008)
- category = 0 - The service option element category is Software (0)
- rate_item_col = 0 - This service option element is the first service option element in its row of service option elements.
- **When Category is Software and Status is Received or Order Canceled** rule is launched when these conditions are satisfied
  - old status <> 1007 - The old status is not Received (1007)
  - old status <> 1008 - The old status is not Order Cancelled (1008)
  - new status = 1007 OR new status = 1008 - The new status is Received (1007) or Order Cancelled (1008)
  - category = 0 - The service option element category is Hardware (1)
  - rate_item_col = 0 - This service option element is the first service option element in its row of service option elements
- **When Category is neither Hardware nor Software and Status is Received or Order Canceled** rule is launched when these conditions are satisfied
  - old status <> 1007 - The old status is not Received (1007)
  - old status <> 1008 - The old status is not Order Cancelled (1008)
  - new status = 1007 OR new status = 1008 - The new status is Received (1007) or Order Cancelled (1008)
  - category <> 0 and category <> 1 - The service option element category is neither Hardware (1) nor Software (0)

- rate_item_col = 0 - This service option element is the first service option element in its row of service option elements

Define CA Process Automation Action

For each Received or Order Cancelled rule, define a CA Process Automation action and associate it with the rule.

Each action uses the following values:

- Type - CA Process Automation
- Start Request Form (SRF) - Click the Search icon and select your Check Availability SRF from the list
- Configuration Name - All the CA Process Automation multiple instances are listed. Select the CA Process Automation to create the process instance
- Parameters - When you select an SRF, the required input parameters are automatically listed. Either enter one or more custom values or select one or more values from the list.

When this action starts the Check Availability SRF, it passes the information necessary to assign a check availability task to the appropriate fulfillment user or group. Typically, you use the CA Process Automation process the SRF calls to set the status of the requested item to Check Availability (1001).

Step 3 - Assign Users to Required CA Process Automation User Groups

You can launch the CA Process Automation client from the CA Service Catalog request tracking page. To do so, assign users to the appropriate CA Process Automation groups in CA EEM. Launch the client in context to an active CA Process Automation process.

When you install CA Process Automation, it creates the following user groups in CA EEM:

- PAMADMIN - the administrators user group
  By default, this group contains one member, named pamadmin, but you can optionally add others.
  Users in this group have complete administrative access to CA Process Automation.
- PAMUser - the user group for non-administrative users
  By default, this group contains one member, named pamuser, but you can optionally add others.

Assign the users to one of these groups. Verify that the users can launch the CA Process Automation client from the CA Service Catalog request tracking page.

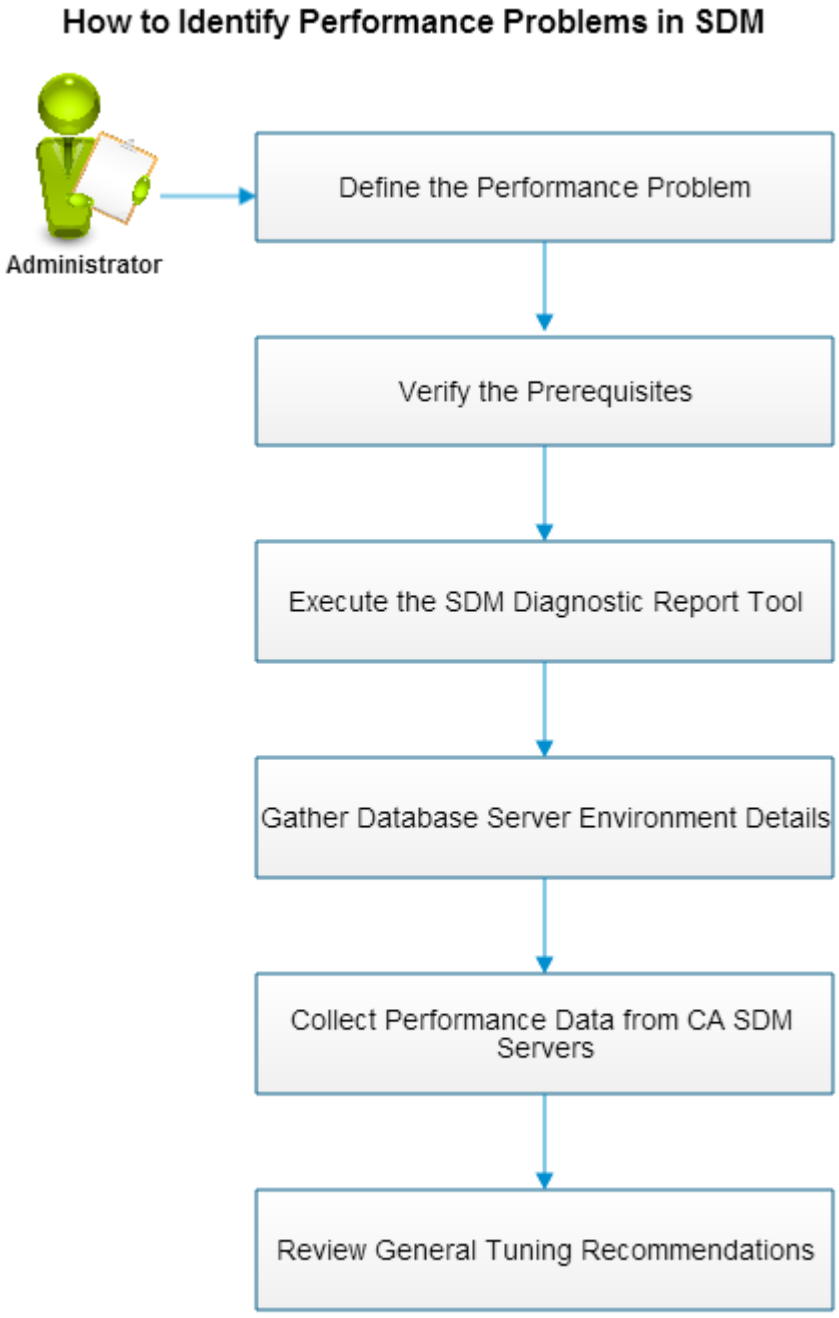
Troubleshooting CA Service Desk Manager

This section contains the following articles:

How to Identify Performance Problems in CA SDM

As a system administrator, you gather information about your installation environment, resource usage, configuration details, and other available system resources. For example, understand the computer configuration to determine the Operating System type, version, and available system resources. This data helps you to identify and diagnose a performance or memory-related issue in CA SDM. The CA Diagnostic Report tool and the Interval Logging utility help you collect diagnostic information about your CA SDM environment.

The following diagram describes how to gather diagnostic information and identify performance problems in CA SDM:



Follow these steps:

1. Define the Performance Problem (see page 3331).
2. Verify the Prerequisites (see page 3331)
   - Install PS Tools (see page 3332)

3. Execute the SDM Diagnostic Report Tool (see page 3332).
   - Collect Information from the CA Diagnostic Report Tool (see page 3333).
   - Verify Windows Report (see page 3334)
   - Verify UNIX Report (see page 3335)
   - Verify Collected Diagnostic Report (see page 3336)
4. Gather database server environment details (see page 3337).
5. Collect Performance Data from CA SDM Servers (see page).
   - Collect Usage Data using Interval Logging (see page 3338).
6. Review general tuning recommendations (see page 3341).

Define the Performance Problem

To define performance problems, begin by collecting the system information. Then consider the following example questions for relevance:

- What did users experience to disrupt their tasks?
- When did users first discover the problem?
- Has your environment changed recently, such as hardware upgrades?
- What functionality of the product experiences issues?
- How many users does the issue impact, and what type of users?
- What types of users are not impacted?
- What is the geographic location of the users that see the problem?
- What is the Access Level of the impacted users?
- Do you host CA SDM on a VMware ESX server or other virtualized environment?
- What other software are you running on the ESX server or host machine?
- What are the specifications of this environment?
- How many CPUs do you have on each computer?
- How much memory did you configure for each computer?

Verify the Prerequisites

1. For Windows operating system, install pslist.exe tools (see page 3332) and add its directory path variable on each CA SDM server.

2. Install and configure the CA SDM servers before running the diagnostic tool.

> **Note:** We recommend that you contact CA Support Online before you use the diagnostic tool.

Install PS Tools for Windows

> **Note:** For a Windows installation, install the pslist.exe tool and add its directory path variable to the system path variable.

Follow these steps:

1. Download PS Tools Suite from Microsoft.
2. Extract pstools.zip to any directory of your choice and add the directory to the Windows %PATH% environment variable.
3. Execute pslist.exe once manually from the command prompt as the Local System user and accept the license agreement. To execute pslist.exe as the Local System user, run the following command:

   ```
   psexec.exe -s -i pslist.exe
   ```

> **Note:** You can start the CA SDM Windows service under a different user account other than the Local System account. For that service, execute pslist.exe under that account and accept the license agreement. To add pslist.exe after installing and configuring CA SDM, accept the PsList license agreement and restart the CA SDM services.

Execute the SDM Diagnostic Report Tool

The CA Diagnostic tool creates a .CAZ file on the Windows OS and .tar.gz on UNIX in the $NX_ROOT\diag\rpt directory. You upload the file that the CA Diagnostic tool creates with your issue at http://support.ca.com.

Follow these steps:

1. Execute supp_diag.cmd on Windows, or execute supp_diag.sh on UNIX.
   The diagnostic tool can take five to 10 minutes to complete.

2. If the data collection process does not complete, navigate to the $NX_ROOT\diag\<host_name>_supp_diag.log log file. To determine the errors that occurred, examine the log file.

   Note: If you want to cancel the background batch job, use CTRL-C to cancel the batch file. Some processes still run in the background, such as MSINFO32.exe. If you have any questions about using this diagnostic tool, contact the CA Support Online.

3. The script directory structure displays the location of the script files, diagnostic zip files, and log files:

   - The $NX_ROOT\diag\bin directory contains script files.
   - The $NX_ROOT\diag\rpt directory contains the diagnostics zip file (in .caz format on Windows systems and in .tar.gz format on UNIX systems).
   - The $NX_ROOT\diag\misc_logs directory contains the log files that can be automatically included in the zip file.

4. To unzip the gathered files, complete the steps that are appropriate for the operating system:

   - **Windows**
   - Open a command prompt.
   - Cd to $NX_ROOT\diag\rpt or any directory where the .CAZ file is located.
   - Execute the following command:

     ```
     $NX_ROOT\diag\bin\cazipxp -u <package_name>.CAZ
     ```

   - **UNIX**
   - Open a command prompt.
   - Cd to $NX_ROOT/diag/rpt or any directory where the .tar or .tar.gz file is located.
   - Uncompress and untar the file:

     ```
     gunzip -d <package_name>.tar.gz

     tar -xvf <package_name>.tar
     ```

Collect Information from CA Diagnostic Report Tool

The CA SDM installation media includes the Diagnostic Report Tool to help collecting information for diagnosing performance problems. You can use the diagnostic tool to collect information relevant to the operating system. You can use the diagnostic tool to determine the commands for collecting data from CA SDM.

Configure the CA SDM server before running the diagnostic tool.

Follow these steps:

- **Windows**
- Set $NX_ROOT as your CA SDM installation root directory.
  The default for $NX_ROOT is the C:\Program Files\CA\Service Desk\ on Windows. You can change the default when you want to change the default directory during the installation process.
- Verify that the system path variable includes $NX_ROOT\bin.
- **UNIX/Linux**
- Set $NX_ROOT as your CA SDM installation root directory.
  The default for $NX_ROOT is -- /opt/CAisd/ on a Unix or Linux operating system. You can change the default when you want to change the default directory during the installation.
- Verify that your $PATH includes $NX_ROOT/bin.

Verify Windows Report

The following list describes the Windows report files that are created and included in the CAZ\tar file package.

- **Ca.olf**
  The Ca.olf report file specifies the CA licensing information from ca_lic directory.
- **Lic98.log**
  The Lic98.log report file specifies the log file that is related to CA licensing from ca_lic directory.
- **Lic98version.log**
  The Lic98version.log report file specifies the log file that is related to CA licensing from ca_lic directory.
- **Licdebug.log**
  The Licdebug.log report file specifies the file that is related to CA licensing from ca_lic directory.
- **Drwatsoninfo.txt**
  The Drwatsoninfo.text report file specifies the Dr. Watson configuration of the computer.
- **<host name>_env.txt**
  The <host name>_env.txt report file specifies the environment variables that are set on the computer.
- **<host name>_slstat.txt**
  The <host name>_sistat.txt report file specifies the output of slstat command.
- **<host name>_pdm_status.txt**
  The <host name>_pdm_status.txt file specifies the output of slstat command.
- **<host name>_dir_listing.txt**
  The <host name>_dir_listing.txt report file specifies the Service Desk install directory listing.

- **<host name>_pslist.txt**
  The <host name>_splist.txt report file specifies the process listing when the PsList Microsoft tool is installed.

- **<host name>_MSINFO32.NFO**
  The <host name>_MSINFO32.NFO report file specifies the MSINFO output gathering system information.

- **<host name>_SYSTEMINFO.TXT**
  The <host name>_SYSTEMINFO.TXT report file specifies the system information.

- **<host name>_appevents.csv**
  The <host name>_appevents.csv report file specifies the application event logs created in the past seven days.

- **<host name>_sysevents.csv**
  The <host name>_sysevents.csv report file specifies the application event logs created in the past seven days.

- **<host name>_hostinfo.txt**
  The <host name>_hostinfo.txt report file specifies the computer information.

- **<host name>_prodinstallinfo.txt**
  The <host name>_prodinstallinfo.txt report file specifies installation information for CA products.

- **<host name>_caprod_registry.txt**
  The <host name>_caprod_registry.txt report file specifies the Registry information of installed CA products.

- **<host name>_softfeatures.txt**
  The <host name>_softfeatures.txt report file specifies the list of software features that are installed for Service Desk.

- **<host name>_ipconfig.txt**
  The <host name>_ipconfig.txt report file specifies the IP configuration information.

- **<host name>_supp_diag.log**
  The <host name>_supp_diag.log report file specifies the log created for running the supp_diag tool.

Verify UNIX Report

The following list describes the UNIX report files that are created and included in the CAZ\tar file.

- **Ca.olf**
  The Ca.olf report file specifies the CA licensing information from ca_lic directory.

- **Lic98.log**
  The Lic98.log report file specifies the log file that is related to the CA licensing from ca_lic directory.

- **<host name>_env.txt**
  The <host name>_env.txt report file specifies the environment variables that are set on the computer.

- **<host name>_slstat.txt**
  The <host name>_slstat.txt report file specifies the output of slstat command.

- **<host name>_pdm_status.txt**
  The <host name>_pdm_status.txt report file specifies the output of the pdm status command.

- **<host name>_dir_listing.txt**
  The <host name>_dir_listing.txt report file specifies the Service Desk install directory listing.

- **<host name>_pslist.txt**
  The <host name>_pslist.txt report file specifies the process listing when the pslist Microsoft tool is installed.

- **<host name>_uname.txt**
  The <host name>_uname.txt report file specifies the output of the uname operating system command.

- **<host name>_diskinfo.txt**
  The <host name>_diskinfo.txt report file specifies the output of df operating system command.

- **<host name>_freemem.txt**
  The <host name>_freemem.txt report file specifies the output of memory information.

- **<host name>_supp_diag.log**
  The <host name>_supp_diag.log report file specifies the log created for running the supp_diag tool.

- **<host name>_prtconf.txt**
  The <host name>_prtconf.txt report file specifies the output of the prtconf operating system command on Solaris and the AIX computers.

- **<host name>_solrev.txt**
  The <host name>_solrev.txt report file specifies the OS version and patches Information on Solaris computers.

- **<host name>_netconf.txt**
  The <host name>_netconf.txt report file specifies the IP configuration Information on AIX computers.

Verify Collected Diagnostic Report

The default CA SDM documentation file\directory list includes the following reports in the CAZ\tar file. Add files or directories that you include in the CAZ\tar file by placing it in the $NX_ROOT\diag\misc_logs directory.

- $NX_ROOT/GENLEVEL or $NX_ROOT/.GENLEVEL

- $NX_ROOT/<COMPUTERNAME>.his

- $NX_ROOT/NX.env
- $NX_ROOT/NX.env.last
- $NX_ROOT/log\
- $NX_ROOT/pdmconf\
- $NX_ROOT/pdmconf\version
- $NX_ROOT/bopcfg\www*.cfg

Gather Database Server Environment Details

You can gather details about your database server to help identify performance problems in CA SDM.

Follow these steps:

1. Determine the location of your database server, such as local or remote.
2. Determine the DBMS version, Operating System version, and patch level.
3. Complete the appropriate steps for your database type:
   - Execute the following queries for SQL Server and note the results:

     ```
     select @@version

     SELECT SERVERPROPERTY('productversion'), SERVERPROPERTY ('productlevel')
     ```

   - Execute the following query for Oracle:

     ```
     select * from v$version where banner like 'Oracle%';
     ```

4. Confirm the version of the database client that you installed on the application server.
5. If available, gather information about Environmental Data, such as the Operating System and other databases.

6. Gather network topology and topology information or other products that you integrate with CA SDM.
   For example, locate information about the products from available PDF files or diagrams.

Collect Performance Data from the CA SDM Servers

You can collect resource usage data on each SDM server in a multiple server configuration to determine the problems. The collected data sets are used to analyze and troubleshoot any performance or memory-related issues in the CA SDM servers. The interval logging utility allows you to start or stop the diagnostic data collection using the CA SDM web interface. Share the collected data set with CA Support Online. CA Support can help identify and resolve the CA SDM server problems.

Interval logging utility runs on pdm_intrvlog_nxd daemon that collects log data from a server. The daemon automatically starts when a Service Desk server start.

- To stop the interval logging daemon manually, remove the entry of interval logging utility from pdm_startup.
- To start the interval logging daemon manually, double-click the pdm_intrvlog_nxd.bat file in the $NX_ROOT/bin folder.

Collect Usage Data using Interval Logging

To collect the resource usage data on the CA SDM servers, configure the server for interval logging. You can select the type of data you want to collect from each server. You can change the logging options for the servers at any time.

For example, if you select only the CPU usage option, the utility collects only CPU usage data on the server.

Follow these steps:

1. Log in to CA SDM.
2. Select Systems, Interval Logging under the Administration tab.
   The Interval Logging Configurations List opens.
3. Click Create New to add an interval log configuration.
4. Complete the following fields:
   - **Server Name**
     The Server Name field specifies the server for which you want to collect the log data. Clicking Search displays the list of servers you can configure for the interval logging.
   - **Recurrence Interval**
     The Recurrence Interval field specifies the time interval during which the log data is collected for the server. For example, if the recurrence interval is set to 3 minutes, the log is collected for every 3 minutes.
     - **Default: 3 minutes**

- **Minimum: 2 minutes**

- **Enabled**
  The Enabled field indicates whether the interval logging is enabled or disabled for the server. If enabled, interval log is collected for the server.

  Note: To stop the interval logging before the scheduled end date, change the Enabled status to NO.

- **Record Status**
  The Record Status field indicates whether the interval log configuration is active or inactive.

- **Scheduled Start Date**
  The Scheduled Start Date field specifies the start date and time for collecting the log data. If a start date is not provided, interval logging starts immediately or whenever you activate and enable the configuration.

- **Scheduled End Date**
  The Scheduled End Data field specifies the end date and time for collecting the log data. If you do not enter an end date, interval logging runs until you inactivate or disable the configuration.

5. Select the appropriate log option that you want to collect from the server.
   For example, select CPU Usage if you want to capture the log for CPU usage data.

   - **CPU Usage**
     The CPU Usage log option collects CPU usage statistics for the server. This log option executes "pslist - x" on Windows and “ps” on UNIX. Depending on your configuration type, you can collect the diagnostic data on the following servers:

     - Conventional: Primary server.
     - Advanced Availability: All servers.

   - **Memory Usage**
     The Memory Usage log option collects memory usage data for the server. This log option executes the "pslist - m" command on Windows and the “ps” command on UNIX. Depending on your configuration type, you can collect the diagnostic data on the following servers:

     - Conventional: Primary server.
     - Advanced Availability: All servers.

   - **Network Status**
     The Network Status log option collects information on all active connections. This log option collects network statistics by executing the "netstat /b" command or the "netstat /a" command. Depending on your configuration type, you can collect the diagnostic data on the following servers:

- Conventional: Primary server.
- Advanced Availability: All servers.

- **Task List**
  The Task List log option collects application and services information for all tasks running on the server. Depending on your configuration type, you can collect the diagnostic data on the following servers:
  - Conventional: Primary server.
  - Advanced Availability: All servers.
- **Web Session Counts**
  The Web Session Counts log option collects CA SDM sessions and user statistics for the web engine processes. This log option executes the "pdm_webstat" command. You can collect the data for any CA SDM servers.
- **Server Status**
  The Server Status log option collects information about all the CA SDM daemons or processes on the server. This log option executes the "pdm_status" command. You can collect the data for any CA SDM servers.
- **DB Report**
  The DB Report log option collects information of database record types by executing the db_report command. You can collect the data for any CA SDM servers.
- **Virtual DB Info**
  The Virtual DB Info log option collects information that is related to the queued database requests. This log option executes the "pdm_vdbinfo" command. You can collect the data for any CA SDM servers.
- **List Server Connections**
  The List Server Connections log option collects information on active connections for the server by executing the pdm_listconn command. You can collect the data for any CA SDM servers.
- **List Slump Processes**
  The List Slump Processes log option collects information about slump connections and processes. This log option executes the "slstat" command. You can collect the data for any CA SDM servers.

6. Click Save.
   The server is configured for the interval logging.
7. (Optional) Repeat Steps 1-5 to create more interval log configurations.
8. Go to the $NX_ROOT\log directory and view the generated log files. The output files that are generated depend on the Interval Logging options you select, where files include:
   - cpu_usage_hostname
   - db_report_hostname

- memory_usage_hostname
- netstat_hostname
- pdm_listconn_hostname
- pdm_vdbinfo_hostname
- server_status_hostname
- session_counts_hostname
- tasklist_hostname

Important! The maximum limit of the output file size defaults to 30 KB. You can modify the file size by changing the @NX_LOGFILE_LIMIT value in NX_env file. If the generated output file exceeds the maximum file size limit, a new file is created. The new file name is appended with the suffix of 1. Files that are generated later have the suffix of the number incrementally.

You can share the collected log data with CA Support to help identify performance problems in your SDM installation.

Review General Tuning Recommendations

As a best practice, we recommend you to monitor the key performance indicators and the resource consumption regularly. Also, ensure that routine maintenance is applied to identify small problems before they become serious.

If you suspect an issue or users complain about slow performance, open a CA Support Online issue. Include information about the problem. For example, send the Interval Logging data, CA SDM Diagnostic Tool Report, and CA SDM standard logs. Send the information to CA Support from each CA SDM server.

The following list describes common signs of performance problems:

- The long messages in the CA SDM standard logs (stdlog.x files)
- Search for the messages in the stdlogs that state "The following query took #### milliseconds...".
- Queuing on database agents in pdm_vdbinfo output
- Search for *Queued Requests(#)* in the pdm_vdbinfo output. You can execute this command at the OS prompt manually. The Interval Logging script also executes this command.
- A large number of connected users to each web engine. For example, more than 200 users.

Note: To display the number of concurrent users per web engine, execute pdm_webstat. You can execute this command manually from the OS command prompt. The Interval Logging script also executes this command.

- User complaints
- When CA SDM is up and running, it is recommended to check the process memory. For optimal performance, we recommend the following method:

  1. Set a notification when the process memory exceeds 1.25 GB and begin a check on the processes that are running.
  2. Set a warning notification when the process memory exceeds 1.5 GB and take corrective actions to check the memory usage.

How to Monitor LDAP Using Trace Logging

This article contains the following topics:

To turn on trace logging to monitor LDAP use within CA SDM, use the pdm_logstat utility.

The pdm_logstat command has the following syntax:

```
pdm_logstat -f ldap_virtdb.c 1000
```

The following stdlog messages help you understand the status of the connection process.

Determine if ldap_virtdb Process Has Started

The first line to look for when analyzing stdlogs for LDAP messages is the startup of the ldap_virtdb process. The LDAP awareness for CA SDM begins only when this process starts.

Note: Even if LDAP integration options are not installed or set up, this process still runs.

```
06/03 17:00:18.27 cpasd1   bopLDAP       1964 SIGNIFICANT  ldap_virtdb.c
680 STARTUP of LDAP_virtdb
```

Determine if All Required Options are Installed

If any of the required LDAP options have not been defined, the stdlog shows the missing options. The following example shows the output:

```
06/03 17:00:18.72 cpasd1   bopLDAP  1964 SEVERE_ERROR ldap_virtdb.c  1023 LDAP Server
port id missing
06/03 17:00:18.78 cpasd1   bopLDAP  1964 SEVERE_ERROR ldap_virtdb.c  1023 LDAP Server
distinguished name missing
06/03 17:00:18.78 cpasd1   bopLDAP  1964 SEVERE_ERROR ldap_virtdb.c  1023 LDAP Server
distinguished name password missing
```

Determine if the LDAP Connection is Successful

You can identify whether the LDAP connection is successful by looking at the entries in the stdlog. The entries indicate that a connection is successfully established with the LDAP server. The following example shows the output:

```
06/05 12:35:10.41 cpasd1   bopLDAP  1912 SIGNIFICANT  ldap_virtdb.c  958 LDAP_SRVR
connecting to host(Francisco.us.danconia.net) port(389)
06/05 12:35:11.01 frisco   bopLDAP  1912 SIGNIFICANT  ldap_virtdb.c 1002 LDAP_SRVR
binding with username(simon)
```

Determine if the LDAP Connection is not Available

If you lose the LDAP server connection, the *LDAP Entries*, *Merge LDAP*, or any other LDAP functionality is disconnected and returns no results. In such circumstances, the stdlog displays messages as the following:

```
06/03 17:00:32.25 cpasd1   bopLDAP  1964 SIGNIFICANT  ldap_virtdb.c    219 LDAP
server not available; 'register_producer' not processed
06/05 10:52:57.63 cpasd1   bopLDAP  1896 SIGNIFICANT  ldap_virtdb.c    219 LDAP
server not available; 'select_full' not processed
06/05 10:52:57.66 cpasd1   web:local 1868 ERROR   sel_data_cache.  611 Error in ldap
Select_Cache method got_initial_count: LDAP server not available; 'select_full' not
processed
06/05 10:52:57.66 cpasd1   bopLDAP  1896 SIGNIFICANT  ldap_virtdb.c    219 LDAP
server not available; 'select_cancel' not processed
```

Determine Actual Filter Used

CA SDM fetches records from the LDAP Directory as per the search base, user search criteria, and the Options Manager filter definition. To determine the actual filter that the search request generates, look for the following message:

```
06/24 14:18:28.32 mcxxx04- bopLDAP    3844 TRACE   ldap_virtdb.c    853 Starting
select full: base=DC=kirklandsd,DC=ca,DC=com; filter=(&(objectCategory=person)(|
(sn=Jones)(pzLastName=Jones))); attributes=(uid,sAMAccountName,pzUserName,
distinguishedName)
```

Determine Attributes Fetched

CA SDM fetches records from the LDAP Directory according to the search base and the Options Manager filter definition. The SEARCH_BASE and attribute mapping as defined in ldap.maj and ldap_group.maj is checked for accuracy by the following message:

```
06/24 14:18:28.39 mcxxx04- bopLDAP       3844 TRACE     ldap_virtdb.c    766 Starting
select short: base=CN=John D. Jones,CN=Users,DC=kirklandsd,DC=ca,DC=com; filter=(&
(objectCategory=person)); attributes=(modifyTimestamp,sn,pzLastName,givenName,
pzFirstName,initials,pzMiddleName,uid,sAMAccountName,pzUserName,telephoneNumber,
pzWorkPhoneNumber,mobile,pzMobilePhoneNumber,department,pzDepartment,
facsimileTelephoneNumber,pzFaxPhoneNumber,pager,mail,pzEmailAddress,streetAddress,
pzAddress,l,pzCity,st,pzState,postalCode,pzPostalCode,c,pzCountry,o,memberOf)
```

Determine Which LDAP Data is Available and Not Available

```
06/24 14:18:28.41 mclda04- bopLDAP       3844 TRACE   ldap_virtdb.c   1396 Value not
available for 'modifyTimestamp'
06/24 14:18:28.41 mclda04- bopLDAP       3844 TRACE   ldap_virtdb.c   1396 Value not
available for 'telephoneNumber,pzWorkPhoneNumber'
```

When CA SDM maps successfully to the LDAP Object ID, the attributes are retrieved for each entry. These attributes are defined in $NX_ROOT/bopcfg/majic/ldap.maj. If the mapping is unsuccessful, a message is logged to indicate that an attribute is not defined.

Tomcat Logging

CA SDM uses a separate log4j.properties file for its web components such as Servlets and PDM_RPC. Support Automation, CMDB Visualizer, and REST also have a separate log4j.properties file. Starting or stopping the Tomcat logging does not require you to recycle the Tomcat daemons.

The following list describes how the log4j.properties files of CA SDM components differ:

- CA SDM monitors the log4j.properties in the NX_ROOT\site\cfg and in the NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF for changes.
- Support Automation monitors the log4j.properties in the NX_ROOT\bopcfg\www\CATALINA_BASE_SA\webapps\SupportAutomation\WEB-INF.
- CMDB Visualizer monitors the cmdbvisualizerlogging.properties in the NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes.
- REST monitors the rest.log4j.properties in the NX_ROOT\site\cfg.

Use the pdm_log4j_config utility only for changing variables in the log4j.properties, cmdbvisualizerlogging.properties, and rest.log4j.properties files. You cannot use the pdm_log4j_config utility to modify the polling interval.

CA SDM checks the log4j properties files for any changes periodically. Configure the time interval by modifying the NX_LOG4J_REFRESH_INTERVAL variable in the NX.env file.

Servlet Defaults

The following servlets log INFO level messages to the jsrvr.log file by default:

- PDMContextListener – Log entry that is generated during the startup and shutdown of services.
- PDMweb -- Log entry that is generated from operations on the user interface.
- UploadServlet -- Log entry that is generated when you attach files to a ticket.
- pdmExport -- Log entry that is generated when you click Export on list forms.
- pdm_report -- Log entry that is generated when you click the Report menu on list forms.
- page_cache -- Log entry that is generated from operations on the user interface.
- BOServlet -- A log entry that is generated when you configure CA Business Intelligence and click the Reports tab.

REST Logging

REST uses the pdm_rest_util.jar and rest-core.jar packages, which contain log4j logging support. These components do *not* write any messages to the standard logs (stdlog.*), but through the log4j component. By default, these packages log INFO, ERROR, and WARN messages. Because the Java packages use the same log4j configuration properties file, each logs messages to the same output file. You view the *rest.log4j.properties* file in the $NX_ROOT\site\cfg\ directory.

To increase the log level to trace or debug, update the following section in the *rest.log4j.properties* file:

```
log4j.rootCategory=debug, jrestlog
```

Locate the output file, as defined in the configuration properties file in the following directory:

```
$NX_ROOT\log\jrest.log
```

Enable CXF Logging

CA SDM disables CXF logging by default because it can affect performance on a production environment. If your environment requires logging for debugging purposes, the administrator can modify the beans.xml file to enable CXF logging.

Follow these steps:

1. Locate the beans.xml file in the following directory:

   ```
   NX_ROOT\bopcfg\www\CATALINA_BASE_REST\webapps\caisd-rest\WEB-INF
   ```

2. Locate the following section of the XML file:

```
<cxf:bus>
    <cxf:features>
    </cxf:features>
</cxf:bus>
```

3. Add <cxf:logging/> to the section, as shown in the following example:

```
<cxf:bus>
    <cxf:features>
       <cxf:logging/>
    </cxf:features>
</cxf:bus>
```

4. Save the XML file.

Troubleshooting LDAP Configuration with CA SDM

This article contains the following topics:

The primary consideration when troubleshooting communications with an LDAP server is that seldom are any two LDAP implementations identical. The CA SDM utilities can verify that LDAP integration is working correctly.

Note:

CA SDM is preconfigured for integration with Microsoft Active Directory, eTrust, and iPlanet only. Integrating with other LDAP servers often requires changes and accommodations on both sides.

To monitor LDAP using the pdm_logstat utility, see How to Monitor LDAP Using Trace Logging (see page 3342).

Show Status of Daemons or Processes

The ldap_virtdb process manages interactions between CA SDM and the LDAP virtual database.

To show the status of all CA SDM daemons (UNIX) or processes

1. Execute pdm_status at the command line with no parameters:

```
pdm_status
```

The pdm_status command shows the status of all CA SDM daemons (UNIX) or processes (Windows). The following output is an example:

```
DAEMON                          STATUS      HOST      PID   SLUMP CONNECT TIME
-------------------------------------------------------------------------------
Agent antfarm                   Running     antfarm   455   Tue Feb 17 17:55:12
Ddict_rd             (ddictrd) Completed   antfarm
Data Dictionary   (ddictbuild) Completed   antfarm
...
User Validation      (boplgin) Running     antfarm   456   Tue Feb 17 17:55:21
```

2. Examine the command output for the status of the ldap_virtdb process.

slstat Command

Run the following command without parameters for verifying whether the bopLDAP is connected:

```
slstat
```

To see the status of bopLDAP, examine the command output.

NX.env File

To verify that the basic LDAP options are correctly installed, review the $NX_ROOT/NX.env file.

Depending on the LDAP options that are installed, the NX.env file consists of the following lines:

```
@NX_LDAP_DN=qauser
@NX_LDAP_ENABLE=Yes
@NX_LDAP_ENABLE_AUTO=Yes
@NX_LDAP_HOST=myserver
@NX_LDAP_PORT=389
@NX_LDAP_PWD=OBUNQXo7CmgbThZlCiMKIwJlA3UXdVNAOjUpHjstfDt2LBIDPgwtWA==
@NX_LDAP_SEARCH_BASE=dc=mycontroller, dc=xyz, dc=com
@NX_LDAP_SERVICE_TYPE=Active Directory
@NX_LDAP_SYNC_ON_NULL=Yes
@NX_LDAP_USER_OBJECT_CLASS=person
```

Important The Sun Java System Directory Server and Novell directory servers does not support paged searching. Hence, LDAP search, import, and sync are limited to the value of NX_LDAP_MAX_FETCH records per invocation. The default value is 100. To specify the maximum number of LDAP records, add the NX_LDAP_MAX_FETCH to your NX.env file. You can set NX_LDAP_MAX_FETCH to any value less than the value of LDAP_SIZELIMIT_EXCEEDED or LDAP_ADMINLIMIT_EXCEEDED on your LDAP server.

How to Connect CA SDM to the Office365 Servers Using SSL

Complete the following steps if you are unable to connect to Office365 servers:

1. Log in to outlook.office365.com using the credentials for the account that you wish to use with maileater.
   You are redirected to the login.microsoftonline.com page.

2. Save the root certificate from the login.microsoftonline.com page as a base 64 encoded.cer file, and copy it to the CA SDM server. Complete the following steps to save certificate:

   a. As an Administrator, click on the lock in the address bar of the page from where you want to save the certificate.

   b. From the Certification Path tab, select the root certificate and click View Certificate.

   c. From the Details tab, click Copy to File, and choose Base 64 Encoded x.509 (.CER) as the format.

3. Log in to CA SDM and use the same settings in the Mailbox details screen (ensure that you add the full email address and file path to the certificate that you saved).

4. Connect CA SDM to the Office365 servers and verify.

Troubleshooting CA Service Catalog

This section contains the following articles:

Maintain Log Files

CA Service Catalog includes log files, each of which is helpful for researching a specific component or a function. To maintain log files, follow these steps:

1. Review the names and locations of all log files (see page 3349).

2. Review the descriptions of the most frequently used log files (see page 3350).

3. Become familiar with the process of setting log levels (see page 3351).

4. Review the process of configuring rollover settings for selected log files (see page 3353).

5. To keep older rolled over log files from consuming excessive disk space, delete them manually at regular intervals.
   Verify that you comply with the file retention policy of your organization. By default, certain

log files are automatically rolled over and are automatically deleted periodically. Both processes occur according to your specifications when you configure rollover settings for selected log files (see page 3353). However, *no other* rolled over log files are automatically deleted; therefore, delete them manually.

Names and Locations of All Log Files

The following log files are located in the USM_HOME\logs folder:

- view.log
- view.log.1, view.log.2, view.log.3, and so forth
  You can configure rollover settings for these log files (see page 3353).

The following log files are located in the USM_HOME\logs\accounting folder:

- accounting.log
- AccountingService.log
- tomcat_fulfillment.log
- wf_admin.log
- wf_process.log
- wf_security.log
- wl.log
- wl.log.1, wl.log.2, wl.log.3, and so forth
  You can configure rollover settings for these log files (see page 3353).
- wsactorSoapRequest.xml
- wsactorSoapResponse.xml

The following log files are located in the USM_HOME\logs\install folder:

- acnt_seed_data.log
- createFiscalPeriod.log
- createRootOffering.log
- DeployServices.log
- importCommonReports.log
- importPlanningContent.log
- importPortalContent.log

- imq_cfg1.log
- imq_cfg2.log
- imq_cfg3.log
- InstallProducts.log
- ixerr.log
- ixutil.log
- seeddata.log
- sqlUtil.log
- usm_eiam_check.log
- usm_eiam_viewG.log
- usm_eiam_viewL.log
- usmInstall.log
- view_seed_data.log
- wf_seed_data.log
- workflow_install.log

The following log file is located in the USM_HOME\logs\LDAPImporter folder:

- LDAPImporter.log

The following log file is located in the USM_HOME\logs\view folder:

- postEvent.log
- tomcat_view.log
- ViewService.log

The following log files are located in the USM_HOME\logs\repagent folder:

- repagent.log
- RepositoryAgentService.log

Most Frequently Used Log Files

If a file is marked with an asterisk (*), you can set the logging levels (see page 3351) for the file.

- **accounting.log***
  Stores log messages that Service Accounting Component generates.
  This file is located in the USM_HOME\logs\accounting folder.

- **AccountingService.log**
  Stores log messages that CA Service Accounting Windows service generates.
  This file is located in the USM_HOME\logs\accounting folder.

- **ixutil.log***
  Stores log messages that the IXUtil import/export command-line utility generates.
  This file is located in the USM_HOME\logs folder.

- **repagent.log***
  Stores log messages that the CA repository agent generates.
  This file is located in the USM_HOME\logs\repagent folder.

- **RepositoryAgentService.log**
  Stores log messages that the Windows service of the repository agent generates.
  This file is located in the USM_HOME\logs\repagent folder.

- **seeddata.log***
  Stores log messages that the database containing the initial data that is supplied with CA Service Catalog generates. This initial data is required to get CA Service Catalog running immediately after installation.
  This file is located in the USM_HOME\logs folder.

- **view.log*, view.log.1*, view.log.2*, view.log.3*, and so forth**
  Store log messages that the Catalog Component component generates. The logs also contain rolled over log files (see page 3353) from previous days.
  These files are located in the USM_HOME\logs folder.

- **ViewService.log**
  Stores log messages that the Windows service of Catalog Component generates.
  This file is located in the USM_HOME\logs\view folder.

- **usmInstall.log**
  Stores log messages that the CA Service Catalog installation program generates.
  This file is located in the USM_HOME\logs\install folder.

- **tomcat_view.log***
  Stores log messages that Apache Tomcat hosting Catalog Component and the Service Accounting Component services generates.
  This file is located in the USM_HOME\logs\view folder.

Set Log Levels

Configuring the log level helps you maintain the log files and troubleshoot any problems that occur in your system.

Follow these steps:

1. Determine the log file whose output you want to control.

2. Determine the log4j.xml file (see page 3352) that controls the output of the log file whose log level you want to set.

3. Edit that log4j file and set the new logging level (see page 3352).

4. Review the contents of the affected log file after approximately 60 seconds. If necessary, reset the log level and review the contents again until you are satisfied with the level of detail.

Note: For more information about the logging features that CA Service Catalog uses, see the information about log4j at http://jakarta.apache.org

Log Files Controlled by Each Log4j.xml File

CA Service Catalog includes several log4j.xml files that control the output of the most frequently used log files. Each log4j.xml file controls the log file of CA Service Catalog services, as summarized in the following table:

Service Logged	Location of Log4j File	Log Files Controlled	Log file Location
Catalog Component	USM_HOME\view \conf	seeddata.logview. logtomcat_view.log	USM_HOME\logs\installUSM_HOME\logsUSM_HOME\logs\view
CA Service Fulfillment	USM_HOME\fulfillment\conf	tomcat_fulfillment.log	USM_HOME\logs\fulfillment
Service Accounting Component	USM_HOME\accounting\conf	accounting.log	USM_HOME\logs\accounting
Repository Agent	USM_HOME\repagent\config	repagent.log	USM_HOME\repagent\log
IXUtil import\export utility	USM_HOME\scripts	ixutil.log	USM_HOME\logs\install

Logging messages that are generated by a CA Service Catalog component, such as the Event Manager, are written to the log file of the calling service. Example: If the Catalog Component service calls the Event Manager, the log for the call is written in the view.log file. Calls from the Service Accounting Component service to the Event Manager are written to the accounting.log file.

Set the Log Level of a Service

You can set the log level to a higher level to investigate a problem. After you are finished investigating, you can reduce the log level for efficiency reasons.

Follow these steps:

1. Open the log4j.xml file (see page 3352) of the CA Service Catalog service whose logging level you want to set.

2. Find the following section:

```
<root>
    <priority value="log-level" />
    <appender-ref ref="accounting" />
    <!-- appender-ref ref="console" /-->
</root>
```

3. Specify one of the following values for the *log-level*:

   - **Fatal**
     Logs only errors that shut down a CA Service Catalog component. This log level typically provides the least detail. This log level requires the least amount of disk space for rolled-over log files and hence the least maintenance.

   - **Error**
     Logs all of the messages from the previous level and failed actions. For example, a user submitted a request, but the system did not present the request for approval.

   - **Warn**
     Logs all of the messages from the previous levels and warning messages. For example, a user creates a service with a name that is not unique.

   - **Informational**
     Logs all of the messages from the previous levels and messages that are informational only. For example, the total number of open database connections.

   - **Debug**
     Logs all of the messages from the previous levels and more detailed messages to help troubleshoot a problem. For example, debug messages can include every step of a multiple-step process.

   - **Trace**
     Logs every action and displays the final XML. This log level typically provides the most detail. This log level requires the most amount of disk space for rolled-over log files and the hence most maintenance.

4. Save and close the log4j.xml file.

5. Recycle the CA Service Catalog service whose logging level you updated.

Important! To make any *other* changes to any log4j file, consult CA Technologies.

Configure Rollover Settings for Selected Log Files

To maintain maximum efficiency, CA Service Catalog automatically rolls over selected frequently used log files, according to default settings. You can configure both the rollover size and the number of rolled over log files retained. Doing so helps you customize the log files to match the needs of your organization more closely.

Follow these steps:

1. Open the log4j.xml file (see page 3352) that controls the output for the log file that you want tc update. Use an editor of your choice.

2. Find the following section:

```
<appender name="view" class="org.apache.log4j.RollingFileAppender>
      <param name="File" value="${usm.home}/logs/view.log" />
      <param name="MaxFileSize" value="size" />
      <Param name="MaxBackupIndex" value="backup-index" />
      ...
</appender>
```

3. Specify the following settings:

   - ***size***
     Specifies the rollover size, in MB. For example, specify 5 to make the log file roll over when its size reaches 5 MB.
     Default: 10

   - ***backup-index***
     Specifies the number of recently rolled over log files that you want to keep on the disk. For example, 50.
     Default: 100

4. Save and close the log4j.xml file.

5. Verify that the log file output matches your needs. If necessary, reconfigure the log4j file or files to match your needs more closely.
   You have configured the rollover settings for selected log files.

Track Log Statements in Memory

This article contains the following topics:

The log appender or the in-memory appender allows writing messages to the memory until an error message occurs. Once the error message occurs, it is logged to the log file. The in-memory appender performs the following functions:

- Tracks all the log statements in the memory until an error occurs.
- Dumps the log statements in the error.log file from the memory.
- Discards the log statements or messages if no error occurs.

Note: The error.log is the default file name and you can rename it to a name of your choice.

The in-memory appender is implemented to log events under com.ca.usm package only. Using the in-memory appender improves the performance as the log statements are filtered at the appender level.

Step 1 - Complete the Prerequisites

You are required to have adequate knowledge of the Apache log4j.

Step 2 - Customize the Configuration File

Customize the appender section of the log4j.xml file by modifying the parameters in the log4j file.

Follow these steps:

1. Open the log4j.xml file from Installed_Loc/view/conf/ and modify the parameters for in-memory appender.
   You can customize the following in-memory appender parameters in appender section:

   - **File**
     Defines the path of the file where the in-memory logs are logged in case of an error.
     Default: <param name="File" value="${usm.home}/logs/error.log" />

   - **MaxFileSize**
     Defines the maximum size of the log file. Once the log file reaches the maximum size, the backup of the current log file is taken.
     Default: <param name="MaxFileSize" value="10MB" />

   - **MaxBackupIndex**
     Defines the maximum number of backup files to be restored on the system.
     Default: <param name="MaxBackupIndex" value="10" />

   - **MaxMemoryLogs**
     Defines the maximum count of logs in the memory. The appender then either recycles the logs in memory or moves them to temporary files on the disk.
     The following actions are performed on the temporary files:

     - If there is no error, the temporary files are discarded.

     - If there is an error, the logs in the temporary files are logged to the log file.
       The optimal value is tested to be 50000.

     Default: <param name="MaxMemoryLogs" value="50000" />

   - **MaxMemoryTime**
     Defines the maximum time in milliseconds for the logs that remain in memory. If the logs remain in memory for MaxMemoryTime, they are discarded.
     The optimal value is tested to be 600000 milliseconds.
     Default: <param name="MaxMemoryTime" value="600000" />

- **ConversionPattern**
  Defines the log statements that are logged based on the pattern provided. For more information about the ConversionPattern, see the Apache log4j documentation.
  The *{UNIQUEID}* helps to identify the complete request from the beginning until the end of the request.

```
<layout class="org.apache.log4j.PatternLayout">
 <param name="ConversionPattern" value="%d{yyyy/MM/dd HH.mm.ss.SSS} %-5p [%X
{UNIQUEID}] [%t] [%c{1}] %m%n" />
 </layout>
```

> **Important!** Do not update the logger name parameter of the logger section in the log4j.xml configuration file.

2. Save the file.
   You have customized the configuration file.

Step 3 - Update the Threshold Parameter in Default Console Appender

To update the log levels of the default console appender, update the threshold parameter to the required log level.

Follow these steps:

1. Open the log4j.xml file from Installed_Loc/view/conf/ and modify the threshold parameter of the default console appender. The following code sample shows the in-memory appender parameters:

```
<appender name="view" class="org.apache.log4j.RollingFileAppender">
    <param name="File" value="${usm.home}/logs/view.log" />
    <param name="MaxFileSize" value="20MB" />
    <param name="MaxBackupIndex" value="100" />
<param name="Threshold" value="INFO" />
    <layout class="org.apache.log4j.PatternLayout">
    <param name="ConversionPattern" value="%d{yyyy/MM/dd HH.mm.ss.SSS} %-5p [%
t] [%c{1}] %m%n" />
    </layout>
  </appender>
```

2. Update the threshold value to INFO, where INFO is the required log level. For more information about the log levels, see the section Set the Log Level of a Service (see page 3352).

3. Save the file.
   You have updated the threshold parameter in the default console appender.

Step 4 - (Optional) Disable the In-Memory Appender

To disable the in-memory appender. comment the following logger section in the log4j.xml configuration file on each computer where CA Service Catalog is installed.

```
<logger name="com.ca.usm">
```

```
  <level value="ALL" />
  <appender-ref ref="memory" />
</logger>
```

Install or Upgrade Issues

This section contains the following issues:

- Product Installation or Upgrade Fails Because of Duplicate Records (see page 3357)

Product Installation or Upgrade Fails Because of Duplicate Records

Symptom:

During the installation or upgrade of CA Service Catalog, CA MDB is automatically installed or upgraded.

Example: CA MDB 1.0.4 is automatically upgraded to CA MDB 1.5 during the CA Service Catalog installation or upgrade. However, suppose CA MDB 1.0.4 is shared with other CA products. Then, the CA MDB upgrade can fail if duplicate records exist where the CA MDB tables require unique constraints. Examples include the following tables: ca_resource_class, ca_resource_family, ca_discovered_software, and cr_stat.

Solution:

Back up these tables, evaluate them, and clean up any duplicate records in them. Then try again to install or upgrade CA Service Catalog.

CA Service Catalog Request Management Issues

This section contains the following issues:

- Pending My Action page Is Not Refreshed Until User Logs Off (see page 3357)
- Request Approval or Fulfillment Pending Action Is Not Assigned (see page 3358)
- Requests Are Assigned to Multiple Users and Groups (see page 3358)
- Requests Do Not Move to the Next Status (see page 3358)

Pending My Action page Is Not Refreshed Until User Logs Off

Symptom:

After you add or remove a user from a group in CA EEM, the Pending My Action page is not refreshed.

Solution:

Log off and log in again to refresh the Pending My Action page.

Request Approval or Fulfillment Pending Action Is Not Assigned

Symptom:

An approval or fulfillment task for a request is assigned to a user or group. However, the request does not appear in the pending action list for the user.

Solution:

Use a user ID or group name not longer than 50 characters.

Requests Are Assigned to Multiple Users and Groups

Symptom:

CA Service Catalog assigns requests pending action to multiple users and groups.

Solution:

CA Service Catalog assigns requests pending action to *both* an Application group and a Global group that is defined in CA EEM when both the following conditions exist:

- Both groups have the same name in CA EEM.
- Both groups are configured to approve requests.

Consider renaming one of the groups or configuring one of them *not* to approve requests.

Requests Do Not Move to the Next Status

Symptom:

Requests do not move to the next status of the request life cycle as expected. Example: From Submitted to Pending Approval.

Solution:

To move requests to the next status of the request life cycle as expected, verify the related date settings.

Follow these steps:

1. Identify the status change where requests are getting stuck.
2. Verify that the related CA Process Automation processes are activated.
3. Verify the following:
    - Verify that you have enabled the rule actions for updating the request status of interest.

- Perform the following steps if you are using CA Process Automation to manage the request status change of interest:
  - Verify that the host name, port number, and other connection parameters for CA Process Automation are configured correctly.
  - Verify that the Global Data Set parameter points to the correct Catalog Component computer.
- Verify whether the assignees for the request are members of CA EEM groups whose names include special characters.
  If the assignees are members of such groups, the request statuses can fail to update. If necessary, rename the applicable groups in CA EEM so that their names do *not* include special characters.

4. Restart the CA Service Catalog Windows services. They are CA Service Catalog and CA Service Accounting.

Browser Issues

This section contains the following issues:

Pages Do Not Appear to Be Refreshing Properly

Symptom:

When I access CA Service Catalog, the pages do not appear as expected in my web browser.

Solution:

Set your browser cache settings to retrieve an updated page from the server on every visit to the page.

Note: For more information, see the documentation for your web browser.

Pop-up Window for Report Data Object Does Not Display Input Fields

Symptom:

I am trying to test a report data object with a query that uses a variable. The dialog for the test does not display the field for entering values for the variable. The problem occurs with all supported web browsers that I use to access CA Service Catalog.

Solution:

Try the following actions:

- Review the view.log file for errors.
- Verify that CA Service Catalog services are running on the computer that you are trying to log in to.
- Clear the browser cache.
- Verify that the trusted sites for the browser include CA Service Catalog.
- Verify that active scripting is enabled for the browser. The following example applies if you are using Internet Explorer:
    1. Select Tools, Internet Options, Security.
    2. On the internet zone, click Custom Level and select Active Scripting.
- Try adjusting other browser security settings.
- Try adjusting the network firewall settings.

If necessary, consult your network administrator for assistance with the previous two items.

Unable to View Invoice in CSV Format from Invoice History UI in HTTPS

Symptom:

I am using Internet Explorer to access CA Service Catalog. I cannot view invoices in CSV format from Invoice History in an HTTPS environment. The invoices do not display correctly.

Solution:

Follow these steps:

1. Open the Internet Explorer browser.
2. Select Tools, Internet Options, Advanced tab.
3. Scroll down to the Security setting.
4. Select the check box named Do not save encrypted pages to disk.
5. Click Apply.
6. Verify that the invoices display correctly.

Integration Issues

This section contains the following issues:

Errors for integration with CA APM

Symptom:

I am unable to integrate CA Service Catalog with CA Asset Portfolio Management.

Solution:

If CA Service Catalog is installed first and CA Asset Portfolio Management is installed later, you must recycle the CA Service Catalog Windows service and then proceed with the integration.

Symptom:

I get an error when trying to assign CA Asset Portfolio Management assets to a CA Service Catalog request item or to view associated assets. The error text is similar to the following: “Warning: A connection to the database could not be established.”

Solution:

The user does not have a role in CA Service Catalog. If the user is meant to be able to assign assets, then the user must use a role in CA Asset Portfolio Management that allows update access to the Asset Fulfillment security object. If the user is only meant to be able to view assigned assets, the user must use a role in CA Asset Portfolio Management which allows view access to the Asset Fulfillment security object, but not update access.

Symptom:

When trying to access CA Asset Portfolio Management, I receive a pop-up message saying "please wait" and CA Asset Portfolio Management opens very slowly or not at all. This error occurs when I use the Microsoft Internet Explorer browser. This error commonly occurs when I attempt to assign a CA Asset Portfolio Management model to a service option.

Solution:

Change your Internet Explorer settings to avoid the pop-up and the delay.

To change Internet Explorer settings:

1. Open the Internet Explorer browser.

2. In the browser bar, select Tools, Internet Options.
   The Internet Options dialog appears.

3. Click the Security tab.
   The security options appear.

4. Click the Local Intranet zone to select it, and click Custom Level.
   The security settings dialog for this zone appears.

5. Scroll to the Miscellaneous group and locate the option named Access data sources across domains.
6. Click Enable or click Prompt; do not click Disable.
7. Click OK to close the local intranet security settings dialog.
8. Click OK to close the Internet Options dialog.

Symptom:

I get an error when trying to assign CA Asset Portfolio Management models to a CA Service Catalog service option.

Solution:

One reason for this error is that the user does not have a role in CA Service Catalog. The user must use a role in CA Asset Portfolio Management that allows access to the Model security object.

Integration Fails

Symptom:

The integration fails between CA Service Catalog and other products. The other products can be CA Service Desk Manager, CA Business Intelligence, and CA Asset Portfolio Management.

Solution:

Verify that every computer with CA Service Catalog or an integrating product is set to the exact date and time. The date and time must also be adjusted for the time zone. This requirement applies to even the CA Service Catalog DBMS Server and integrating products DBMS Servers.

Example: Consider one of the computers is set to November 11, 6:27 p.m. Eastern USA. Now, all computers must be set to November 11, 6:27 p.m. Eastern USA or its equivalent, regardless of the computer's physical or geographic location. Some examples of equivalent dates and times for November 11, 6:27 p.m. Eastern USA are as follows:

- November 11, 3:27 p.m. Pacific USA
- November 11, 5:27 p.m. Central USA
- November 11, 9:27 p.m. Eastern Brazil
- November 11, 11:27 p.m. GMT
- November 12, 5:07 a.m. India Standard
- November 12, 7:27 a.m. China Standard

Methods for synchronizing the time and time zone on all computers include, but are not limited to, the following methods:

- Setting the time and time zone manually on each computer. For more information, see your operating system documentation.
- Configuring the Windows Time service to use an external time source or an authoritative time server. For more information, see the Microsoft web site.

Miscellaneous Issues

This section contains the following issues:

Cannot Add or Update a User Because of Duplicate User ID

Symptom:

When I try to add a new user or update an existing user ID, I receive the following error message:

```
Error - User with this user id already exists. Choose a different user id.
```

Solution:

A duplicate user profile exists. This problem can occur even if that user has been deleted. A deleted user is marked as inactive but the user is retained in the database.

Before assigning the user ID to a different user, remove the user ID from the inactive user.

Follow these steps:

1. Click Administration, Users.
2. Click the View Advanced icon option of the Search Users options.
3. Select User ID from the list of fields and select Contains from the list of operators.
4. Enter the user ID in the value field and click the Add link.
5. Select Inactive from the list of fields and select Equals from the list of operators.

6. Enter 1 for “true” in the value field and click the Add link.

7. Click Search.
   The list of users that match the selection criteria appears.

8. Edit the user: Change, or clear the User ID field, and click OK.

Cannot Connect to a Trusted Computer

Symptom:

I have integrated CA Service Catalog with CA Service Desk Manager. The two products use Secure Socket Layer (SSL) to connect to each other using a trusted relationship. However, when I test the connection, it fails. I also receive error messages that state there are no trusted relationship exists.

Solution:

- Verify that you have configured CA Service Catalog to use SSL.

- Verify especially that you have added self-signed certificates to the keystore, if applicable.
  When you use *self-signed* certificates for any computer that connects directly to CA Service Catalog, add these certificates to the keystore. **Example:** Suppose you want to use clustering with load balancing for CA Service Catalog. In that case, if you are using a self-signed certificate for the load balancing computer, add it to the keystore.
  Moreover, verify the computer to be trusted. Example: Suppose you want to integrate CA Service Catalog with CA Service Desk Manager through a load balancing computer. In that case, CA Service Catalog connects directly to the load balancer (not CA Service Desk Manager). Therefore, the computer to be trusted is the load balancer and not the CA Service Desk Manager computer.

Cannot Delete an Account

Symptom:

When I try to delete an account, a message appears indicating that I cannot delete this account.

Solution:

You cannot delete an account with an active subscription. Before you delete an account, prepare to delete it.

Follow these steps:

1. Cancel the subscriptions that are associated with the account.

2. Close the account by setting the status of the account to Closed.

3. Verify that all the billing runs affecting the account are completed.

Cannot Email a Request

Symptom:

I have CA EEM configured to use an external directory containing many groups. When emailing a request, I get the following error:

```
Cannot send email, please contact your administrator.
```

Solution:

To process the number of groups that are defined in your external directory, increase the value of CA EEM Max Search Size.

Follow these steps:

1. Click the embedded **CA EEM** link in the **Administration Quick Start** menu.
2. Log in using the EiamAdmin user name and password.
3. Click **Configure**, **Session**, **Configuration** menu option.
4. Change the **Max Search Size** to a value larger than the number of groups in your external directory.
5. Click Save.

Cannot Log In to CA Service Catalog

Symptom:

I cannot log in to a CA Service Catalog computer.

Solution:

- Verify that your user name and password are valid.
- Verify that the CA Service Catalog services are running on the computer that you are trying to log in to.
- Verify that the CA Service Catalog computer name does not contain an underscore, if you are using Internet Explorer to access CA Service Catalog. If an underscore appears in the computer name, perform one of the following steps:
  - Remove the underscore in the CA Service Catalog computer name. Update all references to the computer name throughout your environment. You can now use Internet Explorer to access CA Service Catalog.
    For more information about this Internet Explorer issue, see the related knowledge base article on the Microsoft web site.
  - Use Mozilla Firefox or Safari instead of Internet Explorer and then access CA Service Catalog.

Compilation Errors After Customization

Symptom:

After I customize files, multiple compilation-related error messages appear in the logs of Catalog Component computers.

```
...
yyyy/mm/dd computer-name-or-address ERROR [TP-Processor21] [DomProcessor] Error
Generating Document
javax.xml.transform.TransformerConfigurationException: Could not compile stylesheet
...
```

Solution:

- Review the instructions for customizing XSL, XML, JavaScript, and image files (see page 2018). Verify that you have followed all instructions.
- Verify that the filestore is set up correctly. Especially verify that *all* Catalog Component computers share the filestore.

Data Not Uploaded If CA Repository Agent Service Is Configured with Active Directory

Symptom:

Data sets are not uploaded if CA Service Catalog is configured for use with Active Directory. Exceptions appear in the RepositoryAgentService.log file.

Solution:

Install a secondary view server and do *not* configure this view server for use with Active Directory. Configure the CA Repository Agent services and files on this secondary view server. Use this secondary view server to upload the data in CA Service Catalog.

IXUTIL Out-of-Memory Error Occurs

Symptom:

When I use the IXUTIL utility to import or export CA Service Catalog data, the attempt fails. I receive an error message, such as a "generic" SAXException error.

Solution:

Open the ixutil.bat file. Increase the size of the JVM parameter in the ixutil.bat file to 1024 or higher.

Note: The ixutil.bat file is located in the USM_HOME\scripts folder.

Sorting of Services by Selection Type

Symptom:

When I view services in the catalog, they are not sorted by Selection Type as I expect them to be. Even the Featured Services are not sorted by Selection Type.

Solution:

When you create a service, you specify a Selection Type. The sorting of services according to Selection Type is controlled internally. The sort order is *not* based on the name of the Selection Type. Instead, the sort order is based on the *numeric value* of the Selection Type, as follows:

Numeric Value	Selection Type
0	No Selection
1	Single Selection
3	Multiple Selection

Windows Service Does Not Start

Symptom:

One or both Windows services for CA Service Catalog fail to start.

Solution:

The services are set by default to start automatically after a reboot or shutdown. If necessary, start the services manually.

Troubleshooting CA Asset Portfolio Management

This section contains the following articles:

Installation Does Not Start or Displays Server Not Found Error

Valid on all supported operating environments.

Symptom:

When starting the Unicenter APM installation, the installation does not start or you receive a Server Not Found error.

Solution:

Restart the UtilDev Web Server Pro Windows service.

Tenancy Management Page Cannot Be Displayed Browser Error Appears

Symptom:

The following browser error message appears when I click Administration, Tenancy Management:

```
Page cannot be displayed.
```

Solution:

Verify that the CA CASM service is started.

Tenancy Management Page Does Not Appear

Symptom:

When I click the Administration tab, I do not see a Tenancy Management option.

Solution:

Your Unicenter APM administrator has not assigned you to a role in which Tenancy Administration Access is enabled. If you need access to Tenancy Management, contact your Unicenter APM administrator.

Web Servers Named with Underscore Characters

Valid on all supported operating environments.

Symptom:

Using underscore characters in web server host names can cause problems. You see the problems when logging in to the product or when you use Embedded Entitlements Manager for user configuration.

Solution:

If you use a virtual or ghosted system, configure a new host name by creating another image without the underscore. For a production system, add a new host name to your internal Domain Name System (DNS). Adding a host name lets you access the product with a different URL.

Log In Fails with a User Name Containing Extended Characters

Symptom:

When using Embedded Entitlements Manager with Single DB Login authentication, I cannot log in to the Unicenter APM web interface.

Solution:

Select a User Name that does not contain extended characters (that is, Japanese or German characters).

WCF Services Fail when IIS 7 is Installed on Windows 2008

Valid on Windows 2008 operating environments.

Symptom:

When I have Microsoft Internet Information Services (IIS) 7 installed on Windows 2008, the WCF Services do not work. Unicenter APM uses a WCF Service to implement the web services function.

Solution:

This problem happens for one of the following reasons:

- The service file types are mapped incorrectly.
- The Windows components, including IIS 7, were installed in an incorrect order.

To correct the problem, verify and change (if necessary) the IIS settings. Microsoft provides information and solutions for the problem.

To resolve the problem, complete the following steps:

1. In a web browser, open the Microsoft website (http://www.microsoft.com) and search for "IIS Hosted Service Fails".
2. Follow the instructions in the article.

Missing Operating System Message Appears in Message Queue

Symptom:

I receive one of the following error messages in the message queue during the Reconciliation Engine processing of normalization rules:

- The following discovered operating systems are missing from the Public Operating System list:
  Missing Operating System: *operating system name*

- The following discovered operating systems are missing from the Operating System list and must be added to the Public Operating System list or the list for tenant: *tenant name*
  Missing Operating System: *operating system name*

Note: The Reconciliation Engine writes messages to the message queue in the database. To see these error messages in the message queue, set the Engine Debug Level in the Hardware Reconciliation Engine Configuration Settings to Fatal (or a higher level of detail). For more information about the message queue and the configuration settings, see Hardware Reconciliation (see page 2404).

Solution:

The normalization rules apply to all tenants and public data and can be used across tenants. If an operating system value assigned through the normalization list does not exist for a tenant, the Reconciliation Engine produces an error message.

Note: For more information about normalization rules, see Data Normalization (see page 2407).

If one or two operating systems are missing, resolve the problem by adding the operating systems manually to normalization rules.

If numerous operating systems are missing, complete the following steps to resolve the problem:

1. Log in to Unicenter APM and click Administration, Reconciliation Management.

2. On the left, click Reconciliation Message Search.
   The message queue displays reconciliation log messages in the Search Results.

3. Search to find the missing operating system normalization rule error messages.
   The message queue displays all missing operating system normalization rule error messages.

4. Verify that the system administrator email address in the product is correct and click Export to CSV.
   The operating systems that are missing are exported to a CSV file. The system administrator receives an email message with a link to the CSV file.

5. Edit the content of the CSV file to prepare the file for the ITAM Data Importer. For example, you can remove duplicate operating systems or extraneous words from the file.

> **Note:** For more information about using the ITAM Data Importer, see Import Data (see page 1622) section.

6. Log in to the CA APM.

7. Click Administration, ITAM Data Importer, and select the tenant or public data that is missing the operating systems.

8. Import the CSV file.
   The missing operating systems are imported into the Management Database and are available for use during Reconciliation Engine normalization processing.

Incorrect Database Configuration Results in Failure of Discovered Data Import from CA SAM

Symtom:

In the Software Asset Management Configuration page, you incorrectly select the database as Oracle. But you configured CA SAM on SQL database.

When you import data using the Data Importer, discovered data is not saved to the CA APM database as the database is wrongly specified. However, when you later specify the correct database and import the data, the data that was earlier discovered is not imported to CA APM.

Solution:

On the CA SAM database, run the following command using any compatible database client application:

```
delete * from dx_processes where dx_processes.file_name LIKE '%CA_SAM_Device_Export%'
```

Import Data to CA APM Installed on Oracle Database

You may encounter issues when you import data to CA APM that is installed on Oracle database. This article explains the various scenarios and the recommended tasks you must perform to import data successfully.

Terminologies you Must Know

Onboarding

Onboarding refers to the activity of importing data to the database for the first time. This is a one-time activity and does not repeat.

Ongoing

Ongoing refers to the activity of importing data to the database on a frequent basis. The frequency of data import may be daily, weekly, monthly, scheduled, or on-demand.

Pre-requisites

- If you are upgrading from UAPM 11.3.4 to CA APM 14.1, complete the CA APM installation and data migration using the CA APM Migration utility.
- If you are upgrading from ITAM 12.6, 12.8, or 12.9 to CA APM 14.1, then complete the CA APM 14.1 installation.

Recommendations for Data Import

The recommendation steps for the various scenarios only apply to the following environments:

- Oracle Database 11g, 12c
- Standalone installation of CA APM or CA APM integrated with CA SDM, CA Service Catalog, or CA ITCM.

Scenario 1: Onboarding Data More than 100 Thousand Records

To onboard data of more than 100 thousand records on a pristine CA APM Oracle Database, complete the following steps:

1. Stop the following Windows services:
   - CA APM Event ServiceCA APM
   - HW Reconciliation Engine
   - CA APM Registration Service
2. Verify that the CA APM Data Importer Engine Service is running.
3. Start the data import process.
4. After the data import is complete, start CA APM Registration Service.
5. After the registration is complete, start the following services:
   - CA APM HW Reconciliation Engine
   - CA APM Event Service

Scenario 2: Ongoing Data More than 25 Thousand Records

- Existing data on the database - 100 thousand Assets and/or 150 thousand Service Desk Configuration Items.
- Ongoing data load - More than 25 thousand records.

Follow these steps:

1. Stop the following Windows services:
   - CA APM Event Service
   - CA APM HW Reconciliation Engine
   - CA APM Registration Service
2. Verify that the CA APM Data Importer Engine Service is running.
3. Start the data import process.
4. After the data import is complete, start the following Windows services:
   - CA APM Registration Service
   - CA APM HW Reconciliation Engine
   - CA APM Event Service

Scenario 3: Ongoing Data Less than 25 Thousand Records

- Existing data on the database – Less than 25 thousand Assets/Configuration Item data records (record count of the table ca_owned_resource).
- Ongoing data load - Less than 25 thousand records.

No special steps are recommended. All the Windows services may continue to run.

Troubleshooting CA Service Desk Manager Connector

This topic contains the following information:

Verify that the CA SDM Connector Installed Successfully

Symptom:

I want to verify that the CA SDM Connector is installed successfully.

Solution:

Follow these steps:

1. Check if there are any errors in the Catalyst_SDMConnector_InstallDebug.log file or CatalystInstallDebug.log file.

   Note: These files are located in the %TEMP% directory.

2. If either of the log files has errors, open a support issue.
3. If there are no errors in either of the log file, complete the following steps:
   a. Open the CA Catalyst Registry Server UI using the following URL:

      ```
      https://<registryserver:port>/registry/carbon/admin/login.jsp
      ```

   b. Log in to the CA Catalyst Registry UI and browse to the following directory:

      ```
      \topology\physical\<SDM Connector NODE>
      ```

   c. Check if connector-modules.xml and startup.properties files are present in the directory.

   d. If either connector-modules.xml or startup.properties file is missing from the directory, then the CA SDM Connector installation has failed.

- Uninstall and reinstall the CA SDM Connector.

4. Verify that the CA SDM Connector installer has completed the steps to configure the CA Catalyst server. Complete the following steps to verify:

   a. Verify reconciledViews.xml content.

   b. Verify plannerpolicy.xml content.

   c. Verify plancontrol.xml content.

   d. Verify correlation.properties content.

Verify that the CA SDM Connector Started Properly

Symptom:

I want to verify that the CA SDM Connector started properly.

Solution:

Follow these steps:

1. Open the CA Catalyst Admin UI using the following URL:

   ```
   http://<<rose>-Server:port>/adminui
   ```

2. Log in to the CA Catalyst Admin UI.

3. Click CA SDM Container node from the left panel.
   The CA SDM Container node is expanded to display the CA SDM Connector and status of the CA SDM Connector.
   If the status of the CA SDM Connector is RUNNING, then the CA SDM Connector has started properly.

   

   Note: If you have just started the CA SDM Connector, wait for the CA SDM Connector nodes to move to the Running state before you perform any operation.

CA SDM Connector Fails to Start

Symptom:

The CA SDM Connector fails to start.

Solution:

The CA SDM Connector failed to start because of one of the following reasons:

- CA SDM Server is Down (see page)
- Login Failure (see page 3376)

CA SDM Server is Down

Symptom:

If the CA SDM server is down and you try to start the CA SDM Connector, the CA SDM Connector attempts to connect to the server a few times and shuts down. The following line appears in the ServiceDeskManagerConnector.log file located in the CATALYST_HOME/container/data/logs/ directory:

```
Unable to connect to Service Desk Manager.
```

Solution:

Complete the following steps to start the CA SDM Connector:

1. Ensure that the CA SDM Server is up and running.
2. Restart CA SDM Connector Container.

Login Failure

Symptom:

If the password of the logged-in user has changed in CA SDM, the CA SDM Connector fails to log in to CA SDM. The following line appears in the ServiceDeskManagerConnector.log file located in the CATALYST_HOME/container/data/logs/ directory:

```
Login failure
```

Solution:

Complete the following steps to start the CA SDM Connector:

1. Open the following directory from the command prompt:

   ```
   CATALYST_HOME\tools\encrypt
   ```

   

   Note: Ensure that java.exe is in the PATH.

2. Run encrypter.bat <New Password> command and copy the encrypted string output from the command.
3. Browse to the following directory from the https://registryserver:port/registry/carbon/admin/login.jsp (https://registryserverport) URL:

```
\topology\physical\<SDM Connector
Server>\modules\configuration\ServiceDeskManagerConnector.xml
```

4. Click Edit as Text.
5. Replace the value of the password with the encrypted string output that is copied from encrypter utility.
6. Click Save Content.
7. Restart the CA SDM Connector Container.

CA SDM Connector Container Fails to Connect to CA Catalyst Registry or CA Catalyst Server Container

Symptom:

The CA SDM Connector Container failed to connect to the CA Catalyst Registry or the CA Catalyst Server Container.

Solution:

The connection has failed because of one of the following reasons:

- CA Catalyst Registry or CA Catalyst Server Container Service is Down (see page 3377)
- CA Catalyst Registry Database Server or CA Catalyst Server Container Database Server is Down (see page 3377)
- Firewall Restrictions (see page 3378)

CA Catalyst Registry or CA Catalyst Server Container Service is Down

Symptom:

The CA Catalyst Registry or the CA Catalyst Server Container service is down.

Solution:

Complete the following steps to start the connection:

1. Start the CA Catalyst Registry or the CA Catalyst Server Container.
2. Restart the CA SDM Connector Container.

CA Catalyst Registry Database Server or CA Catalyst Server Container Database Server is Down

Symptom:

The database server used by the CA Catalyst Registry or the CA Catalyst Server Container is down.

Solution:

Complete the following steps to start the connection:

1. Start the database server.
2. Start the CA Catalyst Registry or the CA Catalyst Server Container.
3. Restart the CA SDM Connector Container.

Firewall Restrictions

Symptom:

If the CA SDM Connector and the CA Catalyst Registry are on different computers, then firewall restricts the connection.

Solution:

Ensure that the firewall is not blocking any port that is used for communication between the CA Catalyst Registry and the CA SDM Connector container.

Verify the Data Published By the CA SDM Connector

Symptom:

I want to verify the data published by the CA SDM Connector.

Solution:

Follow these steps:

1. Launch the following URL:

   ```
   http://<<rose>-server:port>/ca-rest/home
   ```

2. Log in with the credentials of the CA Catalyst server.
3. Click Browse by CI Type.
   A new page with the data source button is displayed.
4. Select ServiceDesk-CMDB and look for any CI or relationship information.

CIs are Not Displayed in CMDB

Symptom:

I do not see the CIs in the CMDB, even after running the Catalyst job or the Management profile with the enabled integration.

Solution:

Follow these steps:

- If the CIs appear in the Catalyst, then verify that you applied the correct registry configuration steps and recycled the CA Catalyst container service in the CA Catalyst server. When the CA Catalyst Server and the CA SDM Connector are online, perform the full synchronization using the Priming Utility. For more information, see the *CA Catalyst documentation*.
- If the CIs do not appear in the Catalyst, then ensure that the CA Catalyst server, the CA Configuration Automation Connector, and the CA SDM Connector are up and running. Then rerun the CA Configuration Automation Catalyst Job.

Catalyst UI Login Failure

Symptom:

I am unable to log in to the Catalyst UIs such as the Admin UI or USM Web View even though my credentials are correct. However, I am able to log in to the Registry UI with the same credentials.

Solution:

Follow these steps:

1. Ensure that CA Embedded Entitlements Manager is up and running.

   Note: The Registry UI does not use CA Embedded Entitlements Manager for its user validation.

2. Restart the CA Catalyst container service in the CA Catalyst server.
3. Restart CA Catalyst Admin UI service in the CA Catalyst server.

Failed to Launch In-Context to a CI in CA Configuration Automation

Symptom:

I am unable to launch in-context to a CI in CA Configuration Automation while viewing the CI in CA SDM.

Solution:

If the in-context button (CCA$) does not appear for the CIs, ensure that the MDR for CA Configuration Automation was configured. For more information, see Create an MDR Definition in CA SDM (see page 3373).

Relationships are not Displayed in CMDB

Symptom:

I am unable to view the relationships in CMDB.

Solution:

Check the CA Catalyst Profile in CA Configuration Automation to find out the relationship types that were chosen for the export. If you enable TWA, then the relationships appear in TWA after the CI transactions are loaded to CMDB from TWA.

CIs are Not Displayed in the ServiceDesk-CMDB Data Repository

Symptom:

I am unable to view the CIs in the ServiceDesk-CMDB data repository. However, I can view the CIs listed for the default CA Catalyst data repository in the USM Web View.

Solution:

You are unable to view the CIs in the ServiceDesk-CMDB data repository because you have enabled TWA while installing the CA SDM Connector. Complete the following steps to disable the TWA:

1. Browse to the following directory from the https://<registryserver:port>/registry/carbon /admin/login.jsp URL:

   ```
   \topology\physical\<SDM Connector
   Server>\modules\configuration\ServiceDeskManagerConnector.xml
   ```

2. Click Edit as Text.
3. Replace the value for enable_twa property to **false**.
4. Click Save Content.
5. Restart the CA Catalyst Connector container service on the CA SDM server.

> **Note:** If you do not want to disable TWA, follow the CMDB process of verifying and loading the CIs to CMDB using GRloader utility, provided by CMDB.

Limit the Data Exported to CMDB

Symptom:

I want to limit the data exported to CMDB.

Solution:

Follow these steps:

1. Use the CA Catalyst Profiles in CA Configuration Automation to determine which attributes are exported. The attributes include Network Discovery Gateway CIs, Hardware or Storage or Network Details components, and Relationship types. The default profile exports all the NDG CIs, each of the Hardware or Software or Network Details components, and all relationship types.

2. Use the Catalyst Jobs or Management Profiles to determine which servers or services, and blueprints are exported.

Troubleshooting CA CMDB and CA Configuration Automation Integration

This topic contains the following information:

Verify that the CA Configuration Automation Connector Installed Successfully

Symptom:

I want to verify that the CA Configuration Automation Connector started properly.

Solution:

Follow these steps:

1. Check if there are any errors in the Catalyst_CCAConnector_InstallDebug.log file or CatalystInstallDebug.log file.

   Note: These files are located in the %TEMP% directory.

2. If either of the log files has errors, open a support issue.
3. If there are no errors in either of the log file, complete the following steps:
   a. Open the CA Catalyst Server Registry UI using the following URL:

      `https://<registryserver:port>/registry/carbon/admin/login.jsp`

   b. Log in to the CA Catalyst Registry UI and browse to the following directory:

      `\topology\physical\<<ACM>_Connector NODE>`

   c. Check if connector-modules.xml and startup.properties files are present in the directory.
   d. If either connector-modules.xml or startup.properties file is missing from the directory, then the CA Configuration Automation Connector installation has failed.
      - Uninstall and reinstall the CA Configuration Automation Connector.

Verify that the CA Configuration Automation Connector Started Properly

Symptom:

I want to verify that the CA Configuration Automation Connector started properly.

Solution:

Follow these steps:

1. Open the CA Catalyst Admin UI using the following URL:

   `http://<CA_Catalyst_Server>:<port>/adminui`

2. Log in to the CA Catalyst Admin UI.
3. Click CA Configuration Automation Container node from the left panel.
   The CA Configuration Automation Container node is expanded to display the CA Configuration Automation Connector and status of the CA Configuration Automation Connector.

- If the status of the CA Configuration Automation Connector is RUNNING, then the CA Configuration Automation Connector has started properly.

Note: If you have just started the CA Configuration Automation Connector, wait for the CA Configuration Automation Connector nodes to move to the Running state before you perform any operation.

cca.log File Displays Exception Traces

Symptom:

The cca.log file shows errors with exception traces.

Solution:

Review and identify a resolution for the exceptions that appear in the cca.log file. The following possible exceptions may appear in the cca.log file:

- CA Configuration Automation Server Connection Exception (see page)
- Database Exception (see page 3384)
- JVM Port Binding Exception (see page 3385)

CA Configuration Automation Server Connection Exception

Complete the following steps to remove the CA Configuration Automation Server Connection Exception found in the cca.log file:

1. Check if the CA Configuration Automation server is online and can be pinged from the CA Configuration Automation Connector Server.
2. Check if there is any firewall that is blocking access to the necessary CA Configuration Automation server port from the CA Configuration Automation Connector server.

Important! If you have restarted the CA Configuration Automation server while starting the CA Configuration Automation Connector, restart the CA Catalyst container service on the CA Configuration Automation Connector server.

3. If the password of the CA Configuration Automation user has changed since the installation of the CA Configuration Automation Connector, update the password parameter in the CCAConnector.xml file from the CA Catalyst server Registry UI. Complete the following steps:
    a. Go to the following directory:

```
<ROSE>_HOME\ tools\encrypt
```

Note: Ensure that java.exe in present in the path.

b. Run encrypter.bat <New Password> command and copy the encrypted string output from the command.

c. Open the following URL:

```
https://<registryserver:port>/registry/carbon/admin/login.jsp
```

d. Browse to the following directory:

```
\topology\physical\<Configuration_Automation_Connector_Server>\modules\co
nfiguration\CCAConnector.xml
```

e. Click Edit as Text.

f. Replace the value for db.password with the value copied from the encryptor utility.

g. Click Save Content.

h. Restart the CA Catalyst Container service and verify it again.

Database Exception

Complete the following steps to remove the Database Exception found in the cca.log file:

1. Check if the database server is online and can be pinged from the CA Configuration Automation Connector server.

2. Check if there is any firewall that is blocking access to the necessary database ports from the CA Configuration Automation Connector server.

3. If the DB password has changed since the installation of the CA Configuration Automation Connector, update the db.password parameter in the CCAConnector.xml file from the CA Catalyst server Registry UI. Complete the following steps:

   a. Go to the following directory:

   ```
   CATALYST_HOME\ tools\encrypt
   ```

   

   Note: Ensure that java.exe in present in the path.

   b. Run encrypter.bat <New Password> command and copy the encrypted string output from the command.

c. Open the following URL:

```
https://<registryserver:port>/registry/carbon/admin/login.jsp
```

d. Browse to the following directory:

```
\topology\physical\<CA_Configuration_Automation_Connector_Server>\modules
\configuration\CCAConnector.xml
```

e. Click Edit as Text.

f. Replace the value for db.password with the value copied from the encryptor utility.

g. Click Save Content.

h. Restart the CA Catalyst Container service and verify it again.

JVM Port Binding Exception

Complete the following steps to remove the JVM Port Binding Exception found in the cca.log file:

1. Check if any process is using the port that is used for the notification_listen_port parameter during the CA Configuration Automation Connector installation.

2. If a port conflict exists after the installation, update the parameter in the CCAConnector.xml file from the CA Catalyst server Registry UI. Complete the following steps:

   a. Open the following URL:

   ```
   https://<registryserver:port>/registry/carbon/admin/login.jsp
   ```

   b. Browse to the following directory:

   ```
   \topology\physical\<CA_Configuration_Automation_Connector_Server>\modules
   \configuration\CCAConnector.xml
   ```

   c. Click Edit as Text.

   d. Replace the value of the notification_listen_port with the value that does not conflict with other ports on the CA Configuration Automation server.

   e. Click Save Content.

   f. Restart the CA Catalyst Container service and verify it again.

Verify that the CA Configuration Automation Connector Sent Data to the CA Catalyst Server Successfully

Symptom:

I want to verify that the CA Configuration Automation Connector sent data to the CA Catalyst Server successfully.

Solution:

Follow these steps:

1. Open the Catalyst USM web view using the following URL:

   ```
   http://catalystserver:8080/ca-rest/browse/type?mdr=all
   ```

2. Select CMDB-View from Data Source and check if the CIs are listed on the page.

3. If the CIs are not listed in the CMDB-View, complete the following steps:

   a. Ensure that the Catalyst Container Service of the CA Configuration Automation Connector is restarted when you started the CA Configuration Automation server.

   b. Check if the time settings on the CA Catalyst server and the CA Configuration Automation Connector server nodes are same to avoid connectivity issues.

   c. If you used the Catalyst Job to push the data from CA Configuration Automation Connector, verify completion of the Catalyst Job. This verification is applicable for the Management Profile based integration. If the Catalyst Job is complete, the log view on the CA Configuration Automation server displays the Job started and Job finished messages.

   d. Match the Check Sum Table (see page) with the projections of the CA Configuration Automation Connector.

Match the Check Sum Table

Match the Check Sum table with the projections of the CA Configuration Automation Connector. The CA Catalyst Persistence Store maintains the projections of the CA Configuration Automation Connector for every CI sent to the CA Catalyst server.

Follow these steps:

1. Run queries to find the failed CIs.

   Note: You must adapt the queries with the corresponding database names, passwords, and so on. The Database may also need to configure cross computer DB access for CA Configuration Automation and CA Catalyst databases.

   - Use the following query in SQL to identify the failed CIs:

     ```
     select ci_id = CASE CHARINDEX( '|', ci_typ)
     WHEN '0' THEN ci_id
     ELSE (ci_id + substring( ci_typ, CHARINDEX( '|', ci_typ) + 1, len(ci_typ)))
     END collate sql_latin1_general_cp1_ci_as from acm_catlst_ci_cksum
     ```

```
EXCEPT
select c_mdrelementid from [catalystdb].[dbo].t_ci_detail where c_mdrproduct
= 'CA:00033'
```

- Use the following query in ORACLE to identify the failed CIs:

```
CREATE PUBLIC DATABASE LINK catalystdb CONNECT TO catalystadmin IDENTIFIED
BY <Password> USING '//<DBServer>/<DB SID>';
select CASE instr( ci_typ, '|')
HEN 0 THEN cast( ci_id as NVARCHAR2(36) )
ELSE concat( cast( ci_id as NVARCHAR2(36) ) , substr( ci_typ, instr( ci_typ,
'|') + 1, length(ci_typ)))
END as c_mdrelementid
from acm_catlst_ci_cksum
minus
select c_mdrelementid from t_ci_detail@catalystdb where c_mdrproduct = 'CA:
00033'
```

2. Check the invalidCIs.log file from the CATALYST_HOME\container\data\log directory.

> **Note:** For each CI ID output that is received from the query, there exists a corresponding dump for the CI in the invalidCIs.log file.

- If either the invalidCIs.log file is empty or the CI ID is not present in the file, then the CI synchronization from CA Configuration Automation Connector to the CA Catalyst server is still in progress.

> **Note:** The synchronization and reconciliation activities on the CA Catalyst server are not instantaneous and results in the CIs to take time to get across to CMDB.

Failed to Select the Items to Synchronize Between CA Configuration Automation and CMDB

Symptom:
I am unable to choose the items to synchronize between CA Configuration Automation and CMDB. In the old CA Configuration Automation or CMDB CA Business Intelligence-boxed integration I could choose the CI types.
Solution:
A combination of the attribute profile and Catalyst Job or management profile helps you filter data. This filtering mechanism has no similarity with the previous CA Business Intelligence integration where the filter was using CI types.

Integrating

This section contains the following articles:

Integrating CA Service Desk Manager

This section contains the following articles:

Integrate with Other Products

You can integrate CA SDM with some of the CA Technologies products. For more information see the Green book (https://support.ca.com/phpdocs/7/common/greenbooks/CA_Service_Desk_Integrations_Vol_1_ENU.pdf).

Integrate with CA Portal

This article contains the following topics:

You can access CA SDM components through CA Management Portal and CA Portal.

Note: CA Management Portal and CA Portal are not shipped with CA SDM, and must be purchased and licensed separately. CA SDM provides only the most basic information for accessing CA SDM through Portal Administration. For detailed information, see the *CA Portal* and *CA Management Portal Server Administration Online Help*.

Verify CA SDM Web Interface Accessibility

After CA SDM is installed on a system, ensure that you can access the web interface through the tomcat server. For Portal Integration to work, the CA SDM Web Interface must be accessible through tomcat.

Note: For CA SDM LINUX server installation, set the LD_LIBRARY_PATH to $NX_ROOT/sdk /lib.

Install and Start CA Portal

For more information about CA Portal, see the *CA Portal Getting Started Guide* that applies to your installation.

Note: You can install CA Portal on the system where CA SDM is installed, or on a separate system.

Include Portlets

You can use the product to include CA SDM portlets in the portal.

Follow these steps to include portlets:

1. Log in to CA SDM and click Search from the Options Manager on the Administration tab.
   The Options List window appears.
2. Click Portal_Safe_List.
   The Portal_Safe_list Detail window appears.
3. Enter the *servername:portnumber* where the portal was installed in the Options Value Field.
4. Click Install.
5. Restart the CA SDM daemon.
6. Log in to CA Portal as an administrator.

7. Create a user which is valid CA SDM User. For more information about how to create a user, see the CA Portal documentation.

   Note: The password that is used to create this user in the portal could be different from the password that the same user uses to log in to CA SDM. This is because, CA SDM authenticates the users for this integration using a combination of the username, a valid CAPortalsession, and the CA Portal install value. The CA Portal install value is used only if it exists in the PORTAL_SAFE_LIST option.

8. Select Knowledge from the main CA Portal menu bar.
   The Knowledge page appears.

9. Select Library from the left pane Knowledge bar.
   The Library tree appears in the left pane.

10. Create a folder in the Library and then select it. Select Publish File from the Knowledge bar.
    The Publish File form opens.

11. Type the following CA SDM portlet URL in the Content text box on the General Information tab:

    ```
    http://hostname:portnumber/CAisd/PortalServlet?USERNAME=$USER.
    username$&PORTALSESSION=$SESSION$&PORTALINSTALL=portalhostname:portalportnumber
    ```

    Note: Substitute the *hostname:portnumber* parameter with the name and port of the web server on which CA SDM resides. Substitute the *portalhostname: portalportnumber* parameter with the name and port of the web server on which Portal resides.

12. Enter CA SDM in the Title text box.

13. Click Advanced.
    The Advanced properties page of the Publish File form displays.

14. Enter *portal/variable-url* in the Content (mime) Type field and click Publish.
    The published contents appear in the selected Library folder.

15. Configure the Workplace to display this portlet.

16. Log out and log in as the newly created user. You are automatically logged in to CA SDM in the portlet you have created.

Note: If CA SDM is running in a portlet, the preference Avoid Popups is not available in the Preference page. A popup window is used regardless of the setting of the preference.

Connect to the CA Portal Server

To connect to the CA Portal server, open a web browser, and enter the following URL:

```
http://<servername>:<port#>/servlet/portal
```

- **<servername>**
  Specifies the server name (or IP address) of the portal server.

- **<port#>**
  Specifies the port number that the CA Portal server monitors. You specified the port number during the CA Portal server installation. The default port is 8080.

Configure CA SDM to Use SSL with CA Portal

Note: For production purposes, we recommend that you obtain a certificate from a trusted certificate authority.

Before configuring CA SDM to use SSL, verify if the CA Portal and CA SDM integration works without SSL. If the integration works without SSL, you can include portlets.

Setup SSL Using a Self-Signed Certificate

To set up the CA SDM Portal Integration using a self-signed certificate

1. At the command line, enter:

   ```
   %JAVA_HOME%\bin\keytool -genkey -alias tomcat -keyalg RSA
   ```

   Answer the prompts appropriately and enter "changeit" as the password for both password prompts.
   The certificate is now set up.

2. Edit the server.xml file that is located in:

   ```
   $NX_ROOT/bopcfg/www/CATALINA_BASE/conf
   ```

4. Uncomment the following section and save:

   ```
   <!--
   <Connector className="org.apache.coyote.tomcat4.CoyoteConnector"
      port="8443" minProcessors="5" maxProcessors="75" enableLookups="true"
   acceptCount="100" debug="0" scheme="https" secure="true"useURIValidationHack="
   false" disableUploadTimeout="true">
   ```

```
<Factory className="org.apache.coyote.tomcat4.CoyoteServerSocketFactory"
clientAuth="false" protocol="TLS" /></Connector>
-->
```

5. Add keystoreFile attribute to server.xml. (When you run the command in step 1, a .keystore file is created in the home directory of the user. Add the reference to the keystoreFile attribute and Save the file. Your server.xml appears as follows.

```
<Connector className="org.apache.coyote.tomcat4.CoyoteConnector"
port="8443" minProcessors="5" maxProcessors="75" enableLookups="true"
acceptCount="100" debug="0" scheme="https" secure="true"  useURIValidationHack="
false" disableUploadTimeout="true">
<Factory className="org.apache.coyote.tomcat4.CoyoteServerSocketFactory"
clientAuth="false" protocol="TLS" keystoreFile="location/.keystore" />
 </Connector>
```

6. Restart CA SDM.

7. To verify the SSL functionality, point your browser to *https://hostname:8443*. The browser displays a Security Alert dialog. Click Yes.

> **Note:** SSL uses port 8443.

8. Replace the CA SDM portlet to use HTTPS and port 8443.

```
https://hostname:8443/CAisd/PortalServlet?
USERNAME=$USER.username$&PORTALSESSION=$SESSION$&PORTALINSTALL=portalhostname:
portalportnumber
```

Connect to CA SDM when CA Portal Uses SSL

You can import the CA Portal Server Certificate so that a trusted connection can be made between CA SDM and CA Portal. The connection can be made only when CA Portal is configured to use SSL.

To connect to CA SDM when Portal Uses SSL

1. Verify that CA Portal is configured and works with SSL.

> **Note:** For information about the verification process, see your CA Portal documentation.

2. Export the certificate from the computer on which CA Portal is installed by following these steps:

    a. Locate the server.xml file at the following location:

```
PORTAL_Install_Dir\jakarta-tomcat-4.1.29\conf.
```

b. Note the keystore location and password (pwd), as illustrated in the following lines in server.xml. The default password is *changeit* (all lower case). If you used a custom password while creating the certificate during the portal setup, you have to use the custom password. For information, see your CA Portal documentation. In the following steps and examples, *changeit* is the default password used:

```
<!-- Define a SSL Coyote HTTP/1.1 Connector on port 8443 -->
<Connector className="org.apache.coyote.tomcat4.CoyoteConnector"
   port="8443" minProcessors="5" maxProcessors="150"
      enableLookups="true"
      acceptCount="100" debug="0" scheme="https" secure="true"
      useURIValidationHack="false" disableUploadTimeout="true">
 <Factory className="org.apache.coyote.tomcat4.CoyoteServerSocketFactory"
      keystoreFile="c:\Program Files\CA\SC\Unicenter Management
Portal\UMPkeystore"
      keystorePass="changeit"
      clientAuth="false" protocol="TLS" />
    </Connector>
```

c. Navigate to the JRE bin directory (PORTAL_Install_Dir\ jre\bin) on the portal server computer. This directory includes the keytool utility that you use for exporting the PORTAL Server certificate to a file.

d. Access the keytool utility, using the following command:

```
keytool -export -alias tomcat -file umpserver.cer -keystore "c:\Program
Files\CA\SC\Unicenter Management Portal\UMPkeystore"
```

Enter the keystore password: changeit
Certificate is stored in the file <umpserver.cer>

Note: When prompted for the password, use the password that is obtained from step 2b. In the previous example, *changeit* is the password noted in step 2b. The keystore location is also obtained from step 2b.

3. Import the certificate that is obtained from the server to the computer containing the CA SDM installation by using the keytool utility, Complete the following:

a. On the CA SDM computer, navigate to the JRE\bin directory directory, typically at the following location:

```
C:\Program Files\CA\SC\JRE\bin.
```

b. Import the certificate into the Certification authority that is used by the CA SDM Java Virtual Machine.
The following example illustrates an import. In this example, the location of the Certificate authority is as follows:

```
C:\Program Files\CA\SC\JRE\1.4.2_06\lib\security\cacerts
```

When prompted for a *pwd*, enter “changeit”. When prompted for *Trust this certificate*, enter Yes.

```
Keytool.exe -import -alias tomcat -trustcacerts -file umpserver.cer -
keystore "C:\Program Files\CA\SC\JRE\1.4.2_06\lib\security\cacerts"
Enter keystore password:  changeit
Owner: CN=ump001.ca.com, OU=unicenter, O=ca, L=islandia, ST=ny, C=us
Issuer: CN=ump001.ca.com, OU=unicenter, O=ca, L=islandia, ST=ny, C=us
Serial number: 43ecb469
Valid from: Fri Feb 10 10:42:33 EST 2006 until: Thu May 11 11:42:33 EDT
2006
Certificate fingerprints:
         MD5:  A1:AF:AE:92:39:2E:53:D5:1C:6D:FE:44:68:61:DD:5C

D2
Trust this certificate? [no]:  yes
Certificate was added to keystore
```

Note: When prompted for the password, use the password that is obtained from step 2b. In the previous example, *changeit* is the password noted in step 2b.

4. Edit the file portal-xml-api.xml under $NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\xml\portal-xml-api.xml by completing the following steps:

   a. Replace http in following the line:

   ```
   <!DOCTYPE PORTAL SYSTEM "http://127.0.0.1:8080/servlet/media/xml/api
   /request.dtd">
   ```

   With https:

   ```
   <!DOCTYPE PORTAL SYSTEM "https://127.0.0.1:8080/servlet/media/xml/api
   /request.dtd">
   ```

   b. Save the file.

   c. If Portal_Safe_List has been installed, ensure that you change the port number to 8443 and the computer name to include the domain name. For example, computername.ca.com:8443.

Note: Include the domain name in the computer name as the portal certificate contains the domain name. For more information, see your CA Portal documentation.

5. Recycle the CA SDM server.

6. From CA Portal, connect to the CA SDM Portlet using the following URL:

```
http://hostname:portnumber/CAisd/PortalServlet?USERNAME=$USER.
username$&PORTALSESSION=$SESSION$&PORTALINSTALL=servername:8443
```

> **Note:** Substitute *servername* in the URL with the name of the web server on which CA Portal resides. The server name in this URL must include the domain name, for example, servername.ca.com:8443. Substitute the hostname:portnumber with the name and port of the web server on which CA SDM resides.

Integrate with Mainframe Product

The CA SDM data (.dat file) associated with a mainframe product integration is in a list that associates a .dat to the mainframe product name.

> **Note:** The CA SDM server is configured, by default, to use ITIL methodology.

To load CA SDM side data to enable a particular integration, use *pdm_userload -f integXXX.dat*.

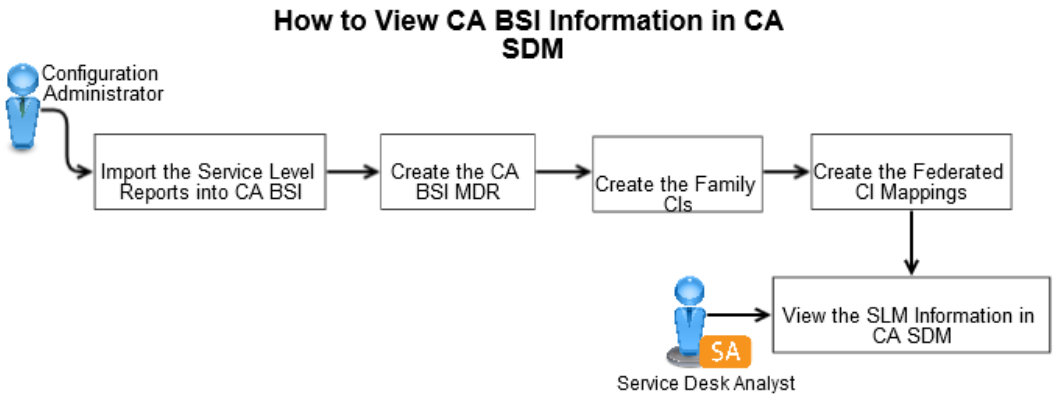
The data files are delivered to $NX_ROOT\data\integrations\.

For more information about enabling the calling side (mainframe product side) of the integration, see the *CA Common Services for z/OS - CA Service Desk Integration Guide*.

Integrate CA Service Desk Manager with CA Business Service Insight

An organization wants to improve the management of changes to IT services and decides to integrate CA BSI and CA SDM. The integration lets CA BSI export Service Level Management (SLM) information into CA SDM. The Configuration Administrator imports the reports into CA BSI and configures CA SDM so that a Service Desk Analyst can view the SLM information. Service Desk Analysts work with this information to improve IT service delivery.

The following diagram explains how a Configuration Administrator enables CA BSI to export SLM data to CA SDM so that a Service Desk Analyst can view the information:



1. Import the Service Level Reports into CA BSI (see page).
2. Create the CA BSI MDR (see page 3397).
3. Create the Family CIs (see page 3397).
4. Create the Federated CI Mappings (see page 3398).
5. View the SLM Information in CA SDM (see page 3398).

Import the Service Level Reports into CA BSI

CA BSI provides the *Service Level Compliance* report by default. The BSI Service tab appears on CI detail pages in CA SDM and displays Exceeds and Violations counts. You import the *Modified Service Level by Metrics vs Target* and *Modified Service Level by Contract vs Target* reports into CA BSI.

Follow these steps:

1. Copy the $NX_ROOT/samples/BSI/bsireports.sql file to the CA BSI database server.
   This Oracle script contains the report definitions that are required for the integration between CA BSI and CA SDM.
2. Connect to the CA BSI Oracle instance with a user that has the SYSDBA role. Or, connect as the database owner.

   Important! This user *must* have update rights to the database. Confirm if you have these privileges with your Oracle Database Administrator.
3. Execute the bsireports.sql script and verify that no errors occur.
   The reports are available for the CA SDM integration.

Create the CA BSI MDR

The Configuration Administrator creates an MDR for CA BSI in CA SDM. This MDR provides information about the CA BSI server, such as the host name and privileged user ID.

Follow these steps:

1. On the Administration tab, click CMDB, MDR Management, MDR List.
2. Click Create New.
3. Complete the following example information:
   - Enter **BSI** as the Class name.
   - Enter labels for the button and MDR names.
     For example, you enter **BSI**.
   - Enter the host name of the CA BSI server.
   - Enter **sadmin** as the Userid to BSI server and enter **CA** (must be an organization name that is configured in BSI server) as the Shared Secret.

     Note: This information depends on your user name and organization. Confirm this information with your CA BSI Administrator.
   - Delete all the contents of the URL to Launch in Context field.
4. Click Save and close the window.

Create the Family CIs

Create the Enterprise Service and Contract Family CIs in CA SDM. These CIs correspond to CA BSI data that you want to view in CA SDM. In this example, you create Service 1 and Contract 7.

Follow these steps:

1. On the Administration tab, click CMDB, CI List.
2. Click Create New.
3. Complete the following information:
   - Enter **Service 1** as the name.
   - Enter **Business Service** as the Class.
4. Click Continue.
5. Click Save and close the window.

6. Create another CI with the following information:
   - Enter **Contract 7** as the name.
   - Enter **License Agreement** as the Class.
7. Click Continue.
8. Click Save and close the window.

Create the Federated CI Mappings

Create the Federated CI Mappings to complete the integration between CA BSI and CA SDM. This mapping provides information about a CI. In this example, you map Service 1 and Contract 7 to the BSI MDR. The Integration component does not verify if the CI Name in CMDB matches with Federated Asset ID. However, this component only verifies the family name of a CI and its MDR class name BSI.

Follow these steps:

1. On the Administration tab, click CMDB, MDR Management, Federated CI Mapping.
2. Click Create New.
3. Complete the following fields:
   - Enter the CI Name and Federated Asset ID.

     Note: Federated Asset ID must be the name of an existing service in BSI, while the CI Name can be anything.

   - Enter the MDR Name.
4. Click Save and close the window.
5. Repeat steps 2 through 4 for the contract CI.

   Note: Federated Asset ID must be the name of an existing contract in BSI, while the CI Name can be anything.

View the SLM Information in CA SDM

The Service Desk Analyst views the SLM information to manage changes to IT services within your organization. For example, you want to analyze the violations that appear for Service 1.

Follow these steps:

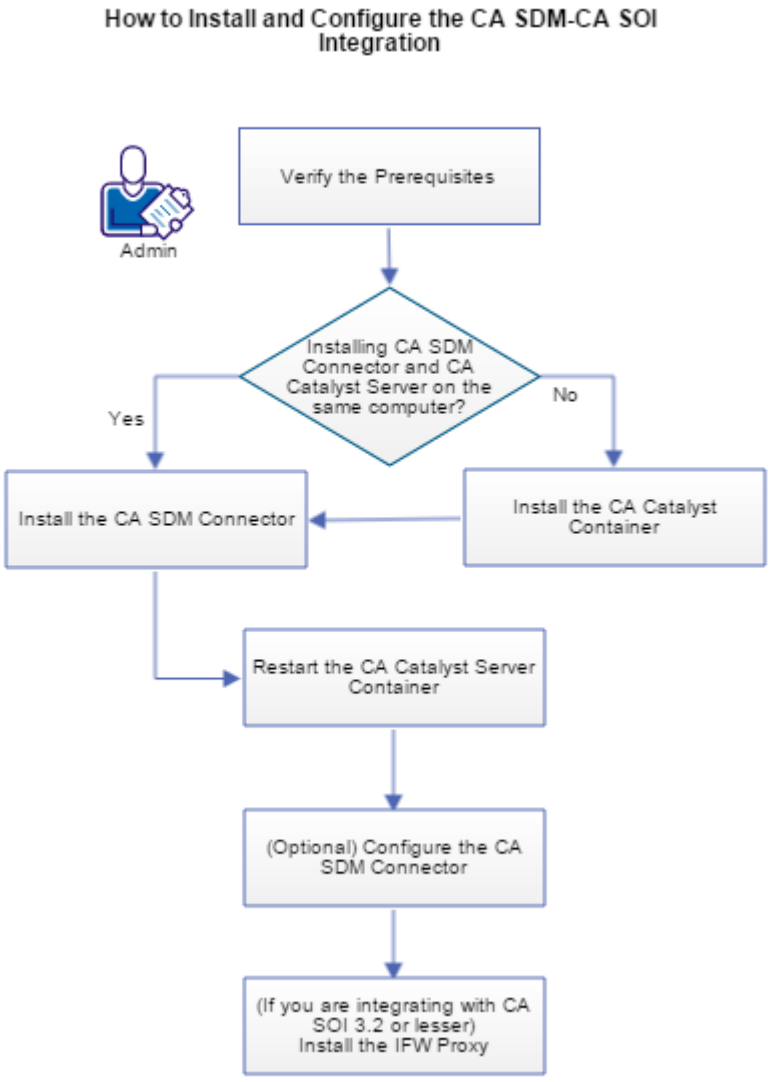
1. On the Administration tab, click CMDB, CI List.
2. Search for the Enterprise.Service and Contract Family CIs that you integrated with CA BSI.
3. Open an Enterprise.Service Family CI to view the BSI Service and BSI Service Metric tabs.
4. Click BSI Service to view Exceed and Violation information from *Service Level Compliance* data in CA BSI.
   The Exceeds and Violations data from the CA BSI *Service Level Compliance* report appears for Service 1.
5. Click BSI Service by Metric to view the Metric, Violation, Compliant, and Target report from the *Modified Service Level by Metric vs Target* data in CA BSI.
6. Open a Contract Family CI that you integrated with CA BSI and click the BSI Contract by Metric tab.

> **Note:** Contact CIs contain the BSI Contract by Metric tab. This tab contains a text box where you enter the Contract Party of the Contract to retrieve information from the *Modified Service Level by Contract vs Target* report in CA BSI.

You have now successfully integrated CA BSI with CA SDM to view SLM information in CA SDM.

Integrate with CA Service Operations Insight

The following diagram describes how to install and configure the CA SDM and CA SOI integration:



Follow these steps:

1. Verify the Prerequisites (see page 3401).

2. If you plan to install the CA SDM Connector and CA Catalyst Server on different computers, install the CA Catalyst Container on the same computer where you plan to install the CA SDM Connector (For more information about installing the CA Catalyst Container, see the *CA Catalyst Implementation Guide*).

   Important! If you are installing CA SOI r3.2 or lesser, ensure that you install CA Catalyst Container r3.2. If you are installing CA SOI r3.4, ensure that you install CA Catalyst Container r3.4.1.

3. Install the CA SDM Connector (see page 533).
4. Restart the CA Catalyst Server Container.
5. (Optional) Configure the CA SDM Connector (see page 535).
6. (If you are integrating with CA SOI r3.2 or lesser) Install the IFW Proxy (see page 3402).

Verify the Prerequisites

Verify the following prerequisites before installing and configuring the integration:

- Hardware and Software Requirements (see page 3401)
- Supported Versions of the Integrated Products (see page 3401)
- Integration Considerations (see page 3401)

Hardware and Software Requirements

CA Catalyst, CA SDM, and CA SOI support a number of hardware, software, operating systems, and databases. For complete information about CA Catalyst and CA SOI, see the respective documentation. For CA SDM, see the following:

- Windows Server 2008 SP1 and SP2 (x64-bit and x86-bit)
- Windows Server 2008 R2 (x64-bit)
- Windows Server 2012 R2 (64-bit only)
- Windows Server 2012 (64-bit only)

Supported Versions of the Integrated Products

The integration between CA SDM and CA SOI supports the following product versions:

- CA SDM r12.9 CUM1, r14.1.01
- CA SOI r3.1, r3.2, r3.2 CUM3, r3.3, r3.3 CUM1
- CA Catalyst Server r3.2
- CA Catalyst Container r3.2, r3.4.1
- CA EEM r8.4, r12.5, r12.5.1
- IFW Proxy r3.1, r3,2

Integration Considerations

Consider the following information before you begin the integration:

- You installed and configured a supported version of CA Catalyst. For more information, see the *CA Catalyst Installation Guide.*
- You upgraded to CA SDM 14.1.01 (see page 633). Ensure that you first apply RO80318 (Windows Master) patch and then the following patches:

Language	Patch
German	T52Y463
Japanese	T52Y464
French	T52Y465
French Canadian	T52Y466
Spanish	T52Y467
Italian	T52Y468
Brazilian Portuguese	T52Y469

- You installed and configured a supported version of CA SOI. For more information, see the *CA SOI Implementation Guide.*

  Important! If you are installing CA SOI r3.2 or lesser, ensure that you install CA Catalyst Container r3.2. If you are installing CA SOI r3.4, ensure that you install CA Catalyst Container r3.4.1.

- Verify that the CA SOI server, the CA Catalyst server (Registry, Container, and Administrator), and CA SDM server are up and running, and all these servers have network connectivity with each other.
- We recommend that you install CA Catalyst, CA SDM and CA SOI on different computers for this integration to work properly.
- You verified the CA SDM Connector Installation Considerations (see page 527).
- (Optional) Migrate Data from CA SDM Connector r2.5 (see page 529)
- (Optional) Migrate Data from CA SDM Connector r3.1 or r3.2 (see page 530)

Install the IFW Proxy

The IFW Proxy enables CA SOI to visualize and manage data provided by the CA SDM Connector. Install the IFW Proxy on each CA Catalyst Container system hosting the CA SDM Connector that you want to manage in CA SOI.

By default, the IFW Proxy is installed on the CatalystConnector container. If you want to install in a custom container you must provide the soi.ifwproxy-<build_number>.exe -Dcatalyst.container_id="<custom_container" command line argument.

Follow these steps:

1. Run IFWProxy.exe on the computer where the CA SDM Connector is installed.
   The Introduction screen appears.

2. Click Next, accept the terms of the license agreement, and click Next.
   The Integration Services Configuration screen appears.

3. Enter the following information, and click Next.

   - **SA Admin**
     Defines the administrator user name created during the CA SOI installation.

   - **Password**
     Defines the password for the administrator user.

   - **Manager host**
     Defines the host name where CA SOI is installed.

   - **ActiveMQ port**
     Defines the ActiveMQ Server port through which connector communication occurs.

   - **UCF broker port**
     Defines a valid port for the UCF Broker to send information created or updated in CA SOI to the CA Catalyst Connector.

   - **Use DNS for name resolution**
     Defines whether to use DNS for name resolution. Leave this check box selected if DNS is not configured in your environment.

   The Install Summary screen appears.

4. Click Install.
   The IFW Proxy is installed and the Install Complete screen appears. If errors occur, check the CA_IFWProxy_InstallLog.log file under the CATALYST_HOME\logs directory for details (CATALYST_HOME denotes the root CA Catalyst installation directory).

Uninstall the CA SDM and CA SOI Integration

If you do not need the integration services, uninstall the following components:

- Uninstall the IFW Proxy (see page 3403)
- Uninstall CA SDM Connector (see page 542)
- Uninstall the CA Catalyst Server (for more information about the uninstallation process, see *CA Catalyst documentation).*
- Uninstall CA SOI (for more information about the uninstallation process, see the *CA SOI documentation*).

Uninstall the IFW Proxy

Uninstalling the IFW Proxy deletes the connection between CA SOI and CA Catalyst Container running the CA SDM Connector.

Follow these steps:

1. Select Uninstall Service Operations Insight IFW Proxy from the Start menu of the computer where CA SDM Connector is installed.

2. Find the connector entry in the CA SOI Administration Web UI and click Remove Connector. The IFW Proxy is uninstalled.

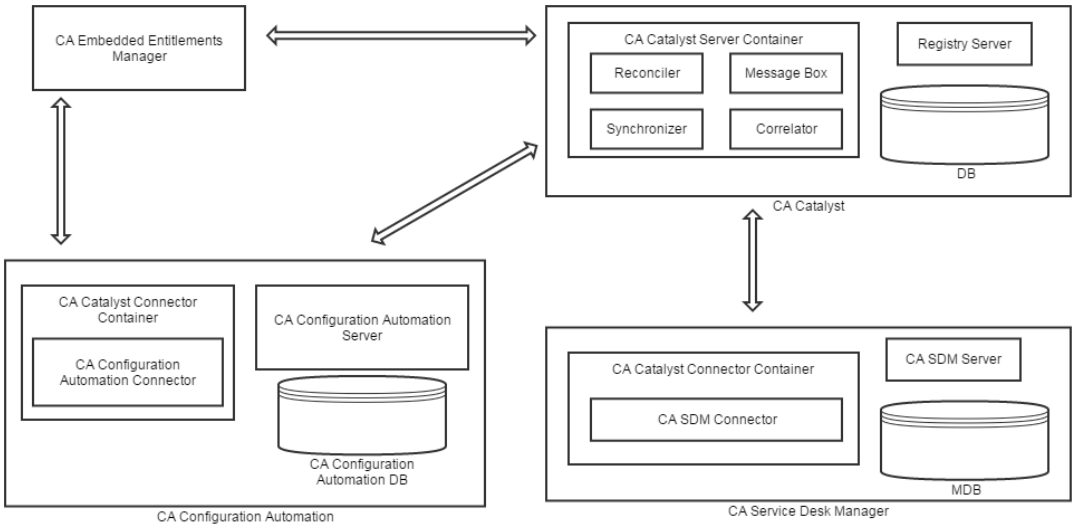
Integrating CMDB with CA Configuration Automation SP1 and SP2

This topic contains information intended for administrators who want to configure CA Catalyst to leverage key CA Configuration Automation data in the CMDB module of CA SDM. Ensure that you are familiar with the following processes:

- Performing administrative tasks in CA Catalyst, CA Configuration Automation, and CA SDM.
- Accessing product updates from CA Support Online
- Performing system administration for Windows and UNIX operating environments
- Managing CIs and CI Relationship data in GRLoader and CA SDM.

Integration Architecture

CA Catalyst integrates the CMDB module of CA SDM with CA Configuration Automation. The following diagram provides a high-level view of the integration architecture:



1. CA Configuration Automation server, database, and connector are installed on a set of servers.

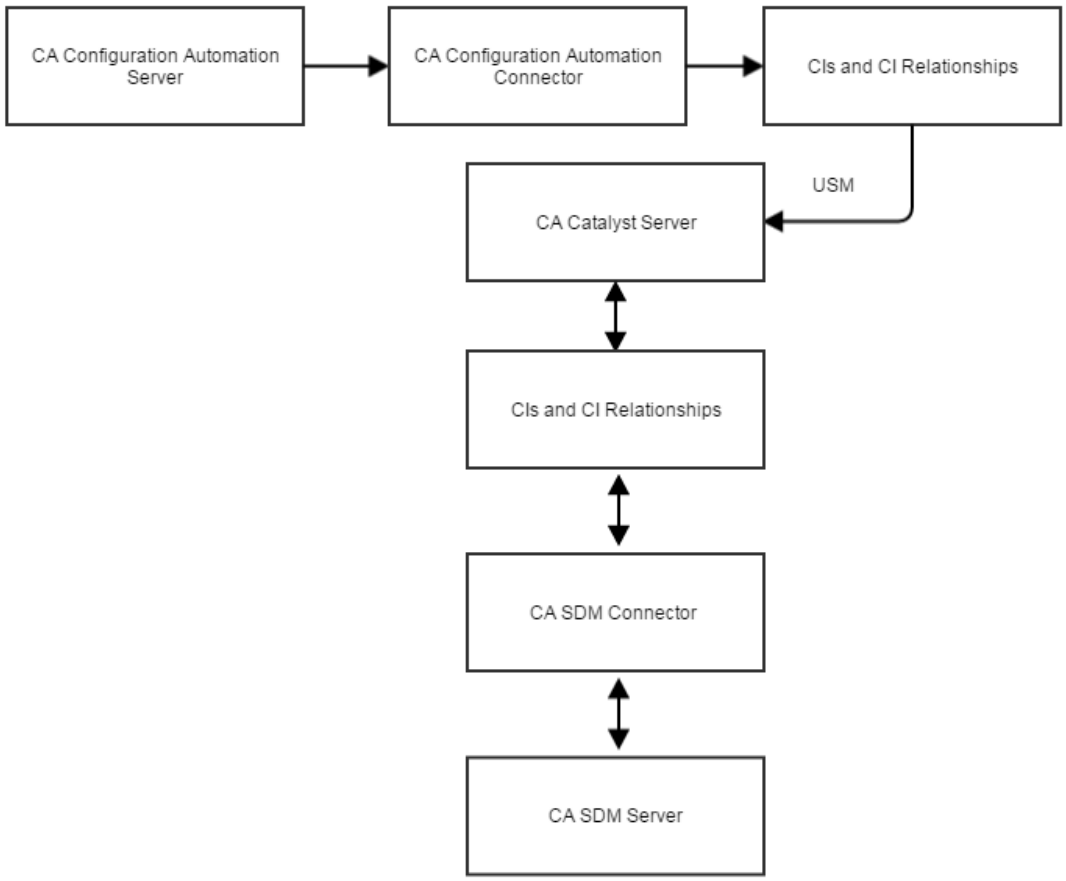
2. CA Catalyst server and database are installed on a separate set of servers.

3. CA SDM server, MDB, and connector are installed on a separate set of servers.

> **Note:** The CA SDM Connector must reside with one of the CA SDM servers.

4. CA Embedded Entitlements Manager is installed on another server.
5. CA Configuration Automation server and CA Catalyst server communicate with CA Embedded Entitlements Manager for authentication and authorization service.
6. CA Configuration Automation uses the CA Configuration Automation connector to communicate with the CA Catalyst server and push the discovered data.
7. CA SDM uses the CA SDM Connector to communicate bidirectionally with the CA Catalyst server and push and receive data.
8. Together all the components are integrated to form a solution and represent the CA Configuration Automation discovered data in the CMDB module of CA SDM.

The following information and diagram provide a summary of how the integration works:



1. The CA Configuration Automation Connector discovers CIs and CI relationship data in CA Configuration Automation.

2. The CA Configuration Automation Connector transforms the data to USM values and publishes the data to CA Catalyst.

3. The CA SDM Connector transforms the USM data into CA SDM values and publishes the CIs and CI data to the Transaction Work Area (TWA) or into CA SDM, directly.

> **Note:** When you enable the TWA flag the CI relationships are loaded to the TWA, only after the CIs are loaded from the TWA to CA SDM.

Install and Configure the Integration

This integration requires installing and configuring the CA Catalyst Server, the CA Configuration Automation Connector, and the CA SDM Connector.

Follow these steps:

1. Verify the Prerequisites (see page 3406).

2. Inactivate the MDR (see page).

3. Create an MDR Definition in CA SDM (see page 3409).

4. Install the CA Configuration Automation Connector (see page 3410).

5. If you plan to install CA SDM Connector and CA Catalyst Server on different computers, install the CA Catalyst Container on the same computer where you plan to install the CA SDM Connector (For more information about installing the CA Catalyst Container, see the *CA Catalyst documentation*).

6. Install the CA SDM Connector (see page 533).

7. (Optional) Configure the CA SDM Connector (see page 3406)
   The integration is installed and the connectors are configured.

8. Restart the CA Catalyst Container service on the CA Catalyst server.

Verify the Prerequisites

Verify the following prerequisites before starting the integration:

Hardware and Software Requirements

CA Catalyst, CA SDM, and CA Configuration Automation support a number of hardware, software, operating systems, and databases. For complete information about CA Catalyst and CA Configuration Automation, see the respective documentation. For CA SDM, see the Supportability Matrix (see page 119).

Supported Version of the Integrated Products

This integration supports the following product versions:

- CA SDM r12.9 CUM1, r14.1.01
- CA Configuration Automation r12.8 SP1, r12.8 SP2
- CA Catalyst Server r3.2
- CA EEM r12.5, r12.5.1
- CA Catalyst Container r3.2, r3.4.1

Integration Considerations

Consider the following information before you begin the integration:

- If you have previously used the CA Cohesion product, note that CA Cohesion ACM r5.0 and CA Configuration Automation are different products with different architectures. The data that these two products discover may also differ.
- If you upgraded to the supported version of CA SDMCA Configuration Automation, CA Catalyst replaces CA Business Intelligence as the integration point.
- You upgraded to CA SDM 14.1.01 (see page 633). Ensure that you first apply RO80318 (Windows Master) patch and then the following patches:

Language	Patch
German	T52Y463
Japanese	T52Y464
French	T52Y465
French Canadian	T52Y466
Spanish	T52Y467
Italian	T52Y468
Brazilian Portuguese	T52Y469

- You installed and configured the supported version of CA Configuration Automation. For more information, see the *CA Configuration Automation Implementation Guide.*
- Ensure that the services and servers discovered in CA Configuration Automation can be exported to CMDB module of CA SDM. For more information about CA Configuration Automation discovery, see the following sections in the *CA Configuration Automation Product Guide:*
  - Service Management
  - Server Management
  - Network Management

- Blueprint Management

- You applied the patch to enable the reactivation of the federated CI mapping. When a CI is deactivated in the CMDB module of CA SDM, the ID mappings also get deactivated by default. When this CI is activated again, the ID mappings remain deactivated because of the post trigger issue in CA SDM. Use the following text fixes to fix this issue:

  - RO42342 (for CA SDM r12.6)

  - RO42343 (for CA SDM r12.5)

  Note: When you apply the patch, the CA SDM service stops automatically. Start the CA SDM server after applying the patch.

- Verify that the CA Configuration Automation Server, the CA Catalyst Server (Registry, Container, and Administrator), and CA SDM server are up and running. Verify that all these servers have network connectivity with each other.

- We recommend that you install CA Catalyst, CA Configuration Automation, and CA SDM on different computers for this integration to work properly.

- You verified the CA SDM Connector Installation Considerations (see page).

- Reviewed the Frequently Asked Questions for the Integration (see page 3420).

Inactivate the MDR

If you want to import CIs and relationships from CA Configuration Automation r12.6 to the CA CMDB, you can first inactivate any MDRs defined in CA CMDB for CA Cohesion ACM r5.0, CA Application Configuration r12.0, and CA Configuration Automation r12.5. This action deactivates all the Federated CI Mappings for CA Cohesion ACM r5.0. View the Federated CI Mappings list in the Federated CI Mapping node on the Administration tab.

Important! If you want to retain both CA Cohesion ACM r5.0 and CA Configuration Automation as active MDRs, do *not* inactivate the r5.0 MDR. CIs imported from CA Configuration Automation reconcile to existing CIs imported from CA Cohesion ACM r5.0. For those CIs that are imported from both CA Configuration Automation and CA Cohesion ACM r5.0, both of these MDRs appear as MDR buttons on the CI detail page.

Follow these steps:

1. Launch CA SDM by entering the following URL in the web browser:

   ```
   http://<SDM Server Name>:<Port>/CAisd/pdmweb.exe
   ```

2. From the Administration tab, navigate to CA CMDB, MDR Management, MDR List.
   The MDR List appears.

3. Open the MDR that you want to deactivate and click Edit.
   The Update MDR Definition page appears.

4. From the Active drop-down list, select Inactive and click Save.
   The MDR is inactivated.

Create an MDR Definition in CA SDM

Create the MDR definition to specify information about the MDR contributing to the CIs. The MDR definition completes the Launch-in-Context URL configuration. You can verify the configuration from a CI detail page within CA SDM

Example: Create an MDR Definition to specify the CA Configuration Automation server information. Follow these steps:

1. Log in to the CA SDM as a user with Administrator access such as ServiceDesk.

2. On the Administration tab, click CA CMDB, MDR Management, MDR List.
   The Management Data Repository (MDR) List page appears.

3. Click Create New.
   The Create New MDR Definition page appears.

4. Complete the following required information:

   - **Button Name**: Defines the MDR button label that appears on the CI Detail page. Enter CCA.
   - **MDR Name**: Specifies the data that is sent in the mdr_name field in XML. Enter CCA.
   - **MDR Class**: Specifies the data that is sent in the mdr_class field in the XML. Enter CCA.
   - **Active**: Denotes the MDR definition as active or inactive. Inactive MDR definitions are logically deleted, but they can be made active again by using the Search utility. Select Active.
   - **Owner**: Specifies the contact responsible for this MDR. Enter ServiceDesk.
   - **Description**: Specifies the description of the MDR. Enter CCA LIC URL.
   - **Hostname**: Specifies the host name, DNS name, or IP address of the host, which contains the web server that hosts the launched web page. **Example:** CA Configuration Automation server hostname.
   - **Port**: Specifies the TCP/IP port used by the MDR web server to serve up web pages. **Example**: CA Configuration Automation Port.
   - **Path**: Specifies the portion of the URL that precedes the question mark (?) character. Enter CCAUI.jsp.
   - **Parameters**: Specifies the portion of the URL that follows the question mark (?) character. Keep the default selection.

- **CMDBf Timeout**: Specifies time limit for CMDBf endpoint query. Enter 10.
- **URL to Launch in Context**: Required for launch in context. Keep the default URL.

5. Click Save.
   The MDR definition is created.

6. Complete the following steps to modify the ServiceDeskManager_ConnectorSB.xml file:

   a. Open the Catalyst Server Registry UI using the following URL:

   ```
   https://<registryserver:port>/registry/carbon/admin/login.jsp
   ```

   b. Log in to Catalyst Registry UI and browse to the following directory:

   ```
   \topology\physical\<CA_Catalyst_Server>\ServiceDeskManager_ConnectorSB.xml
   ```

   c. Click Edit as Text.

   d. Search for the following lines:

   ```
   <Field output="temp_mdr_class" type="map" input="MdrProductLastUpdated">
   </Field>
   ```

   e. Enter the following code just before the </Field> tag:

   ```
   <mapentry mapin="CA:00033" mapout="CCA" />
   ```

   f. Search for the following lines:

   ```
   <Field output="temp_mdr_name" type="map" input="MdrProductLastUpdated,
   MdrProdInstanceLastUpdated">
   </Field>
   ```

   g. Enter the following code just before the <Field> tag:

   ```
   <mapentry mapin="CA:00033,.*" mapout="CCA" />
   ```

   h. Click Save Content.

Install the CA Configuration Automation Connector

You can install the CA Configuration Automation Connector locally on the CA Configuration Automation Server (recommended), on the CA Catalyst Server, or on a Windows system that is in the same domain as the CA Configuration Automation Server.

Note: If you install the CA Configuration Automation Connector on the same server hosting the CA Catalyst Server, then Choose Installation Folder, CA EEM, and Peer Node Configuration screens are not displayed when you run the installation program. The information in these screens is collected when you install the CA Catalyst Server.

Important! We recommend that you do *not* install the CA Configuration Automation Server on the CA Catalyst Server host because performance problems can occur. If you install CA Catalyst on the CA Configuration Automation server host, you run into port conflicts. To avoid conflicts change the default ports. Ensure that the CA Catalyst Registry Server is up and running before you start the CA Configuration Automation Connector installation.

Follow these steps:

1. Open CA Configuration Automation installer and complete the following steps:

   a. Click Run the CA Catalyst CA Configuration Automation Connector Installation Wizard.
   The installer introduction page appears.

   b. Click Next, accept the terms of the License Agreement, and click Next.
   The Choose Install Folder page opens.
   Note: This page is *not* displayed if the CA Catalyst components already reside on the system.

   c. Specify the installation folder and click Next.
   Note: The maximum installation path length is 150 characters. The installation program blocks paths with more than 150 characters.
   The Administration Configuration screen appears and displays the default CA Catalyst user in the Username field.

   d. Enter the CA Catalyst administrator user password and click Next.
   The CA Embedded Entitlements Manager Server Configuration screen appears.

2. Enter the following CA Embedded Entitlements Manager information and click Next.

   - **Server**
   Specifies the CA Embedded Entitlements Manager host server.

   - **User**
   Specifies the name of the CA Embedded Entitlements Manager administrator user.

   - **Password**
   Specifies the password for the CA Embedded Entitlements Manager administrator.

   - **Application Name**
   Identifies the CA Catalyst and CA Embedded Entitlements Manager integration using the following format: CATALYST-<*CA_Catalyst_host_name*>.

     Note: Use the same EEM Application name that you used during the CA Catalyst server installation.

   - **Default Catalyst Access for all users**
   Select READ-WRITE as the default access for all users.

   The Remote Registry Server Configuration screen appears.

Note: You can use the same CA Embedded Entitlements Manager Server for CA Catalyst and CA Configuration Automation.

3. Enter the following information and click Next.

   - **Registry Host**
     Specifies the CA Catalyst Registry host server. This repository contains the USM schema and policies that control the behavior of other components in the CA Catalyst container.
     Note: For detailed information about CA Catalyst architecture and components, see the *CA Catalyst Installation Guide*.

   - **HTTP Port**
     Specifies the server port number where you installed the CA Catalyst Registry.

   - **Secure Server Port**
     Specifies the secure server port number where you installed the CA Catalyst Registry.

   The Catalyst Container Server Configuration screen appears.

4. Enter the following information and click Next.

   - **Node Name**
     Specifies the name of the host where the CA Configuration Automation Connector is installed.

   - **Bus Port**
     Specifies the bus port number for the CA Catalyst server.

   - **HTTP Port**
     Specifies the HTTP listening port of the CA Catalyst server.

   - **HTTP Service Port**
     Specifies the SOAP-based web service HTTP network port on the CA Catalyst server. Other systems use this port to make API remote procedure calls to the CA Catalyst server.

   - **HTTPS Service Port**
     Specifies the SOAP-based web service HTTPS network port on the CA Catalyst server. Other systems use this port to make secure API remote procedure calls to the CA Catalyst server.

   The Peer Node Configuration screen appears.

5. Enter the following information and click Next.

   - **Peer Host**
     Specifies the name of the CA Catalyst server.

   - **Peer Port**
     Specifies the WS Endpoint port number of the CA Catalyst server.

- **Message Bus Host**
  Specifies the server where the CA Catalyst message bus is deployed; typically the same computer that hosts the CA Catalyst server.

- **Message Bus Port**
  Specifies the bus port number where you installed the Message Bus.

The CA Configuration Automation Connector Configuration screen appears.

6. Enter the following information and click Next.

   - **CA Configuration Automation Server Hostname**
     Specifies the name of the CA Configuration Automation server that the CA Configuration Automation Connector monitors for alarms and updates.

   - **CA Configuration Automation Server Port**
     Specifies the port the CA Configuration Automation Connector uses to communicate with the CA Configuration Automation server.

   - **CA Configuration Automation Server User**
     Specifies an administrator user who can access the CA Configuration Automation server.

   - **CA Configuration Automation Server Password**
     Specifies the password for the specified user.

   - **Verify CA Configuration Automation Server Password**
     Ensures that the password was entered correctly by matching the passwords.

   - **CA Configuration Automation Notification Listener Port**
     Specifies the port that receives events from CA Configuration Automation.

   - **HTTPS**
     Enables https on the target CA Configuration Automation Server.

   - **X.509 Certificate Authentication**
     Enables client authentication on the target CA Configuration Automation Server.

   - **Certificate Path**
     Specifies the path to the certificate for the CA Configuration Automation Server User that you configured.

   - **Certificate Password**
     Specifies the password for the certificate file.

   The Database Server screen appears.

7. Enter the following information and click Next.

   - **Database Type**
     Specifies the type of database that the CA Configuration Automation server uses.

   - **Server Name**
     Specifies the name of the CA Configuration Automation Database host.

- **Port Number**
  Specifies the listening port that the CA Configuration Automation database host uses.

- **Instance Name (Optional)**
  Specifies the name of the CA Configuration Automation Database instance.

The Database Configuration screen appears.

8. Enter the following information and click Next.

   - **Database Name**
     Specifies the name of the CA Configuration Automation Database.

   - **Database User**
     Specifies the name of the CA Configuration Automation Database administrator user.

   - **Database User Password**
     Specifies the password of the CA Configuration Automation Database administrator user.

   - **Retype Password**
     Ensures that the password is entered correctly by matching the passwords.

   The Change Detection Alert Metric and Threshold Levels page appears.

9. Enter the following information and click Next.

   - **Alert Metric**
     Specifics one of the following metrics that are used to determine the severity level of the alert when combined with the threshold values:

     - **CountChange**
       Specifies the number of changes from the source to the target server that the Change Detection operation discovers. This number of changes determines the severity level of an alert.

     - **CountSource**
       Specifies the number of changes to the source server that the Change Detection operation discovers. This number of changes determines the severity level of an alert.

     - **CountTarget**
       Specifies the total number of changes to the target server that the Change Detection operation discovers. This total number of changes determines the severity level of an alert.

     - **CountTotal**
       Specifies the total number of changes that the Change Detection operation discovers. This total number of changes determines the severity level of an alert.

   - **Information Threshold**
     Specifies the minimum number of changes for the specified Change Detection metric that is required to assign an Information severity level to an alert.

Note: The value in the threshold fields must increase with each severity level. The Information value must be the lowest, the Minor value must be next lowest, and so on, until the Fatal value, which is the highest.

- **Minor Threshold**
  Specifies the minimum number of changes for the specified Change Detection metric that is required to assign a Minor severity level to an alert.
- **Major Threshold**
  Specifies the minimum number of changes for the specified Change Detection metric that is required to assign a Major level to an alert.
- **Critical Threshold**
  Specifies the minimum number of changes for the specified Change Detection metric that is required to assign a Critical severity level to an alert.
- **Fatal Threshold**
  Specifies the minimum number of changes for the specified Change Detection metric that is required to assign a Fatal severity level to an alert.

The Installation Summary page appears.

10. Review your selections and click Install.
    The CA Configuration Automation Connector installs on the system and integrates with the appropriate CA Configuration Automation and CA Catalyst instances. The Install Complete page appears when the installation finishes.
    If the Installation Summary page displays installation errors, view the CATALYST_HOME\CA_Configuration_Automation_Connector_InstallLog.log file to troubleshoot the installation. This file is created when you click Done after the installation finishes. CATALYST_HOME specifies the folder where you installed CA Configuration Automation Connector.

How to Export CI Data

This integration lets you manage CI data in CA Catalyst, CA Configuration Automation, and CA SDM. You can export CI data from CA Configuration Automation to CA SDM.

Note: Management Profiles can also be used to export data instead of Catalyst Jobs.

Complete the following steps to create a Catalyst Job in CA Configuration Automation and execute a process to export the CI data:

1. Complete the following steps to create and execute the Catalyst Job:
   a. Log in to the CA Configuration Automation server UI from the following URL:

      ```
      http://<CA_Configuration_Automation_Server>:<port number>
      ```

Note: The default port number is 8080.

b. Click Administration.

c. On the Catalyst Integration tab, click Jobs.

d. From the Catalyst Job pane, click Table Actions, Create Catalyst Job.

e. Enter the following information:

- **Name**
  Specifies the name of the Catalyst Job.
- **Attribute Profile**
  Attaches an attribute profile with the necessary filter criteria. If you do not want to use the filter criteria, select Use Default.
- **Services/ Server Groups/ Servers**
  Specifies the Services, Server Groups, and Servers that you want to export, in that order, from the consecutive Wizard pages.
- **Blueprint Groups/ Blueprints**
  Specifies the Blueprint Groups and Blueprints that you want to export, in that order, from the consecutive Wizard pages.
- **Schedule**
  Schedules the job, if needed for synchronizing the updates on the CIs.

f. Click Finish to save the Job.

g. Select the check box next to the Job that you created.

h. Select Run Catalyst Job under Select Actions to execute the Job.

Note: For more information about creating and executing the Catalyst Job, see the CA Configuration Automation and CA Configuration Automation Connector Product documentation.

Important! Create a Catalyst profile or use the default catalyst profile before creating and executing the Catalyst Job.

2. You can view all the available CIs in [set value for the rose variable at the book level], CA Configuration Automation, and CA SDM in the CA Catalyst USM Web View. Complete the following steps:

a. Open the following URL to access CA Catalyst:

```
http://<CA_Catalyst_Server:port>/ca-rest/home
```

b. Log in to CA Catalyst and click Browse by CI Type.

c. Select the CA Catalyst (CMDB-view) data repository from the Now viewing data-source drop-down list.
The list of the available CI types appears.

d. Click a CI Type, such as Computer System.
The available CIs with the type set as Computer System appear.

e. Click a CI from the results.
The CI details appear.

Note: Similarly, you can view the CA Configuration Automation and ServiceDesk-CMDB Data Repositories.

CA Catalyst lets you view data repositories for CA Catalyst, CA Configuration Automation, and CA SDM.

3. After data exports from CA Configuration Automation to CA Catalyst, view the data that is imported to CA SDM from CA Catalyst. Complete the following steps:

a. Log in to CA SDM.

b. Complete *one* of the following actions:

Note: Use TWA as a staging area for unapproved changes and for checking duplicates.

c. Enter the search criteria and click Search to find a CI.

Note: If you click Search without entering the search criteria, the list of all CIs is displayed.

d. Open the exported CI from the CI List.
The Configuration Item Detail page appears.

Note: You can also use the CMDB Visualizer to display a visual representation of the relationship of a CI to other resources. Visualizer is available only if it was configured during the CA SDM installation.

CI details appear in CA SDM. Visualizer provides a graphical representation of the configuration item showing its relationship to other resources.

CA Catalyst User Interfaces

After you install the integration, the following CA Catalyst URLs help you configure the changes and verify the CI data:

- **CA Catalyst Registry Server UI**
  Lets you apply post-installation configuration changes. You can also verify that the connectors are installed correctly.
  URL: https://<catalyst_registry_server>:port/registry/carbon/admin/login.jsp
  Default Port: 8443

- **CA Catalyst USM Web View**
  Lets you view the CIs that are exported to CA Catalyst. Use Web View to verify that a CI exists in each of the CA Configuration Automation, ServiceDesk-CMDB, and CA Catalyst (CMDB-View) data repositories.
  URL: http://<catalyst_server>:port/ca-rest/home
  Default Port: 8080

- **CA Catalyst Admin UI**
  Lets you check the status of CA Catalyst and its connectors.
  URL: http://<catalyst_server>:port/adminui/portal
  Default Port: 8082

Uninstall the Integration

You can uninstall the CA Configuration Automation Connector when it is no longer required in your environment.

Follow these steps:

1. Click Start, All Programs, CA Catalyst, and uninstall in the following order:

   a. Uninstall CA Configuration Automation Connector.

   b. Uninstall CA Catalyst Container (You *must* uninstall the CA Catalyst Container only when the CA Configuration Automation Connector is installed standalone and not installed with any CA Catalyst component).

2. If you have installed the CA Configuration Automation Connector and CA Catalyst on different computers, complete the following steps to delete the CA Configuration Automation node in the CA Catalyst Registry UI:

   a. Enter the following URL to open the CA Catalyst Registry Server UI:

   ```
   https://<registryserver:port>/registry/carbon/admin/login.jsp
   ```

b. Select CA Configuration Automation Server Node from the \topology\physical directory.

c. Click Delete.

3. If you have installed the CA Configuration Automation Connector and CA Catalyst on the same computer, delete specific files from the CA Catalyst Registry UI after uninstalling the CA Configuration Automation Connector. Complete the following steps:

   a. Delete the CCAConnector.conf and CCAConnector.xml files from the following directory:

      `\topology\physical\<CA_Catalyst_Server>\modules\configuration\`

   b. Delete the cca_policy.xml and cca_policySB.xml files from the following directory:

      `\topology\physical\<CA_Catalyst_Server>\modules\policy\`

   c. Click the connector-modules.xml file name from the following directory:

      `\topology\physical\<CA_Catalyst_Server>\`

   d. Complete the following steps to edit the connector-modules.xml file:

      i. Click Edit as Text.

      ii. Delete the lines from the <feature name="catalyst-cca-connector"> tag to < /feature> tag in the file.

      iii. Click Save Content.

   e. Click the startup.properties file name from the following directory:

      `\topology\physical\<CA_Catalyst_Server>\`

   f. Complete the following steps to edit the startup.properties file:

      i. Click Edit as Text.

      ii. Delete the catalyst-cca-connector;3.0.0 text from the file.

      iii. Click Save Content.

4. Restart the CA Catalyst Container service on the CA Catalyst server.

5. Uninstall CA SDM Connector (see page 3418).

6. Restart the CA Catalyst Container service on the CA Catalyst server.

7. Uninstall the CA Catalyst Server. For more information, see the CA Catalyst documentation.

Frequently Asked Questions for the Integration

The following categories lists the commonly asked questions for CA Configuration Automation integration:

System Requirements

I am currently using CA Catalyst Container r2.5 to integrate CA SDM with CA Spectrum Service Assurance (CA SSA) or CA Service Operations Insight (CA SOI). Can I also integrate my CA SDM environment with CA Configuration Automation?

Use Catalyst connector 3.2 to integrate CA SDM with both CA SOI and CA Configuration Automation. For more information on the supported products, see the Supportability Matrix (see page 119).

Installation and Uninstallation

During installation of the CA Configuration Automation and SDM Connectors, I have to enter a Node Name on the Catalyst Container Server Configuration panel. What do I enter as the Node Name?

The Node Name is the host name of the computer on which you installing the connector. For example, if you are installing the SDM Connector on server A, enter Server A as the Node Name.

After installing the integration, there are three different application instances in the Embedded Entitlement Manager (EEM) for the integration (for example, CATALYST-<CACatalystServer>, CATALYST-<CCAConnectorServer>, CATALYST-<CASDMConnectorServer>). Is this correct?

No, there must only be one application instance for the integration with EEM. When installing the connector, enter the same application name that was used during the CA Catalyst installation (CATALYST-<CatalystServer>).
If, after installing your connector, you have multiple application instances for the integration in EEM, uninstall the connector. Next, you unregister the extraneous application instances from EEM using the following steps:

1. Log in to the EEM UI using the <Global> application instance, https://<EEMServer>:5250/spin/eiam
2. Select the Configure, Applications submenu.
3. From the list of applications in the left pane, click on the name of the application instance added by the CA Configuration Automation or CA SDM connector.
4. On the right-hand pane, click Unregister.
5. Repeat for any other incorrect application instances.
6. Log out of EEM.

Once the steps for EEM are executed, reinstall the connector, ensuring to use the same application instance name used during the CA Catalyst installation.

When installing the CA SDM Connector, I noticed there was an option to 'Enable TWA'. What does this option do? Why would I use it?

When the 'Enable TWA' option is selected, CIs are imported into a staging location within CA SDM called the Transaction Work Area (TWA) instead of directly into the CMDB. This allows you to vet the data (remove or modify) before the CIs are loaded into the CMDB. After reviewing the CIs, you would be responsible for transferring the CIs to the CMDB using the GRLoader import utility. This approach gives you much more control over which CIs are stored in the CMDB, but it is also a more manual and time-consuming method.

Exporting

How do I export CIs from CA Configuration Automation?

There are two ways to export CIs from CA Configuration Automation. The first way is to execute a CA Catalyst Job. To configure a job, you must log into the CCA UI and navigate to Jobs sub-menu option on Catalyst Integration tab within the Administration section. From the Catalyst Jobs table, click on Table Actions and select Create Catalyst Job. The second way is to run an integration-enabled Management Profile. To enable the integration within a Management Profile, you must create a Management Profile or edit an existing profile. On the Profile tab, in the Catalyst Integration, select the Enable Integration option and select an Attribute Profile. Save the Management Profile and run it.

What is the best method of pushing the data from CA Configuration Automation into CA Catalyst (and ultimately CA CMDB) – using Management Profiles or Catalyst Jobs?

The Catalyst jobs in CA Configuration Automation give you more control over the data entering the CMDB. When you define a Catalyst Job, you select exactly which services/servers and blueprints to export. When using Management Profiles, any service/server assigned to the integration-enabled management profile will be exported and any blueprints configured within the profile will also be exported.

When exporting CIs from CA Configuration Automation, do all chosen CIs get sent to CA Catalyst regardless of whether they were previously exported?

CA Configuration Automation maintains a check sum table in its database called acm_catlst_ci_cksum. When a CI is exported, CA Configuration Automation queries the table to see if a check sum for the CI exists. If the CI is not present in the table, a check sum of the CI's attributes is stored within the table and the CI is sent to Catalyst. If the CI is present in the table but the check sum is different, then the new checksum is entered into the table and the CI is sent to Catalyst for an update. If the CI is present and the checksum is the same, the CI is dropped and not sent to Catalyst as there were no changes to the CI.

After exporting my selected CIs from CA Configuration Automation, I see server CIs within SDM that are not listed in the Servers table within CA Configuration Automation and were not part of my Catalyst Job or Management Profile. Where did these CIs come from?

These server CIs most likely are a result of selecting to export communication or configuration relationships or both from CA Configuration Automation. The 'unknown' server CIs are typically the source/target servers discovered as part of those relationships. From the CA Configuration

Automation UI, click on a server from the Servers table to bring up the server details, select the Relationship tab and then select the Communication or Configuration sub-menu option. View the list of relationships, noting the servers listed in the source and target columns. The 'unknown' servers should be among those in the list.

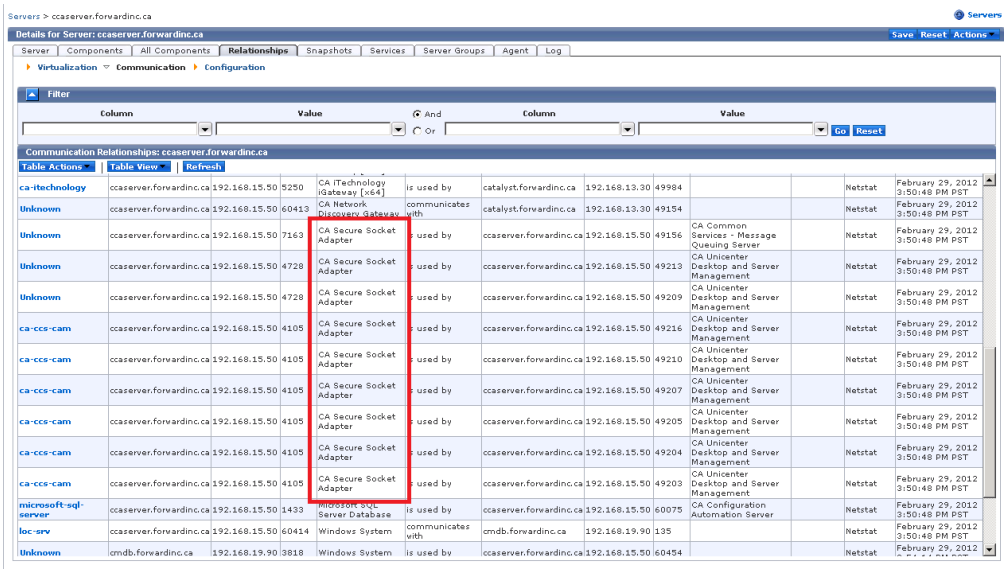
When I view my CIs within CA SDM, why do I see multiple entries for the same application?

When exporting Component CIs (for example, ProvisionedSoftware CIs) from CA Configuration Automation, the CA Configuration Automation Connector uses the Blueprint Name as the name of the CI. Although the blueprint name is not unique, the CORA attributes, specifically the system name, make the CI unique.

I ran a CA Catalyst Job or integration-enabled Management Profile in CA Configuration Automation. Then I used the CA Catalyst USM Web View to verify the CI counts in the three data repositories: CA Configuration Automation, CA Catalyst (CMDB-View) and ServiceDesk-CMDB. Why are the CI counts between the CA Configuration Automation and CA Catalyst (CMDB-View) or ServiceDesk-CMDB are different?

When CA Configuration Automation exports the CI or CI relationships, it is possible that multiple instances of the same server or same relationship exist. When the information is processed for export, the duplicate instances are reconciled and only one instance of the CI is sent to Catalyst.

For example, see the following screenshot:



This screenshot shows the communication (Netstat) relationships for the server, ccaserver. forwardinc.ca, discovered using the Softagent technology during Network Discovery. The highlighted portion shows that there are 9 instances where the CA Secure Socket Adapter application on ccaserver.forwardinc.ca is communicating with target servers.

From the CCA relationships, a BackgroundProcess CI is created in the Unified Service Model (USM) to represent the process attributes on the relationship. For the CA Secure Socket Adapter application, 9 processes would have been derived based upon what is seen in the screenshot. However, these 9 processes essentially represented the same process when each of the CCA relationships is prepared for export (the target servers are all in fact the same although communication is on different ports). Consequently, only one BackgroundProcess CI (out of the 9) is stored in Catalyst.

Also, as part of the CI processing, an 'IsHostFor' relationship is established from the ComputerSystem /VirtualSystem to the BackgroundProcess causing the relationships to be reconciled . This is the expected behavior as Catalyst helps to reconcile all duplicate CIs.

Why do the number of relationships in CA CMDB and ServiceDesk-CMDB Projection Sheet of the CA Catalyst differ?

The Unified Service Model (USM) enforces a constraint that relationships are correlated using source, target, and scope. Scope is an attribute which represents the service object the relationship affects. When CA Catalyst sends relationships to CMDB for creation, the CA SDM connector creates the CI and traverses the CMDB network of CIs to find its scope. If the scope is not found, the CA SDM connector publishes the unscoped version of the relationship to CA Catalyst. Later, if the CA SDM connector finds the scope due to some update activity on the relationship, it publishes the scoped relationship to CA Catalyst. The scoped and the unscoped relationships do not correlate which results in extra relationships in the CA Catalyst database. There is no side-effect of having both scoped and unscoped version of relationships in the CA Catalyst database. However, the relationships tend to persist in CA Catalyst until they are removed from CMDB. When the relationship is removed from CMDB, it deletes the scoped, and the unscoped relationships from CA Catalyst.

When I delete servers or components from CA Configuration Automation, are those deletions reflected in CA Catalyst and CA SDM?

Yes. The CA Configuration Automation Connector has a timer thread and, at an interval specified by the delete_thread_interval configuration parameter defined in CA Configuration Automation (default: 15 minutes). The thread identifies the CIs marked for deletion in the checksum table and publishes a delete event to CA Catalyst.

I have multi-tenancy enabled in CA Configuration Automation but not in CA SDM (or vice versa). Will this cause any problem?

Yes. Catalyst does reference the tenant of a CI when performing a reconciliation. Tenancy that is enabled within CA Configuration Automation, but not within CA SDM may create a problem with reconciliation of information within Catalyst. We recommend that if you are using multi-tenancy, enable it in both products and ensure that the names of the tenants exist in both. If you are not using tenancy in CA Configuration Automation, but have it enabled in CA SDM you should not run into a problem if the CI is tenanted to "Public". The problem will only occur if it were assigned to a specific tenant. Possible problems that you may see includes updates to the CIs within CA Configuration Automation not propagating to CA SDM, or relationships not being imported into CA SDM from CA Configuration Automation.

Integrate with CA Configuration Automation 12.8.3

Integrating CA SDM 14.1 with CA Configuration Automation 12.8.3 includes the following steps:

Step 1: Verify the Prerequisites (see page 3424)

Step 2: Create CA Configuration Automation MDR in CA SDM (see page 3425)

Step 3: Define the CA SDM Configuration Properties in CA Configuration Automation (see page 3425)

Step 4: Create CA SDM Job to Export CIs to CA CMDB (see page 3425)

Step 1: Verify the Prerequisites

Verify the following prerequisites before starting the integration:

Hardware and Software Requirements

CA SDM and CA Configuration Automation support several hardware, software, operating system, and database. For more information about CA Configuration Automation, see System Requirements (https://docops.ca.com/display/CATCA1283/System+Requirements). For CA SDM, see the Supportability Matrix (see page 119).

Supported Version of the Integrated Products

This integration supports the following product versions:

- CA Configuration Automation 12.8.3
- CA EEM r12.51 CR02

Integration Considerations

Consider the following information before you begin the integration:

- Install CA SDM (see page 269).
- Install CA Configuration Automation (https://docops.ca.com/pages/viewpage.action?pageId=272568213) .
- Ensure that the services and servers that are discovered in CA Configuration Automation can be exported to CMDB module of CA SDM. For more information about CA Configuration Automation discovery, see the following sections:
  - Service Management (https://docops.ca.com/display/CATCA1283/Service+Management)
  - Server Management (https://docops.ca.com/display/CATCA1283/Server+Management)
  - Network Management (https://docops.ca.com/display/CATCA1283/Network+Management)
  - Blueprint Management (https://docops.ca.com/display/CATCA1283/Blueprints)
- Verify that the CA Configuration Automation and CA SDM servers are up and running. Verify that all these servers have network connectivity with each other.
- We recommend that you install CA Configuration Automation, and CA SDM on different computers for this integration to work properly.

Step 2: Create CA Configuration Automation MDR in CA SDM

For the CA SDM server to identify the details of the CA Configuration Automation server, create an MDR in the CA SDM server. For more information about creating the MDR, see Create CA Configuration Automation MDR in CA SDM (https://docops.ca.com/display/CATCA1283/Export+CI+data+from+CCA+Database+to+CA+CMDB#ExportCIdatafromCCADatabasetoCACMDB-CreateaCAConfigurationAutomationMDR).

Step 3: Define the CA SDM Configuration Properties in CA Configuration Automation

Define the CA SDM configuration properties, before you export the CIs from CA Configuration Automation to CA SDM. For more information about defining the CA SDM configuration properties, see Define the CA SDM Configuration Properties in CA Configuration Automation (https://docops.ca.com/display/CATCA1283/Export+CI+data+from+CCA+Database+to+CA+CMDB#ExportCIdatafromCCADatabasetoCACMDB-SDMConfigurationProperties).

Step 4: Create CA SDM Job to Export CIs to CA CMDB

To export the CIs to the CA CMDB, create an SDM job in CA Configuration Automation. For more information about creating an SDM job, see Create CA SDM Job to Export CIs to CA CMDB (https://docops.ca.com/display/CATCA1283/Export+CI+data+from+CCA+Database+to+CA+CMDB#ExportCIdatafromCCADatabasetoCACMDB-CreateSDMJobtoExportCIstoCACMDB).

Integrating CA Service Catalog

This section contains the following articles:

Integrate CA SiteMinder with CA Service Catalog

This article contains the following topics:

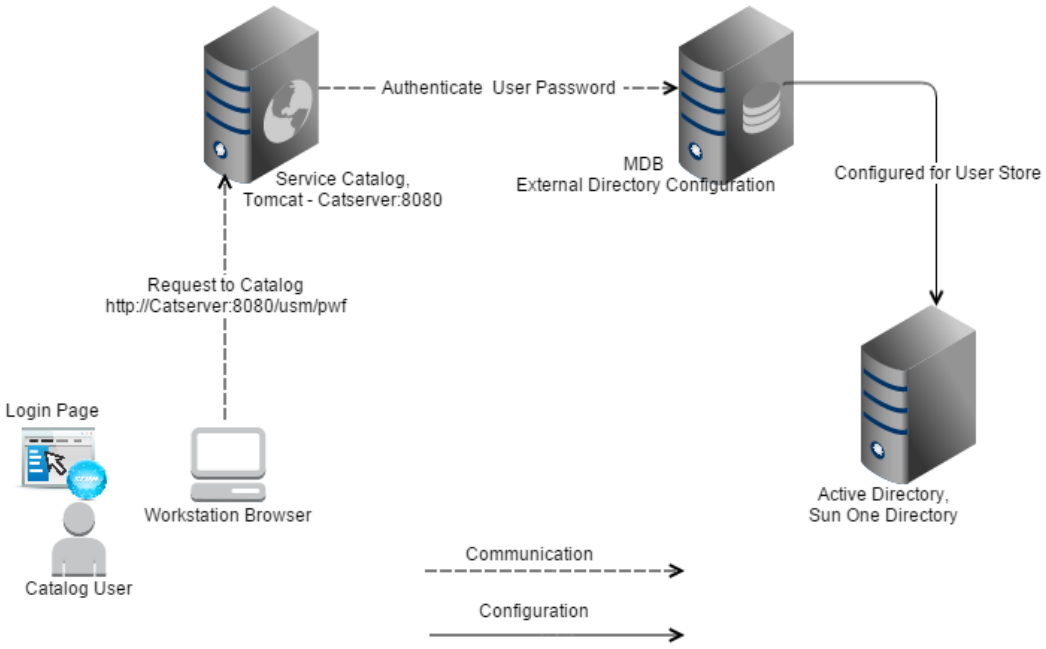
By default, CA Service Catalog uses CA EEM to authenticate the requests. You can optionally use CA SiteMinder to provide Web based single sign-on (SSO) and enhanced authentication to CA Service Catalog users.

Options to Authenticate Users

This section explains the two possible authentication flows for authenticating CA Service Catalog users. The first authentication flow uses CA EEM alone. The second authentication flow uses CA EEM with CA SiteMinder, enabling single sign-on and providing enhanced security.

Authentication Flow Using CA EEM

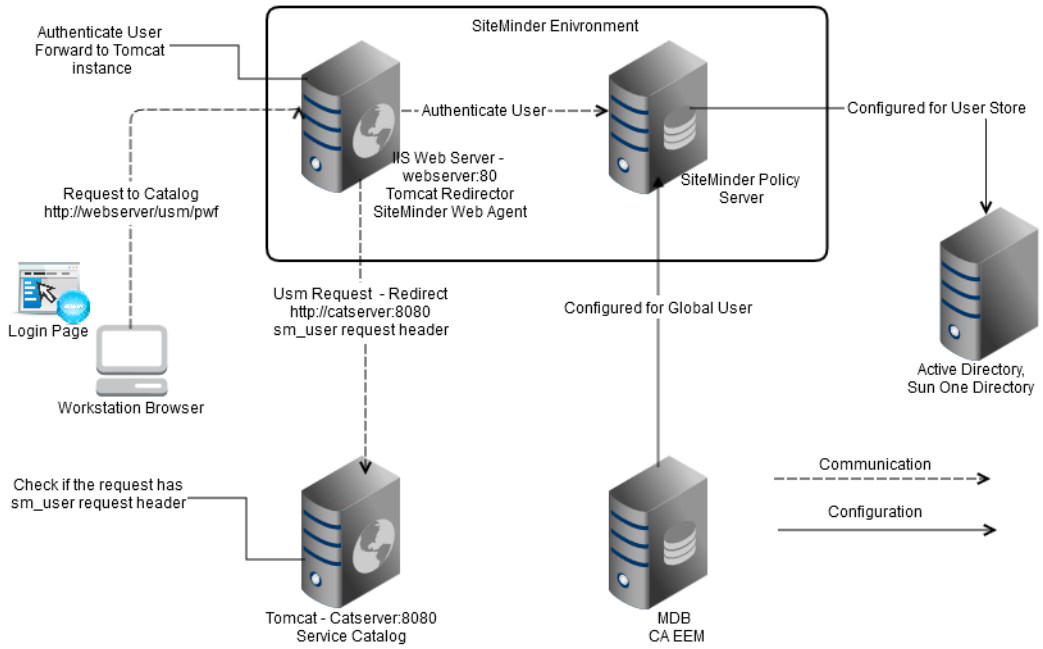
By default, CA Service Catalog uses CA EEM to authenticate users. In this example of the basic authentication flow, requests from CA Service Catalog users first pass through Tomcat. The requests then pass through the MDB, and end at your authentication server, for example, Active Directory. The following diagram illustrates the basic authentication flow with CA EEM and Active Directory:



Authentication Flow Using CA SiteMinder

In this authentication flow with CA SiteMinder, requests from CA Service Catalog users go to CA SiteMinder for authentication. If the request is authorized, then the requests are forwarded to the Tomcat instance of Catalog Component by the web server hosting CA SiteMinder. Thus, in this flow, CA SiteMinder validates the authentication requests from CA Service Catalog users. The following diagram illustrates the enhanced authentication flow with CA SiteMinder.

Note: As shown in the following diagram, CA SiteMinder requires a web server: either Microsoft Internet Information Server (IIS) or Apache Tomcat. CA SiteMinder does *not* work directly with Tomcat and relies on the request being redirected from the web server to the Tomcat instance.



Set Up Web Single Sign-on

To implement web-based (SSO) and enhanced authentication to CA Service Catalog users, complete the following tasks:

1. Install and configure CA SiteMinder, including its Policy Server and CA SiteMinder Web Agent. For more information, see your CA SiteMinder documentation.

2. Redirect the authentication requests from your web server to Tomcat. Here, your web server (such as Apache or Microsoft Internet Information Server [IIS]) has the CA SiteMinder web agent installed.
   For more information, see your web server documentation.

3. In the SiteMinder Administration GUI, configure CA SiteMinder to protect CA Service Catalog resources by performing the following tasks. For more infromation, see your CA SiteMinder documentation.

   a. Open the policy server UI.

   b. Create an agent object for CA Service Catalog; do *not* check support 4.x Agents".

   c. Create an agent configuration object for the agent you just created.

   d. Create a host configuration object.

   e. Optionally, create an authentication scheme.

   f. Create a realm and a rule with the resource filter as usm/*.

   g. Create a CA Service Catalog domain and add the user directories, administrator, and realm to the domain.

h. Create a policy and add the rule that you just created to the policy.

4. In the Administration, Configuration section of the CA Service Catalog GUI, configure the single sign-on authentication parameters to match CA SiteMinder.

Integrate CMDB with CA Service Catalog

This article contains the following topics:

CMDB Overview

A configuration management database (CMDB) is a repository of asset information defining the critical configuration items in your environment and their relationships. A service catalog fits into that framework as a tool to help with financial governance, workflow, management of service requests, and service definition. The closer the relationship between the infrastructure assets that are represented by the configuration items and the logical services that the users consume, the more useful the integration between the CMDB and the service catalog is to your organization.

CMDB is a comprehensive, integrated solution for managing the IT components and services and their relationships. You can store reliable, up-to-date details on assets, which are known as configuration items, and their relationships with each other. These relationships form the basis for impact analysis, an important tool for controlling change within an organization.

When the two are integrated, the CA Service Catalog services are associated with CMDB configuration items. Using the CMDB Visualizer, you can trace the dependencies of the services on other configuration items. You can therefore determine the impact of configuration items on services. An important application is when a configuration item used by one or more services either suffers loss of performance or stops working. You can visually pinpoint the impact of this event to the service.

When a specific change affects a configuration item, use the CMDB impact analysis tools to figure out how the change affects the services. Then you can use CA Service Catalog to determine the organizations and users that have subscribed to the impacted services. This information helps you plan the change that is required. Also, you can use the service level agreements between the subscribing organization and the providers to help plan the change. For example, if a heavily used server slows down or crashes, determine the impact on CA Service Catalog services by using the integration. You can answer the following questions:

- Which specific services use that server?
- Do those services use any other server?
- Are other servers available to replace the affected server?
- Which accounts and subscriptions are affected?

- What are the possible financial risks? For example: do the affected services or configuration items have associated service-level agreements (SLAs)? Do the impacted services help generate revenue?

Your analysis can include impact analysis, efficiency analysis, financial analysis and profitability, and ITIL considerations. Both CMDB and CA Service Catalog support ITIL principles.

Key Terms

Configuration Management Database (CMDB) is a functional data repository that unifies and simplifies the management of configuration information. CMDB consolidates and reconciles disparate sources of IT-related data in the context of business priorities. CMDB provides visibility into configuration item information such as resource attributes, relationships and dependencies.

Configuration items form the basis of configuration management solutions. Typically, a configuration item is a collection of objects that are related to the specific functionality of a larger system. Examples of these objects are requirements, code, documentation, models, and other files.

Visualizer provides a unified graphical view of relationships between configuration items and inter-dependencies of business processes. It helps you determine which CA Service Catalog services are connected to which CMDB configuration items.

Types of Association Between Services and Configuration Items

You can view, modify, and create associations between any CA Service Catalog services and any CMDB configuration items. Typically, the most suitable configuration items belong to the Business Service class in the Enterprise Services family. Several configuration items in this family and class are provided by default. You can create any new ones that you require.

The following types of association between CA Service Catalog services and CMDB configuration items are possible:

- One service to one configuration item
- One service to many configuration items
- Many services to one configuration item
- Many services to many configuration items

The many-to-many relationship between CA Service Catalog services and CMDB configuration items is the most commonly used.

You can also:

- Associate existing services to existing configuration items.
- Use an existing service to create one or more new configuration items.
- Create a service for one or more existing configuration items.

Prerequisites for CMDB - CA Service Catalog Integration

- Be familiar with basic functions and administration of CMDB, such as families, classes, configuration items, and relationships between configuration items. Understand how to use the analysis tools, such as root cause analysis and impact analysis.
- You must be familiar with basic functions and administration of CA Service Catalog.
- Ensure that both CA Service Catalog and CMDB are installed, configured, and running.
- If you are using Service Accounting Component, ensure that it is installed, configured, and running.
- Use the same MDB installation for CMDB and CA Service Catalog.

After you have installed and configured CA Service Catalog and CMDB, integrate them by performing the setup tasks first.

Step 1 - Perform Common Setup Tasks

This article contains the following topics:

The CMDB and CA Service Catalog administrators can work together to perform the following common setup tasks:

Step 1a - Verify Access Rights

CA Service Catalog administrators must ensure that CMDB administrators, analysts, and other users have the required access rights in CA Service Catalog to components (such as requests, subscriptions, business units, or accounts) that are associated to configuration items.

Assign CA Service Catalog administrator roles to these CMDB users. By doing so, you ensure that they have required access rights.

CMDB administrators must ensure that CA Service Catalog administrators have the required access rights to CMDB configuration items that are associated to CA Service Catalog components.

Step 1b - Configure for Single Sign-on

Bypass user login by configuring CA Service Catalog and the CA products with which it integrates to use single sign-on.

To configure CMDB and CMDB Visualizer to use single sign-on, configure them to use either CA SiteMinder or Windows NTLM authentication.

To configure CA Service Catalog to use single sign-on, configure it to use either CA SiteMinder or Windows NTLM Authentication. For more information about how to configure, see in Integrating with CA SiteMinder (see page 3425). You can also use Windows NTLM authentication, as explained in Enable External Authentication of Users (see page 1429) section.

Step 2 - Perform Setup Tasks for CMDB

As a CMDB administrator, on the CMDB computer, log on to CMDB. Access the CMDB Administration tab, and perform the following tasks.

1. Using the Web Services Policy option, create the Web Services Access policy.

    a. Assign a name. The suggested name and code are USM_CMDB_Policy, but you can use any name that meets your needs.

    b. Assign a proxy user to this policy.

    > **Important!** This proxy user *must* have administrative access to CMDB.

    c. Verify that the Allow Impersonate property of CMDB is set to Yes.

    CMDB checks the access type of the CA Service Catalog user to be impersonated against the access type of the policy proxy user. If the access level of the CA Service Catalog user is less than or equal to the grant level of the proxy user's access type, CMDB replaces the CA Service Catalog user with the proxy user. For more information, see your CMDB documentation.

2. Generate the policy key file for the Web Services Access policy that you created. To generate the key file, use the pdm_pki tool.
   The suggested name is USM_CMDB_Policy.p12, but you can use any name that meets your needs.
   Verify that the HasKey property is set to Yes in the newly created Web Services access policy. The system typically configures this setting automatically when you generate the policy key file.
   Copy the policy key file to the CA Service Catalog server and save it in the USM_HOME directory.

   > **Important!** If you are using application clustering, copy the policy key file to the USM_HOME directory of *every* Catalog Component cluster node.

3. Verify that the Business Service class of the Enterprise Service family exists. This class is required for CA Service Catalog users to create a configuration item in CMDB. If this class does not exist, create it manually or run the CMDB installation again to load default data.

Step 3 - Perform Setup Tasks for CA Service Catalog

This article contains the following topics:

As a CA Service Catalog administrator, on the CA Service Catalog computer, log in to CA Service Catalog.

Update the Configuration Settings

Specify the configuration settings for CA CMDB.

Follow these steps:

1. Click Configuration, CMDB, on the Administration tab of CA Service Catalog.

2. Complete the Configuration settings, as follows:

   - **Enable HTTPS**
     Specifies the option (Yes or No) that matches your implementation.

   - **Host Name**
     Specifies the host name of CMDB computer.

     Note: This recommendation applies after you have configured the integration and have started to use it: Do *not* change the host name of the CMDB computer or the CA Service Catalog computer, *unless* the two host computers share MDB.

   - **Port Number**
     Specifies the port number on the CMDB computer that listens for incoming calls from CA Service Catalog.

   - **Key File Name**
     Specifies the name of the Web Services policy key file that you created earlier.
     The default value is USM_CMDB_Policy.p12.

   - **Policy Code**
     Specifies the name of the Web Services policy code that you created earlier.
     The default value is USM_CMDB_Policy.

   - **Default New CI State Inactive**
     Specifies whether new configuration items that you create through this integration have a default state of *inactive* or *active*.
     Specify Yes for inactive or No for active.

3. Verify the CMDB Configuration by clicking Test Connection.
   If the test fails, perform the following actions:

   a. Verify that your settings are completed correctly, especially the host name and port number of the CMDB computer.

   b. Verify that the CMDB service is up and running.

Update the Visualizer Settings

Specify the configuration settings for the CMDB Visualizer.

Follow these steps:

1. Click Configuration, CMDB Visualizer on the Administration tab.
2. Specify the following Visualizer Configuration settings:
   - **Enable HTTPS**
     Select the option (Yes or No) that matches your implementation.
   - **Host Name**
     Specifies the host name of the CMDB Visualizer computer, typically the CMDB computer.
   - **Port Number**
     Specifies the port number of the CMDB Visualizer.
3. Verify the CMDB Visualizer by clicking Test Connection.
   If the test fails, perform the following actions:
   a. Verify that your settings are completed correctly, especially the host name and port number of the CMDB Visualizer computer.
   b. Verify that the CMDB Visualizer service is up and running.

Step 4 - Set Up the CMDB - CA Service Catalog Integration

This article contains the following topics:

Follow these steps to enable the integration between CMDB and CA Service Catalog:

1. Ensure that CA Service Catalog, Service Accounting Component (if used), and CMDB are installed, configured, and running.
2. Ensure that you verify the MDB version compatibility for all CA products that you plan to integrate, including CMDB.
   - Review the level of maturity of each product in your environment.
   - Review standard process and procedures in your organization, especially external standards that you must follow. Examples of standards are ITIL, ISO, COBIT, and CORA. ITIL is especially applicable because both CMDB and CA Service Catalog support ITIL concepts.

- In CMDB, review the configuration items in the Business Service class of the Enterprise Services family. These configuration items are considered to be the most likely candidates for integration with CA Service Catalog services. Remember, however, that you can associate *any* configuration item or items with one or more CA Service Catalog services.
- In CA Service Catalog, review the existing services.
- In both, review the existing associations if any.

3. Review the key terms (see page 3429) for the integration.
4. Review the types of association between services and configuration items (see page 3429) that you can create.
5. Review the associations that already exist, if any; for more information, see View Associations Between Services and Configuration Items (see page 3438).
6. Determine any *new* Catalog-CMDB associations that make sense for your business. Ask these questions:
   - Which existing configuration items must be associated with one or more services? Do those services already exist, or do you have to create new ones?
   - Which existing services must be associated with one or more configuration items? Do those configuration items already exist, or do have to create new ones?
   - Do you want to populate the CMDB service by service?
   - Have you started or finished populating the CMDB, using the guidelines for doing so in the CMDB documentation? Or do you want to start by seeding CA CMDB with a few mission critical applications and business services?
   - Have you checked the business continuity plan of your organization? Review this plan and determine which business services and respective components in your infrastructure are critical.
     As you answer the questions, consider the following factors:
   - Keep in mind that the goal of all associations is to use IT to support your business needs.
   - If applicable, begin thinking about associations starting from the perspective of the product that is most mature in your environment. For example, if you have an established CMDB implementation but a newer CA Service Catalog implementation, then CMDB is the more mature product. Start by viewing your existing configuration items in the Business Service class of the Enterprise Services family. Determine which ones could use CA Service Catalog services, to serve your business needs. In this model, it is likely that you first create the needed services and next create the associations.
     Conversely, if you have mature services but your CMDB implementation is just starting, create configuration items corresponding to the services. For example, for critical services connected to service level agreements, create configuration items that are based on the hardware or other infrastructure that is required to support the CA Service Catalog services.

For example, define your email application and server as configuration items and associate them to an email service in CA Service Catalog. Similarly, you can also associate that email application and server with a service for requesting Blackberry units and subscriptions.

- If you are using Service Accounting Component, consider creating and associating configuration items with the services related to your most important subscriptions and most important financial reporting items.

7. Create any configuration items that you need for the integration.

8. Create any services that you need for the integration.

   Note: When a service is copied or inherited, its associations to CIs are *not* copied.

9. Consider service level agreements (SLAs).
   Whenever the availability of services is affected, the SLA can have a significant effect on impact analysis. For example, if a server used by a service that your company provides is down, the ability to meet the SLA obligations to your customers is affected. Therefore, you want to set up your service-to-configuration item associations to include services and computers that are involved in meeting SLA obligations.

10. Associate the services to configuration items. These associations are *from* CA Service Catalog *to* CMDB. You associate a CA Service Catalog service ID with a CMDB UUID (not a logical ID). For example, consider the New Hire Onboarding service, which is one of many services that are supplied with CA Service Catalog. This service can be used for requesting office equipment that is required by a newly hired employee. Create a configuration item for each of these assets and associate them to the service. In this case, the association is many to one (many configuration items to one service).

11. Using the CMDB Visualizer, leverage the analysis tools of CMDB, such as impact analysis and root cause analysis. For more information, see How to Leverage Information from Analysis Tools (see page 3440).

Create a Configuration Item for a Service and Associate Them

Many of the associations that you create involve CA Service Catalog services and existing CMDB configuration items. You can *create* a configuration item specifically for a service, if no suitable configuration item exists already. You do not have to create and associate a configuration item for every service. Instead, create and associate such configuration items *only* when they support your business needs and goals.

Before associating a service to a configuration item, ensure that the service is *defined* in CA Service Catalog. The service option groups and service options for that service have been specified. For more information about defining services, see the Manage Services (see page 2987) section.

> **Note:** If you associate a CA Service Catalog service with a CMDB configuration item that does *not* display the Attributes tab, you *cannot* view the service-related details of the configuration item from CA Service Catalog. For more information, see the CMDB documentation.

For more information to associate services with *existing* configuration items, see Associate Services with Configuration Items (see page 3436).

Follow these steps:

1. From the CA Service Catalog home page, select Catalog, CMDB CI Association.
2. Under the line "The current business unit is: *business-unit-name*," click the Catalog tab.
   The list of existing folders, sub folders, and services appears.
3. Expand the folders and sub folders as needed, until the services you want appear.
4. Check the box next to the service or services for which you want to create and associate a configuration item.
5. Click the right arrow next to the Selected Services box.
6. Click Next.
   The screen refreshes, and the CI List for Association appears. The names of any configuration items that are already associated with the selected service appears.
7. View the list of existing associations under the CI Name heading.
8. Click Create CI to *create* a configuration item for each selected service.
   For each selected service, a new configuration item is created in the Business Service class of the Enterprise Services family. Also, a one-to-one association is created between each service and its new, same-named configuration item. By default, the system also displays the names of several CMDB configuration item attributes. While the *names* of these attributes are listed by default, the *values* of these attributes are not populated by default. You can optionally populate these values. In addition, you can add and populate other attributes of your choosing. For more information, consult your implementation team, including your CMDB administrator and CA Service Catalog administrator.
9. Click Save to associate the new configuration item and all selected service.

Associate Services with Configuration Items

Create only the associations that support your business goals and needs.

Before associating a service to a configuration item, ensure that the service is *defined* in CA Service Catalog. The service option groups and service options for that service have been specified.

Note: If you associate a CA Service Catalog service with a CMDB configuration item that does *not* display the Attributes tab, you *cannot* view the service-related details of the configuration item from CA Service Catalog.

Follow these steps:

1. From the CA Service Catalog home page, select Catalog, CMDB CI Association.
2. Under the line "The current business unit is: *business-unit-name*," click the Catalog tab.

   Note: If you know the name of the service or folder that you want, you can optionally use the Search tab to display services.

3. Expand the folders and sub folders as needed, until the services you want appear.
4. Check the box next to the service or services that you want to associate with one or more configuration items.
5. Click the right arrow next to the Selected Services box.
   This action selects the services. The names of the selected services appear in the Selected Services box.
6. Click Next.
   The screen refreshes, and the CI List for Association appears, displaying the names of the service that you selected. The services are listed in the service column. If any service is already associated to one or more configuration items, the item is listed next to the service in the CI Name column.

   You can associate each of these services (either individually or as a group) to one or more configuration items.
7. Check the service or services that you want to associate to one or more configuration items in the same action. Leave any other services unchecked; you can optionally associate such services to configuration items in a separate action.

Note: To *create* a configuration item for each selected service and associate them, click Create CI, as explained in Create a Configuration Item for a Service and Associate Them (see page 3435). If you click Create CI, new configuration item is created for each selected service. Also, a one-to-one association is created between each service and its new, same-named configuration item.

To associate a single service with one or more existing configuration items, perform the following actions:

1. Check the service and click Associate CIs.

2. Click Search or use a search string to display the available configuration items.

3. Verify that all configuration items that you want to associate with the service that you checked, and click OK.
   If you selected only one configuration item, a one-to-one association is created between the checked service and that item.
   If you selected two or more configuration items, a one-to-many association is created between the checked service and those items.

To associate two or more services with one or more existing configuration items, perform the following actions:

1. Check the services and click Associate CIs.

2. Click Search or use a search string to display the available configuration items.

3. Verify that all configuration items that you want to associate with the services that you checked, and click OK.
   If you selected only one configuration item, a many-to-one association is created between the checked services and that item.
   If you selected two or more configuration items, a many-to-many association is created between the checked services and those items.

4. Click Save after associating the items.

Your associations are saved. The associations are used for impact analysis, root cause analysis, and other analysis functions for your integration between CMDB and CA Service Catalog.

View Associations Between Services and Configuration Items

You can quickly view existing associations from CA Service Catalog services to CMDB configuration items. It is helpful to see such quick views for many reasons, including saving time, avoiding duplicate associations, and gaining quick access to the CMDB Visualizer for the service and any associated configuration items.

Note: If your implementation requires you to log in to CMDB Visualizer, see your administrator to obtain a user name and password for accessing CMDB Visualizer.

Follow these steps:

1. Click Catalog, Service Offerings.

2. Search the folders and services, expanding them if necessary, until you locate the service you want.

3. Under the Actions icons, click the CMDB Association icon. Its tooltip text is "CMDB CI Associations."
   The Service Offerings dialog appears, showing the configuration items that are currently associated with the service.

4. Optionally, perform one of the following actions:

   a. Click the Visualizer icon to view the relationship of those configuration items currently associated with the service. Its tooltip text is "CMDB Visualizer."
      Log in to CMDB Visualizer and use the Visualizer features to find the most critical relationships; you use this information for impact analysis, root cause analysis, and other analysis.

   b. Delete the association by selecting the configuration item or items and clicking Remove Association.

View the Service-Related Details of a Configuration Item

The service-related details of a CMDB configuration item are the CA Service Catalog service or services associated with the item, the number of requests for each associated service, and any other related properties that your organization deems important. This information can be a critical part of your analysis activities for the associated services and configurations items. For example, a high number of associated requests, subscriptions, or accounts may indicate that a configuration item is very critical for business continuance and therefore merits special attention.

If your implementation requires you to log in to CMDB Visualizer, see your administrator to obtain a user name and password for accessing CMDB Visualizer.

Note: If you associate a CA Service Catalog service with a CMDB configuration item that does *not* display the Attributes tab, you *cannot* view the service-related details of the configuration item from CA Service Catalog.

Follow these steps:

To begin in CA Service Catalog, perform the following actions.

1. Click Catalog, Service Offerings.

2. Search the folders and services, expanding them if necessary, until you locate the service you want.

3. Under the Actions icons, click the CMDB Association icon. The tooltip text for this icon is "CMDB CI Associations."
   The Service Offerings dialog appears, showing the configuration item or items that are associated with the service.

4. Click Visualizer.

5. (Optional) Log in to CA CMDB Visualizer.
   The associated items appear in CMDB Visualizer. If these items have relationships with other configuration items, the related items and the relationships also appear.

To begin in CMDB Visualizer, perform the following actions:

1. Log in to CMDB Visualizer.

2. Display the configuration items that are associated with the service of interest.
   If these items have relationships with other configuration items, the related items and the relationships also appear.

3. Right-click the configuration item and select View Properties.

4. Click the Attributes tab and click the Service Catalog button, which is the managed data repositories (MDR) button for CA Service Catalog.

   The CA Service Catalog GUI opens.

   Note: Optionally right-click the configuration item and select View, MDR. From the list of MDRs, select Service Catalog.

5. If the CA Service Catalog GUI does not open, perform the following actions:

6. a. Verify that the CA Service Catalog host name property specified in the MDR button is correct.

   b. Verify that the CA Service Catalog services are started.

7. If necessary, log in to CA Service Catalog.
   The CI Associated Offering Details dialog appears.

8. View the count for the requests, subscriptions, accounts, and business units that are related to the configuration item and its associated service or services.
   If multiple services are associated to the configuration items whose properties are viewing, the counts for all associated services are listed.
   For requests, accounts, subscriptions, and business units, optionally click the links for further details about each count:

Use this information along with any information you obtain from the CMDB Visualizer analysis tools. These tools are summarized in Leverage Information from Analysis Tools (see page 3440).

Leverage Information from Analysis

After you have established the relationships between configuration items, you can use the CMDB Visualizer for the following tasks:

- Provide a 360-degree view of the relationships between business-critical configuration items within your organization.

- Perform root cause analysis for Incidents and Problems.
- Perform impact analysis on changes to configuration items.
- Create filters in the CMDB Visualizer to customize your views of configuration items.

Performing these tasks helps you detect and strengthen the connections between IT and business: specifically, between your IT components (configuration items) and business services. Each analysis also helps you understand the connections between configuration items and helps you maximize their value.

A service can both *be* a configuration item and can also involve *changing* the IT infrastructure. While the distinction sometimes seems obvious, distinguishing between these two types of services explicitly can be helpful.

Consider a managed application service example: A department requests that the IT department supply and maintain a server, install an application, and administer the application. The interaction with the CMDB is through a workflow. The workflow includes change orders for configuration items. The workflow also sets up relationships between the server, application, application service, and other configuration items.

Integrate CA Business Service Insight with CA Service Catalog

This article contains the following topics:

CA Business Service Insight automates, activates, and accelerates the management, monitoring, and reporting of business and technology *service level agreements* (*SLAs*) and service delivery agreements for enterprises and service providers. CA Business Service Insight enables organizations to understand the performance and cost implications of these agreements in real time. Enterprises and service providers can leverage one solution to manage service delivery across the business and technology infrastructure, efficiently.

The top-down methodology for service level management begins with contracts that use business language and metrics. These contracts integrate with technical data sources for continuous measurement of service performance in relation to contract terms and conditions. The resulting transparency and control enable you to manage more efficiently both the expectations between IT and the business and your contracts with external service providers, such as CA Service Catalog.

Benefits of the Integration

The *integration* of the two products provides the following benefits:

- As a CA Service Catalog administrator, when defining a service option, you can browse the list of contracts in CA Business Service Insight. You can select a contract, and can associate it with the service option. You can also select a service component, contractual metrics, and incentive metrics from that contract to associate it with the service option. Together, they specify the quality of service that is expected for the service option. The service component specifies *what* is being monitored. The "what" can be a component that is related to the service option. And the metrics specify *which data* is being monitored. The "which" can be kilobytes per second or violations per month.

- Using the integration, you measure adherence to CA Business Service Insight contracts according to the service as a whole.

- This association of a service option with a contract and the monitoring that both products provide, supports the transparency of service quality. The association also provides financial adjustments as specified by the contract. For example, the adjustments can include reduced charges when the service does not meet the terms of the contract.

- You can use either CA Business Service Insight or CA Service Catalog to view the level of compliance of a CA Service Catalog service to the terms of its associated CA Business Service Insight contracts.

- You can use the billing features of Service Accounting Component to determine any financial adjustments that a service requires.

Comparison to Request SLA

CA Service Catalog enables administrators to create request SLAs to monitor whether service options in a request are processed within the time period that you specify for each monitored state. Your request SLAs specify time to warning and time to violation for a selected service option. A single request SLA specifies the amount of time that is permitted between specified statuses. For example, the time that is taken to move from Submitted to Approved or from Approved to Completed.

Request SLAs is a feature of CA Service Catalog. Quality of Service SLAs is available only if CA Service Catalog is integrated with CA Business Service Insight. You define QoS SLAs in CA Business Service Insight.

Request SLAs remain in CA Service Catalog as a time metric during the request life cycle of an *individual* request. In contrast, QoS SLAs in CA Business Service Insight measure averages and other values for *all* requests of a specific service during a certain time period. Examples follow:

- The average approval time for Desktop procurement service must not exceed 15 calendar days during a single one-month period.

- The maximum fulfillment time for the Desktop procurement service must not exceed 20 calendar days during a single one-month period.

CA Business Service Insight also uses QoS SLAs to provide several more metrics of various types, either during the request life cycle or after it has ended and while the requested service is being delivered. For example, a QoS SLA stipulates that the service must be available an average of 99% of the time every day. Another QoS SLA requires that the maximum time that a service can be unavailable on any one day is 15 minutes.

Request SLAs in CA Service Catalog cover *business* days while QoS SLAs in CA Business Service Insight cover *calendar* days.

Metrics in Contracts and Services

Administrators in CA Business Service Insight can obtain request processing data from CA Service Catalog to evaluate whether service options in services met, exceeded, or failed to meet the metrics that are defined in the contract for the service. For example, a contract defines metrics for a laptop service to meet the following goals:

- A service must be available for users 99% of each one-week period to meet a Gold metric, 95% for a Silver metric, and 90% for a Bronze metric.
- Fulfill each request for a laptop computer in 15 or fewer calendar days. If a request for laptop service is not fulfilled in 15 or fewer business days, credit the requestor's (or business unit's) account with an adjustment of 5% of the laptop cost.
- Fulfill all requests for a laptop computer in an average time of 10 or fewer calendar days. If the average fulfillment time of the laptop requests is more than business 10 days, credit the requestor's (or business unit's) account with a fixed adjustment of $1000.
  The fulfillment time starts when the request is approved and ends when the fulfillment process is completed.

Such metrics that define the maximum time period for requests to move from one status to another -- either individually or on average -- are named request SLAs (see page 3442).

Finally, administrators can optionally report on this data and publish it in dashviews in dashboards (see page 3461).

Prerequisites for CA Business Service Insight - CA Service Catalog Integration

This task is required to establish the communication between the two products.

Important! Verify that Microsoft Internet Explorer is installed on the computers from which you plan to access CA Business Service Insight. Even when you access CA Business Service Insight indirectly through CA Service Catalog, use Internet Explorer.

1. Verify that both CA Service Catalog and CA Business Service Insight are installed and running.
   For more information, see the respective documentation.
   As part of this task, verify that both products support the browser you are using.
2. Verify that you have administrator rights in both products, specifically:
   - The Service provider role (SP administrator) in CA Service Catalog.
   - The Super administrator role in CA Business Service Insight
3. Enable the CA Business Service Insight openAPI. By doing so, you ensure that CA Service Catalog can access the CA Business Service Insight secured web services.
   For more information, see your CA Business Service Insight documentation.

Note: If you require SSL support for this API, if necessary, see the Windows Communication Foundation (WCF) documentation on the Microsoft MSDN web site, msdn.microsoft.com. For further assistance enabling SSL support for the CA Business Service Insight openAPI, if necessary, contact CA Business Service Insight CA Support at http://ca.com/support (http://www.ca.com/support).

4. Verify that you have a copy of the digital certificate that contains the CA Business Service Insight public key for the server certificate that is used to enable the openAPI.

5. Import the CA Business Service Insight public key certificate into a Java keystore file, in CA Service Catalog:

```
keytool -import -file  publickey.cer -keystore  oblicorekeyfile -alias
oblicoreauthcert
```

   a.
   - **publickey.cer**
     Specifies the client certificate file for communicating with CA Business Service Insight using the open API.
   - **oblicorekeyfile**
     Specifies the name of the Java keystore file that this command generates. CA Service Catalog uses this file to access CA Business Service Insight.
   - **oblicoreauthcert**
     Specifies the alias name for the publickey.cer file.

   Enter the password that you want to use for this keystore file.

Set Up the CA Business Service Insight - CA Service Catalog Integration

This article contains the following topics:

Administrators of CA Service Catalog and CA Business Service Insight set up the integration between the products as follows.

1. Verify that CA Business Service Insight includes contracts, service domains, and metrics useful for measuring the quality of the CA Service Catalog services with which you plan to use them. For example, you want to monitor quality for services that include internet connectivity. In that case, you want to verify that the metrics include related quality measures, such as maximum wait time to establish connections, refesh screens, change addresses.
   Consider the following:

   - In CA Business Service Insight, consider naming such contracts with a special prefix, such as "Catalog_" for easy reference.

   - If your implementation of CA Service Catalog, uses multi-tenancy, then consider mapping the contract parties in CA Business Service Insight to your CA Service Catalog business units.
     Alternatively, consider naming your CA Business Service Insight contracts with a special prefix, such as "Service_Provider_name_" or "Tenant_name" for easy reference.

2. Create reports to access metric-related SLA data (see page 3445).

3. Verify that all CA Service Catalog and CA Business Service Insight computers are set to the same exact date and time and are adjusted, if necessary, for the time zone that you have chosen. This requirement includes the DBMS server for both integrating products.
   For example, suppose that you decide to use the Eastern USA time zone. In that case, if the current time is November 11, 6:27 p.m. Eastern USA, then set all computers to November 11, 6:27 p.m. Eastern USA or its equivalent, regardless of the physical or geographic location of the computer.

4. In CA Service Catalog, set the administration configuration parameters (see page 3448) for connecting to CA Business Service Insight.

5. In CA Service Catalog, set the request management configuration parameters (see page 3449).

6. In CA Service Catalog, for each applicable service option group, add the service option element for the CA Business Service Insight contract (see page 3454) you want to associate. When you do so, you specify important details such as the contract name, the service component, metrics.

7. Understand how the integration works after the request life cycle is completed (see page 3458).

8. In CA Business Service Insight, import the adapter package (see page 3450).

9. In CA Business Service Insight, create the adapter (see page 3452).

10. Test the Adapter (see page 3453).

Step 1 - Create Reports to Access Metric-Related SLA Data

This task is required to meet the prerequisites for setting up the integration. In CA Business Service Insight, create specific parameterized reports to access metric-related SLA data from CA Service Catalog. CA Service Catalog requires these reports to obtain service level data from CA Business Service Insight. To create the reports, run the SQL queries in this procedure on the Oracle database of CA Business Service Insight.

Follow these steps:

1. Open the Oracle database for CA Business Service Insight.

2. To create the Service Level by Metric report, run the following SQL query:

```
insert into t_report_galleries (report_id, report_name, report_type,
report_description, report_xml, is_executable, schedule_id, report_owner,
report_hirarchy, is_grouped, report_gallery_create_date,
report_gallery_modify_date, is_inherit_parent_permissions, folder_id,
is_ready_type, is_parameterized, e2e_type, inherit_permissions)values(90000001,
'Service Level by Metric parameterized report', 'NORMAL', 'This report is
parameterized report which return service level data by metric. This report is
used by CA Service Catalog. Please do not modify this report.','<REPORT_GROUP
TYPE="NORMAL" MARGIN="Y"><REPORT_ITEM><REPORT LOCALE="0" ORDER="ASC" ORDER_BY="
VALUE" TOP="0"><Y ID="PROVIDED" AGG="AVG" WITH_CORRECTION="1" SHOW_CORRECTION="
1" WITH_EXCEPTION="1" WITH_ADJUST="1" WITH_INCOMPLETE="1" INCLUDE_TARGET="1"
INCLUDE_FORECAST="0" WITH_THRESHOLDS="0" BUSINESS_DATA="1"/><X ID="RULE"
/><FILTER IS_PARAMETERIZED="Y"><TIME FORMAT="DD/MM/YYYY" TYPE="span"
IS_PARAMETERIZED="Y" IS_MANDATORY="Y"><SPAN LAST="0"><UNIT>QUARTER</UNIT><
/SPAN></TIME></FILTER><STEPS NUM="0"/><DISPLAY_PROPERTIES><GRID_COLOR>0<
/GRID_COLOR></DISPLAY_PROPERTIES><FILTER_DEFAULTS><CONTRACT IS_PARAMETERIZED="
Y" IS_MANDATORY="N">-1</CONTRACT></FILTER_DEFAULTS></REPORT><
/REPORT_ITEM><pdf><!--<option><name>parameter name</name><value>parameter value<
/value></option>--></pdf></REPORT_GROUP>', 1, null, 100, 1, null, sysdate,
sysdate, 0, 500, 0, 1, 0, 0)
```

3. To create the Deviation by Metric report, run the following SQL query:

```
insert into t_report_galleries (report_id, report_name, report_type,
report_description, report_xml, is_executable, schedule_id, report_owner,
report_hirarchy, is_grouped, report_gallery_create_date,
report_gallery_modify_date, is_inherit_parent_permissions, folder_id,
is_ready_type, is_parameterized, e2e_type, inherit_permissions)values(90000002,
'Deviation by Metric parameterized report', 'NORMAL', 'This report is
parameterized report which return Deviation data by metric. This report is used
by CA Service Catalog. Please do not modify this report.','<REPORT_GROUP TYPE="
NORMAL" MARGIN="Y"><REPORT_ITEM><REPORT LOCALE="0" ORDER="ASC" ORDER_BY="VALUE"
TOP="0"><Y ID="DEVIATION" AGG="COUNT" WITH_CORRECTION="1" SHOW_CORRECTION="1"
WITH_EXCEPTION="1" WITH_ADJUST="1" WITH_INCOMPLETE="1" INCLUDE_TARGET="0"
INCLUDE_FORECAST="0" WITH_THRESHOLDS="0" BUSINESS_DATA="1"/><Y_FILTER
CONDITION="GT"><NUM1>0</NUM1></Y_FILTER><X ID="RULE"/><FILTER IS_PARAMETERIZED="

0, 0)
```

5. To create the Revenue by Metric report, run the following SQL query:

```
insert into t_report_galleries  (report_id, report_name, report_type,
report_description, report_xml, is_executable, schedule_id, report_owner,
report_hirarchy, is_grouped, report_gallery_create_date,
report_gallery_modify_date, is_inherit_parent_permissions, folder_id,
is_ready_type, is_parameterized, e2e_type, inherit_permissions) values
(90000006,'Revenue by Metric used by CA Service Catalog','NORMAL','This report
is parameterized report which return revenue by metric. This report is used by
CA Service Catalog. Please do not modify this report.','<REPORT_GROUP TYPE="
NORMAL" MARGIN="Y"><REPORT_ITEM><REPORT LOCALE="0" ORDER="ASC" ORDER_BY="VALUE"
TOP="0"><Y ID="REVENUE" AGG="SUM" WITH_CORRECTION="1" SHOW_CORRECTION="1"
WITH_EXCEPTION="1" WITH_ADJUST="1" WITH_INCOMPLETE="1" INCLUDE_TARGET="0"
INCLUDE_FORECAST="0" WITH_THRESHOLDS="0" BUSINESS_DATA="1"/><X ID="RULE"
/><FILTER IS_PARAMETERIZED="Y"><TIME FORMAT="DD/MM/YYYY" TYPE="range"
IS_PARAMETERIZED="Y" IS_MANDATORY="N"><RANGE><FROM>01/01/2010 00</FROM><TO>26/08
/2010 00</TO></RANGE></TIME></FILTER><STEPS NUM="0"
/><DISPLAY_PROPERTIES><GRID_COLOR>0</GRID_COLOR><
/DISPLAY_PROPERTIES><FILTER_DEFAULTS><RULE IS_PARAMETERIZED="Y" IS_MANDATORY="N"
```

```
>-1</RULE></FILTER_DEFAULTS></REPORT></REPORT_ITEM><pdf><!--
<option><name>parameter name</name><value>parameter value</value></option>--><
/pdf></REPORT_GROUP>',1,null,100,1, null,sysdate,sysdate,0,500,0,1,0,0)
```

You have created the reports for accessing metric-related SLA data.

Step 2 - Set the Administration Configuration Parameters

Setting and testing the administration configuration parameters for CA Business Service Insight in the CA Service Catalog GUI is a required task for this integration.

Follow these steps:

1. Click Configuration and click the CA Business Service Insight link under Options on the Administration tab of CA Service Catalog.

2. Click the Modify icon to next to each property that you want to update:

   - **Certificate Alias Name**
     Specifies the alias name (logical name) of the CA Business Service Insight certificate that is stored in the trusted store. If your CA Service Catalog implementation uses multiple certificates from other products, you can optionally merge all certificates into a single keystore file. You can do so with or without using Secure Socket Layer (SSL) and Hypertext Transfer Protocol Secure (HTTPS).

   - **Enable HTTPS**
     Specifies that CA Service Catalog and CA Business Service Insight use Hypertext Transfer Protocol Secure (HTTPS) to communicate.
     Select Yes to use HTTPS to communicate with CA Business Service Insight; otherwise, specify No.

     Important! If you specify Yes, verify that CA Business Service Insight is using HTTPS. If necessary, configure it to use HTTPS.

   - **Host Name**
     Specifies the computer name on which CA Business Service Insight is hosted.

   - **Keystore Name**
     Specifies the filename of the Java keystore file that includes the CA Business Service Insight public key certificate.

     Important! This file *must* reside in the USM_HOME directory.

   - **Keystore Password**
     Specifies the password for opening the keystore file, to read the certificate in the trusted store.

   - **Organization**
     Specifies the name of the CA Business Service Insight organizational unit.

- **Port Number - {1-65535}**
  Defines the port on which the CA Business Service Insight host listens for incoming connections. The default is 80.

- **User ID and User Password**
  Specifies the user ID and password that CA Service Catalog uses to log in to CA Business Service Insight.

3. Verify that you are finished updating configuration properties.

4. Click Test to test all connections between CA Service Catalog and CA Business Service Insight. The connections include the Open API and the login credentials.

5. Click the Launch button to open CA Business Service Insight.
   The connection is tested, using the new values that you specified. If the connection fails, try using a different value.

6. Recycle Catalog Component.

The CA Business Service Insight configuration details are updated with the values that you specified.

Step 3 - (Optional) Set the Request Management Configuration Parameters

Setting the request management configuration parameters is an optional but recommended task when you set up the integration with CA Business Service Insight. The catalog users who are requesting a service can view the related performance data for the service.

1. Select CA Service Catalog, Configuration, Request Management Configuration.

2. Click the Modify icon to next to each property that you want to update.

3. Verify the setting for the following parameter and update it if necessary.

- **Display Service Health**

Specifies whether to enable catalog users requesting a service to view actual, current data regarding the quality or "health" of a service, which is based on the level of compliance of the service to its associated metrics. The contractual metrics, incentive metrics, and SLA health period that is specified in the contract-specific details for the service option elements in the service being requested determine this data.The metric data includes both the performance criteria and the actual number of violations, including the time increments measured. If you enable this option, catalog users can view this actual, current metric data for the service they are requesting.

You have set the request management configuration parameters.

Step 4 - Add the Service Option Element for the Contract

A required task for integrating CA Business Service Insight and CA Service Catalog is creating a service option element that associates a meaningful CA Business Service Insight contract to a service option group.

For more information, see add the service option element for the contract (see page 3454).

Step 5 - Understand how the Integration Works After the Request Life Cycle Is Completed

The integration between the two products is most meaningful after the CA Service Catalog request has been approved and fulfilled. At that point, the requested resource is made available to the requestor, and CA Business Service Insight begins to monitor whether the resource meets the terms of contract. For example, for availability, efficiency, or other metrics.

For more information, see the section Understand how the Integration Works After the Request Life Cycle Is Completed (see page 3458).

Step 6 - Import the Adapter Package

The adapter package contains two files that package the CA Business Service Insight: CA Service Catalog adapter (the adapter) and related files. The adapter enables you to connect CA Business Service Insight contracts (including metrics) with CA Service Catalog services, so that you can monitor whether the delivery of the requested services meets or exceeds the terms of the contract. With that data, you can adjust the billing for the services, as needed, to include any contract-related adjustments.

Follow these steps:

1. Locate the file that is named CAServiceCatalogRequestSLA.mpxx in the Utilities folder of the CA Service Catalog installation media.

2. Log in to CA Business Service Insight as an administrator.

3. Import the CAServiceCatalogRequestSLA.mpxx file, as follows:

    a. Click Administration, Content Transfer, Packages.

    b. Click Upload Package.

    c. Browse to the CAServiceCatalogRequestSLA.mpxx file, select it, and click Upload.
    The package is uploaded and is available for import. If the file already exists, you receive an error message from CA Business Service Insight. If you receive such a message, verify that the file exists by opening the Import page that is mentioned in the next step. Verify whether the file appears in the list of files available for import.

4. Import the CAServiceCatalogRequestSLA.mpxx file, as follows:

    a. Click Administration, Content Transfer, Import from Menu bar.
    The CA Business Service Insight Import page opens.

    b. Select the package that is named CAServiceCatalogRequestSLA from the drop-down list.

    c. Select Skip and Continue as the On Collision option.

    d. Click Import.

    If the import process fails, verify that none of the artifacts being imported already exists on the target computer.
    This process requires a few minutes to complete.

5. Locate the SQL adapter configuration file for your DBMS:

   - CA Service Catalog Request Mgmt Sys AdapterConfig_Oracle.xml
   - CA Service Catalog Request Mgmt Sys AdapterConfig_SqlServer.xml

   You use this file to read CA Service Catalog request data from your database depending on whether you are using Oracle or Microsoft SQL Server.
   Verify that the file for your DBMS resides on the computer on which you open CA Business Service Insight.

6. Verify that the following artifacts are created:

   - A service domain named *Request Management*.
   - Two domain categories that are named *Number of times the Permissible Time Exceeded Target* and *Response Time*.
   - A Service component named *Service Catalog Request Management System*.
   - An event type named *Catalog Request Status Time Event Template*.
   - A resource type named *Catalog Request Management System*.

   Two translation tables *SOE_Resource_Map_Table*

   and*Catalog_Event_Transl_Table (SOE=service option elements)*

   - Two translation scripts: one for creating resources from CA Service Catalog service option elements and another for creating event type for different statuses
   - Two business logic templates *Number of Violations* and *Average Time*.
     The Average Time template calculates the average time for a request to transition from one status to another. For example, from Submitted to either Approved or Rejected, or from Pending Fulfillment to Fullfilled.

   These artifacts form a "framework" for holding contract-related data about CA Service Catalog services.

7. Obtain the ID of the event type that is named *Catalog Request Status Time Event Template*. This ID is required when you create the adapter (see page 3452). To obtain the ID:

   a. Open the Configuration menu and click Event Types.

   b. Move the mouse over the event type to display the ID.

   c. Record the ID for use when you create the adapter.

You have imported the adapter package and are now ready to create the adapter.

Step 7 - Create the Adapter

After you have imported the adapter package, you are ready to create the adapter. This task is required to enable the integration between CA Service Catalog and CA Business Service Insight.

Follow these steps:

1. On the computer where CA Business Service Insight is hosted, open the SQL adapter configuration file for your DBMS:
   - CA Service Catalog Request Mgmt Sys AdapterConfig_Oracle.xml for Oracle
   - CA Service Catalog Request Mgmt Sys AdapterConfig_SqlServer.xml for Microsoft SQL Server (SQL Server)
2. Locate the following line in that file:

   ```
   "FieldDisplayName="Catalog Request Status Time Event Template" AdditionalData="
   1500"
   ```

3. Verify that the value for the AdditionalData= expression in this file matches the ID you recorded for the event type that is named *Catalog Request Status Time Event Template* at the end of the procedure to import the adapter (see page 3450).
   If the ID in the file is different than the ID you recorded, update the ID in the file to match the one you recorded.
   Save your changes (if applicable) and close the file.
4. Log in to CA Business Service Insight.
5. Click Administration, Configuration, Adapters.
6. Click the Add New button and select the option that is named Create from configuration file.
7. Browse the local computer on which you opened the browser. Select the SQL adapter configuration file for your DBMS (from Step 1), and click OK.
   After a short wait, the adapter is created, and a configuration window opens.
8. Configure the newly created adapter, as follows:
   a. Specify a suitable name to the adapter, such as CA Service Catalog Adapter.
   b. Select the address for the adapter.
      You typically specify the address of the CA Business Service Insight server.
      If applicable, select the Localhost option.
      Otherwise, click Add adapter address to create an address.
   c. Select a time zone and click Next.
   d. Update the server name and user credentials for the database to match the CA Service Catalog database.
   e. Click Test Connection and click Next.

f. Click Test Query and click Next.

g. Verify that the results are valid and click Next.
The mapping screen appears.

9. Click Finish.

You have installed the adapter and can now test the adapter (see page 3453).

Step 8 - Test the Adapter

After you have imported and installed the adapter, test it to verify that it works properly in your implementation. This task is required to enable the integration between CA Service Catalog and CA Business Service Insight.

Follow these steps:

1. Open the Windows Control Panel and verify that the following CA Business Service Insight services are running. If necessary, start them:
   - Oblicore - AdapterDeployment
   - Oblicore - AdaptersListener
   - Oblicore - ScriptHost
   - Oblicore - TaskHost (For translation)
2. Verify that your CA Service Catalog implementation includes active services and requests.
3. Log in to CA Business Service Insight. Use its scheduler to schedule the adapter to run every 30 through 60 minutes.
4. Wait for the first scheduled run of the adapter to complete. Log in to CA Business Service Insight, and select Configuration, Translation, Translation Entries.
5. Verify that the adapter has generated at least a few pending entries. The adapter cannot process the pending entries now, because the event types and resources that are related to these entries are not yet created.
6. Wait for the next scheduled run to complete. Log in to CA Business Service Insight, and select Configuration, Translation, Translation Entries.
7. Verify that the following changes have occurred:
   - The pending entries are translated.
   - The new resources of the type that is named *Catalog Request Management System* are created. These represent service option elements in requests that CA Service Catalog users have submitted.
   - New event types are created, similar to the following examples:

- 101-2-CatalogRequestStatusChangeEvent
- 101-200-CatalogRequestStatusChangeEvent
- 101-2000-CatalogRequestStatusChangeEvent

Using these event types, resources, and other imported artifacts, you can optionally create new contracts with metrics and link them to CA Service Catalog services.

Add the Service Option Element for the Contract

This article contains the following topics:

You can associate *only one* CA Business Service Insight contract to a service option.

Follow these steps:

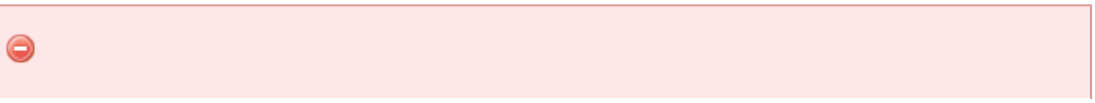
1. Navigate to CA Service Catalog, Service Offerings, Option Groups tab.
2. Click the service option group name to which you wish to add the new service option element.
3. Double-click the new row or column heading to add a new row or column of cells.
   a. Double-click a new, empty cell to define a new service option element.
   b. Double-click an existing service option element to edit the definition of an existing service option element.

   The Service Option Element Definition window is displayed.
   The Service Option Element Definition window is used to specify the characteristics of a service option element using two tabs, Definition and Options.
4. Select CA Business Service Insight Contract for Type on the Definition tab and specify the contract-specific details (see page 3454).
   This option associates a CA Business Service Insight service level agreement and enables you to specify details for this association.
5. Also on the Definition tab, complete the remaining fields and click Update.
   These remaining fields are not related to the CA Business Service Insight integration. But, these fields are required for all service option elements in CA Service Catalog.

The changes to the service option element are updated.

Contract-Specific Details for the Service Option Element

Specify the contract-specific details when you add the service option element for the contract.



Important! Consult an administrator with knowledge for assistance to complete these fields. This knowledge is critical for specifying meaningful values that result in effective monitoring of the quality of services.

- **Display Text**
  Specifies a brief summary of the contract for the catalog user requesting the service.

- **Contract**
  Select the contract that you want from the drop-down list. The list shows contracts that have been created, tested, and committed in CA Business Service Insight.
  Typically, an organization has relatively few contracts, each with service components and metrics that you can associate to a service option element. Optimally, an organization develops services and contracts together.
  Click the View link to see the contract details, especially the effective period (starting and ending dates) of the contract. Review the effective period of *both* the contract and the service option group. Verify that they match or that effective period of the service option group is contained within the effective period of the contract. If a conflict exists, you can still associate the contract to the service option element. But, you *cannot* measure performance (obtain metric data) during the discrepancy period.
  Viewing the contract details helps you make more informed decisions when you complete the other remaining fields on this dialog.

- **Service Component**
  Select the service component (service) to monitor the contract that is selected in the previous field. A contract typically covers one or more service components.
  In each service option element, you can select one service component to monitor.
  Verify that this service component is meaningful for *both* the selected contract and the service option group you are modifying.
  Click the View link to see details about the metrics that apply to the selected service component details.
  Service components are related to, but independent of, contracts.

- **Contractual Metrics and Incentive Metrics**
  Contractual metrics specify minimum quality-of-service requirements. For example, average response time of two business days to fulfill requests to fix or replace broken laptops.
  Incentive metrics can specify one or both of the following options:

  - Discounts to the customer from the service provider, for the service provider failing to meet the minimum requirements of the contract. For example, an incentive metric can specify a discount of $100 each day the service provider fails to fulfill an average of 100 requests per hour during normal business hours and 10 requests per hour outside of normal business hours.

  - Extra charges to the customer from the service provider, for the service provider exceeding the minimum requirements of the contract. For example, an incentive metric can specify an extra $100 charge for every day when the average response time is less than one-half of the maximum response time.

  The specific metrics available depend on the selected contract and service component. Typically, you associate ten or fewer of each type (contractual and incentive) to a service option element. The metrics that you select determine both the financial adjustments for the associated service at

invoice time (if any) and the health of each service that contains this service option element. CA Service Catalog displays this data to catalog users requesting a service when they click the link to check the health of a service that contains this service option element.

- **SLA Health Period**
  Defines the time increments to use for filtering and displaying the metric-related SLA data. Examples include per hour, day, week, month, year, or a custom-specified time period.
  Verify that the increments you select are meaningful for the contract, service component, and metrics that are selected.
  You can configure the request management configuration parameters (see page 3449) to display the selected contractual metrics and the SLA health period to catalog users when they request a service that contains this service option element.

- **Charge for SLA**
  Specifies the charge for maintaining an SLA. If you check this box, more fields open for you to specify the details of the charge (see page 3456).

- **Associate Service Option Group**
  Indicates that a service option group is associated with this service option element. Checking this field exposes a list of tiered service option elements, allowing the administrator to select an associated service option element and tier type (see page 3458).

  Note: These fields are intended for use by customers who formerly integrated CA Service Catalog and now want to integrate CA Service Catalog with CA Business Service Insight to achieve compatible results.

Charge for SLA - Details

If you check Charge for SLA on the Contract-specific Details for the Service Option Element, the following fields appear. These fields provide a means of specifying charges or credits to an account, *either* instead of *or* in addition to the metrics specified in the contract.

- **Cost Type**
  Specifies the type of cost for the SLA. Select from the following list:

  - **Specify Value**
    Specifies the cost value that appears in the catalog and the requesting or subscribing user cannot change the value.
    This setting exposes the following field:
    Unit Cost - The cost per SLA that is to appear in the catalog.

  - **User Specified**
    Specifies the default cost value that appears in the catalog. The requesting or subscribing user can change the value.
    This setting exposes the following field:
    Default Unit Cost - The default cost value that is to appear in the catalog.

  - **Allocate Cost**
    The cost is allocated based on a Set as established in Budgeting and Planning in Service Accounting Component.
    This setting applies only if Service Accounting Component is installed.

This setting exposes the following fields:
Default Unit Cost - This value in this field is set to 0, because the cost value is determined from the Set value that is specified and the associated value for this service option element in that set, together with the Allocation Method.
Set - List of Budgeting and Planning sets available through Service Accounting Component.
Allocation Method - The list of allocation methods for the value in the budgeting and planning set for this service option element.
Assign - Use the value in the set for the total cost of this service option element.
Distribute by Subscribed Account - Use the value in the set for this service option element that is divided by the number of accounts that are subscribed to this service option element.
Distribute by Subscription - Use the value in the set for this service option element that is divided by the number of subscriptions to this service option element.
Weighted Distribution - Use the value in the set for this service option element that is allocated according to actual usage by the account.

- **Standard Cost**
  The cost is allocated based on a Set value as established in Budgeting and Planning in Service Accounting Component.
  This setting applies only if Service Accounting Component is installed.
  This setting exposes the following fields:
  Default Unit Cost - This value in this field is set to 0, because the cost value is determined from the Set value that is specified and the associated value for this service option element in that set, together with the Allocation Method.
  Set - List of Budgeting and Planning sets in Service Accounting Component.
  Allocation Method - The list of allocation methods for the value in the budgeting and planning set for this service option element.
  Assign - Use the value in the set for the unit cost of this service option element.

- **Display Unit Type**
  Specifies the text value that appears with the cost value.

- **Billing Cycle**
  Indicates how the cost value is applied to an invoice if Service Accounting Component is installed. Select from the following list:

  - **One-Time**
    The charge is applied one time.

  - **Installments**
    Cost is applied on an "installment plan": the entire cost is spread across several payments over time, rather than a single payment of the entire cost.
    This setting exposes the following fields:

    - Periodic Type: The type of interval to be used when applying the cost: Daily, Weekly, Monthly, or N/A.

    - Periodic Type Interval: The frequency of the interval that is specified in Periodic Type field that is used to determine the billing interval of the cost.

    - Number of Installments: The number of times the cost must be applied.

- **Periodic**
  This setting exposes the following fields:
  Periodic Type: The type of interval to be used when applying the cost: Daily, Weekly, Monthly, or N/A.
  Periodic Type Interval: The frequency of the interval that is specified in Periodic Type field that is used to determine the billing interval of the cost.

- **N/A - Not applicable**
  Specifies that this field does not apply.

- **Charge Type**
  Indicates whether cost value must appear as a Charge or a Credit on an invoice from Service Accounting Component.

- **Budget**
  Indicates whether the item is associated with a budget.
  If Service Accounting Component is installed, the Administrator can associate a cost value with a Budgeting and Planning set value that is associated with this service option element.
  If Service Accounting Component is not installed, this field serves as additional categorization for the service option element.

Tier Type - Details

If you check Associate to Service Option group on the Contract-specific Details for the Service Option Element, the following fields appear. These fields mainly provide a means of specifying charges or credits to an account, either *instead of* or *in addition to* the metrics specified in the contract.

Tier Type

Specifies the name of the tier type that you select; the default is Lookup.

A tier is a single row in a tiered service option group. Association into a tiered service option group starts at the top row and moves down, with the top tier having the lowest tier values.

A service option element with a defined tier type matches the right tier in the specified tiered service option group (where the tier service option group is specified in the same service option element when the tier type is defined).

Lookup

Use the first tier that matches the value being passed to the tiered service option group.

Lookup Multiple

Use each tier that matches the value being passed to the tiered service option group.

Understand how the Integration Works After the Request Life Cycle Is Completed

This article contains the following topics:

1. Once the request is fulfilled and the user attempts to begin using the requested service or services, CA Business Service Insight monitors:

   - The resources that are specified in the service component.
   - The metrics that are selected in the service option element or elements that are associated with a contract.

2. CA Business Service Insight retains the contract metric-related data (see page 3459). CA Business Service Insight retrieves related data from CA Service Catalog to:

   - Display service health, which the contractual metrics determine, incentive metrics, and SLA health period that are included in the contract-specific details for service option elements.
   - Calculate SLA violations and adjustments. When you run invoices in CA Service Catalog, it queries CA Business Service Insight for statistics regarding the contractual and incentive metrics, to determine any applicable extra charges or discounts to be included in the invoice.

Create Billing Adjustments for Metric-Related SLAs

The metrics that you select when you specify the contract-specific details for the service option element essentially define SLAs for the service that includes the service option element. These SLAs provide extra charges for services that exceed contract terms and also provide discounts for services that fail to meet contract terms. To include these extra charges and discounts when you run invoices, you create an SLA violation adjustment for either all accounts or specific accounts. Once you create the adjustment, CA Service Catalog automatically includes it during invoice runs and adjusts the final amount of the invoice.

Follow these steps:

1. Verify that the effective dates of the service, service option group, and service option element are included within the effective dates of the contract associated with the service option element (see page 3454).
   Adjustments for the invoice do not include any discrepancy period between these effective dates. For example, suppose the effective dates for the service, service option group, and service option element include the entire calendar year, January through December, while the effective dates for the contract cover February through December. In this case, the invoice for January includes no extra charges and no discounts that are related to SLAs.

2. Click Accounting, Adjustments, SLA Violation, Add SLA Violation Adjustment.

3. Complete the fields on the page.

   - **Business Unit**
     Specifies that this adjustment applies to all accounts in the service provider business unit.

- **Adjustment Name**
  Specifies an intuitive name for the adjustment.
  You can optionally create a single adjustment for all accounts that use a specific service, or you can create individual adjustments for individual accounts that use that service. The latter approach is required if you want to specify different adjustment criteria for different accounts that use the same service.

- **Adjustment For:**
  Specifies either all accounts or a specific account.
  If you select a specific account, the adjustment types (fixed or proportional) do not apply. Instead, the account you specify receives the entire adjustment and other accounts are not affected.

- **Description**
  Specifies a brief description for the adjustment.

- **Status**
  Specifies whether the adjustment is active or inactive.

- **Adjustment Type**
  Specifies whether the adjustment in the invoice is fixed or proportional.
  Fixed adjustments divide the total extra charge or discount equally across all accounts, as illustrated in the example of fixed charges (see page 3460).
  Proportional adjustments divide the total extra charge or discount proportionally across all accounts, which are based on the number of subscribers per account, as illustrated in the example of proportional charges (see page 3461).

- **Apply to Service**
  Specifies the service to which this adjustment applies.

- **Service Option Group**
  Specifies the service option group to which this adjustment applies.

- **Service Option Element**
  Specifies the service option element to which this adjustment applies.
  The CA Business Service Insight contract, service component, and metrics that determine the adjustment are defined in this service option element.

4. Click OK.

The adjustment is saved.

Example of Fixed Charges

Fixed adjustments divide the total extra charge or discount equally across all accounts, as illustrated in this example.

The extra adjustment for a service is $20. Two accounts are subscribed to the service: Account-A and Account-B.

Account-A includes seven subscriptions, while Account-B includes three subscriptions.

Both Account-A and Account-B each receive a $10 adjustment.

Example of Proportional Charges

Proportional adjustments divide the total extra charge or discount proportionally across all accounts, which are based on number of subscribers per account.

The extra adjustment for a service is $20. Two accounts are subscribed to the service: Account-A and Account-B.

Account-A includes seven subscriptions, while Account-B includes three subscriptions.

The adjustments are calculated as follows:

Total number of subscriptions = 7 + 3 = 10

Total number of accounts = 2

Adjustment for Account-A = (20x7)/10 = 14

Adjustment for Account-B = (20x3)/10 = 6

Thus, Account-A receives a $14 adjustment, while Account-B receives a $6 adjustment.

Publish Dashviews in Dashboards

Dashviews are important components in CA Business Service Insight for publicizing performance measurements from contracts, especially metric-related data. As an administrator, you can create dashviews in CA Business Service Insight and can publish them in CA Service Catalog. By doing so, CA Service Catalog users better understand the quality and performance of services over time.

CA Business Service Insight administrators create dashviews as graphical representations of performance data for CA Service Catalog services. The performance data shows the quality of the services over time. Dashviews are containers that typically hold either a widget (speedometer) or a report that helps to organize information.

You can embed dashviews in portals and can resize them. You can configure dashviews to display a background image that helps represent the status of multiple entities The entities can be countries, organizational units, and stages of a process.

Note: For more information about creating and managing dashviews in CA Business Service Insight, see your CA Business Service Insight documentation.

Follow these steps:

1. Design your dashviews to meet your requirements in CA Business Service Insight.

2. Identify the dashviews that you want to publish in CA Service Catalog; if necessary create new ones. Select dashviews related to services better understand the quality and performance of services over time.
   You can optionally do either or perform both of the following actions:

   - Select dashviews for one or more contracts that are linked to your most commonly used services.
   - Select a dashview that highlights specific metrics in such a contract.

3. Record the following information about the dashviews that you have chosen to publish in dashboards:

   - Dashview ID
   - User name who owns the dashboard
   - Organization to which the user belongs
   - Name of the CA Business Service Insight server on which the dashview resides

Create a dashboard item of type External Web Content for each dashview, in CA Service Catalog.

- Using the information from Step 2, replace the text field that is named Content URL in each dashboard item with the following URL:

  ```
  http://[ServerName]/NewDashboard/DashboardWebPart.aspx?dashviewId=[ID]&username=[CA Oblicore Guarantee username]
  &organization=[Organization]
  ```

  For example:

  ```
  http://hesed333/NewDashboard/DashboardWebPart.aspx?dashviewId=32&username=sadmin&organization=CA
  ```

Verify the Health of Services

As an administrator, advise catalog users to view the health of a service when they create a request, if *all* of the following conditions are met:

- The service is associated to metrics in a CA Business Service Insight contract.
- The association is configured to display the health of the service.
  Administrators optionally specify both of these settings when they configure the contract-specific details for the service option elements (see page 3454) in the service being requested.
- The Display Service Health configuration parameter (see page 3449) is enabled.

Catalog users can view the quality or "health" of a service, which is based on the level of compliance of the service to its associated metrics.

Note: For individual services, verify that the dashview data (from Step 1) matches the health-of-service data (from Step 2).

Follow these steps:

1. Click Home, Requests.
2. Find the service that you want in the catalog, using one of these sections.
3. Open the service that you want and view its details.
4. Click View Service Health.
   The metric data for the service appears. The data includes both the performance criteria and the number of violations during the time increments specified by the administrator. Time increments can be per hour, day, week, month, or year.
5. Review the data and decide whether the service levels meet your expectations.

Using the data, you can either finish and submit the request or cancel the request.

Integrating CA Asset Portfolio Management

Integrate with CMDB

The article contains the following articles:

This section explains how to integrate CA APM with CMDB Release 12.7 and CMDB that is included in CA Service Desk Manager Release 12.7.

CMDB is a comprehensive, integrated solution for managing the IT components and services in an enterprise and their relationships, in heterogeneous computing environments. CMDB lets you provide and store reliable, up-to-date information about assets, known as configuration items (CI), and their relationships with each other. These relationships form the basis for impact analysis, an important tool for controlling change within an organization.

CMDB integrates with CA APM in several areas, including the following areas:

The CA APM audit history records can include all of the changes that have been made to asset/CI records by CA Service Desk Manager, CMDB, and CA APM.

- When CA Service Desk Manager and CMDB are installed, the asset/CI audit history records include any CA APM audit history records on the CMDB Versioning tab.
- When you define an asset in CA APM, you can categorize and control the asset and CI records by selecting or clearing the Asset and CI check boxes. This flexibility is provided because CIs that CMDB creates may not be relevant to CA APM. Conversely, assets that CA APM creates may not be relevant to CMDB.
- CA APM can extend the fields on an asset/CI within the context of *asset families*. The extended fields can be shared in CA APM. For example, a CA APM administrator can configure the Asset page and define an asset extended field to let users view and update a CI that is created in CA Service Desk Manager and CMDB.
- You can define an event on a field that is shared with CMDB in CA APM and trigger the event in either CA APM or CMDB. For more information about managing events and notifications, see Events and Notifications (see page 2376).
- A CA Service Desk Manager and CMDB user can define a Management Data Repository (MDR) and allow the CMDB CI to launch the corresponding asset in CA APM.

How to Integrate CA APM and CMDB

When you integrate CA APM and CMDB, you integrate and delineate the assets that CA APM manages from the configuration items (CIs) that CMDB manages in a simple and concise manner. The CA APM users can move to a shared classification model for the assets and CIs. To integrate CA APM and CMDB, complete the following steps:

1. Share asset and configuration item audit history records.
2. Categorize the asset and configuration item records.
3. Define an asset extended field.
4. Define an event on a shared field.
5. Define a Management Data Repository (MDR) from CA Service Desk Manager and CMDB.

Share Asset and Configuration Item Audit History Records

To integrate CA APM and CMDB, the CA APM audit history records can include all of the changes that were made to asset/CI records by CA Service Desk Manager, CMDB, and CA APM. In addition, when CA Service Desk Manager, CMDB, or both are installed, the asset/CI audit history records in CMDB (Versioning tab) includes any CA APM audit history records.

CMDB 11.2 and greater includes audit history records from CA APM. The audit history records are updated in both CMDB and CA APM when the CA Asset Portfolio Management - Event Service service is started. For more information, see Start the Services.

Categorize the Asset and Configuration Item Records

In this step to integrate CA APM and CMDB, you can categorize and control the asset and CI records when defining an asset in CA APM by selecting or clearing the Asset and CI check boxes. This flexibility is provided because CIs that CMDB creates may not be relevant to CA APM and conversely, assets that CA APM creates may not be relevant to CMDB.

Consider the following information when using these check boxes:

- **Default Values**
  - All new asset records that CA APM creates are initially set both as an Asset only and Managed by CA APM. On the New Asset page in CA APM, the Asset check box is selected, the Managed by CA APM check box is selected, and the CI check box is not selected.
  - All asset records that CMDB creates (with or without CA Service Desk Manager) are initially set to CI only. On the CI pages in CMDB, the CI? column heading is set to Yes and the Asset? column heading is set to No.
  - Both CA APM and CMDB have the Asset and CI fields available on the New Asset and CI pages. However, the Managed by CA APM check box is only viewable in CA APM. The existing audit and security features for each product applies to these check boxes.
- **Appearance**
  - The Asset and CI fields appear in CA APM and CMDB even when other CA Technologies products are installed. The Asset and CI fields do not appear in CA Service Desk Manager when CMDB is not installed.
  - The CA APM administrator can configure the user interface and move the Asset and CI fields to a new location, make the fields read-only, required, or optional, and hide the fields.

    Note: For more information about configuring the user interface, see How to Configure the User Interface (see page 1520).
- **Viewing and Updating**
  - **CA CMDB**
    - By default, the CMDB analyst and administrator can update the Asset and CI field values.
    - CMDB, by default, does not allow the Asset? value to be changed when the Asset? value is set to Yes.
  - **CA APM**
    - By default, CA APM sees asset and CI records.

- The CA APM administrator can configure the user interface and move the Asset and CI check boxes to a new location, make the check boxes read-only, required, or optional, and hide the check boxes. After you select the CI check box and save the asset, the CI check box is not available and you cannot change the setting.

  Important! We strongly recommend that you configure the CI check box in CA APM as read-only and restrict changes to the check box to only the CMDB analyst and administrator.

- An asset in CA APM in which the Managed by CA APM check box is selected is always an asset. You cannot save an asset in CA APM in which the Managed by CA APM check box is selected without also selecting the Asset check box.

- **Searching**
  - **CMDB**
    - The CMDB search initially displays, by default, all records. However, an option is provided to filter records.

      Note: If CA Service Desk Manager is installed, the same default search rules apply.

  - **CA APM**
    - The default asset search includes a drop-down list for Managed by CA APM, CI, and Asset. This flexibility is provided so that you can differentiate between assets and CIs.

- **Hardware Reconciliation**
  Hardware reconciliation analyzes all asset and CI records. Searches provide a way to view any CIs that are related to discovered assets as the result of running hardware reconciliation. A CA APM user can view the exceptions and determine whether they want to select the Asset check box. As a result of selecting the Asset check box, the asset records are available in a CA APM asset search.

Define an Asset Extended Field

In this step to integrate CA APM and CMDB, CA APM can extend the fields on an asset within the context of *asset families*. The extended fields can be shared in CA APM. For example, a CA APM administrator can configure the Asset page and define an asset extended field to let users view and update a CI that is created in CA Service Desk Manager and CMDB.

Important! These steps work only the first-time you complete the wizard and define the asset extended field. Before you define the extended field, verify that you have the following information from the usp_owned_resource table in CA CMDB for reference: table name, format (character, boolean, currency, date, decimal, or integer), field name, attribute name, and field size. After you complete the wizard, you can configure the extended field like any field in CA APM.

Example: Define an Asset Extended Field for Warranty Start Date

In this example, you define an asset extended field for Warranty Start Date. In CA Service Desk Manager/ CA CMDB on the Inventory tab, you view the label in the CI as Warranty Start Date. Next, you view the information for the associated nr_wrty_st_dt column from the usp_owned_resource table in CMDB. In this example, the nr_wrty_st_dt column format is integer, the field name is nr_wrty_st_dt, the attribute name is nr_wrty_st_dt, and the field size is 4. Record and enter this information exactly as it appears in the appropriate Format, Field Name, Attribute Name, and Field Size fields in the wizard. We also recommend that to avoid confusion, you use the same label for the CI (Warranty Start Date) on the Label field in the wizard.

To define an asset extended field

1. Determine the CA Service Desk Manager and CMDB extension table name and database field name by reviewing the CA Service Desk Manager and CMDB schema files.

   Note: For more information about the CA Service Desk Manager and CMDB schema files, see the CA Service Desk Manager and CMDB documentation.

2. Log in to CA APM using login credentials in which you have permissions to define an extension.

3. Click Asset, New Asset.

4. On the left, click CONFIGURE: ON.
   The configuration of the page is enabled.

5. In the Configuration Information area of the page, define and save a global configuration.

6. Click Add Extension.
   A wizard appears.

7. Follow the on-screen instructions to enter the information for the extended field.

8. In the Type page of the wizard, complete the following steps:

   a. Select the Simple Field option.

   b. Select the part of the page on which the new field appears.

   c. Select the Across all extended types check box.

d. Click Next.

9. In the Fields page of the wizard, complete the following steps:

> **Important!** Enter the column information from the usp_owned_resource table in CMDB. We also recommend that to avoid confusion, you use the same label for the CI on the Label field.

a. Click Add Field.

b. Enter the field label to appear on the page.

c. Select the data format.

d. Enter the database field name.

e. Enter the attribute name.

f. Enter the field size.

g. (Optional) Enter a description for the field.

h. Specify whether an entry for the field is required.

i. Click the checkmark icon to save the field.
The product displays the field information you enter.

j. Click Next.

10. In the Summary page of the wizard, review the field information and click Save and Exit.

11. Verify that the field appears on the Asset page.

12. Click Save Configuration.
All users see the extended field on the page. You can define an event in CA APM and trigger the event in either CA APM or CMDB. For more information about managing events, see Events and Notifications (see page 2376).

Define an Event on a Shared Field

You can define an event in CA APM on any field that is shared between CA APM and CMDB. When the criteria for the event occurs by a change in CA Service Desk Manager/CMDB or CA APM, the event will complete and the notification will be sent. For example, you can define an event on the Asset page for the Contact field. If the event is a change event, the event can be completed when you change the Contact field in either the asset or the related configuration item (CI). Once the event has completed, a notification will be sent.

Note: For more information about managing events and notifications, see Events and Notifications (see page 2376).

Define a Management Data Repository (MDR) from CA Service Desk Manager and CMDB

In this step to integrate CA APM and CMDB, a CA Service Desk Manager and CMDB user can define a Management Data Repository (MDR) and allow the CMDB CI to launch in context the corresponding asset in CA APM.

To define a MDR from CA Service Desk Manager and CMDB

1. In the CA Service Desk Manager web interface, log in as an administrator.
2. Select the Administration tab. From the Administration browser, select CMDB, MDR Management, MDR List.
3. Click Create New.
   The MDR Provider definition appears.
4. Enter the following required MDR provider information:
   - **Button Name**
     Specify *ITAM* as the button name.
   - **MDR Name**
     Specify *ITAM* as the MDR name.
   - **MDR Class**
     Specify *GLOBAL* as the MDR class.
   - **Hostname**
     Specify the CA APM server name by using the network address or the DNS name of the CA APM web server.

   Important! The MDR provider form automatically populates the URL for Launch in Context field based on the information that you provide, so you do *not* enter a value for this field.
5. Click Save.
   The CA APM MDR provider is defined.
6. In CMDB, define a CI.
7. Click the Attributes tab in the CI detail form.
8. Click the ITAM button that you previously defined.
   The corresponding asset in CA APM appears.

Integrate with CA Service Catalog Manually

Important! Review the following section only if you want to manually integrate CA Asset Portfolio Management with CA Service Catalog when the automatic integration between the two has failed.

CA Service Catalog integrates with CA Asset Portfolio Management in several areas, including these areas:

- Requested items can be associated with CA Asset Portfolio Management Assets. Asset managers can associate CA Asset Portfolio Management assets with items requested from the catalog during request fulfillment.
- Catalog entries can be associated with CA Asset Portfolio Management Models. CA Service Catalog catalog administrators can associate one or more CA Asset Portfolio Management models with a service option. This association can assist with automated asset creation and association during request fulfillment using a workflow process and the CA Service Catalog web services.

Important! CA Service Catalog and CA Asset Portfolio Management must share the same MDB and the same CA EEM for this integration to work properly.

Requirements for the integration:

- You must have a role defined in CA Asset Portfolio Management.
- Verify that CA Asset Portfolio Management supports your internet browser.
- Check whether the CA Asset Portfolio Management application and web servers reside on the same computer or different computers. If they reside on different computers, complete the CA Asset Portfolio Management web services section in the administration configuration settings on the CA Service Catalog GUI.
- Authorized CA Service Catalog users use the CA Asset Portfolio Management Model Assignments window to assign eligible assets during the fulfillment of a request.

You can assign the assets through CA Service Catalog services if the following requirements are met:

- The assets must be active.
- The assets must not be assigned to any user.

You can associate one or more CA APM models with a service option, if the following requirements are met.

CA Service Catalog and CA Asset Portfolio Management administrators work together to use one of the following methods to authorize CA Service Catalog users (typically request managers) to assign assets:

1. Assign to the user the Fulfiller role in CA Asset Portfolio Management.

2. Assign to the user another role in CA Asset Portfolio Management that can update the Asset Fulfillment object. If you use another role, it must have the same Asset Fulfillment security settings as the CA Asset Portfolio Management Fulfiller role.

3. Specify a proxy user for CA Asset Portfolio Management in CA Service Catalog. To specify this proxy user, select **Administration**, **CA APM Web Services**, and complete the fields. Specify this CA Asset Portfolio Management user in the **User ID** field.
   In this case, CA Service Catalog users inherit the authority of the proxy user to assign assets.

Note: For information about fulfilling requests from inventory, see How to Fulfill Requests from Inventory (see page 2088).

Follow these steps:

Step 1 - Create Users in CA Service Catalog

To enable the integration between CA APM and CA Service Catalog, create customized users in CA Service Catalog specifically for use with this integration.

Follow these steps:

1. Determine a CA APM user ID that CA Service Catalog can use as a proxy user.
   You can supplement the proxy user with the following CA Service Catalog users:

   - The Service Delivery administrator, service designers, and catalog administrators can associate service options to models.

   - Request managers can use the gold brick icon to fulfill the requests pending action that are assigned to them.

Note: If you specify a proxy user, the Catalog system uses the proxy user, *not* authorized request managers, to fulfill the requests.

2. As a catalog administrator, work with a CA APM administrator to meet these criteria:
   - This user must be an authorized user in CA APM.
   - In the user details in CA APM, under Permissions, for Role Details, Asset Fulfilment Access is required.
3. Log in to CA Service Catalog as the spadmin user or another user with the Service Delivery Administrator role.
4. Select Administration, Configuration, CA APM Web Services in CA Service Catalog. Specify the CA APM user ID from the previous step in the User ID field.
5. Set up the following users:
   - Catalog User
   - Request Manager (Approver for the Catalog User)
   - Service Delivery Administrator, typically spadmin (Fulfiller)
6. Enable all rules for Event Type: Request/Subscription Item Change except When Status is Pending Fulfillment.
7. Log out of CA Service Catalog.

Step 2 - Create or Update Administrator in CA EEM

To enable the integration between CA APM and CA Service Catalog, create customized users in CA EEM specifically for use with this integration.

Follow these steps:

1. Log in to CA EEM as EiamAdmin. For Application, select Global.
2. Select Manage Identities, Users and click Go, without specifying any search criteria.
3. If the Administrator user already exists under the Users node, skip this step.
   Otherwise, create the Administrator user under Users node, and specify Administrator for the Name and the Display Name.
   Set the password for this Administrator user and click Save.
   For more information about creating global users in CA EEM, see the CA EEM (https://wiki.ca.com/display/eem1251/Create+Global+Users) documentation.
4. Log out of CA EEM.

Step 3 - Configure CA APM

To enable the integration between CA APM and CA Service Catalog, configure CA APM for use with this integration.

Note: The CA EEM-related steps apply specifically to CA APM 11.3.4. For equivalent steps for CA APM Release 12.6, see the CA APM documentation.

To configure CA APM

1. Log in to CA APM as an administrator.
2. In CA APM Security, assign the Service Delivery Administrator (the Fulfiller created in Create Users in CA Service Catalog (see page 3471)) to act as UAPM Fulfiller.
   For more information to perform this task, see Administering CA Asset Portfolio Management (see page 1568).
3. Start the CA APM Configurator and open CA APM.
4. In CA APM, under Option 3, Choose Your Security Type, select EIAM with Single DB Login.
5. Enter the host name of the computer on which CA EEM is installed for EIAM Host Name, click Update.
6. Start the CA APM Configurator and open CA APM Web Services.
7. In CA APM Web Services, under Option 3, Choose Your Security Type, select EIAM with Single DB Login.
8. Enter the host name of the computer on which CA EEM is installed for EIAM Host Name, click Update.
9. Exit from CA APM Configurator.
10. Reset Microsoft Internet Information Server (IIS) by opening the Windows command prompt window and entering iisreset.
11. Restart the following Windows services:
    - UAPM Cache Service
    - UAPM Tomcat Service
    - CA Catalog Component

Step 4 - Update CA APM Web Services in CA Service Catalog Configuration

Update the CA APM Web Services in CA Service Catalog Configuration.

Follow these steps:

1. Log in to CA Service Catalog as a user with the Service Delivery Administrator role.
2. Click **Administration**, **Configuration**, **CA APM Web Services**.

3. Click on Modify icon for **Host Name** property and update CA APM Application Server Host Name.

4. Click on Modify icon for **Port Number** property and update CA APM Web Services Port Number.

5. Save these configurations.

6. Restart CA Service Catalog Service.

Step 5 - (Optional) Create New Rules and Actions

You may need to create new rule actions in CA Service Catalog to enable the integration with CA Asset Portfolio Management. As supplied, CA Service Catalog rules and actions can have only limited changes made by users. However, you can create new rules and actions, if required. For maximum efficiency, create new rules and actions by copying and modifying existing rules and actions. These steps illustrate how to copy and modify a predefined rule and its actions. You can optionally use these steps as a model to copy and modify other predefined rules and their actions.

Follow these steps:

1. Log in to CA Service Catalog as a user with the Service Delivery Administrator role.

2. Click **Administration**, **Events-Rules-Actions**.

3. Click the **Request/Subscription Item Change** event.

4. Click the Copy icon for the rule that you want to copy and modify, for example, the rule named **When Category is Hardware and Status is Pending Fulfillment**. The Copy icon apears in the icon columns next to the Description field.
   A dialog appears prompting you to enter the name of the new rule.

5. Enter the new name and click **OK**.
   You return to the Event Type Details page. The new rule is added to the list of rules for the event.

6. Click the Edit icon to edit the details of the rule, for example, its name, description, status, or event type.
   The Edit Rule page appears.

   a. Select Enabled in the Status drop-down list.
      The new rule is enabled. You must enable the new rule to activate it, because new rules are disabled by default.

   b. Update the remaining fields, as needed, to meet your requirements.

   c. Click OK.

   You return to the Event Type Details page.

7. Click the new rule to open it.
   The Rule Details and Actions page opens.
   The rule details that you modified earlier appear in read-only format.
   The actions for the rule also appear, so that you can view and modify them as needed: Actions that were enabled in the old rule are enabled in the new rule. Similarly, actions that were disabled in the old rule are disabled in the new rule.

8. (Optional) Add, edit, or copy the action.

9. When you are finished modifying actions, click Done to close the rule.
   You return to the Event Type Details page.

10. Locate the original rule that you copied and click the Disable button; this button appears on the Rules bar.
    The rule is disabled. Disabling the original rule is important to help prevent duplicate rules and actions from being triggered.

Step 6 - Create a Service and Request

A required task of integrating CA Asset Portfolio Management and CA Service Catalog is creating at least one service and request that use the features enabled by the integration.

Follow these steps:

1. Define a Service using a service option group
   As part of defining the service option group, do the following from the Options tab of the service option element:

   a. Ensure that Track As An Asset is checked.

   b. Specify the same category for the service option element as you specified in the rule condition associated with the service.
      For example, if you created a new rule and action (see page 3474) using the Hardware category, then you *must* create your service option group elements as Hardware Category. For more information about how to create service option groups, see the section Service Option Groups.

2. Log out of CA Service Catalog.

3. Log on to CA Service Catalog as the Catalog User created earlier.

4. Submit a request using the service that you defined earlier. The request will proceed through its life cycle.

5. Log out of CA Service Catalog.

6. Log on to CA Service Catalog as the Request Manager (Approver for the End User) that you created earlier.

7. Approve the request in the Pending Actions queue.

8. Log out of CA Service Catalog.

9. Log on to CA Service Catalog as the Service Delivery Administrator (Fulfiller) that you created in an earlier step.

10. To fulfill the request that you submitted in an earlier step, do the following:

    - Become familiar with the Assign Assets window.
    - Assign an Available Asset to a Requested Service Option.

Note: For more information about fulfilling requests, see the section Request Management from an Administrator Perspective (see page 2115).

Step 7 - Configure for Single Sign-On

You can optionally bypass user login by configuring CA Service Catalog and the CA products with which it integrates to use Single Sign-On.

To configure CA Asset Portfolio Management to use Single Sign-On, see Maintaining Security (see page 1570).

Similarly, to configure CA Service Catalog to use Single Sign-On, configure it to use either CA SiteMinder (see page 3425) or NTLM authentication on Windows.

Verify the CA Asset Portfolio Management - CA Service Catalog Integration

This article contains the following topics:

When you are viewing the Fulfill Request or Edit Request window (and the request is past the approval phase of its life cycle), you may see the Assigned Assets gold brick icon in the Actions column for a requested service option. The gold brick icon indicates this service option is eligible to have one or more assets assigned to it from available inventory.

To search available inventory, click the Assigned Assets gold brick icon. The CA APM Assign Assets window appears. By default, the Assigned Assets action is selected so the list of assets already assigned to the requested service option appears.

Using the Assign Assets window, you can do the following:

- View the list of assets assigned to the requested service option by selecting Assigned Assets in the Actions list

- Search for and assign assets to the requested service option
- Indicate that an available asset could not be found in inventory
- Display assigned assets and remove the assignment

Associate a CA APM Model with a Service Option

This information is available during workflow-driven fulfillment and can be useful if CA APM assets are automatically created or assigned to the request.

Follow these steps:

1. Click Catalog, Service Offerings.
2. Click the Option Groups tab.
3. Select any service option group and click the Definition tab.
4. Click the CA APM Model icon.
5. Click Assign Models to display the UAPM Model Assignments window and perform the following actions:
   - **View Assigned Models**
     Select Assigned Models from the Action list.
   - **Assign Models**
     Select Assign from the Action list. You can search for both active and inactive CA APM models that match the criteria you enter and check the ones you want to assign to the service option. Click Assign Models to save the assignment.

     Note: To search for both active and inactive CA APM models, before running the search, do not select the option to include only active records.
   - **Remove Assigned Models**
     Select View Assigned Models from the Action list. Check the models you want to remove from the Assigned Models list and click Remove Assignment.
6. Click Go.
   The Assign Models window is closed.

Assign an Available Asset to a Service Option for Software

Use the Search for Assets section of the Assign Assets window to search for available assets and assign one or more of them to the requested service option for software. Doing so is required to fulfill a service option for software.

Follow these steps:

1. Select an asset in the Search Results List to assign to the requested service option.
   The Asset window appears for the selected asset.

2. Navigate to the Entitlements for the Software asset and select an entitlement to assign or create a new entitlement.

3. Click the Assign and Save button.
   The Asset page refreshes and displays a confirmation message.

4. Click the Refresh button on the CA Service Catalog Fulfill Request window.
   The service option status is changed.

Note: Do not change the status manually. After the Assign Assets window changes the status of the requested service option, you may no longer be assigned a fulfillment task for that service option. Therefore, you may no longer permitted to change its status.

Assign an Available Asset to a Service Option for Hardware

Use the Search for Assets section of the Assign Assets window to search for available assets and assign one or more of them to the requested service option for hardware. Doing so is required to fulfill a service option for hardware.

Follow these steps:

1. Select an asset in the Search Results List to assign to the requested service option.
   The Asset window appears for the selected asset.

2. Click the Assign button.
   The Asset page refreshes and displays a confirmation message.

3. Click the Refresh button on the CA Service Catalog Fulfill Request window.
   The service option status is changed.

Note: Do not change the status manually. After the Assign Assets window changes the status of the requested service option, you may no longer be assigned a fulfillment task for that service option. Therefore, you may no longer permitted to change its status.

Mark a Requested Service Option as Not Filled From Inventory

If you have used the Assign Assets window to search the available asset inventory and have been unable to find an eligible asset, you can indicate that the requested service option could not be filled from inventory.

Follow these steps:

1. Click the Not Assigned From Inventory button.
   The status of the requested service option is automatically changed to Not Filled From Inventory.

   Note: You must have conducted an asset search for the Not Assigned From Inventory button to appear.

2. Click the Refresh button on the CA Service Catalog Fulfill Request window.
   The service option status is changed.

   Note: Do not change the status yourself since once the Assign Assets window changes the status of the requested service option you may no longer be assigned a fulfillment task for that service option and therefore no longer permitted to change its status.

Remove Asset Assignment

If an asset has been incorrectly assigned to a requested service option, you can remove the incorrect assignment. Click Remove Assignment from the Actions drop down list on the Assign Assets window. The list of assigned assets is displayed.

To remove the assignment for one or more non-Software assets assigned to the requested service option:

1. Select the check box for each asset in the Search Results List for which assignment is to be removed for the requested service option.

2. Complete the Asset Information section of the Assign Assets window.
   The assets for which assignment is to be removed are updated with the specified information.

   Note: If a field is left blank, the associated field on the assigned assets is set to blank. For more information on the meaning of the asset-related fields, see the CA APM documentation.

3. Click the Remove Assignment button.
   The Remove Assignment list of assigned assets is displayed. The status of the requested service option is not affected by a remove assignment.

To remove the assignment for a Software asset assigned to the requested service option

1. Select an asset in the Search Results List for which assignment is to be removed for the requested service option.
   The Asset window is displayed for the selected asset.

2. Navigate to the Entitlements for the Software asset and select an entitlement for which to remove the assignment.

3. Click the Remove Assignment and Save button.
   The asset is removed from the list of assigned assets. The status of the requested service option is not affected by a remove assignment.

How Assets Are Filtered During Fulfillment

By default, when a request reaches fulfillment, CA APM filters assets *only* according to models associated with service options.

You can optionally replace the default filtering with advanced filtering by issuing the equivalent custom query at the database console.

Example

For example, consider the following query:

```
update usm_configuration
set value =
'model=$model_ids$&loc=$loc_id$&org=$org_id$&dept=$dept_id$&ccenter=$costcenter$&tenan
t=$tenant_id$'
name = 'asset_fulfillment_url_params'
```

This query filter assets according to the following criteria:

1. Models: Associated to service option

2. Location: Location of the user

3. Organization: Organization of the user

4. Department: Department of the user

5. Cost Center: Cost Center of the user

6. Tenant: BU of the user

Integrate with Common Components Manually

This article contains the following topics:

- Integrate with CA Process Automation Integration for a Data Importer Process Manually (see page 3487)
- Integrate with CA Process Automation Integration for a Notification Process Manually (see page 3489)

Integrate CA Asset Portfolio Management with CA EEM Manually

Important! Review the following section only if you want to manually integrate CA Asset Portfolio Management with CA EEM when the automatic integration between the two has failed.

Execute the following commands in the computer where CA EEM is installed.

1. Log in to the product and navigate to Administration, System Configuration, EEM.
2. Enter in the EEM Backend field the name of the server where CA EEM is installed. On the server where CA EEM is installed, register CA APM with CA EEM using the following steps:
   a. From the Start menu, select Run and open a command prompt (cmd) window.
   b. In the command prompt window, change the directory to the folder safex_12.51.2.11_win32.
   This folder can be found in the following path:
   [ITAM Root Path]\ITAM\InstallConfig\AlleghenyInstallFiles\EEMSetup\

   Note: If this folder is not available, copy the EEMSetup folder from the server where CA APM is installed (using the same folder path).

   c. Execute the following command:

   ```
   safex.exe -h localhost -u EiamAdmin -p [EEM login password] -f
   "[ITAM Root Path]\ITAM\InstallConfig\AlleghenyInstallFiles\EEMSetu

   EEM_CASCM_APP_CREATION.xml"
   ```

   Note: Replace [EEM login password] and [ITAM Root Path] with the actual values.

3. On the server where CA EEM is installed, create a certificate user using the following steps:
   a. From the Start menu, select Run and open a command prompt (cmd) window.

b. In the command prompt window, change the directory to the folder safex_12.51.2.11 _win32.

   This folder can be found in the following path:

   [ITAM Root Path]
   \ITAM\InstallConfig\AlleghenyInstallFiles\EEMSetup\EEMCertutilities\

   Note: If this folder is not available, copy the EEMSetup folder from the server where CA APM is installed (using the same folder path).

   This folder contains the CA.Common.Data.dll configuration file.

c. In the CA.Common.Data.dll configuration file, specify the database details.

d. Execute the following command:

```
EEMCertUtilities.exe localhost APM eiamadmin [EEM login password]
uapmadmin
```

Integrate CA Asset Portfolio Management with CA Business Intelligence Manually

Important! Review the following section only if you want to manually integrate CA Asset Portfolio Management with CA Business Intelligence when the automatic integration between the two has failed. If you have any other earlier version of CA Business Intelligence, install CA Business Intelligence 4.1 SP3 and migrate the data from your earlier version (see page 285) for the reports to work.

The article contains the following topics:

CA Business Intelligence is a set of reporting and analytic software that several CA products use to present information and support business decisions. CA products use CA Business Intelligence to integrate, analyze, and present vital information that is required for effective enterprise IT management.

CA Business Intelligence installs SAP BusinessObjects Enterprise as a stand-alone product that provides a complete suite of information management, reporting, query, and analysis tools. The installation operates independently of any CA product, allowing the products to share CA Business Intelligence services.

CA products leverage an extensive set of business intelligence capabilities, including reporting, query, and analysis, using BusinessObjects Enterprise technology. CA Asset Portfolio Management provides predefined BusinessObjects Enterprise reports. For more information about the predefined reports, see Reports (see page 2428). CA Business Intelligence provides users with additional configurable reporting capabilities.

Important! Install CA Business Intelligence before you install CA Asset Portfolio Management.

Integrate CA APM and CA Business Intelligence

CA APM supplies the required data to get started with BusinessObjects Enterprise reports. After you install BusinessObjects Enterprise and CA APM, you perform required setup tasks before using reports. To integrate CA APM with BusinessObjects Enterprise, complete the following steps:

1. Follow these best practices when maintaining and using CA Business Intelligence:
   - Install and maintain one universe per CA product.
   - Do *not* modify the default universe. Instead, copy it and modify the copy. Otherwise, your changes can be erased when you apply service packs, patches, and other updates. Back up all your changes and then apply the patches to your customized universe.
   - Reports:
     - Verify that the services in Central Configuration Manager (CCM) is running, when the reports stop running.
     - Do not overwrite predefined reports.
     - Always use a predefined report as a base to build a custom report and maintain consistent formatting in all reports.
     - Administrators *can modify all the reports and can create* new reports that are based on the existing universe. However, administrators must not add any reports to the existing folders.
     - Both administrators and end users *must not* change pre-defined reports. Any changes to those reports are applied to all other users using the same CA Business Intelligence instance. Instead, both administrators and end users must create their own custom folders, copy the reports there, rename them, and customize them.
     - Both administrators and end users must add new reports that they create to their custom folders.
2. Become familiar with BusinessObjects Enterprise, including the documentation, so that you can administer and use the product. You must be able to perform at least the following functions:

- Install CA Business Intelligence, which installs BusinessObjects Enterprise.
- Use predefined reports in BusinessObjects Enterprise.

3. Install CA Business Intelligence BusinessObjects Enterprise. Make a note of the following login credentials and connection information, that is required during the CA Asset Portfolio Management installation:
   - BusinessObjects Enterprise administrator ID
   - BusinessObjects Enterprise administrator password
   - BusinessObjects Enterprise Central Management Server (CMS) port. The CMS maintains a database of information about your BusinessObjects that you use with CA Business Intelligence. The default CMS port is 6400.
   - CA Business Intelligence Server Name
4. If you use MS SQL as the MDB, make sure you install Microsoft SQL Server Native Client (64-bit) on the server where CA Business Intelligence is installed.
5. If you use Oracle as the MDB, define an Oracle Net Service Name (64-bit) on the server where CA Business Intelligence is installed. Make a note of the NSN, which you are asked to enter during the CA Asset Portfolio Management installation.
6. Verify that BusinessObjects Enterprise is installed by logging into BI launch pad.
7. Install CA Asset Portfolio Management by using the CA Service Management Installer.
   a. Go to the CA Service Management Install path and locate the \filestore\BOXI\biconfig folder.
   b. Copy the contents of the biconfig folder on to the CA Business Intelligence computer.
   c. Create an XML file (with the contents of Example XML File (see page 3486)) and update this file, according to your requirements.

      Set the following parameters in your XML file:
      - Networklayer: OLE DB
      - RDBMS:
        - For Microsoft SQL Server: MS SQL Server 2008 or MS SQL Server 2012
        - For Oracle: Oracle Client
      - User name and password parameters for your database
        - For SQL Server: Use *sa* for the user name
        - For Oracle: Use *mdbadmin* for the user name

Note: These users have access to all required tables in the MDB.

- Path name of the CA_ITAM_Reporting.biar file on the CA Business Intelligence computer
- (For MS SQL Server only) Name of the database. For example, MDB
- (For Oracle only) Name of the NSN created previously in the data source parameters
- Server parameter: Computer name of your Oracle or SQL Server server

d. Open a Windows command prompt and navigate to the biconfig folder on the CA Business Intelligence computer and enter the following command:

```
biconfig -h "host" [-n "port"] -u "user" [-p "password"] -f "XML-c
```

The quotation marks (" ") *are* required as shown in the command. However, the brackets [ ] are *not* required; the brackets signify optional parameters.
The following parameters are required, unless noted otherwise.

- **host**
  Specifies the CA Business Intelligence Central Management Server (CMS) host.
- **port**
  (Optional) Specifies the CA Business Intelligence CMS port. The default is 6400.
- **user**
  Specifies the CA Business Intelligence CMS user.
- **password**
  Optional. Specifies the CA Business Intelligence CMS password.
- **XML-config-file-name**
  Specifies the path name of the XML file you modified.
  If the file resides in the biconfig folder, you can specify the file name only. Otherwise, specify the complete path name.
- **help**
  Optional. Displays the help for the biconfig utility.
  Enter *two* dashes to display the help.

Note: For more information about using biconfig, see the biconfig-readme.txt file in the biconfig folder.

e. Verify the Import as follows:

i. Review the biconfig.log file in the biconfig folder.
This file lists the status of the import. This file also includes error messages if the BIAR file is not imported successfully. A return code of zero (0) indicates a successful import.

ii. Log in to BI launch pad as a CA Business Intelligence administrator.

iii. Verify that you can view the CA Asset Portfolio Management Reports under Public Folders/CA Reports/CA Service Management/CA Asset Portfolio Management.

f. Specify a password for the uapadmin user in CA Business Intelligence. This password is empty by default.

8. Become familiar with and use the predefined reports. For more information about the predefined CA Asset Portfolio Management reports, see Reports (see page 2428).

Example XML File to Import BIAR

```
<?xml version="1.0"?>
<biconfig version="1.0">
<!-- Import BIAR file -->
<step priority="1">
<add>
<biar-file name="Specify path of CA_ITAM_Reporting.biar file on the CA Business
Intelligence computer">
<networklayer>OLE DB</networklayer>
<rdbms> <Specify the name of your RDBMS> </rdbms>
<username> <Specify sa (SQL Server) and mdbadmin (Oracle)> </username>
<password> <Specify the sa password or mdbadmin password> </password>
<datasource> <Database name (SQL Server) or NSN name created in data source
parameters (Oracle)> </datasource>
<server><Specify the Database Server name></server>
</biar-file>
</add>
</step>
<step priority="2">
<add-if-missing>
<user name="uapadmin">
<password mode="normal"><Specify the password for uapadmin user in CA Business
Intelligence></password>
<description>ITAM Admin User</description>
<password-expiry>false</password-expiry>
<can-change-password>true</can-change-password>
<change-password-on-next-logon>false</change-password-on-next-logon>
</user>
</add-if-missing>
</step>
<step priority="3">
<add-if-missing><membership>
<group>CA ITAM Administrators</group>
<user>uapadmin</user>
</membership>
</add-if-missing>
</step>
</biconfig>
```

Report Configurations and Product Updates

When you install updates to CA APM, the update process overwrites the existing product components. The update process may, in some cases, overwrite the reporting components. As a result, any reporting configurations you previously made may be lost. However, CA Technologies

provides you with a method to retain your report configurations when you apply CA Asset Portfolio Management updates. Follow the instructions in a CA Technologies-provided white paper, which you can open from http://ca.com/support.

Under Technical Support, navigate to the product page for CA Asset Portfolio Management. Search the Recommended Reading list for *White Paper: Reporting Components Upgrade and Version Control to Retain Customizations*. You can safeguard your report configurations by implementing the strategy that is outlined in the white paper.

Note: See CA Business Intelligence (https://docops.ca.com/display/CABI41SP3/CA+Business+Intelligence+Home) for information about configuring reports.

Integrate with CA Process Automation Integration for a Data Importer Process Manually

The article contains the following topics:

CA APM and CA Process Automation integrate to let you set up and configure a Data Importer process. This integration uses a sample data import XML file that you import into CA Process Automation and integrate with an overall process workflow. The Data Importer process launches the Data Importer and executes a data import.

Note: This integration uses CA Process Automation and a sample data import XML file that is company-provided. You can also use any other workflow provider to create your own overall workflow and Data Importer process.

How to Set Up the CA Process Automation Data Importer Process

Use the following steps to set up the Data Importer process:

1. Install CA APM and CA Process Automation.
2. Log in to the application server where you installed CA APM.
3. Access the following folder on the CA APM application server where the Storage Manager Service is installed.

   ```
   [ITAM Root Path]\Storage\Common Store\Import
   ```

4. Locate the Import_Automation_Workflow.xml file.
5. In CA Process Automation, import the Import_Automation_Workflow.xml file.

6. In CA Process Automation, integrate the Import_Automation_Workflow.xml into your overall process workflow.

7. In CA Process Automation, modify the settings for the Data Importer process parameters.

    a. Change the default Import Service URL to match your required setting.

    b. Change the default CA APM user ID and password to your own settings.

    c. Change the default data import name to match your data import.

    d. Specify the data file name that corresponds to your data import.

> **Note:** For information about using CA Process Automation, see the CA Process Automation documentation.

Modify CA Process Automation Workflow Process Parameters

After you install CA APM and CA Process Automation and import the Import_Automation_Workflow.xml file into CA Process Automation, the default workflow process parameters are defined in CA Process Automation. You can modify the default process parameters to include your required settings. You provide actual (hard-coded) values for the process parameters. You must verify that the values you enter are valid.

You can modify the process parameters in the main data set or in the individual process start request forms. The parameters that you specify for an individual process override the parameters in the main data set for that process.

Follow these steps:

> **Important!** CA APM and CA Process Automation do not validate the information that you enter for the parameters. You must verify that your input is valid and that you entered the data in the correct format.

1. Log in to CA Process Automation and navigate to the CA Process Automation client.

2. Enter the information for the Data Importer parameters. The following fields require explanation:

    - **ITAMImportServiceURL**
      Specifies the complete URL path where the Import Service is running.
      Example:

      ```
      http://server/ImportService/ImportService.svc
      ```

- **username**
  Specifies the CA APM user ID.

- **password**
  Specifies the CA APM user password.

- **Importname**
  Specifies the name of the data import that you want to execute.

- **FilePath**
  Specifies the complete path and name of the data file that is associated with your data import.
  Example:

```
C:\\CAITAMCostcenter.csv
```

3. Save the changes in CA Process Automation.

Note: For information about setting up a process in CA Process Automation, see your CA Process Automation documentation.

Integrate with CA Process Automation Integration for a Notification Process Manually

This article contains the following topics:

CA APM and CA Process Automation integrate to let you set up and configure a notification process that delivers notifications to specific recipients after a defined event occurs. CA APM provides email notification processes with the product. These processes are delivered in files that are included on the product installation media. You import the files into CA Process Automation and specify process parameters in CA Process Automation and CA APM.

How to Set Up the CA Process Automation Notification Process

Use the following steps to set up the email notification processes that are provided with CA APM.

1. Install CA APM and CA Process Automation.

2. In CA Process Automation, import the workflow provider notification process files (see page 3490).

3. In CA Process Automation, configure the mail server (see page).

4. In CA Process Automation, modify the settings for the workflow process parameters (see page).

    a. Change the default email address for the administrator (Admin_Email_To parameter) to specify your required setting.

    b. Change the default CA APM URL (ITAM_URL parameter) to specify your required setting.

    c. Change the default CA Process Automation URL (ITPAM_URL parameter) to specify your required setting.

    d. (Optional) Change any of the other parameters for which you want to specify your required settings.

5. In CA APM and CA EEM, permit CA APM users to use CA Process Automation (see page).

6. In CA EEM, create CA Process Automation user accounts for any non-CA APM users.

7. In CA APM, specify the workflow process parameters when you define an event.

> **Note:** For information about defining an event in CA APM, see Events and Notifications (see page 2376). For information about using CA Process Automation and CA EEM, see the CA Process Automation and CA EEM documentation (https://wiki.ca.com/display/eem1251/CA+Embedded+Entitlements+Manager+-+Source+Home).

Import the Workflow Provider Notification Process Files

CA APM provides default email notification process files. You import these files into CA Process Automation before you can set up and can configure email notifications in the products.

> **Note:** For more information about importing and working with the files, see the CA Process Automation documentation.

Follow these steps:

1. Log in to CA Process Automation as the administrator.

2. Navigate to the CA Process Automation client.

3. Locate the ITAM.xml file on the CA APM installation media using the following path:

    ```
    CD1\SetupFiles\ITPAM\
    ```

4. Import the ITAM.xml file into the **/** node.

Note: In CA Process Automation Release 3.1, you import the XML file from the client. In Release 4.0 SP1, you import the XML file from the Library tab.

Select the import options to set the imported versions as current and to make the imported custom operators and sensors available.
The notification process files are imported into the default /ITAM folder.

Configure the CA Process Automation Mail Server

To implement email notifications between CA Process Automation and CA APM, configure the mail server for CA Process Automation.

1. Log in to CA Process Automation as the administrator.
2. Navigate to the CA Process Automation client.
3. Navigate to the library browser.
4. Locate and lock the default environment.
5. Locate the alert module and clear the inherit check box.
6. Specify the SMTP (mail) server.
   Example: mail.company.com
7. Specify the From address.
   Example: admin@company2.com
8. Save the changes.
9. Unlock the default environment.
   The changes require a few minutes to take effect.

Note: You can send an email notification to an external email address if your SMTP (mail) server settings permit email delivery to the external address. Check your mail server settings to verify if you can send email to external addresses.

Modify CA Process Automation Workflow Process Parameters

After you install CA APM and CA Process Automation and import the notification process files into CA Process Automation, the default workflow process parameters are defined in CA Process Automation. You can modify the default process parameters to include your required settings. You provide actual (hard-coded) values for the process parameters. You must verify that the values you enter are valid.

You can modify the notification process parameters in the data set that applies to all notification processes or in the individual process start request forms. The parameters you specify for an individual process override the parameters in the main data set for that process.

Note: You specify some of the notification process parameters for the workflow provider when you define an event in CA APM. For more information about specifying process parameters in CA APM, see Workflow Provider Process Parameters (see page 2393).

To modify CA Process Automation workflow process parameters

Important! CA APM and CA Process Automation do not validate the information that you enter for the parameters. You must verify that your input is valid and that you entered the data in the correct format.

1. Log in to CA Process Automation and navigate to the CA Process Automation client.
2. In the ITAM folder, locate the data set that is named Dataset.
3. Enter the information for the parameters.
   The following fields require explanation:
   - **Ack_Interaction_Form_Full_Path**
     Full path to the file that contains the acknowledgment interaction form in CA Process Automation. The email notification recipient uses this form to acknowledge receipt of the notification. Each workflow process must have a unique user interaction form and a unique path to the form. You can find the acknowledgment interaction form files that are provided with the product in the folder that contains the processes and main data set (/ITAM or the folder where you imported the processes).
   - **Admin_Email_CC**
     Email address of the copy recipients for the email that is sent to the administrator when a notification error occurs.
   - **Admin_Email_To**
     Email address of the administrator for the email that is sent when a notification error occurs. Change the default value to your required setting.
   - **Log_Folder_Path**
     Full path of the error log file that is created when an error occurs with the notification process. If you do not specify a path, the log file uses the default CA Process Automation log file path.
   - **ITAM_Username**
     User name to log in to CA APM. CA Process Automation requires access to CA APM for information about notification recipients and escalation.

- **ITAM_Password**
  User password to log in to CA APM. CA Process Automation requires access to CA APM for information about notification recipients and escalation.

- **Admin_Email_Subject**
  Subject for the email that is sent to the administrator when a notification error occurs. This parameter can be set in the main data set or in the individual process start request form.

- **Admin_Email_Header**
  Header or introduction for the email that is sent to the administrator when a notification error occurs (for example, "Hello"). This parameter can be set in the main data set or in the individual process start request form.

- **Admin_Email_Footer**
  Signature for the email that is sent to the administrator when a notification error occurs (for example, "Thank You"). This parameter can be set in the main data set or in the individual process start request form.

- **Log_File_Name**
  Name of the error log file that is created when an error occurs with the notification process. The email that is sent to the administrator when a notification error occurs contains the log file name. If you do not specify a name, the log file uses the following default CA Process Automation log file name:

  ```
  process name_process instance number.log
  ```

- **ITAM_URL**
  CA APM URL that CA Process Automation uses to access CA APM for information about notification recipients and escalation. Change the default value to your required setting.
  Example:

  ```
  http://ITAMAPPSERVER:99/ITAMService/Service.asmx
  ```

- **ITPAM_URL**
  CA Process Automation URL that is included in the email notification message. Change the default value to your required setting.
  Example:

  ```
  http://PAMSERVER:8080/itpam
  ```

4. Save the changes in CA Process Automation.

Note: For information about setting up a notification process, see your workflow provider documentation.

Permit CA APM Users to Use CA Process Automation

The CA APM users who receive notifications need to access CA Process Automation to acknowledge the notifications. These users need to have permission to use CA Process Automation. You permit users to use CA Process Automation by performing steps in CA APM first and then in CA EEM. In CA APM you define and authorize users to log in to and use CA APM. In CA EEM, you permit the authorized CA APM users to use CA Process Automation.

To permit CA APM users to use CA Process Automation

1. Log in to CA APM.
2. Verify that both new users and existing users are authorized to log in to and use CA APM.

   Note: For information about defining and authorizing new users and authorizing existing users in CA APM, see Maintaining Security (see page 1570).

   The product defines and authorizes the CA APM users. CA EEM now includes the CA APM users in the list of available users.
3. Log in to CA EEM, selecting CA Process Automation from the application drop-down list.

   Important! You must select the CA Process Automation application when you log in to CA EEM to permit CA APM users to use CA Process Automation.
4. Select a CA APM user from the list of all users and click the application user details for the user.
5. Select a CA Process Automation user group for the user and save the selection.

   Note: For information about using CA EEM to add applications to user details, see this topic (https://wiki.ca.com/display/eem1251/Users) in the CA EEM documentation.

   The CA APM user can now access and use CA Process Automation.

Required Indicators and Multiple Line Text Fields for Parameters

The default notification processes that are delivered with the product contain the parameters that appear on the product Event Definition user interface and the parameters that you specify in the workflow provider. The default processes also contain XML formatting that lets you display a

required indicator and a multiple line text field on the product user interface. These items are not readily available from the workflow provider, and so they are specified in the process. In the CA Process Automation start request form for each default process, the following XML statement appears before the Description of each user interface parameter:

```
<FieldDescriptor><IsRequired>true_or_false</IsRequired><Length>number</Length><
/FieldDescriptor>
```

- **IsRequired**
  Specifies if the parameter is required (true) or not required (false). If the parameter is required, the product displays the standard required indicator on the user interface.
  Example: <FieldDescriptor><IsRequired>true</IsRequired></FieldDescriptor>

- **Length**
  Specifies the length of the parameter text entry field. To define a multiple line text field, specify a value greater than 255.
  Example: <FieldDescriptor><Length>275</Length></FieldDescriptor>

You can change the default notification processes that are delivered with the product, and you can also create your own new notification process. To include information about the required indicator and field length in your changed or new process, you must insert the XML statement before the Description of each user interface parameter in your process.

Note: If you are creating a new notification process, you must have a corresponding start request form for the process. For information about changing or creating notification processes, see your workflow provider documentation.

Reference

This section contains the following articles:

CA Service Desk Manager Reference Commands

This section contains CA Service Desk Manager reference commands.

Data Element Dictionary

This article contains the following topics:

Explains the definitions for the tables in the CA SDM database. The tables are found in schema (.sch) files. See the ddict.sch file in the $NX_ROOT/site directory (UNIX) or *installation-directory*\site directory (Windows) for the most current list of all database tables for your specific installation.

Important! Although several of the tables in this section are obsolete, for backward compatibility, or reserved for future use, it is important that you not delete these -- or any other table -- from the database schema. You can add new tables and add new fields /columns to the existing tables, but never delete any of the tables. Many applications access the mdb database, so deleting or modifying existing fields or tables could cause some applications to not function properly. Ensure that you follow supported schema modification best practices by using the Web Screen Painter.

admin_tree Table

Program control table used by CA SDM applications.

- **SQL Name** -- admin_tree
- **Object** -- ADMIN_TREE

Field	Data Type	Reference	Remarks
caption	STRING 50		
description	STRING 255		Specifies the textual description of this tree entry.
has_children	INTEGER		
id	INTEGER KEY		Unique (to the table) Numeric ID
kt_admin	INTEGER		
kt_ks_caption	STRING 50		
kt_ks_flag	INTEGER		
kt_manager	INTEGER		
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
parent_id	SREL		
resource	STRING 255		
sd_admin	INTEGER		

Animator Table

Program control table used by CA SDM applications

- **SQL Name** -- anima
- **Object** -- ANI

Field	Data Type	Reference	Remarks
a_act	INTEGER		
a_delta	INTEGER		
a_lock	STRING 200		
a_name	STRING 30 S_KEY		
a_org	LOCAL_TIME		
a_string	STRING 30		
a_time	LOCAL_TIME		
id	INTEGER KEY UNIQUE NOT_NULL		Unique (to the table) Numeric ID
t_method	STRING 30 S_KEY		
t_persid	STRING 30 S_KEY		
t_type	INTEGER		

Atomic_Condition Table

These define a single condition.

- **SQL Name** -- atomic_cond
- **Object** -- atomic_cond

Field	Data Type	Reference	Remarks
cond_code	STRING 500		
connecter	INTEGER NOT_NULL		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
description	STRING 240		Specifies the textual description of this condition.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
l_paran	INTEGER NOT_NULL		
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
lval	STRING 30 NOT_NULL	Act_Type_Assoc :: code	
operator	INTEGER NOT_NULL		
owning_macro	STRING 30	Spell_Macro::persid	
persid	STRING 30		Persistent ID (SystemObjectName:id)
r_paran	INTEGER NOT_NULL		
rval	STRING 50		
rval_assoc	STRING 30	Act_Type_Assoc :: code	
sequence	INTEGER NOT_NULL		Ordering

Attribute_Name Table

Provides corresponding user name for an object attribute. Default population for the table should set at_name and at_dflt to the same thing. The user sees and is able to modify only the at_name. at_dflt is used to restore the default name. at_desc could be user changeable or not. It is of use for identifying the attribute for an as yet unplanned user maintenance application. at_sys should never be seen by the user, nor should at_obj.

- **SQL Name** -- atn

Field	Data Type	Reference	Remarks
at_desc	STRING 240		Specifies the description of the attribute.
at_dflt	STRING 30		Specifies the default external name.
at_name	STRING 30		Specifies the user name for attribute.
at_obj	STRING 30	S_KEY	Specifies the system object name.
at_sys	STRING 30	S_KEY	Specifies the system name.
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL	KEY	Unique (to the table) Numeric ID

Audit_Log Table

Contains all audit log entries.

- **SQL Name** -- audit_log
- **Object** -- audlog

Field	Data Type	Reference	Remarks
analyst	Byte 16	ca_contact::uuid	Specifies the user whose update generated this audit record.**Note:** This is a foreign key.
attr_after_val	nvarchar (160)		Specifies the new value of the object's attribute that has changed.
attr_before_val	nvarchar (160)		Indicates the previous value of the object's attribute that has changed.
attr_name	nvarchar (80)		This is the object's attribute that has changed.
aud_opr	INTEGER		Indicates the type of operation that generated this entry, such as, update, insert, and delete.
audobj_name	nvarchar (10)		Used for tracking the object that has changed.
audobj_persid	nvarchar (30)		Used for tracking the object that has changed.
audobj_trkid	nvarchar (40)		Used for tracking the object that has changed.
audobj_uniqueid	nvarchar (30)		Used for tracking the object that has changed.
change_date	INTEGER		The change date value for this Audit_Log.
id	INTEGER		Specifies the unique (to the table) numeric ID.**Note:** This is a primary key.

Field	Data Type	Reference	Remarks
int1_rsrved	INTEGER		Reserved
int2_rsrved	INTEGER		Reserved
persid	nvarchar (30)		This is the Persistent ID (SystemObjectName:id).
str1_rsrved	nvarchar (25)		Reserved for future use by CA.

Behavior_Template Table

Each object includes a list of things to execute based on the state of the object. If no behavior is associated with the state transition then it simply controls whether the object can be transitioned to the state.

- **SQL Name** -- bhvtpl
- **Object** -- bhvtpl

Field	Data Type	Reference	Remarks
context_attrname	STRING 30		Specifies the attribute name, such as "state".
context_attrval	INTEGER		Specifies the attribute value.
context_type	STRING 30 NOT_NULL		Specifies information which determines whether the transition is valid for the consumercontext object. **Note:** For general use, the context_attrnamecontext_attrval pair was added. However, can't get the list of valid values very easily from the GUI so we've added an SREL to the object that context_attrnamecontext_attrval really represents. short name of object (eg. wf)
del	INTEGER NOT_NULL	Active_Boolean_Table:: enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
description	STRING 500		Specifies the textual description of this behavior template
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID

Field	Data Type	Reference	Remarks
last_mod_by	UUID	ca_contact:: uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
macro_condition	STRING 30	Spell_Macro :: persid	Specifies whether the macro executes.
object_id	INTEGER NOT_NULL		Specifies the id of creator object.
object_type	STRING 30 NOT_NULL		Specifies the short name of creator object.
persid	STRING 30		Persistent ID (SystemObjectName:id)
transition_errmsg	STRING 240		Specifies the text to display on failure.
transition_test	STRING 30	Spell_Macro :: persid	Specifies the condition.

Bop_Workshift Table

Workshift definition.

- **SQL Name** -- bpwshft
- **Object** -- wrkshft

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table:: enum	This is the Deleted flag:**0** -- Active**1** -- Inactive /marked as deleted
description	nvarchar (80)		Specifies the textual description of this workshift.
id	INTEGER		Unique (to the table) Numeric ID.
last_mod_by	Byte(16)	ca_contact:: uuid	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).**Note:** This is a primary key.
sched	nvarchar (1000)		Describes the schedule of this workshift.
sym	nvarchar (30)		Represents the symbolic value for this workshift.

BU_TRANS Table

Program control table used by Knowledge Management.

- **SQL Name** -- BU_TRANS
- **Object** -- BU_TRANS

Field	Data Type	Reference	Remarks
BU_DATE	LOCAL_TIME		
BU_PROCESSED	INTEGER		
BU_RATING	REAL		
DOC_ID	INTEGER	SKELETONS::id	
HIT_NO_VOTE	INTEGER		
HIT_ORIGIN	INTEGER		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
INDEX_ID	INTEGER	O_INDEXES::id	
User_slv	INTEGER		
Ticket_slv	INTEGER		
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
USER_ID	UUID	ca_contact::uuid	Specifies the UUID of the user id.
kd_duration	INTEGER		Specifies the duration of a specific event, such as how long a knowledge document was open.

Business_Management_Repository Table

Table that keeps track of CA NSM repositories used by Service Analyzer.

- **SQL Name** -- busrep
- **Object** -- bmrep

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
hostname	STRING 64 UNIQUE NOT_NULL		
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
nx_desc	STRING 40		
password	STRING 200		
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 60 UNIQUE NOT_NULL S_KEY		
userid	STRING 40		

Column_Name Table

Column Name list used by Web Screen Painter.

- **SQL Name** -- cn

Field	Data Type	Reference	Remarks
cn_desc	STRING 240		description of column
cn_dflt	STRING 30		default external name
cn_name	STRING 30		user name for column
cn_sys	STRING 30 S_KEY		system name
cn_table	STRING 30 S_KEY		system table name
del	INTEGER NOT_NULL		

Field	Data Type	Reference	Remarks
			Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID

Contact_Method Table

Defines contact method types. The cm_template field is a command string that gets executed as a script (with environment variables set) by the notify subsystem.

- **SQL Name** -- ct_mth
- **Object** -- cmth

Field	Data Type	Reference	Remarks
cm_template	nvarchar (240)		Specifies the method template.
del	INTEGER	Active_Boolean_Table::enum	Identifies the Delete flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted)
id	INTEGER		Specifies the primary key of this table, this is also a unique, numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Specifies the Contact method description.
persid	nvarchar (30)		Specifies the Persistent ID (SystemObjectName:id).
supports_smtp	INTEGER		Determines if the method supports SMTP email addresses.
sym	nvarchar (60)		Identifies the Contact method symbolic name.
write_file	INTEGER		Flag that indicates the following:**1** -- write output to the file

D_PAINTER Table

Tables to be used for Form Server and Screen Painter For the new GUI.

- **SQL Name** -- D_PAINTER

Field	Data Type	Reference	Remarks
CNTLID	INTEGER		id of the control
CNTLTYPE	INTEGER		type of control
DDID	INTEGER		data dictionary id
ENTITYID	INTEGER		entity type
EXTRA_L1	INTEGER		user-definable
EXTRA_L2	INTEGER		user-definable
EXTRA_L3	INTEGER		user-definable
EXTRA_S1	STRING 50		user-definable
EXTRA_S2	STRING 50		user-definable
EXTRA_S3	STRING 50		user-definable
FORMGROUP	STRING 50		group in which the form is contained
FORMID	INTEGER		id number of the form
FORMNAME	STRING 50		name of the form
FORMTYPE	INTEGER		type of form
ID	INTEGER UNIQUE NOT_NULL KEY		key ID
MAPBACK	STRING 30		data dictionary owner
PARENTID	INTEGER		control id of parent control
PREDEFINED	INTEGER		**0** -- Normal screen **2** -- Default screen
PROPLIST	STRING 1000		properties for the control
SECLEVEL	INTEGER		security level
TSTAMP	REAL		time stamp

Delegation_Server Table

List of servers that can be delegated from this one along with xport methods.

- **SQL Name** -- dlgsrvr
- **Object** -- dlgsrvr

Field	Data Type	Reference	Remarks
anon_userid	STRING 8		Specifies the anonymous userid.
appl_addr	STRING 48		Specifies the name or address of application.
default_assignee	UUID	ca_contact::uuid	Specifies the assignee for incoming tickets.
default_userid	STRING 8		Specifies the default userid.

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
metafile	STRING 256		Specifies the path to conversion metafile def.
nx_desc	STRING 40		Specifies the description.
password	STRING 16		Specifies the server password.
server	STRING 128		Specifies the server name or ip address.
sym	STRING 64 UNIQUE NOT_NULL S_KEY		Specifies the system name.
transport	INTEGER		

Controlled_Table Table

Program control table used by CA SDM applications.

- **SQL Name** -- ctab
- **Object** -- ctab

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_ Table:: enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER		Primary key to this table, it is a unique numeric ID.
nx_desc	nvarchar (40)		Specifies the Table description.
obj_name	nvarchar (30)		Specifies the Majic object name that corresponds to this table.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (30)		Represents the symbolic name of this controlled table.

EBR_SUFFIXES Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_SUFFIXES

- **Object** -- EBR_SUFFIXES

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
SUFFIX	STRING 50		

Priority Table

List of Priority entries. The priority reflects the time-frame in which a ticket must be resolved. For the ticket, it represents the highest priority of any problem attached to the ticket. Problem priorities are derived from the scope (impact) and severity of the problem.

- **SQL Name** -- pri
- **Object** -- pri

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Deleted flag that indicates the following:**0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER		Primary key of this table.
id	INTEGER		Specifies the unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Describes the priority.
service_type	nvarchar (30)	Service_Desc:: code	Classic Service Type. Foreign key to the code field of the srv_desc table.
sym	nvarchar (12)		Indicates the symbolic name for this priority.

Queued_Notify Table

Notifications that are queued due to workshifts are saved here.

- **SQL Name** -- not_que
- **Object** -- notque

Field	Data Type	Reference	Remarks
cmth_over ride	INTEGER		method over ride
	INTEGER 30		

Field	Data Type	Reference	Remarks
context_instance			Contains the persistent ID of the associated Activity Log for the notifications
context_persid	STRING 30		Contains the persistent ID of object for notification
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
internal	INTEGER		internal notification
msg_ack	STRING 40		message acknowledgment
msg_body	STRING 1000		message text
msg_body_html	STRING 32768		message text
msg_title	STRING 40		Msg header text
notify_level	INTEGER		notification level
persid	STRING 30		Persistent ID (SystemObjectName:id)
transition_pt	INTEGER		transition point

Quick_Template_Types Table

Quick_Template_Types - Reference table for quick template types.

- **SQL Name** -- quick_tpl_types
- **Object** -- quick_tpl_types

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER UNIQUE NOT_NULL		Enumerated value for this entry - specifies ordering in lists and relative values
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
nx_desc	STRING 40		Descriptive Info
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 30		Symbolic name of level

Remote_Ref Table

Remote References. Used for smart hooks. Determines what command to execute. Different command for UNIX and pc's using the same smart hook. Can apply security to smart hook.

- **SQL Name** -- rem_ref
- **Object** -- rrf

Field	Data Type	Reference	Remarks
description	STRING 500		Specifies the description of the command.
arch_type	STRING 12		Specifies the architecture to exec this on UNIX or PC. If empty, then all.
code	STRING 12 UNIQUE NOT_NULL S_KEY		Specifies the noneditable key for command.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1 --** Inactive/marked as deleted
exec_str	STRING 500		Specifies the string to execute on UNIX.
function_group	STRING 30		Specifies the function group for security.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
pcexec_str	STRING 500		Specifies the string to execute on pc.
sym	STRING 30 NOT_NULL		Specifies the name of command.

Response Table

Personalized response text used to simplify data entry when using the CA SDM applications.

- **SQL Name** -- response
- **Object** -- response

Field	Data Type	Reference	Remarks
chg_flag	INTEGER S_KEY		
cr_flag	INTEGER S_KEY		
del	INTEGER NOT_NULL		

Field	Data Type	Reference	Remarks
		Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
in_flag	INTEGER S_KEY		
iss_flag	INTEGER S_KEY		
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)
pr_flag	INTEGER S_KEY		
response	STRING 1000		response text
response_owner	UUID S_KEY	ca_contact::uuid	response owner
sym	STRING 50 NOT_NULL S_KEY		symbol

Rootcause Table

Reference table to denote the rootcause type used when resolving or closing a request, change order, or issue.

- **SQL Name** -- rootcause
- **Object** -- rc

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar(240)		Provides a textual description of this root cause.
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
sym	nvarchar(60)		Identifies the symbolic value for this Rootcause.

Rpt_Meth Table

Reporting methods used to display information within the CA SDM applications.

- **SQL Name** -- rptmth
- **Object** -- rptm

Field	Data Type	Reference	Remarks
description	STRING 80		Specifies the textual description of this reporting method.
def_pg_len	STRING 80		Specifies the page length default.
default_out	STRING 80		Specifies the output default.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
is_default	INTEGER		If set, this specifies the default reporting method.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
script	STRING 1000		
sym	STRING 30 NOT_NULL		

Reporting_Method Table

Reference table to denote how the contact with the customer occurred. Example: email, phone.

- **SQL Name** -- repmeth
- **Object** -- rptmeth

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag as follows:**0** -- Active**1** -- Inactive/marked as deleted
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (60)		Identifies the symbolic value for this Reporting Method.

Note_Board Table

Message board (announcements) on the main menu.

- **SQL Name** -- cnote
- **Object** -- cnote

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Boolean_Table:: enum	**0** -- Inactive **1** -- Active
close_date	LOCAL_TIME		Indicates when closed
cnote_type	INTEGER		Indicates the announcement type
control_group	UUID		Specifies the group to display to
del	INTEGER		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
internal	INTEGER		Internal Flag
loc_id	UUID	ca_location:: location_uuid	Indicates a pointer to location
organization	UUID	ca_organization :: organization_ uuid	Indicates a pointer to Organization
persid	STRING 30		Persistent ID (SystemObjectName:id)
posted_by	UUID	ca_contact::uuid	Specifies who posted the announcement
posted_date	LOCAL_TIME		Indicates the last modify time
text	STRING 4000		Indicates the message text

Prob_Category Table

Call Request call areas. Category of the issue that the customer is calling about. Can be hierarchical.

- **SQL Name** -- prob_ctg
- **Object** -- pcat

Field	Data Type	Reference	Remarks
id	INTEGER	UNIQUE NOT_NULL KEY	Unique (to the table) numeric ID.
persid	STRING (30)		Persistent ID (SystemObjectName:id)
del	INTEGER	NOT_NULL	Delete flag that indicates the following: **0** -- Active **1** -- Inactive/marked as deleted
sym	STRING (1000)	NOT_NULL S_KEY	Specifies the symbolic name of the request area.
last_mod_dt	LOCAL_TIME		Identifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
description	STRING (500)		Identifies the textual description of the call area.
organization	UUID	ca_organization	Foreign key to the id field of the ca_organization table, this is the Organization.
assignee	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this is the Assignee.
group_id	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this is the Group.
tcode	INTEGER		Deprecated
service_type	STRING (30)	Service_Desc	Foreign key to the code field of the srv_desc table, this is the Classic Service Type.
survey	INTEGER	Survey_Template	Foreign key of the id field of the survey_tpl table, this is the Survey.
schedule	INTEGER	Bop_Workshift	Deprecated
auto_assign	INTEGER		Represents the flag that enables auto assignment.

Field	Data Type	Reference	Remarks
owning_contract	INTEGER	Service_Contract	Foreign key to the id field of the svc_contract table.This is the Service Contract.
cr_flag	INTEGER		Represents the cr_flag status. When set to 1, this status is valid for requests.
in_flag	INTEGER		Specifies the Incident flag. When set to 1, the status is valid for Incidents.
pr_flag	INTEGER		Specifies the Problem flag. When set to 1, the status is valid for Problems.
suggest_knowledge	INTEGER		Specifies whether or not to suggest knowledge to users. **1** -- Suggest knowledge. **2** -- Do not suggest knowledge.
assignable_ci_attr	STRING (60)		Identifies the name of the attribute on a CI object that contains the grp contact that should be used to perform Category/CI auto group assignment.
flow_flag	INTEGER		Specifies the type of workflow:**0** -- Classic Workflow or none (default) **2** -- CA IT PAM
caextwf_start_id	INTEGER	caextwf_start_forms	Identifies the CA IT PAM process definition information to use when the user selects this category on a change order, issue, request.
tenant	UUID	ca_contact	
ss_include	INTEGER		Required. On new default: 0
ss_sym	STRING (128)		
category_urgency	INTEGER	Urgency	
sap_prop	INTEGER		

Product Table

Reference table to denote the product that the complaint relates to.

- **SQL Name** -- product
- **Object** -- prod

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Delete flag that indicates the following:**0** -- Active**1** -- Inactive/marked as deleted
id	INTEGER		Primary key of this table.
	byte(16)	ca_contact::uuid	

Field	Data Type	Reference	Remarks
last_mod_by			Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (60)		Specifies the symbolic value for this Product.

sa_agent_availability Table

Program control table used by Support Automation.

- **SQL Name** -- sa_agent_availability
- **Object** -- sa_agent_availability

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
agentID	UUID	ca_contact	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
status	INTEGER		
availEpoch	LOCAL_TIME		
clientSessionID	INTEGER	sa_login_session	
matchEpoch	LOCAL_TIME		
groupID	INTEGER	sa_group	
incidentCount	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Table_Name Table

Table name list used by CA SDM applications.

- **SQL Name** -- tn

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
tn_desc	STRING 240		description or table
tn_dflt	STRING 30		default external name
tn_name	STRING 30		user name for table
tn_sys	STRING 30 S_KEY		system name

usp_special_handling Table

The usp_special_handling table defines the characteristics of each special handling classification.

Attribute	Data Type	SREL References	Flags
alert_icon_url	STRING 1000		
alert_text	STRING 60		
autodisplay_notes	INTEGER		
del	INTEGER		NOT_NULL
description	STRING 4000		
escalate_urgency	INTEGER		
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
sym	STRING 60		NOT_NULL
tenant	UUID	ca_tenant	

usp_symptom_code Table

The usp_symptom_code table associates codes with a special handling classification.

Attribute	Data Type	SREL References	Flags
del	INTEGER		NOT_NULL
description	STRING 4000		
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
sym	STRING 60		NOT NULL
tenant	UUID	ca_tenant	

usp_tab Table

Information on Tabs used in the Role Based UI.

- **SQL Name** -- usp_tab
- **Object** -- tab

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
name	STRING (80)		Tab Name
display_name	STRING (80)		Text displayed on tab
code	STRING 30		Code
del	INTEGER	Active_ Boolean_ Table::enum	
description	STRING (255)		Description
menu_bar_obj	INTEGER	usp_menu_bar::id	Foreign key to the menu bar id field of the usp_menu_bar table.
web_form_obj	INTEGER	web_form::id	Foreign key to the web form id field of the usp_web_form table.

usp_ticket_type Table

The usp_ticket_type table lists the ticket types referenced by Action Object drop-down list (action_object) in the usp_mailbox_rule table.

Field	Data Type	Description
id	INTEGER UNIQUE KEY	Specifies the primary key of this table.
allow_mailbox	INTEGER	
code	STRING 30 UNIQUES_KEY	Specifies the REL_ATTR value of the table, and the distinct keyword for each ticket type that is recognized by some components
del	INTEGER	
sym	STRING 60	Specifies the symbolic value for the ticket type.
ticket_object	STRING 30	Specifies the Majic object for the ticket (cr, chg, or iss).
ticket_object_type	STRING 1	Specifies the Call_Request_Type field (R, I or P) for the cr object.

The following values are the defaults for the usp_ticket_type table:

id	code	sym	ticket_obj	ticket_obj_type
100	REQUEST	Request	cr	R
200	INCIDENT	Incident	cr	I
300	PROBLEM	Problem	cr	P
400	CHANGE	Change	chg	
500	ISSUE	Issue	iss	

usp_web_form Table

Information on Web Forms used in the Role Based UI.

- **SQL Name** -- usp_web_form
- **Object** -- web_form

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
name	STRING (80)		Tab Name
code	STRING 30		Code
del	INTEGER	Active_Boolean_Table::enum	
description	STRING (255)		Description
wf_resource	STRING (1024)		The URL to display the HTMPL form, Report, Go button resource or third party form.
wf_type	INTEGER		The type of the web form: **0** -- HTMPL **1** -- Report **2** -- Go Resource **3** -- Other
dflt_for_obj	STRING 30		For Go Resource type web forms only. Indicates that this Go Resource will override the role's default when displaying objects of this type (such as "Request", "Issue", "Change Order"). Only one Go Resource can be assigned a dflt_for_obj for each type.

usp_attr_control Table

A dependent_control object specifies the attribute name and locked or required value that activates dependent control.

- **SQL Name** -- usp_attr_control
- **Object** -- att_control

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE REQUIRED KEY
control	control	INTEGER REF	usp_dependent_control	
attrname	attrname	STRING 64		Identifies attribute name.
locked	locked	INTEGER		Identifies locked attribute.
required	required	INTEGER		Identifies required attribute.
last_mod_dt	last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
last_mod_by	last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
del		INTEGER	nn	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
tenant		UUID REF	ca_tenant	

usp_auto_close Table

The auto close object controls the automatic closure of a ticket (request, incident, problem, change order, issue). The usp_auto_close table lists the automatic closure settings. For each ticket type, you can define the number of business hours before the closure takes place. By definition, zero hours means that automatic closure is not implemented for the ticket type.

In an untenanted system only one active row is allowed in this table.

In a tenanted system, each tenant can have its own row and only one row is permitted. In addition, one active Public row is permitted for tenants that do not have a tenanted row. If a tenant does not have its own row of auto-close settings, and there is not an active Public row, the automatic closure feature is disabled for that tenant.

- **SQL Name** -- usp_auto_close
- **Object** -- auto_close

Label	Field	Description
id	INTEGER	Unique key

Label	Field	Description
sym	STRING 80	
cr_ach	INTEGER	
in_ach	INTEGER	
pr_ach	INTEGER	
chg_ach	INTEGER	
iss_ach	INTEGER	
description	STRING 255	
last_mod_dt	LOCAL_TIME	
last_mod_by	UUID REF	ca_tenant
del	INTEGER	nn
tenant	UUID REF	ca_tenant

usp_ci_window Table

The usp_ci_window table stores the associations between windows and configuration items.

- **SQL Name** -- usp_ci_window
- **Object** -- ci_window

Attribute	Data Type	SREL References
id		
nr_uuid	UUID	nr (object)
Window_id	ID	window (object)
producer_id	STRING	
persistent_id	STRING	
last_mod_by	SREL	cnt.id (http://cnt.id/)
last_mod_dt	DATE	

usp_email_type Table

The usp_email_type table lists the email types that are available for the Email Type drop-down list (email_type) in the usp_mailbox table.

Field	Data Type	Description
id	INTEGER UNIQUE KEY	Specifies the primary key of this table.
code	STRING 30 UNIQUE S_KEY	Specifies the code value for the email type.
del	INTEGER	
incoming	INTEGER	Specifies whether the email type is incoming or outgoing.
sym	STRING 60	Specifies the symbolic value for the email type.

The following values are the defaults for the usp_email_type table:

id	code	incoming	sym
100	NONE	1	NONE
200	IMAP	1	IMAP
300	POP3	1	POP3
400	SMTP	0	SMTP

usp_export_list_format Table

The usp_export_list_format table lists the file format that is used to export list results outside of CA Service Desk Manager.

- **SQL Name** -- usp_export_list_format
- **Object** -- usp_exlist_format

Label	Field	Description
id	INTEGER	Unique (to the table) Numeric ID.
file_extention	STRING	Specifies the active file format to export search list results. Excel (.xls) is currently supported.
mime_type	STRING	Specifies the internet media type.
xslt_name	STRING	Specifies the XSL file name on the server.
sym	STRING	Specifies the export file format.
delete_flag	INTEGER	Delete indicator.

usp_ical_alarm Table

- **SQL Name** -- usp_ical_alarm
- **Object** -- ical_alarm

Field	Data Type	Reference	Remarks
id	**INTEGER**		**Unique key**
del	INTEGER		
alarm_value	STRING 120		
sym	STRING 60		
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID REF	ca_contact	

usp_ical_event_template Table

- **SQL Name** -- usp_ical_event_template
- **Object** -- ical_event_template

Field	Data Type	Reference	
id	INTEGER		Unique key
del	INTEGER		NOT_NULL
obj_type	STRING 30		NOT_NULL
code	STRING 60		NOT_NULL
sym	STRING 60		NOT_NULL
start_date	STRING 30		NOT_NULL
end_date	STRING 30		
alarm	INTEGER	usp_ical_alarm	
categories	STRING 128		
summary	STRING 240		
description	STRING 4000		
url	STRING 4000		
extra_entries	STRING 4000		
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	

usp_owned_resource Table

Holds information about the owned resource.

- **SQL Name** -- usp_owned_resource
- **Object** -- usp_owned_resource

Attribute	DB Field	Data Type	SREL References	Flags
argis_id	nr_argis_id	STRING		
assoc_projex	assoc_projex	BREL	projex.id (http://projex.id/)	
audit_userid	audit_userid	LOCAL SREL	cnt	
assoc_in	assoc_in	QREL	cr	
assoc_pr	assoc_pr	QREL	cr	
bm_rep	nr_bm_rep	INTEGER	busrep id	
bm_label	nr_bmlabel	STRING		
bm_macro_smag	bm_macro_smag			

Attribute	DB Field	Data Type	SREL References	Flags
		LOCAL STRING 0		
bm_status	nr_bms	INTEGER	busstat status_no

warranty_start	nr_wrty_st_dt	LOCAL_TIME		
id	owned_resource_uuid	UUID		

USP_Preferences Table

Holds information about the CA SDM and Knowledge Management application preferences.

- **SQL Name** -- usp_preferences
- **Object** -- usp_preferences

Field	Data Type	Reference Remarks
ANALYST_ID	UUID	ca_contac t ::uuid
ARC_DOCS_TO_ DISPLAY	INTEGER	
ASSIGNEE	INTEGER	
AUTHOR	INTEGER	

Field	Data Type	Reference	Remarks
BU_RESULT	INTEGER		
CLASSIC_ RESULTSET_ CONTEXT	INTEGER		Specifies the Classic resultset context menu activation.
CREATED_VIA	INTEGER		
CREATION_DATE	INTEGER		Indicates the timestamp indicating when this record was created.
CURRENT_ACTION	INTEGER		
CUSTOM1	INTEGER		
CUSTOM2	INTEGER		
CUSTOM3	INTEGER		
CUSTOM4	INTEGER		
CUSTOM5	INTEGER		
CUSTOM_NUM1	INTEGER		
CUSTOM_NUM2	INTEGER		
DOC_ID	INTEGER		
DOC_TEMPLATE	INTEGER		
DOC_TYPE	INTEGER		
DOC_VERSION	INTEGER		
EXPIRATION_DATE	INTEGER		
GLOBALSD_ ACTIVE_ZONE	INTEGER		Specifies the status of the Global Service Desk Active Zone log reader:**0x01** -- Reduce popups**0x02** -- Close log reader
HITS	INTEGER		
ID	INTEGER NOT_NULL KEY		Specifies the numeric ID that is unique to this table.
INBOX_COUNTER	INTEGER		
INITIATOR	INTEGER		
ITEM	INTEGER		
KT_REPORT_ CARD_PAST_ DAYS	INTEGER		Indicates the Knowledge report card past_days status. This is a user-defined preference.
KT_REPORT_ CARD_SCREEN_ DEFAULT	INTEGER		Indicates the Knowledge report card screen default. this is a user-defined preference.
LAST_ACCEPTED_D ATE	INTEGER		
LAST_MOD_DT	LOCAL_TIM E		Indicates the timestamp for when this record was last modified.
MODIFY_DATE	INTEGER		

Field	Data Type	Reference	Remarks
ONE_B_DOC_ VIEW_MODE	INTEGER		
ONE_B_DOCS_TO_ DISPLAY	INTEGER		
ONE_B_HIDE_ DETAILS	INTEGER		
ONE_B_MATCH_ TYPE	INTEGER		
ONE_B_SEARCH_FI ELDS	INTEGER		
ONE_B_SEARCH_O RDER	STRING 255		
ONE_B_SEARCH_TY PE	INTEGER		
ONE_B_WORD_ PARTS	INTEGER		
OWNER	INTEGER		
PRIMARY_INDEX	INTEGER		
PRIORITY	INTEGER		
PRODUCT	INTEGER		
PUBLISHED_DATE	INTEGER		
REVIEW_DATE	INTEGER		
SD_ACCEPTED_ HITS	INTEGER		
SD_IMPACT	INTEGER		
SD_PRIORITY	INTEGER		
SD_ROOTCAUSE	INTEGER		
SD_SEARCH_ FIELDS_CR	INTEGER		Specifies the CA SDM and Knowledge Management search fields for requests.
SD_SEARCH_ FIELDS_ISS	INTEGER		Specifies the CA SDM and Knowledge Management search fields for issues.
SD_SEVERITY	INTEGER		
SD_URGENCY	INTEGER		
START_DATE	INTEGER		
STATUS	INTEGER		
SUBJECT_EXPERT	INTEGER		
USER_DEF_ID	INTEGER		
WEB_LAST_LOGIN	LOCAL_TIM E		Indicates the time of the last web login.
	INTEGER		Specifies the maximum height for pop-up1.

Field	Data Type	Reference	Remarks
WEB_POPUP1_ HEIGHT			
WEB_POPUP1_ WIDTH	INTEGER		Specifies the maximum width for the Web pop-up1.
WEB_POPUP2_ HEIGHT	INTEGER		Specifies the medium Web pop-up2 height.
WEB_POPUP2_ WIDTH	INTEGER		Specifies the Medium Web pop-up2 width.
WEB_POPUP3_ HEIGHT	INTEGER		Specifies the Small Web pop-up3 height.
WEB_POPUP3_ WIDTH	INTEGER		Specifies the Small Web pop-up3 width.
WEB_POPUP4_ HEIGHT	INTEGER		Specifies the extra Small Web pop-up height.
WEB_POPUP4_ WIDTH	INTEGER		Specifies the extra Small Web pop-up4 width.
WEB_ PREFERENCES	INTEGER		Indicates Web Preferences Flags.
WEB_SUPPRESS_T OUR	INTEGER		Specifies the Web suppressor tour flag: **1** -- Do not Suppress**2** -- Suppress tour page
WEB_TOOLBAR_ TAB	INTEGER		Indicates the initial toolbar tab.
WF_TEMPLATE	INTEGER		

usp_pri_cal Table

Stores priority calculation data.

- **SQL Name** -- usp_pri_cal
- **Object** -- pri_cal

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
name	STRING 80		NOT_NULL UNIQUE NOT_NULL S_KEY
description	STRING 1024		
del	INTEGER		NOT_NULL
in_flag	INTEGER	Boolean_Table	
pr_flag	INTEGER	Boolean_Table	
imp_def	INTEGER	Impact	
urg_def	INTEGER	Urgency	

Field	Data Type	Reference	Remarks
ci_imp	INTEGER	Boolean_Table	
cat_urg	INTEGER	Boolean_Table	
bk_window	INTEGER		
cnt_vip	INTEGER		
pri_5_4	INTEGER	Priority	
pri_5_3	INTEGER	Priority	
pri_5_2	INTEGER	Priority	
pri_5_1	INTEGER	Priority	
pri_5_0	INTEGER	Priority	
pri_4_4	INTEGER	Priority	
pri_4_3	INTEGER	Priority	
pri_4_2	INTEGER	Priority	
pri_4_1	INTEGER	Priority	
pri_4_0	INTEGER	Priority	
pri_3_4	INTEGER	Priority	
pri_3_3	INTEGER	Priority	
pri_3_2	INTEGER	Priority	
pri_3_1	INTEGER	Priority	
pri_3_0	INTEGER	Priority	
pri_2_4	INTEGER	Priority	
pri_2_3	INTEGER	Priority	
pri_2_2	INTEGER	Priority	
pri_2_1	INTEGER	Priority	
pri_2_0	INTEGER	Priority	
pri_1_4	INTEGER	Priority	
pri_1_3	INTEGER	Priority	
pri_1_2	INTEGER	Priority	
pri_1_1	INTEGER	Priority	
pri_1_0	INTEGER	Priority	
pri_0_4	INTEGER	Priority	
pri_0_3	INTEGER	Priority	
pri_0_2	INTEGER	Priority	
pri_0_1	INTEGER	Priority	
pri_0_0	INTEGER	Priority	
cap_reason	INTEGER	Boolean_Table	
last_mod_dt	LOCAL_TIME		

Field	Data Type	Reference	Remarks
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_tenant	

usp_properties Table

Provides a list of property/value pairs for CA SDM and Knowledge Management applications.

- **SQL Name** -- usp_properties
- **Object** -- usp_properties

The maximum number of characters (HTML or pure text) allowed in the document's resolution field is 32768 bytes by default. The system Administrator can set this limit based on the type of data being stored. The limit can be set from the Administration tab, Knowledge, Documents, Document Settings.

There is also a built-in limit of 32768 bytes for the document's pure text that will be indexed. If the resolution of a document is larger than the set limit, only the first 32768 bytes of the document will be indexed and the rest will be ignored.

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID.
auto_policies_last	Date		Displays the *last* date and time when automated policies were run on the server; stored in seconds, in UNIX time format.
auto_policies_next_ interval	Number		Identifies the number of days between automated calculation batches.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
notify_days_bef_doc_ exp	Number		Defines the number of days before the document expires and a notification is sent.
property_default	STRING 32768		Identifies the property default.
property_description	STRING 255		Identifies the property description.
property_name	STRING 100 S_KEY		Identifies the property name.
property_type	STRING 100		Identifies the property type.
property_value	STRING 32768		Identifies the property value.
suggest_knowledge_ for _issue_cats	INTEGER		Flag that determines whether or not to suggest knowledge to customers. **1** -- Suggest knowledge by default for all issue categories. **0** -- Do not suggest knowledge.

usp_notification_phrase Table

The usp_notification_phrase table lists common phrases that notification message templates can use.

- **S QL Name** -- usp_notification_phrase
- **Object** -- notification_phrase

Field	Data Type	References	Description
id	INTEGER UNIQUE KEY		Specifies the primary key of this table.
del	INTEGER REF		
last_mod_dt	LOCAL_TIME		Specifies the time stamp of when this record was last modified.
last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
code	STRING UNIQUES_KEY		Specifies the code name for the notification phrase that identifies the specific phrase when referenced in other text.
sym	STRING		Specifies the display name for the notification phrase.
description	STRING		Describes the notification phrase.
phrase	STRING		Specifies the phrase text to use for notification.

usp_organization Table

This table provides extensions to the ca_organization table that are used only by CA SDM products.

- **SQL Name** -- usp_organization
- **Object** -- org

Field	Data Type	Reference	Remarks
iorg_assigned_svr	INTEGER		Deprecated.
iorg_service_type	nvarchar(30)	Service_Desc::code	Foreign key to the code field of the srv_desc table, this is the Classic Service Type.
last_mod	INTEGER		Indicates the timestamp of when this record was last modified.
organization_uuid	byte(16)		Primary key. Unique identifier.
owning_contract	INTEGER	Service_Contract::id	Identifies the unique (to the table) numeric ID.

Form_Group Table

Listing of defined form groups.

- **SQL Name** -- fmgrp
- **Object** -- fmgrp

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (100)		Specifies the textual description of this form group.
id	INTEGER		Primary key of this table, it is a unique, numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
sym	nvarchar (30)		Specifies the symbolic value for this Form_Group.

True_False_Table Table

Contains localized True or False strings that display on the UI.

- **SQL Name** -- True_False_Table
- **Object** -- true_false

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY Unique to the table Numeric ID.
del	INTEGER		NOT_NULL Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER		NOT_NULL Enumerated value for this entry **0** -- False **1** -- True
sym	STRING 60		UNIQUE NOT_NULL S_KEY Identifies the symbolic value for this target
desc	STRING 40		Describes the enum

Access Level and Type

This article contains the following information:

Access_Levels Table

Access level definitions for CA SDM applications.

- **SQL Name** -- acc_lvls
- **Object** -- acc_lvls

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Deleted flag:**0** -- Active **1 --** Inactive/marked as deleted)
enum	INTEGER		Indicates the enumerated value for this entry, it specifies ordering in lists and relative values **Note:** This is a primary key.
id	INTEGER		Unique (to the table) Numeric ID.
nx_desc	nvarchar (40)		Specifies the description or access level.
persid	nvarchar (30)		Specifies the Persistent ID (SystemObjectName:id).
sym	nvarchar (12)		Specifies the symbolic name of the level.

Access_Type_v2 Table

Access type information for the CA SDM applications.

- **SQL Name** -- acctyp_v2
- **Object** -- acctyp

Field	Data Type	Reference	Remarks
access_level	INTEGER	Access_Levels::enum	Enumerated value for this entry, it specifies ordering in lists and relative values. **Note:** This is a foreign key.
config	INTEGER		Indicates that it is authorized for the configuration interface.
default_flag	INTEGER		Specifies the default flag value for this Access Type.

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_ Table::enum	Indicates the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted)
description	nvarchar (100)		Describes the textual description of this Access Type
external_auth	INTEGER		Allows external authorization for this Access Type.
grant_level	INTEGER	Access_Levels:: enum	Enumerated value for this entry, this specifies ordering in lists and relative values. **Note:** This is a foreign key.
id	INTEGER		Specifies the primary key of this table.
last_mod_by	Byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
ldap_access_ group	nvarchar (512)		Identifies the ldap access group value for this Access Type.
pin_field	nvarchar (50)		Specifies the field that contains the user's pin for pin type authentication.
sym	nvarchar (30)		Indicates the symbolic value for this Access Type.
user_auth	INTEGER		Identifies the user authentication type for this Access Type.
view_internal	INTEGER		Controls access to internal logs.
wsp	INTEGER		Indicates the Web Screen Painter authorization level.
cmdline_role	INTEGER	role::id	Specifies the id of the role that is used for command line utilities.
reporting_role	INTEGER	role::id	Specifies the id of the role that is used for reporting.
web_service_ role	INTEGER	role::id	Specifies the id of the role that is used for web services.
rest_web_servi ce_role	INTEGER	usp_role	

Activities

This article contains the following topics:

Act_Log Table

Act_Log is a history of activities associated with a call request. The types of activities are listed in the Act_Type table.

- **SQL Name** -- act_log
- **Object** -- alg

Field	Data Type	Reference	Remarks
action_desc	nvarchar (4000)		Provides the textual description of the activity log entry.
analyst	byte(16)	ca_contact::uuid	Foreign key to the Contact that created this activity log entry.
call_req_id	nvarchar (30)	Call_Req::persid	This is the Persistent ID (SystemObjectName:id).
description	nvarchar (4000)		Indicates the textual description of this Activity Log.
id	INTEGER		Identifies the unique (to the table) numeric ID.
internal	INTEGER		Marks this as Internal log.
knowledge_session	nvarchar (80)		Indicates the reference to a knowledge tool session.
knowledge_tool	nvarchar (12)		Specifies the Knowledge tool used for this activity.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id).
system_time	INTEGER		Indicates the Date and Time of record creation.
time_spent	INTEGER		Specifies the time spent on this activity by the user.
time_stamp	INTEGER		Specifies the Date and Time of the user activity.
type	nvarchar (12)	Act_Type::code	(Not Used) Specifies the acknowledgement, which is a noneditable string enum.**Note:** This is a foreign key.

Act_Type Table

Identifies the activities which may be used to create a history of a ticket. Controls the creation of the activity automatically, generates a notification to those contacts specified on the call request, and controls the notification level and message.

- **SQL Name** -- act_type
- **Object** -- aty

Note: Adding an activity type requires customization to allow the activity to be part of a ticket history.

Field	Data Type	Reference	Remarks
id	INTEGER		Indicates the numeric ID that is unique to this table.
persid	nvarchar (30)		Specifies the Persistent ID: (SystemObjectName:id).
code	nvarchar (12)		This is the primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the status of the Deleted flag:**0** -- Active**1** -- Inactive/marked as deleted
sym	nvarchar (60)		Describes the name of the activity.
description	nvarchar (500)		Specifies the textual description of this Activity Type.
flag1	INTEGER	Boolean_Table:: enum	Specifies the flag1 value: **1** -- Used by call requests.
flag2	INTEGER	Boolean_Table:: enum	Specifies the flag2 value: **1** -- Used by change requests.
flag3	INTEGER	Boolean_Table:: enum	Specifies the flag3 value: **1** -- Used by issues
flag4	INTEGER	Boolean_Table:: enum	Specifies the flag4 value: **1** -- Used by messages
flag5	INTEGER	Boolean_Table:: enum	Specifies the flag5 value: **1** -- Used by Knowledge Management
flag6	INTEGER	Boolean_Table :: enum	Specifies the flag6 value: **1** -- Used by Support Automation
krc_flag	INTEGER	Boolean_Table :: enum	Specifies the flag7 value: **1** -- Used by the Knowledge Report Card
sa_notif_flag	INTEGER	Boolean_Table :: enum	Specifies the flag8 value: **1** -- Used by Support Automation assistance sessions
cr_notifiy_info	nvarchar (30)		Specifies the request information link to macros for notify.
chg_notify_info	nvarchar (30)		Specifies the change order information link to macros for notify.
iss_notify_info	nvarchar (30)		Specifies the issue information link to macros for notify.
msg_notify_info	nvarchar (30)	Spell_Macro:: persid	Specifies the message information link to macros for notify.
kd_notify_info	nvarchar (30)		Specifies the knowledge document information link to macros for notify.

Field	Data Type	Reference	Remarks
kd_comment_ notify_info	nvarchar (30)		Specifies the knowledge document comment information link to macros for notify.
krc_notify_info	nvarchar (30)		Specifies the knowledge report card information link to macros for notify.
sa_notif_info	nvarchar (30)		Specifies the support automation information link to macros for notify.
cr_send_survey	INTEGER		Specifies the request information link to macros for notify.
cr_survey_ msgbody	Long Varchar		Specifies the body text of the survey.
cr_default_ survey	INTEGER	Survey_ Template	Specifies the default template used for the survey.
cr_survey_ msgtitle	nvarchar (80)		Specifies the title of the survey.
cr_survey_ method	INTEGER	Contact_ Method	Specifies the contact method used in the survey.
chg_send_ survey	INTEGER		
chg_survey_ msgbody	Long Varchar		Specifies the body text of the survey.
chg_default_sur vey	INTEGER	Survey_ Template	Specifies the default template used for the survey.
chg_survey_msg titl	nvarchar (80)		Specifies the title of the survey.
chg_survey_met hod	INTEGER	Contact_ Method	Specifies the contact method used in the survey.
iss_send_survey	INTEGER		
iss_survey_msgb ody	Long Varchar		Specifies the body text of the survey.
iss_default_surv ey	INTEGER	Survey_ Template	Specifies the default template used for the survey.
iss_survey_msgti tl	nvarchar (80)		Specifies the title of the survey.
iss_survey_meth od	INTEGER	Contact_ Method	Specifies the contact method used in the survey.
krc_send_survey	INTEGER		
krc_survey_ msgbody	Long Varchar		Specifies the body text of the survey.
krc_default_surv ey	SREL	svy_tpl	Specifies the default template used for the survey.
krc_survey_msgt itle	nvarchar (80)		Specifies the title of the survey.

Field	Data Type	Reference	Remarks
krc_survey_method	SREL	cmth	Specifies the contact method used in the survey.
sa_send_survey	INTEGER		
sa_survey_msgbody	Long Varchar		Specifies the body text of the survey.
sa_default_survey	SREL	svy_tpl	Specifies the default template used for the survey.
sa_survey_msgtitle	nvarchar (80)		Specifies the title of the survey.
sa_survey_method	SREL	cmth	Specifies the contact method used in the survey.
internal	INTEGER		Specifies the activity type:**0** -- User activity**1** -- Internal
last_mod_dt	DATE		Indicates the timestamp of when this record was last modified.
notify	INTEGER		Specifies whether to generate notifications:**0** -- No**1** -- Yes
notify_level	INTEGER	Notification_Urgency	Indicates the Notification level.
notify_ack	nvarchar (240)		Indicates the Notification message.
notify_body	Long nvarchar		Indicates the Notification message body.
notify_body_html	Long nvarchar		Specifies the Notification message body html.
notify_title	nvarchar (80)		Specifies the Notification message title.
ci_flag	INTEGER		Specifies the CI flag value.
cnt_flag	INTEGER		Specifies the contact flag value.
ci_notify_info	nvarchar (30)		
cnt_notify_info	nvarchar (30)		
rel_ticket	INTEGER		Specifies the related ticket of the activity.
single_tenant	UUID	ca_tenant	Specifies the UUID of the single tenant.
tenant_group	UUID	ca_tenant	Specifies the UUID of the tenant group.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Act_Type_Assoc Table

Maps a field of an object we want to do activity logging for to an Activity Type (Assignee field on a request is mapped to 'Transfer' Act_Type. All _rsrved fields are reserved for CA and NOT FOR CLIENT USE)

- **SQL Name** -- atyp_asc
- **Object** -- act_type_assoc

Field	Data Type	Reference	Remarks
act_type	STRING 30	Act_Type::code	Associated activity type
code	STRING 12		UNIQUE NOT_NULL S_KEY
description	STRING 80		Textual description of this Act Type Association
id	INTEGER		Unique (to the table) Numeric ID UNIQUE NOT_NULL KEY
int1_rsrved	INTEGER		Flex field
int2_rsrved	INTEGER		Flex field
int3_rsrved	INTEGER		Flex field
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
log_me_f	INTEGER		Logging on/off flag
ob_type	STRING 30		Associated object type
ob_type_attr	STRING 50		Attribute name within associated object
persid	STRING 30		Persistent ID (SystemObjectName:id)
str1_rsrved	STRING 30		Flex fields - reserved for CA
str2_rsrved	STRING 30		Flex field
str3_rsrved	STRING 30		Flex field
sym	STRING 30 NOT_NULL		

Boolean

This article contains the following topics:

Active_Boolean_Table Table

Table to translate 0 and 1 for the del field on records.

- **SQL Name** -- actbool
- **Object** -- actbool

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		**0** -- Active **1** -- Inactive/marked as deleted
description	STRING 240		Textual description of this boolean value
enum	INTEGER NOT_NULL		Enumerated value for this entry
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
sym	STRING 12 S_KEY		

Active_Reverse_Boolean_Table Table

Table to translate 0 and 1 for the del field on records.

- **SQL Name** -- acrtbool
- **Object** -- actrbool

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		**0** -- Active **1** -- Inactive/marked as deleted
description	STRING 240		Specifies the textual description of this boolean value
enum	INTEGER NOT_NULL		Enumerated value for this entry
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
sym	STRING 12 S_KEY		

Boolean_Table Table

Table of boolean values that allows the customer to define the text associated with true and false.

- **SQL Name** -- bool_tab
- **Object** -- bool

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER NOT_NULL		

Field	Data Type	Reference	Remarks
			Enumerated value for this entry - specifies ordering in lists and relative values
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
nx_desc	STRING 40		
sym	STRING 12 UNIQUE NOT_NULL S_KEY		

Reverse_Boolean_Table Table

Reverse boolean lookup table.

- **SQL Name** -- rbooltab
- **Object** -- rev_bool

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER NOT_NULL		Enumerated value for this entry - specifies ordering in lists and relative values
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
nx_desc	STRING 40		
sym	STRING 12 UNIQUE NOT_NULL S_KEY		

Asset

This article contains the following topics:

Am_Asset_Map Table

Maps a CA Asset Management asset to an internal object am_domain_id and am_unit_id to form a unique AM asset identifier. NOT FOR CLIENT USE.

- **SQL Name** -- am_map
- **Object** -- am_asset_map

Field	Data Type	Reference	Remarks
am_dmuuid	STRING 64		AM DMUUID of asset
am_domain_id	INTEGER		AM asset domain identifier which created asset
am_server	STRING 64		AM name of UAM domain server
am_type	INTEGER		AM asset type **1** -- Computer **2** -- User
am_unit_domain_id	INTEGER		AM asset domain identifier of asset
am_unit_id	INTEGER		AM asset unit id
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
int1_rsrved	INTEGER		Reserved for CA
int2_rsrved	INTEGER		Reserved for CA
ob_persid	STRING 30		
ob_type	STRING 30		
persid	STRING 30		Persistent ID: SystemObjectName:id
str1_rsrved	STRING 80		Reserved for CA
str2_rsrved	STRING 80		Reserved for CA
version	INTEGER NOT_NULL		Internal version

Asset_Assignment Table

Describes a relationship between two assets. Each instance of this table is one parent-child arrangement.

- **SQL Name** -- hier
- **Object** -- hier

Field	Data Type	Reference	Remarks
hier_child	UUID NOT_NULL S_KEY	ca_owned_resource:: uuid	Specifies the child.
hier_license_num	STRING 40		Specifies the license serial number.
hier_log_date	LOCAL_TIME NOT_NULL		Specifies the time of assignment.
hier_parent	UUID NOT_NULL S_KEY	ca_owned_resource:: uuid	Specifies the parent.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
	UUID	ca_contact::uuid	

Field	Data Type	Reference	Remarks
last_mod_by			Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)

Archive and Purge

This article contains the following topics:

Archive_Purge_History Table

Historic information about archive/purge activities completed.

- **SQL Name** -- arcpur_hist
- **Object** -- arcpur_hist

Field	Data Type	Reference	Remarks
chd_obj_deleted	INTEGER		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
end_time	LOCAL_TIME		
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
obj_deleted	INTEGER		
persid	STRING 30		Persistent ID (SystemObjectName:id)
rule_name	STRING 30 NOT_NULL	Archive_Purge_Rule::persid	
start_time	LOCAL_TIME		

Archive_Purge_Rule Table

Rule definitions for the archive/purge engine.

- **SQL Name** -- arcpur_rule

- **Object** -- arcpur_rule

Field	Data Type	Reference	Remarks
add_query	STRING 240		
arc_file_name	STRING 240		
conf_obj_name	STRING 64		
days_inactive	INTEGER NOT_NULL		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
name	STRING 30 NOT_NULL UNIQUE NOT_NULL S_KEY		Specifies the text name of this item.
oper_type	INTEGER NOT_NULL		
persid	STRING 30		Persistent ID (SystemObjectName:id)
reoccur_interv	DURATION		
sched	STRING 30	Bop_Workshift :: persid	

Attached_Events Table

This article contains the following topics:

This table lists the actual attached events and their information.

- **SQL Name** -- att_evt
- **Object** -- atev

Field	Data Type	Reference	Remarks
	LOCAL_TIME		Time canceled

Field	Data Type	Reference	Remarks
cancel_time			
event_tmpl	STRING 30 NOT_NULL S_KEY	Events::persid	Specifies the persid for the attached event.
fire_time	LOCAL_TIME		Datetime event will fire.
first_fire_time	LOCAL_TIME		Datetime event first fired.
group_name	STRING 30		Group smag field.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
num_fire	INTEGER		Number of times the event fired.
obj_id	STRING 30 NOT_NULL		The persid of the object.
owning_ast	INTEGER	Attached_SLA::id	Owning ast object (CA Service Desk Manager Version 11.0).
persid	STRING 30		Persistent ID (SystemObjectName:id).
start_time	LOCAL_TIME		Datetime when the event was attached.
status_flag	INTEGER		
user_smag	STRING 200		User smag field
wait_time	DURATION		Time to wait before firing

Attached_SLA Table

Service Level Agreements associated to a ticket.

- **SQL Name** -- attached_sla
- **Object** -- attached_sla

Field	Data Type	Reference	Remarks
_mapped_chg	INTEGER	chg id	
_mapped_cr	STRING 30	Call_Req::persid	These are mostly required for advanced runtime queries.
_mapped_iss	STRING 30	issue persistent_id	
_mapped_iss_wf	INTEGER	isswf::id	
_mapped_wf	INTEGER	wf::id	
del	INTEGER NOT_NULL		

Field	Data Type	Reference	Remarks
		Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
last_ttv_upd	LOCAL_TIME		
map_sdsc	STRING 30 NOT_NULL	Service_Desc:: code	
persid	STRING 30		Persistent ID (SystemObjectName:id)
sla_viol_status	INTEGER		
ticket_id	INTEGER NOT_NULL S_KEY		
ticket_type	STRING 30 NOT_NULL		
time_to_ violation	LOCAL_TIME		
ttv_event	STRING 30	Attached_Events:: persid	

Attachment Table

Object Attachments. (5.0 version)

- **SQL Name** -- attmnt
- **Object** -- attmnt

Field	Data Type	Reference	Remarks
attmnt_name	STRING 240		Specifies the attachment name.
created_by	UUID	ca_contact::uuid	Specifies who created this attachment.
created_dt	LOCAL_TIME		Specifies when the attachments was created.
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
description	STRING 500		Specifies the textual description of this attachment.
exec_cmd	STRING 12	Remote_Ref:: code	Specifies the unix exec string (not currently used).
file_date	LOCAL_TIME		Specifies the date of the file.

Field	Data Type	Reference	Remarks
file_name	STRING 240		Specifies the server attachment filename.
file_size	INTEGER		Specifies the size of the file.
file_type	STRING 12		Specifies the file extension (not currently used).
folder_id	INTEGER	attmnt_folder::id	Specifies the folder id.
folder_path_ids	STRING 255		Specifies the folder path ids.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
inherit_permission_id	INTEGER		Specifies the folder ID where pgroup permissions come from.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
link_only	INTEGER	Boolean_Table :: enum	
link_type	String		If embedded image = EMBD_IMG, otherwise NULL
orig_file_name	STRING 240		original file name, URL or UNC
persid	STRING 30		Persistent ID (SystemObjectName:id)
read_pgroup	INTEGER	P_GROUPS::id	Specifies the group of groups eligible to read the document.
rel_file_path	STRING 512		Specifies the relative path to the file.
repository	SREL	Document_Repository::persid	Specifies the repository.
status	STRING 12		Specifies the attachment status (INSTALLED, INSTALL_FAILED, LINK_ONLY).
write_pgroup	INTEGER	P_GROUPS::id	Specifies the group of groups eligible to update the document.
zip_flag	INTEGER		Specifies if the file is zipped.

attmnt_folder Table

List of attachment repository locations.

- **SQL Name** -- attmnt_folder
- **Object** -- attmnt_folder

Field	Data Type	Reference	Remarks
description	STRING 500		Textual description of this attachment folder
folder_name	STRING 255		Specifies the folder name
folder_path_ ids	STRING 255		Specifies the folder path ids
folder_type	INTEGER		Specifies the folder type
has_children	INTEGER		Specifies if the folder has children
id	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
inherit_ permission_ id	INTEGER	attmnt_folder::id	Specifies the id of folder to inherit from
last_mod_ date	LOCAL_TIME		Specifies the last modify date
parent_id	SREL	attmnt_folder::id	Specifies the parent folder id
read_pgroup	INTEGER	P_GROUPS::id	Read p Group permissions of the attachment
repository	SREL	Document_ Repository:: persid	Specifies the repository pers id
write_pgroup	INTEGER	P_GROUPS::id	Write p Group permissions of the attachment
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Attachment

This article contains the following topics:

Attachment Table

Object Attachments. (5.0 version)

- **SQL Name** -- attmnt
- **Object** -- attmnt

Field	Data Type	Reference	Remarks
attmnt_name	STRING 240		Specifies the attachment name.
created_by	UUID	ca_contact::uuid	Specifies who created this attachment.
created_dt	LOCAL_TIME		Specifies when the attachment was created.

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
description	STRING 500		Specifies the textual description of this attachment.
exec_cmd	STRING 12	Remote_Ref:: code	Specifies the unix exec string (not currently used).
file_date	LOCAL_TIME		Specifies the date of the file.
file_name	STRING 240		Specifies the server attachment filename.
file_size	INTEGER		Specifies the size of the file.
file_type	STRING 12		Specifies the file extension (not currently used).
folder_id	INTEGER	attmnt_folder::id	Specifies the folder id.
folder_path_ids	STRING 255		Specifies the folder path ids.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
inherit_ permission_id	INTEGER		Specifies the folder ID where pgroup permissions come from.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
link_only	INTEGER	Boolean_Table :: enum	
link_type	String		If embedded image = EMBD_IMG, otherwise NULL
orig_file_name	STRING 240		Original file name, URL or UNC
persid	STRING 30		Persistent ID (SystemObjectName:id)
read_pgroup	INTEGER	P_GROUPS::id	Specifies the group of groups eligible to read the document.
rel_file_path	STRING 512		Specifies the relative path to the file.
repository	SREL	Document_ Repository::persid	Specifies the repository.
status	STRING 12		Specifies the attachment status (INSTALLED, INSTALL_FAILED, LINK_ONLY).
write_pgroup	INTEGER	P_GROUPS::id	Specifies the group of groups eligible to update the document.
zip_flag	INTEGER		Specifies if the file is zipped.

attmnt_folder Table

List of attachment repository locations.

- **SQL Name** -- attmnt_folder
- **Object** -- attmnt_folder

Field	Data Type	Reference	Remarks
description	STRING 500		Textual description of this attachment folder
folder_name	STRING 255		Specifies the folder name
folder_path_ ids	STRING 255		Specifies the folder path ids
folder_type	INTEGER		Specifies the folder type
has_children	INTEGER		Specifies if the folder has children
id	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
inherit_ permission_ id	INTEGER	attmnt_folder::id	Specifies the id of folder to inherit from
last_mod_ date	LOCAL_TIME		Specifies the last modify date
parent_id	SREL	attmnt_folder::id	Specifies the parent folder id
read_pgroup	INTEGER	P_GROUPS::id	Read p Group permissions of the attachment
repository	SREL	Document_ Repository:: persid	Specifies the repository pers id
write_pgroup	INTEGER	P_GROUPS::id	Write p Group permissions of the attachment
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

usp_lrel_attachments_changes Table

Relates attachments to change orders.

- **SQL Name** -- usp_lrel_attachments_changes
- **Object** -- lrel_attachments_changes

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chg	INTEGER	Change_Request	
attmnt	INTEGER	Attachment	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_attachments_issues Table

Relates attachments to issues.

- **SQL Name** -- usp_lrel_attachments_issues
- **Object** -- lrel_attachments_issues

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
iss	STRING 30	Issue	
attmnt	INTEGER	Attachment	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_attachments_requests Table

Relates attachments to requests, problems, or incidents.

- **SQL Name** -- usp_lrel_attachments_requests
- **Object** -- lrel_attachments_requests

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
cr	STRING 30	Call_Req	
attmnt	INTEGER	Attachment	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

Document_Repository Table

Contains Information on document repositories, which are used to store attachments.

- **SQL Name** -- doc_rep
- **Object** -- doc_rep

Field	Data Type	Reference	Remarks
description	STRING 500		Specifies the description.
archive_path	STRING 255		

Field	Data Type	Reference	Remarks
archive_type	INTEGER		
cgi_path	STRING 255		Specifies the location and name of CGI.
default_rep	INTEGER		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
file_limit_size	INTEGER		Specifies the file limit size.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)
prohibited_ext	STRING 500		Specifies the prohibited file extensions.
protocol	STRING 12		HTTP or SHARE
repository_type	INTEGER		Specifies the type of repository (attachments, knowledge).
retrieve_path	STRING 255		Specifies how to get back to upload_path via protocol.
server	STRING 30		Specifies the name of Doc Server.
servlet_path	STRING 255		Specifies the servlet URL.
sym	STRING 30 NOT_NULL S_KEY		Specifies the name of document repository.
upload_path	STRING 255		Specifies the server location of doc repository.

Company (CA MDB)

This article contains the following topics:

ca_company Table

Company information (CA-MDB).

- **SQL Name** -- ca_company

- **Object** -- ca_cmpny

Field	Data Type	Reference	Remarks
alias	nvarchar(30)		Identifies the Company alias or "also known as" name. For example, CA.
authentication_ password	nvarchar(20)		Specifies the authentication password.
authentication_ user_name	nvarchar(64)		Specifies the authentication user name.
bbs	nvarchar(30)		Identifies bulletin board system information.
company_name	nvarchar (100)		Identifies the company name.
company_type	INTEGER	ca_company_type::id	Identifies the Company Type or Vendor Provider. **Note:** This is the Foreign key to the id field of the ca_company_type table.
company_uuid	Byte (16)		The Primary key of this table.
creation_date	INTEGER		Indicates the date this record was created.
creation_user	nvarchar(64)		Identifies the user or process that created the record.
delete_time	INTEGER		Specifies the delete time.
description	nvarchar (400)		Shows the textual description of this entry.
exclude_registration	INTEGER		Indicates to exclude registration.
inactive	INTEGER	Active_Boolean_Table:: enum	Flag representing whether this record is active or inactive.**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Indicates the date that this record was last updated.
last_update_user	nvarchar(64)		Identifies the user or process that last updated the record.
location_uuid	Byte (16)	ca_location:: location_uuid	Identifies the location.**Note:** This is the Foreign key to the ca_location table entry.
month_fiscal_year_ends	INTEGER		Specifies the Integer value (1-12) representing the month the company's fiscal year ends.
parent_company_ uuid	Byte (16)	ca_company:: company_uuid	This is the Foreign key to the company_uuid field of the ca_company table for the company's parent company.

Field	Data Type	Reference	Remarks
primary_contact_ uuid	Byte (16)	ca_contact::uuid	Specifies the Primary contact. **Note:** This is the Primary foreign key to the ca_contact table.
source_type_id	INTEGER		Represents the Source type id.**Note:** This is the Foreign key to the ca_source_type table.
version_number	INTEGER		Specifies the version number for transaction integrity.
web_address	nvarchar(50)		Identifies the company web address.

ca_company_type Table

Company type information (CA-MDB).

- **SQL Name** -- ca_company_type
- **Object** -- vpt

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date this record was created.
creation_user	nvarchar (64)		Identifies the user or process that created the record.
description	nvarchar (255)		Provides the textual company type description of this entry.
id	INTEGER		Specifies the Primary key, this also identifies the unique company type numeric ID.
inactive	INTEGER	Active_Boolean_ Table::enum	Specifies Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that updated the record.
name	nvarchar (100)		Identifies the unique, company type name.
version_ number	INTEGER		Specifies the version number for transaction integrity

Contact (CA MDB)

This article contains the following topics:

ca_contact Table

Table of persons that interact with the system in some manner (CA-MDB).

- **SQL Name** -- ca_contact
- **Object** -- cnt

Field	Data Type	Reference	Remarks
admin_organization_uuid	Byte (16)	ca_organization :: organization_uuid	Identifies the Administrative Organization.**Note:** This is the Foreign key to the ca_organization table.
alias	nvarchar (30)		Identifies the Contact alias or "known as" name.
alt_phone_number	nvarchar (40)		Specifies the alternate phone number.
alternate_identifier	nvarchar (30)		Identifies the alternate contact (for example, the social security number).
comment	nvarchar (255)		Shows the text of the comment.
company_uuid	Byte (16)	ca_company::company_uuid	Identifies the Company.**Note:** This is the Foreign key to the ca_company table.
contact_type	INTEGER	ca_contact_type::id	Specifies the Contact type, such as: Customer, Analyst, and so on.**Note:** This is the Foreign key to the id field of the ca_contact_type table.
contact_uuid	Byte (16)		This is the Primary key, and is a unique identifier.
cost_center	INTEGER	ca_resource_cost_ center::id	Identifies the cost center.**Note:** This is the Foreign key to the id field of the ca_resource_cost_center table.
creation_date	INTEGER		Identifies the date that the record was created.
creation_user	nvarchar (64)		Specifies the user or process that created this record.
delete_time	INTEGER		Shows the time of deletion.
department	INTEGER	ca_resource_department::id	Identifies the department.**Note:** This is the Foreign key to the id field of the ca_resource_department table.

Field	Data Type	Reference	Remarks
email_address	nvarchar (120)		Identifies the email address.
exclude_registration	INTEGER		Indicates to exclude registration.
fax_number	nvarchar (40)		Identifies the fax number.
first_name	nvarchar (100)		Identifies the first name.
floor_location	nvarchar (30)		Identifies the floor location. (for example, the employee works on the first floor).
inactive	INTEGER	Active_Boolean_ Table::enum	Specifies the Active flag, as follows:**0** -- Active**1** -- Inactive
inrdid	INTEGER		Identifies the role ID.
job_function	INTEGER		Specifies the job function.**Note:** This is the Foreign key to ca_job_function table.
job_title	INTEGER	ca_job_title::id	Specifies the job title.**Note:** This is a Foreign key.
last_name	nvarchar (100)		(Required) Identifies the last name.
last_update_date	INTEGER		Shows the date this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated the record.
location_uuid	Byte (16)	ca_location::location_uuid	Specifies the location.**Note:** This is the Foreign key to the ca_location table entry.
mail_stop	nvarchar (30)		Identifies the mail stop.
middle_name	nvarchar (100)		Identifies the middle name.
mobile_phone_number	nvarchar (40)		Specifies the mobile phone number.

Field	Data Type	Reference	Remarks
organization_uuid	Byte (16)	ca_organization::organization_uuid	Specifies the Organization.**Note:** This is a Foreign key to the id field of the ca_organization table.
pager_email_address	nvarchar (120)		Identifies the pager email address.
pager_number	nvarchar (40)		Identifies the pager number.
pri_phone_number	nvarchar (40)		Identifies the primary phone number.
room_location	nvarchar (30)		Identifies the Room location (for example, the employee works in Cube 123).
supervisor_contact_uuid	Byte (16)	ca_contact::uuid	Identifies the Supervisor.**Note:** This is a Foreign key to the ca_contact table.
userid	nvarchar (100)		Specifies the User account id (for example, a company employee ID). This ID is unique for active records in order to prevent a user from retrieving the security settings of another user.
version_number	INTEGER		Version number for transaction integrity.

ca_contact_type Table

Definitions of type/classifications of personal information stored in the ca_contact table (CA-MDB).

- **SQL Name** -- ca_contact_type
- **Object** -- ctp

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date when this record was created.
creation_user	nvarchar (64)		Identifies the user or process that created this record.
delete_time	INTEGER		Specifies the delete time.
description	nvarchar (255)		Specifies the textual, contact type description.
exclude_registration	INTEGER		Indicates to exclude registration.
hourly_cost	Money		Specifies the hourly cost.

id	INTEGER		Unique (to the table), numeric contact type ID.**Note:** This is a Primary key.
inactive	INTEGER	Active_Boolean_Table::enum	Identifies the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Identifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique,contact type name.
user_uuid	UUID	ca_contact:: uuid	This is a unique identifier.**Note:** This is also the Primary key.
version_number	INTEGER		Version number for transaction integrity.
view_internal	INTEGER		Flag to represent whether this contact type is allowed to view internal data.

Job (CA MDB)

This article contains the following topics:

ca_job_function Table

Job function descriptions (CA-MDB).

- **SQL Name** -- ca_job_function
- **Object** -- job_func

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date when this record was created.
creation_user	nvarchar (64)		Specifies the user or process that created the record.
delete_time	INTEGER		Identifies the delete time.
description	nvarchar (255)		Specifies the Job function description.
exclude_registration	INTEGER		Indicates to exclude registration.
id	INTEGER		Identifies the unique (to the table) numeric job function ID.**Note:** This is a Primary key.

Field	Data Type	Reference	Remarks
inactive	INTEGER	Active_Boolean_Table::enum	Sets the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	varchar (64)		Identifies the user or process that last updated the record.
name	varchar (100)		Identifies the job function name.
version_number	INTEGER		Specifies the version number for transaction integrity.

ca_job_title Table

Job title descriptions (CA-MDB).

- **SQL Name** -- ca_job_title
- **Object** -- position

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar(64)		Identifies the user or process that created the record.
delete_time	INTEGER		Indicates the time of deletion.
exclude_registration	INTEGER		Indicates to exclude registration.
id	INTEGER		Identifies the unique (to the table) numeric job title ID.**Note:** This is a Primary key.
inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Indicates the date of when this record was last updated.
last_update_user	varchar (64)		Specifies the user or process that last updated the record.
name	varchar (100)		Specifies the job title name.
version_number	INTEGER		Specifies the version number for transaction integrity.

Organization

ca_organization Table

Used to describe a business, or associate businesses with smaller business units, or contacts to businesses.

- **SQL Name** -- ca_organization
- **Object** -- org

Field	Data Type	Reference	Remarks
abbreviation	nvarchar(30)		Identifies the abbreviation of the organization.
alt_phone_cc	INTEGER		Identifies the alternate phone number country code.
alt_phone_number	nvarchar(32)		Specifies the alternate phone number.
comment	nvarchar (255)		Shows the comment.
company_uuid	byte (16)	ca_company::company_uuid	Foreign key to the company_uuid field of the ca_company table representing the organization's company.
contact_uuid	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table representing the organization's primary contact.
cost_center	INTEGER	ca_resource_cost_center::id	Foreign key to the id field of ca_resource_cost_center table which represent this cost center.
creation_date	INTEGER		Identifies the date of when this record was created.
creation_user	nvarchar(64)		Identifies the user or process that created the record.
delete_time	INTEGER		Specifies the time of deletion.
description	nvarchar (255)		Indicates the description of the organization.
email_address	nvarchar (120)		Specifies the email address.
exclude_registration	INTEGER		Indicates to exclude registration.
fax_cc	INTEGER		Specifies the fax number's country code.
fax_number	nvarchar(32)		Identifies the fax number.

inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar(64)		Specifies the user or process that last updated this record.
location_uuid	byte (16)	ca_location::location_uuid	Foreign key to the location_uuid field of the ca_location table for the organization's parent location.
org_name	nvarchar (100)		Identifies the name of the organization.
organization_uuid	byte (16)		This is the Primary key for Organization.
pager_email_address	nvarchar (120)		Identifies the pager email address.
parent_org_uuid	byte (16)		Foreign key to the organization_uuid field of the ca_organization table for the organization's parent organization.
pri_phone_cc	INTEGER		Identifies the country code for the primary phone number.
pri_phone_number	nvarchar(32)		Identifies the primary phone number.
version_number	INTEGER		Specifies the version number for transaction integrity.

Model Definitions

ca_model_def Table

Model definitions for specific manufacturer/model combinations (CA-MDB).

- **SQL Name** -- ca_model_def
- **Object** -- mfrmod

Field	Data Type	Reference	Remarks
abbreviation	nvarchar(30)		Specifies the model abbreviation.
capacity	float		Defines the capacity.
capacity_unit	INTEGER		Defines the capacity unit.**Note:** This is the Foreign key to the id field of the ca_capacity_unit table.

Field	Data Type	Reference	Remarks
class_id	INTEGER	ca_resource_class::id	Foreign key to the id field of the ca_resource_class table for the class to which this model belongs.
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar(64)		Identifies the user or process that created the record.
current_as_of_ date	INTEGER		Specifies the date which represents the point at which the model information is considered current.
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Identifies the model description.
exclude_registration	INTEGER		Indicates to exclude registration.
family_id	INTEGER		Foreign key to the id field of the ca_resource_family table for the family to which this model belongs.
gl_code	INTEGER		Specifies the GL code.**Note:** This is the Foreign key to the id field of the ca_resource_gl_code table.
inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0** -- False (Active)**1 --** True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar(64)		Specifies the user or process that last updated this record.
manufacturer_uuid	byte (16)	ca_company::company_uuid	Foreign key to the company_uuid field of the ca_company table for the record that represents the manufacturer.
model_uuid	byte (16)		Specifies the model ID.**Note:** This is a Primary key.
name	nvarchar (100)		Identifies the unique Model name.
operating_system	INTEGER		Operating system.**Note:** It is a Foreign key to the id field of the ca_resource_operating_system table.
preferred_seller_uuid	byte (16)		Foreign key to the company_uuid field of the ca_company table for the record that represents the preferred seller company of this model.
subclass_id	INTEGER		Foreign key to the id field of the ca_resource_class table for the subclass to which this model belongs.
version_number	INTEGER		Indicates the version number for transaction integrity.

Resource

This article contains the following topics:

ca_resource_class Table

Definitions of the classifications that may be applied to an asset/resource.

- **SQL Name** -- ca_resource_class
- **Object** -- grc

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date the of when this record was created.
creation_user	nvarchar(64)		Identifies the user or process that created the record.
delete_time	INTEGER		Indicates the date of deletion.
description	nvarchar (255)		Specifies the class description.
exclude_registration	INTEGER		Indicates to exclude registration.
family_id	INTEGER	ca_resource_family::id	Primary key that is also the resource family id.
id	INTEGER		Primary key that is also the class id.
inactive	INTEGER	Active_Boolean_Table::enum	Sets the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Indicates the date the record was last updated.
last_update_user	nvarchar(64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique class name within family.

Field	Data Type	Reference	Remarks
parent_id	SREL		Foreign key back to the id field of the ca_resource_class table to allow for hierarchical class groupings (for example, subclass).
usp_nsm_class	INTEGER	buscls id	Represents the CA NSM class.**Note:** This is the Foreign key to the id field of the buscls table.
version_number	INTEGER		Specifies the version number for transaction integrity.

ca_resource_cost_center Table

An asset is associated with.

- **SQL Name** -- ca_resource_cost_center
- **Object** -- cost_cntr

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Identifies the date of when this record was created.
creation_user	nvarchar (64)		User or process that created the record.
delete_time	INTEGER		Specifies the time of deletion.
description	nvarchar (255)		Indicates the cost center description.
exclude_registration	INTEGER		Specifies to exclude registration.
id	INTEGER		Primary key that is also the cost center id.
inactive	INTEGER	Active_Boolean_Table::enum	Sets the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated this record.
name	nvarchar (100)		Identifies the unique cost center name.
version_number	INTEGER		Specifies the version number for transaction integrity.

ca_resource_department Table

Department that a resource is assigned to and associated with.

- **SQL Name** -- ca_resource_department

- **Object** -- dept

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar (64)		Indicates the user or process that created this record.
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Specifies the department description.
exclude_registration	INTEGER		Specifies to exclude registration.
id	INTEGER		Primary key that is also the resource department id.
inactive	INTEGER	Active_Boolean_Table ::enum	Sets the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique department name.
version_number	INTEGER		Specifies the version number for transaction integrity.

ca_resource_family Table

High level classification of a resource items, such as Computer, furniture, phone, software and so on.

- **SQL Name** -- ca_resource_family
- **Object** -- nrf

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar (64)		Indicates the user or process that created this record.
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Specifies the family description.
exclude_ registration	INTEGER		Specifies to exclude registration.
id	INTEGER		Primary key that is also the resource family id.

Field	Data Type	Reference	Remarks
inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0** -- False (Active)**1** -- True (Inactive)
include_reconciliation	INTEGER		Specifies the flag that indicates whether to include this family in reconciliation.
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique family name.
table_extension_ name	nvarchar (30)		Identifies the name of the associated table to hold extended data for this family.
version_number	INTEGER		Indicates the version number for transaction integrity.

ca_resource_gl_code Table

General ledger entry a resource is assigned to/associated with.

- **SQL Name** -- ca_resource_gl_code
- **Object** -- gl_code

Field	Data Type	Reference	Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar (64)		Indicates the user or process that created this record.
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Specifies the GL code description.
exclude_registration	INTEGER		Specifies to exclude registration.
id	INTEGER		Primary key that is also the resource GL code id.
inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0** -- False (Active) **1** -- True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique GL code name.
	INTEGER		

Field	Data Type Reference		Remarks
version_number			Indicates the version number for transaction integrity.

ca_resource_operating_system Table

Operating system a resource is assigned to/associated with.

- **SQL Name** -- ca_resource_operating_system
- **Object** -- opsys

Field	Data Type Reference		Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar (64)		Indicates the user or process that created this record.
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Specifies the operating system description.
exclude_registration	INTEGER		Indicates to exclude registration.
id	INTEGER		Primary key that is also the resource operating system id.
inactive	INTEGER	Active_Boolean_Table::enum	Specifies the Active flag, as follows:**0 --** False (Active) **1 --** True (Inactive)
last_update_date	INTEGER		Specifies the date of when this record was last updated.
last_update_user	nvarchar (64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique operating system name.
version_number	INTEGER		Specifies the version number for transaction integrity.

ca_resource_status Table

Status of a resource/asset.

- **SQL Name** -- ca_resource_status
- **Object** -- rss

Field	Data Type Reference		Remarks
creation_date	INTEGER		Specifies the date of when this record was created.
creation_user	nvarchar (64)		Indicates the user or process that created this record.

Field	Data Type	Reference	Remarks
delete_time	INTEGER		Indicates the time of deletion.
description	nvarchar (255)		Specifies the operating system description.
exclude_ registration	INTEGER		Specifies to exclude registration.
id	INTEGER		Primary key that is also the resource status id.
inactive	INTEGER	Active_Boolean_ Table::enum	Specifies the Active flag, as follows:**0** -- False (Active) **1** -- True (Inactive)
last_update_d ate	INTEGER		Specifies the date of when this record was last updated.
last_update_us er	nvarchar (64)		Specifies the user or process that last updated the record.
name	nvarchar (100)		Identifies the unique status name.
version_numb er	INTEGER		Indicates the version number for transaction integrity.

Tenant

This article contains the following topics:

ca_tenant Table

This table lists information about a tenant.

- **SQL Name** -- ca_tenant
- **Object** -- tenant

Column	Type	Remarks
id	UUID	ID
name	STRING 255	Specifies the tenant name.
tenant _numb er	STRING 30	Specifies the alternate tenant identification (customer comment; no OTB use)
service _provid er	INTEGER	**1** -- Service Provider tenant
contact	SREL cnt	Specifies the primary contact for the tenant .

Column	Type	Remarks
logo	STRING 255	Specifies the URL of the tenant logo.
description	STRING 1024	
phone_number	STRING 255	
fax_phone	STRING 255	
alt_phone	STRING 255	
location	SREL loc	Specifies the location of the tenant .
inactive	INTEGER	**1** -- tenant deleted
version number	INTEGER	Specifies the update version of this tenant (incremented whenever tenant is saved).
tenant	UUID (SREL tenant)	Always specifies the same value as the ID
ldap_tenant_group	STRING 512	Specifies the name of the LDAP group that corresponds to this tenant.
subtenants_ok	INTEGER	**1** -- tenant is allowed to have subtenants
fkey_group	UUID (SREL tenant_group)	Specifies the tenant group to which objects that belong to this tenant can reference. Same as the supertenant group. System-maintained (cannot be edited).
supertenant_group	UUID (SREL tenant_group)	Specifies the tenant group that includes the tenant and higher tenants in this hierarchy. Can include the service provider (if in the same hierarchy). System-maintained (cannot be edited).
subtenant_group	UUID (SREL tenant_group)	Specifies the tenant group that includes the tenant and lower tenants in this hierarchy. System-maintained (cannot be edited).
related tenant_group	UUID (SREL tenant_group)	Specifies the tenant group that includes all tenants in this hierarchy (includes the subtenant and supertenant groups). Can include the service provider (if in the same hierarchy). System-maintained (cannot be edited).
tenant_depth	INTEGER	Specifies the number of levels above the tenant in this hierarchy. System-maintained (cannot be edited).
parent	UUID	Specifies the tenant immediately above this tenant in the hierarchy.

Column	Type	Remarks
creation_user	STRING 64	Specifies the user ID of contact who created this tenant.
creation_date	INTEGER	Specifies the date of tenant creation (number of seconds after 0000 hours on 01/01/1970).
last_update_user	STRING 64	Specifies the user ID of contact who last updated this tenant.
last_update_date	INTEGER	Specifies the date of last update (number of seconds after 0000 hours on 01/01/1970).
terms_of_usage	UUID REF ca_tou	Specifies the terms of usage associated with the tenant.

ca_tenant_group Table

This table lists information about a tenant group.

- **SQL Name** -- ca_tenant_group
- **Object** -- tenant_group

Column	Type
id	UUID
name	STRING 255
description	STRING 1024

ca_tenant_group_member Table

This table lists information about a tenant group member.

- **SQL Name** -- ca_tenant_group_member
- **Object** -- tenant_group_member

Column	Type
id	UUID
tenant	SREL tenant
tenant_group	SREL tenant_group

g_tenant Table

Column	Type	Remarks
id	integer	
remote_sys_id	SREL Global_Servers	Required (NOT NULL)

Column	Type	Remarks
remote_id	UUID	Regional tenant id
tenant_name	STRING 255	

Call Request

This article contains the following topics:

Call_Req Table

Integration with call manager.

- **SQL Name** -- call_req
- **Object** -- cr

Field	Data Type	Reference	Remarks
active_flag	INTEGER	Boolean_Table ::enum	Sets the Active flag, as follows:**0** -- Inactive**1** -- Active
affected_rc	byte (16)	ca_owned_resource::uuid	Foreign key to the id field of the ca_owned_resource table. It identifies the asset.
assignee	byte (16)		Foreign key to the contact_uuid field of the ca_contact table. It identifies the assignee.
call_back_date	INTEGER		Specifies the call back timestamp for this request.
call_back_flag	INTEGER		Specifies the call back flag value for this request.
category	nvarchar(30)	Prob_Category ::persid	Foreign key to the persistent_id field of the prob_ctg table. This identifies the category.
change	INTEGER	chg ID	Foreign key to the ID field of the chg table. This is the associated change order.
caused_by_chg	INTEGER	Change_Request	Indicates the change request was caused by another change order.
charge_back_id	nvarchar(12)		Indicates the user-defined string field.

Field	Data Type	Reference	Remarks
close_date	INTEGER		Represents the timestamp of when this request was closed.
cr_tticket	INTEGER		Not used.
created_via	INTEGER	Interface::id	Foreign key to the id field of the interface table. Based on site-defined conditions, this reflects which interface created the request.
customer	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table. This identifies the Affected End User.
description	nvarchar (4000)		This is the textual description of this call request.
event_token	nvarchar(30)		Used by TNGeh_writer for message matching.
external_system_ticket	STRING 4000		
extern_ref	nvarchar(30)		(Deprecated) Specifies the trouble ticket associated with the call request.
group_id	byte (16)		Foreign key to the contact_uuid field of the ca_contact table, this represents the Assigned to Group ID.
id	INTEGER		Specifies the unique (to the table) numeric ID.
impact	INTEGER	Impact::enum	Foreign key to the enum field of the impact table, this identifies the impact of the request.
incident_priority	INTEGER		Specifies the computed incident priority if this is an ITIL incident.
incorrectly_assigned	INTEGER		Indicates that the incident is assigned incorrectly.
last_act_id	nvarchar(12)		Identifies the persid of the last activity.
last_mod_by	byte (16)		Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
log_agent	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table. This identifies who the request was reported by.
macro_predict_viol	INTEGER		Indicates that it is likely to violate its sla (boolean) for action macros to predict sla violations.
major_incident	INTEGER		Identifies the incident as a major incident.
open_date	INTEGER		Identifies the timestamp of when the request was created.

orig_user_admin_org	UUID	ca_organization	
orig_user_cost_center	INTEGER	ca_resource_cost_center	
orig_user_dept	INTEGER	ca_resource_department	
orig_user_organization	UUID	ca_organization	
outage_detail_ what	STRING 4000		Describes the outage details.
outage_detail_ who	STRING 4000		
outage_detail_ why	STRING 4000		Describes why the outage occurred.
outage_reason	INTEGER	Outage_Reason	Identifies the reason for the outage.
outage_type	INTEGER	Outage_Type	Identifies the type of outage.
parent	nvarchar(30)	Call_Req::persid	Foreign key to the persistent_id field of the call_req table to allow for hierarchical request groupings (for example, "parent/child").
pct_service_restored	INTEGER		Represents the percentage of service restored.
persid	nvarchar(30)		Identifies the Persistent ID (SystemObjectName:id).
predicted_sla_viol	INTEGER		Indicates that an sla violation has been predicted by Neugents: **1** -- Request
priority	INTEGER	Priority::enum	Foreign key to the enum field of the pri table, this indicates the priority of the call request.
problem	nvarchar(30)		Foreign key to the persistent_id field of the call_req table to allow for linking this incident to a problem.
ref_num	nvarchar(30)		Shows a visible reference number to the user.
requested_by	UUID	ca_contact	Identifies who requested the ticket.
remote_control_used	INTEGER		Indicates that remote control was used.

Field	Data Type	Reference	Remarks
resolvable_at_lower	INTEGER		Indicates that the ticket was resolved at a lower level.
resolve_date	INTEGER		Indicates the timestamp of when this request was resolved.
return_to_service	INTEGER		Indicates whether service is fully restored.
rootcause	INTEGER	Rootcause::id	Foreign key to the id field of the rootcause table. Specifies the root cause of the request.
sched_token	nvarchar (128)		Specifies the job scheduling token.
severity	INTEGER	Severity:: enum	Foreign key to the enum field of the Severity table, this identifies the severity of the Request.
sla_violation	INTEGER		If defined, this flags the request as follows:Template **1** -- Request has violated its sla
solution	nvarchar(30)	Call_Req:: persid	(Decrecated) Foreign key to the persistent_id field of the crsol table for old request solutions.
status	nvarchar(12)	Cr_Status:: code	Foreign key to the code field of the cr_stat table, this is the status of the problem.
string1	nvarchar(40)		Identifies the user defined string field.
string2	nvarchar(40)		Identifies the user defined string field.
string3	nvarchar(40)		Identifies the user defined string field.
string4	nvarchar(40)		Identifies the user defined string field.
string5	nvarchar(40)		Identifies the user defined string field.
string6	nvarchar(40)		Identifies the user defined string field.
summary	nvarchar (240)		Identifies the summary text.
support_lev	nvarchar(30)	Service_Desc ::code	Foreign key to the code field of the srv_desc table, this defines the Classic Service Type.
symptom_code	INTEGER	Symptom_Code	
template_name	nvarchar(30)	Cr_Template:: template_name	Foreign key to the template_name field of the cr_tpl table, this specifies the name of the request template.
caextwf_instance_id	INTEGER	caextwf_instances	

Field	Data Type	Reference	Remarks
			Indicates the CA Process Automation process instance id and process definition name and reference path launched by this Service Desk object.
tenant	UUID	ca_tenant	
outage_start_ time	LOCAL_TIME		
outage_end_time	LOCAL_TIME		
ticket_ avoided	INTEGER		**0** -- Do not search **10** -- Perform search **20** -- Open knowledge document **30** -- Ticket avoided by self-service
time_spent_sum	INTEGER		Specifies the sum of activity time spent.
type	nvarchar(10)	crt code	Foreign key to the crt table, this is the Request type.
urgency	INTEGER	Urgency:: enum	Foreign key to the enum field of the urgency table, this indicates the call request urgency.
target_start_last	LOCAL_TIME		Time when target timer started or restarted.
target_hold_last	LOCAL_TIME		Time of most recent ticket hold
target_hold_count	INTEGER		Number of times ticket went into a Hold status
target_resolved_last	LOCAL_TIME		Time of most recent ticket resolution
target_resolved_ count	INTEGER		Number of times ticket went into a Resolved status
target_closed_last	LOCAL_TIME		Time ticket was last closed
target_closed_count	INTEGER		Number of times that ticket was closed
affected_service	UUID	ca_owned_ resource	UNIQUE NOT_NULL KEY

Call_Req_Type Table

Stores codes used in Call_Req.type and the detail form names that should be displayed. This is used by the ITIL vertical market customizations to display alternative forms for cr_detail based on the value of Call_Req.type

- **SQL Name** -- crt

- **Object** -- crt

Field	Data Type	Reference	Remarks
code	nvarchar (10)Y		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
display_name	nvarchar (30)		The display name value for this Request type.
id	INTEGER		Specifies the unique (to the table) numeric ID.
nx_desc	nvarchar (30)		The description value for this Request type.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (30)		The symbolic value for this Request type.

Call_Solution Table

This table exists in the schema for backward compatibility only. Although there is an interface to it, you should not use this table at all; however, it is important that you not delete it from the schema.

- **SQL Name** -- crsol
- **Object** -- crsol

Field	Data Type	Reference	Remarks
description	STRING 500		Specifies the problem description.
cr_count	INTEGER		Specifies the call request usage count:**0** -- Yes**1** -- No call request usage count
cr_flag	INTEGER		Indicates the call request manager flag used by ITIL code.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Specifies the status of the Deleted flag:**0** -- Active**1** -- Inactive/marked as deleted.
id	INTEGER UNIQUE NOT_NULL KEY		Indicates the numeric ID that is unique to the table.
in_flag	INTEGER		Specifies the in_flag used by ITIL code.
last_mod_dt	LOCAL_TIME		Indicates the timestamp for when this record was last modified.
nx_desc	STRING 40		Specifies the name for prob_mgr cbox table.
persid	STRING 30		Indicates the Persistent ID:SystemObjectName:id
pr_flag	INTEGER		Specifies the pr_flag used by ITIL code.
	INTEGER		Indicates the status of solution approved.

Field	Data Type	Reference	Remarks
sapproved		Boolean_Table::enum	
sname	STRING 40		Specifies the solution name.
solution	STRING 1000		Specifies the solution description.
sym	STRING 60 NOT_NULL S_KEY		Specifies the symbol for the solution.
tcode	INTEGER		This field is no longer used.

Cr_Call_Timers Table

Call Request call timers. A stop watch with various thresholds that gives the help desk analyst a visual and audio indication of elapsed time.

- **SQL Name** -- crctmr
- **Object** -- ctimer

Field	Data Type	Reference	Remarks
beep	INTEGER		A beep indicator for then the threshold is reached:**0** -- No beep**1** -- Beep
color	STRING 12		Indicates the color of the timer at the start time.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Specifies the status of the Delete flag: **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		The ID unique (to the table) Numeric ID.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp for when this record was last modified.
persid	STRING 30		Identifies the Persistent ID (SystemObjectName:id).
text	STRING 240		Identifies the threshold text to display when the timer indicates elapsed time.
threshold	DURATION NOT_NULL		Identifies the threshold elapsed time.

Cr_Status Table

Call Request Status. Lists the states of the call request. May be added to at will. Allows the user to control whether the call request is active or inactive when it is changed to this status.

- **SQL Name** -- cr_stats

- **Object** -- crs

Field	Data Type	Reference	Remarks
active	INTEGER		Sets the Active flag, as follows:**0** -- Inactive**1** -- Active
code	nvarchar (12)		Primary key of this table.
cr_flag	INTEGER		When this flag is set to 1, this status is valid for Requests.
del	INTEGER	Active_Boolean_Table::enum	The Delete flag that indicates the following:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (500)		Identifies the textual description of the status.
hold	INTEGER		Sets the Hold flag, as follows:**0** -- Start events**1** -- Stop events
id	INTEGER		Unique (to the table) numeric ID.
in_flag	INTEGER		When this flag is set to 1, the status is valid for Incidents.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
pr_flag	INTEGER		When this flag set to 1, the status is valid for Problems.
resolved	INTEGER		Flag that indicates the following:**0** -- Not yet resolved**1** -- Resolved
sym	nvarchar (30)		Identifies the symbol of the Request status name.

Cr_Stored_Queries Table

Custom bin stored queries. System administrators may add to this table at will. Determines which queries may be used by help desk analysts to customize their scoreboard.

- **SQL Name** -- crsq
- **Object** -- crsq

Field	Data Type	Reference	Remarks
description	STRING 240		Specifies the textual description of this stored query.
code	STRING 12 UNIQUE NOT_NULL S_KEY		Specifies the non-editable handle for the query.

Field	Data Type	Reference	Remarks
count_url	STRING 240		Specifies the URL for counts, if obj_type=url.
criteria	STRING 240		Specifies the where clause for querying.
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	The deleted flag **0** -- active **1** -- inactive/marked as deleted)
id	INTEGER UNIQUE NOT_NULL KEY		Specifies the key (to the table) Numeric ID.
label	STRING 80		Specifies the label to display on the scoreboard.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp for when this record was last modified.
obj_type	STRING 30		Indicates the scoreboard, with the capability of having enough space to allow for expansions to accommodate the cr, tt, ir, and chg types.
persid	STRING 30		The Persistent ID (SystemObjectName:id).

Cr_Template Table

Request Template Table maps a template name to a Call_Req that will be used as a template.

- **SQL Name** -- cr_template
- **Object** -- cr_tpl

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_ Table::enum	The Delete flag that indicates the following:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (1000)		Shows the description of the template.
id	INTEGER		Identifies the nique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
quick_tmpl_type	INTEGER	Quick_Template_ Types::enum	Flag that indicates the following:**1** -- Quick tmpl**2** -- Quick tmpl+review
template		Call_Req::persid	Persistent ID (SystemObjectName:id).

Field	Data Type Reference	Remarks
	nvarchar (30)	
template_class	nvarchar (12)	Indicates to allow subclassing templates.
template_name	nvarchar (30)	Identifies the unique name of the template.

cr_trans Table

A transition object controls the current and next ticket status. The cr_trans table lists the status, new status, and actions that need to occur for a default transition.

- **SQL Name** -- cr_trans
- **Object** -- cr_trans

Label	Field	Description
id	INTEGER	Unique key.
status	SYMBOL	Specifies the current ticket status.
new_status	SYMBOL	Specifies the new ticket status
must_comment	INTEGER	Comment required when using a transition. On new default: 0
is_default	INTEGER	Default transition that appears when the Status field is empty. On new default: 0
condition	BOP_REF_STR_REF Macro	Site condition macro to approve transition.
condition error	STRING 255	Error message for site condition.
description	STRING 255	Description of this transition.
last_mod_dt	LOCAL_TIME	Timestamp of last update to this record.
last_mod_by	UUID REF ca_contact	User who last updated this.
del	INTEGER nn	Logical database delete status.
tenant	UUID REF ca_tenant	Reference to Tenant information.

Knowledge Management Tables

This article contains the following topics:

CI_ACTIONS Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_ACTIONS
- **Object** -- CI_ACTIONS

Field	Data Type	Reference	Remarks
ACTION_ORDER	INTEGER		
ACTION_TITLE	STRING 100		
ANALYST_ID	UUID	ca_contact::uuid	
GROUP_ID	UUID	ca_contact::uuid	
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
PREDEFINED	INTEGER		
STATUS_CURRENT_ID	INTEGER	CI_STATUSES::id	
UNPUBLISH	INTEGER		
UNRETIRE	INTEGER		
WF_TEMPLATE_ID	INTEGER	CI_WF_TEMPLATES ::id	

CI_ACTIONS_ALTERNATE Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_ACTIONS_ALTERNATE
- **Object** -- CI_ACTIONS_ALTERNATE

Field	Data Type	Reference	Remarks
ACTION_ID	INTEGER	CI_ACTIONS::id	
CONTACT_ID	UUID	ca_contact::uuid	
CONTACT_TYPE	INTEGER		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

CI_BOOKMARKS Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_BOOKMARKS
- **Object** -- CI_BOOKMARKS

Field	Data Type	Reference	Remarks
BOOKMARK_TITLE	STRING 100		
DOCUMENT_ID	INTEGER	SKELETONS::id	
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
USER_ID	UUID	ca_contact::uuid	

CI_DOC_LINKS Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_DOC_LINKS
- **Object** -- CI_DOC_LINKS

Field	Data Type	Reference	Remarks
DOC_ID1	INTEGER	SKELETONS::id	Specifies the parent ID.
DOC_ID2	INTEGER	SKELETONS::id	Specifies the child ID.
id	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
parent_child	INTEGER		Indicates the document has one of the following relationships with another document: **0** -- See also link **1** -- Parent Child Link
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

CI_DOC_TEMPLATES Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_DOC_TEMPLATES
- **Object** -- CI_DOC_TEMPLATES

Field	Data Type	Remarks
ID	INTEGER NOT_NULL KEY	Unique (to the table) Numeric ID
IS_DEFAULT	INTEGER	
IS_PREDEFINED	INTEGER	
KD ID	Long	Knowledge Document id that is used as a template for default values.
LAST_MOD_DT	LOCAL_TIME	Indicates the timestamp of when this record was last modified.
PAGE_HTML	STRING 32768	
TEMPLATE_NAME	STRING 255	

CI_DOC_TYPES Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_DOC_TYPES
- **Object** -- CI_DOC_TYPES

Field	Data Type	Reference	Remarks
DOC_TYPE_TXT	STRING 50		
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

CI_PRIORITIES Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_PRIORITIES
- **Object** -- CI_PRIORITIES

Field	Data Type	Reference	Remarks
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
PRIORITY	STRING 50		

CI_STATUSES Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_STATUSES
- **Object** -- CI_STATUSES

Field	Data Type	Reference	Remarks
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
PREDEFINED	INTEGER		
STATUS	STRING 50		
STATUS_DESCRIPTION	STRING 255		
STATUS_ORDER	INTEGER		

CI_WF_TEMPLATES Table

Program control table used by Knowledge Management.

- **SQL Name** -- CI_WF_TEMPLATES
- **Object** -- CI_WF_TEMPLATES

Field	Data Type	Reference	Remarks
ID	INTEGER KEY		Unique (to the table) Numeric ID
IS_DEFAULT	INTEGER		
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
WF_DESCRIPTION	STRING 255		
WF_NAME	STRING 255		

Doc_Versions Table

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- DOC_VERSIONS
- **Object** -- DOC_VERSIONS

Field	Data Type	Reference	Remarks
ID	INTEGER		Specifies the primary key.
doc_ID	INTEGER	skeletons::id	Specifies the SREL to the knowledge document object.
ver_count	INTEGER		Specifies the internal version ID that indicates the number of versions created (1, 2, 3, 4...)
ver_comment	STRING (2000)		Specifies the comment text.
start_date	DATE		Specifies the date when this version started.
end_date	DATE		Specifies the date when this version ended.
started_by	UUID		Specifies the user that created this version.
published_by	UUID		Specifies the user that published this version.
status_ID	INTEGER		Specifies the document version status.
ver_status	INTEGER		Specifies the previous version's status: **0** -- Existed **1** -- Archived **2** -- Deleted (this only relates to the resolution field)
title	STRING		Specifies the document version title.
summary	STRING		Specifies the document summary text.
problem	STRING		Specifies the problem description.
notes	STRING		Specifies the document notes.
doc_type_ID	INTEGER		Specifies the document type.
ext_doc_ID	INTEGER		Specifies the Tree ID when Decision Tree is used.
last_mod_by	Byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.

EBR_ACRONYMS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_ACRONYMS
- **Object** -- EBR_ACRONYMS

Field	Data Type	Reference	Remarks
ACRONYM	STRING 50		

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_ DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

EBR_KEYWORDS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_KEYWORDS
- **Object** -- EBR_KEYWORDS

Field	Data Type	Reference	Remarks
ENTITY_ID	INTEGER		
EXT_TABLE_ID	INTEGER		
FULL_WORD	STRING 50		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID

EBR_LOG Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_LOG
- **Object** -- EBR_LOG

Field	Data Type	Reference	Remarks
ASKED_DATE	LOCAL_TIME		
BEST_IDS	STRING 110		
EXTERNAL_ID	STRING 50		
FILTER_DATA	STRING 32768		
FUZZINESS	INTEGER		
ID	INTEGER KEY		Unique (to the table) Numeric ID
KEYWORDS	STRING 32768		
MATCH_TYPE	INTEGER		
METHOD_ PERFORMANCE	INTEGER		
METHOD_TYPE	INTEGER		
NUM_MATCHES	INTEGER		
ORDER_DIRECTION	INTEGER		
PRIMARY_ORDER	STRING 50		
ROWS_FOUND	INTEGER		

Field	Data Type	Reference	Remarks
ROWS_TO_FETCH	INTEGER		
SEARCH_IN	INTEGER		
SEARCH_QUALITY	INTEGER		
SEARCH_TEXT	STRING 255		
SEARCH_TYPE	INTEGER		
SECONDARY_ORDER	INTEGER		
SESSION_ID	INTEGER		
SQL_TEXT	STRING 32768		
TOP_MATCH_ID	INTEGER		
UNIQUE_WORD_COUNT	INTEGER		
USER_ID	STRING 100		
WORD_COUNT	INTEGER		

EBR_METRICS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_METRICS
- **Object** -- EBR_METRICS

Field	Data Type	Reference	Remarks
COMMENTS	STRING 255		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
METRIC	STRING 50		
WEIGHT	REAL		

EBR_NOISE_WORDS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_NOISE_WORDS
- **Object** -- EBR_NOISE_WORDS

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
NOISE_WORD	STRING 50		

EBR_PATTERNS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_PATTERNS
- **Object** -- EBR_PATTERNS

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
PATTERN_DEFAULT	STRING 255		
PATTERN_NAME	STRING 50		
PATTERN_VALUE	STRING 255		
PATTERN_VALUE_ADM	STRING 255		

EBR_PREFIXES Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_PREFIXES
- **Object** -- EBR_PREFIXES

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
PREFIX	STRING 50		

EBR_PROPERTIES Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_PROPERTIES
- **Object** -- EBR_PROPERTIES

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
PROPERTY_ADMIN	INTEGER		
PROPERTY_DEFAULT	STRING 50		
PROPERTY_NAME	STRING 50 S_KEY		
PROPERTY_TYPE	STRING 50		
PROPERTY_VALUE	STRING 32768		
PROPERTY_VALUE_ADM	STRING 32768		

EBR_SUBSTITS Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_SUBSTITS
- **Object** -- EBR_SUBSTITS

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
SYMBOL1	STRING 50		
SYMBOL2	STRING 50		

ES_CONSTANTS Table

Program control table used by Knowledge Management.

- **SQL Name** -- ES_CONSTANTS
- **Object** -- ES_CONSTANTS

Field	Data Type	Reference	Remarks
COMMENTS	STRING 255		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_ DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
NAME	STRING 50		Specifies the text name of this item.
PROPERTYID	INTEGER		
PROPVALUE	INTEGER		

ES_NODES Table

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- ES_NODES
- **Object** -- ES_NODES

Field	Data Type	Reference	Remarks
DISPLAYED_ TEXT	STRING 32768		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_ DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
LINK_ID	INTEGER		

Field	Data Type	Reference	Remarks
		ES_NODES: :id	
NODE_ID	INTEGER		
NODE_SHORT_DESC	STRING 150		
NODE_TYPE	INTEGER		
PARENT_ NODE_ID	INTEGER		
QUERY_RESP_NUMBER	INTEGER		
QUERY_RESP_TYPE	STRING 50		
RESPLINKID1	INTEGER		
RESPLINKID2	INTEGER		
RESPLINKID3	INTEGER		
RESPLINKID4	INTEGER		
RESPLINKID5	INTEGER		
RESPLINKID6	INTEGER		
RESPLINKID7	INTEGER		
RESPONSE1	STRING 100		
RESPONSE2	STRING 100		
RESPONSE3	STRING 100		
RESPONSE4	STRING 100		
RESPONSE5	STRING 100		
RESPONSE6	STRING 100		
RESPONSE7	STRING 100		
ROOT_ID	INTEGER	ES_NODES: :id	
TREE_ID	INTEGER	SKELETONS ::id	

ES_RESPONSES Table

Program control table used by Knowledge Management.

- **SQL Name** -- ES_RESPONSES
- **Object** -- ES_RESPONSES

Field	Data Type	Reference	Remarks
ID			Unique (to the table) Numeric ID

Field	Data Type	Reference	Remarks
	INTEGER NOT_NULL KEY		
LAST_MOD_ DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
PARENT_ NODE_ID	INTEGER	ES_NODES ::id	
RESPONSE_ LINK_ID	INTEGER	ES_NODES ::id	
RESPONSE_ LINK_ORDER	INTEGER		
RESPONSE_ LINK_TEXT	STRING 100		

ES_SESSIONS Table

Program control table used by Knowledge Management.

- **SQL Name** -- ES_SESSIONS
- **Object** -- ES_SESSIONS

Field	Data Type	Reference	Remarks
COMMENT_T EXT	STRING 50		
EVALUATION	INTEGER		
EXTERNAL_ID	STRING 50		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_D T	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
PATH_IDS	STRING 50		
PATH_QAS	STRING 32768		
SESSION_ID	INTEGER		
TREE_ID	INTEGER	ES_NODES: :id	

Index_Doc_Links Table

Program control table used by Knowledge Management.

- **SQL Name** -- index_doc_links
- **Object** -- index_doc_links

Field	Data Type	Reference	Remarks
DOC_ID	INTEGER	SKELETONS::id	
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
INDEX_ID	INTEGER	O_INDEXES::id	
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
RELATIONAL_ID	STRING 255		

KD_Atmnt Table

Program control table used by Knowledge Management.

- **SQL Name** -- kd_attmnt
- **Object** -- kd_attmn

Field	Data Type	Reference	Remarks
ATTMNT_ID	INTEGER	Attachment::id	
DOC_ID	INTEGER	SKELETONS::id	
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
RES_ID	Long		If there is an embedded image, the RES_ID points to the resource file id in the attmnt table.

Knowledge_Keywords Table

Knowledge Base key words for associating trouble codes and call areas to solutions.

- **SQL Name** -- km_kword
- **Object** -- kwrd

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

Field	Data Type	Reference	Remarks
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 30 NOT_NULL S_KEY		keyword

kdlinks Table

Each record indicates a link between a KD and request or issues link_type field represented by the following enum value:

1 = KD is a solution to the ticket

2 = Ticket created is based on the document last_mod_by the person that links the document and the ticket

- **SQL Name** -- kdlinks
- **Object** -- kdlinks

Field	Data Type	Reference	Remarks
cr	STRING 30	Call_Req:: persid	
ID	INTEGER KEY		Specifies the Numeric ID that is unique to this table.
iss	STRING 30	Issue	
kd	INTEGER	SKELETONS::id	
last_mod_by	UUID	ca_contact:: uuid	Specifies the UUID of the contact who last modified this record.
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp for when this record was last modified.
link_type	INTEGER		
sd_obj_id	INTEGER		
sd_obj_type	STRING 5		

KEIT_TEMPLATES Table

Field Name	Type	Index	Comment
ID	Int	Primary Key	
TEMPLATE_NAME	Text (50)		
EXP_SUB_CAT	int		Indicates a flag to export sub categories: **0** -- No **1** -- Yes
EXP_SEC_CAT	int		

Field Name	Type	Index	Comment
			Indicates a flag to export secondary categories **0** -- No **1** -- Yes
EXP_ALL_DOCS	int		Indicates a flag to export all documents linked to the selected category **0** -- No **1** -- Yes
EXP_FILTER	Text (2048)		Additional Filter for export
EXP_ATTMNT	int		Indicates a flag to export attachments **0** -- No **1** -- Yes
EXP_INDEX_DOC	int		Indicates a flag to Index documents after import **0** -- No **1** -- Yes
OVERRIDE_PUB	int		Indicates a flag to override published documents **0** -- No **1** -- Yes
OVERRIDE_UNPUB			Indicates a flag to override unpublished documents **0** -- No **1** -- Yes
OVERRIDE_DEFAULTS			Use the default values when overriding documents
ERR_THRESHOLD	int		Error threshold for stopping the process
FIELD_LIST	Text		List of fields to export
CAT_LIST	Text		List of categories to export
DEFAULT_LIST	Text		List of fields, their types and values used as defaults on import
STATUS_ID and following fields			Used internally to fulfill the DEFAULT_LIST field
last_mod_by	UUID		
last_mod_dt	Long		

KT_act_content Table

The kt_act_content table is used for action content links.

Field	Data Type	Remarks
Id	Long	id
Name	String	Name of the action content.
Code	String (10)	Action content code - Rel_attr
Description	String	Description of the action content
URL	String	URL of the action content
HTMPL	String	Parameters for the HTMPL URL

KT_Blc Table

Program control table used by Knowledge Management to store the best link conditions data for the Recommended Documents feature.

- **SQL Name** -- kt_blc
- **Object** -- kt_blc

Field	Data Type	Reference	Remarks
ID	INTEGER		Primary key.
KD	INTEGER		SREL to the knowledge document object.
Kcat	INTEGER		SREL to knowledge category for recommended document condition type of 4.
BLC_Type	INTEGER		SREL to recommended document condition type.
BLC_Text	STRING 255		The recommended document condition term.
Author_ID	UUID		SREL to cnt
Del	INTEGER	Active_Boolean _Table:: enum	Specifies the status of the Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
Last_mod_dt	DATE		Shows the date of when this record was last updated.

KT_Blc_Type Table

Program control table used by Knowledge Management to store the Best Link Condition types for the Recommended Documents feature.

- **SQL Name** -- kt_blc_type
- **Object** -- kt_blc_type

Field	Data Type	Reference	Remarks
ID	INTEGER		Primary key.
SYM	STRING 50		**1** -- Full Match **2** -- Exact Match **3** -- Keyword List **4** -- Knowledge Category
BLC_Condition	STRING 255		Category path if BLC type is category; otherwise, BLC text is used.
Last_mod_dt	DATE		Shows the date of when this record was last updated.

KT_Flg_Status Table

Identifies the different flag statuses used by the Automated Policies feature.

- **SQL Name** -- kt_flg_status
- **Object** -- kt_flg_status

Field	Data Type	Reference	Remarks
ID	INTEGER		Identifies the unique (to the table) numeric ID.
sym	STRING (50)		Flag type name.

KT_Flg_Type Table

Identifies the different flags types used by the Automated Policies feature to flag documents for correction.

- **SQL Name** -- kt_flg_type
- **Object** -- kt_flg_type

Field	Data Type	Reference	Remarks
ID	INTEGER		Identifies the unique (to the table) numeric ID.
sym	STRING (50)		Flag type name.
description	STRING (2000)		Flag type description.
init_by_users	INTEGER (1/0)		Specifies the flag type users select in the end user interface.
show_as_comment	INTEGER (1/0)		Displays the flag type as a comment when document is open for viewing.
follow_up	INTEGER (1/0)		Raises follow-up mechanism for the flag type.
time_to_complete	INTEGER		Specifies the time from which the argument is completed.
dev_assignee	UUID		For future use.
del	INTEGER		Specifies if the flag type is active or inactive.
last_mod_by	UUID	SREL to the Contacts table.	Displays the last date of when a user modified the record.
last_mod_dt	Long (date)		Displays the last modified date.

KT_Life_Cycle_Rep Table

Identifies the knowledge document life cycle data for the Automated Policies feature in Knowledge Management.

- **SQL Name** -- KT_Life_Cycle_Rep
- **Object** -- KT_Life_Cycle_Rep

Field	Data Type	Reference	Remarks
ID	Long	Primary index.	Identifies the unique (to the table) numeric ID of the primary index.
policy	Long	Required field. SREL to query_policy.	Identifies the Policy ID.
kd	Long	Required field. SREL to the knowledge document (Skeletons table).	Identifies the Document ID.
last_mod_dt	Long (date)		Displays the last modified date.

KT_REPORT_CARD Table

Program control table used by Knowledge Management.

- **SQL Name** -- kt_report_card
- **Object** -- kt_report_card

Field	Data Type	Reference	Remarks
ID	INTEGER		KEY Unique (to the table) Numeric ID
SUBJECT_ID	nvarchar(64)		
PAST_DAYS	INTEGER		
ORG_STATISTICS	INTEGER		
DOCUMENTS_SUBMITTED	INTEGER		
DOCUMENTS_PUBLISHED	INTEGER		
TOTAL_HITS	INTEGER		
AVERAGE_EFFECTIVENESS_RATING	INTEGER		

Field	Data Type	Reference	Remarks
TOTAL_SOLUTION_ COUNT	INTEGER		
USER_SLV_CNT	INTEGER		
TOTAL_VOTES	INTEGER		
AVG_RATING	REAL		
LINKED_ KNOWLEDGE_BY_ OTHERS	INTEGER		
LINKED_ KNOWLEDGE_BY_ME	INTEGER		
CLOSED_TICKETS	INTEGER		
TICKETS_WITH KNOWLEDGE	INTEGER		
TICKETS_HAD_ SEARCH_ ACTIVITES	INTEGER		
KNOWLEDGE_ SUBMIT_FROM_ TICKET	INTEGER		
TIME_TO_PUBLISH	INTEGER		
MY_COMMENTS	INTEGER		
DOCUMENTS_ RETIRED	INTEGER		
TIME_TO_FIX	INTEGER		
FLAGS_FIXED	INTEGER		
COMMENTS_ON_ MY_DOCUMENTS	INTEGER		
FIRST_CALL_RES_ WITH_KNOW	INTEGER		
FIRST_CALL_RES_ WITHOUT_KNOW	INTEGER		
creation_user	nvarchar(64)		Specifies the name of the person who created this record. Should be in form: LastName, FirstName
creation_date	INTEGER		Indicates the timestamp indicating when this record was created
last_update_user			

Field	Data Type	Reference	Remarks
	nvarchar(64)		Specifies the contact who last modified this record. Should be in form: LastName, FirstName
last_update_date	INTEGER		Indicates the timestamp of when this record was last modified
CONTRIBUTOR_ UUID	SREL	cnt	TENANCY_ UNRESTRICTED
IS_SUPERVISOR	INTEGER		
SUPERVISOR_ UUID	SREL	cnt	TENANCY_ UNRESTRICTED
MY_ORG_REF_ID	SREL	KT_REPORT_ CARD	
ALL_ORG_REF_ID	SREL	KT_REPORT_ CARD	
PAST_DAYS_TEXT	nvarchar(20)		Populates from the resource file.
LAST_MOD_DT_ TEXT	nvarchar(50)		Specifies the KRC calculation date.
DOCUMENTS_ PUBLISHED_ PERCENT	nvarchar(4)		
AVG_HITS	nvarchar(20)		
AVG_RATING_ TEXT	nvarchar(100)		
last_mod_by	SREL	cnt	
last_mod_dt	DATE		

O_INDEXES Table

Program control table used by Knowledge Management.

- **SQL Name** -- O_INDEXES
- **Object** -- KCAT

Field	Data Type	Reference	Remarks
DESCRIPTION	STRING 255		Textual description
AUTHOR_ID	UUID	ca_contact::uuid	
CAPTION	STRING 50		
CR_CAT	STRING 30	Prob_Category	
DOC_TEMPLATE	INTEGER		

Field	Data Type	Reference	Remarks
		CI_DOC_ TEMPLATES::id	
HAS_CHILDREN	INTEGER		
HAS_DOCS	INTEGER		
ID	INTEGER KEY		Unique (to the table) Numeric ID
iSS_CAT	STRING 30	Issue_Category	
KEYWORDS	STRING 255		
LAST_MOD_BY	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
LAST_MOD_DT	LOCAL_TI ME		Indicates the timestamp of when this record was last modified
OWNER_ID	UUID	ca_contact::uuid	
PARENT_ID	SREL	O_INDEXES::id	
PERMISSION_INDE X_ ID	INTEGER	O_INDEXES::id	
READ_PGROUP	INTEGER	P_GROUPS::id	
RELATIONAL_ID	STRING 255		
SUBJECT_EXPERT_ ID	UUID	ca_contact::uuid	
WF_TEMPLATE	INTEGER	CI_WF_ TEMPLATES::id	
WRITE_PGROUP	INTEGER	P_GROUPS::id	

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- KD
- **Object** -- Skeletons

Field	Data Type	Reference	Remarks
Active_st ate	INTEG ER		
Active_st ate_date	LOCAL _TIME		
assignee _ID	UUID	ca_contac t::uuid	
author_I D	UUID	ca_contac t::uuid	

Field	Data Type	Reference	Remarks
bu_result	REAL		
created_via	INTEGER		
creation_date	LOCAL_TIME		Indicates the timestamp when this record was created.
current_action_ID	INTEGER	ci_actions::id	
custom1	STRING 50		
custom2	STRING 50		
custom3	STRING 50		
custom4	STRING 255		
custom5	STRING 255		
custom_num1	REAL		
custom_num2	REAL		
doc_template_ID	INTEGER	ci_doc_templates :: id	
doc_type_ID	INTEGER	ci_doc_types::id	
doc_version	STRING 50		
expiration_date	LOCAL_TIME		
expire_notification_sent	INTEGER		
ext_doc_ID	INTEGER		
flg_cnt	INTEGER		Number of open flags in the KD.
fullwords	STRING 32768		
hits	INTEGER		

Field	Data Type	Reference	Remarks
ID	INTEGER KEY		Identifies the unique (to the table) numeric ID.
indexed	INTEGER		
inherit_permission	INTEGER		
initiator	STRING 100		
initiator_ID	UUID	ca_contact::uuid	
KD_permission_index_ID	INTEGER	o_indexes::id	
last_accepted_date	LOCAL_TIME		
last_hit_date	INTEGER (DATE)		Specifies the last hit date created.
last_mod_dt	LOCAL_TIME		Indicates the timestamp when this record was last modified.
last_vote_date	INTEGER (DATE)		Specifies the last vote date presented in the Knowledge Report Card interface.
locked_by_ID	UUID	ca_contact::uuid	
modify_date	LOCAL_TIME		
notes	STRING 32768		
owner_ID	UUID	ca_contact::uuid	
parent_cr	STRING 30	call_req::persid	
parent_iss	STRING 30	issue persistent_id	
primary_index	INTEGER	o_indexes::id	

Field	Data Type	Reference	Remarks
priority_ID	INTEGER	ci_properties::id	
PROBLEM	STRING 32768		
published_date	LOCAL_TIME		
read_pgroup	INTEGER	p_groups::id	
resolution	STRING 32768		
resolution_length	INTEGER		
resolution_short	STRING 255		
review_date	LOCAL_TIME		
rework_ver	INTEGER (1/0)		**0** -- Specifies all available knowledge document version records. **1** -- Specifies a rework version record.
sd_accepted_hits	INTEGER		
sd_asset_ID	UUID	ca_owned_resource::uuid	
sd_impact_ID	INTEGER	impact::enum	
sd_priority_ID	INTEGER	priority::enum	
sd_problem	STRING		Problem persid
sd_product_ID	INTEGER	Product::id	
sd_rootcause_ID	INTEGER	rootcause::id	
sd_severity_ID	INTEGER	severity::enum	
sd_urgency_ID	INTEGER	urgency::enum	
shortwords			

Field	Data Type	Reference	Remarks
	STRING 32768		
skip_auto_policies	INTEGER (4) (1/0)		Boolean (1/0) field to indicate if the automated policies should skip a knowledge document.
status_ID	INTEGER	ci_statuses::id	
subject_expert_ID	UUID	ca_contact::uuid	
summary	STRING 255		
ticket_avoided	INTEGER		Specifies the counter field to update in the Customer/Employee interface when the user accepts a document as a solution to a request /incident/problem during the self-service process.
title	STRING 255		
user_def_ID	STRING 40		
user_slv_cnt	INTEGER		
vote_count	INTEGER		
avg_rating	FLOAT		
faq_sym	INTEGER		
ver_comment	STRING 1000		Comment logged when the rework (new) version was created
ver_count	INTEGER		Specifies the version ID for the number of versions created (1, 2, 3, 4...).
ver_cross_ref_ID	INTEGER		Specifies a cross-reference between the published document record and the new version record.
wf_template	INTEGER	ci_wf_templates :: id	
word_count_total	INTEGER		
wordcount	INTEGER		
wordcounts			

Field	Data Type	Reference	Remarks
	STRING 32768		
wordorders	STRING 32768		
wordplace	STRING 32768		
wordspans	STRING 32768		
write_pgroup	INTEGER	p_groups::id	

LONG_TEXTS

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- long_texts
- **Object** -- long_texts

Field	Data Type	Reference	Remarks
ACTUAL_TEXT	STRING 32768		
CNT_ORDER	INTEGER		
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
REF_PERSID	STRING 30		

P_Groups Table

Program control table used by Knowledge Management.

- **SQL Name** -- P_GROUPS
- **Object** -- P_GROUPS

Field	Data Type	Reference	Remarks
GRP_LIST	STRING 4096		
GRP_LIST_KEY	STRING 255		

Field	Data Type	Reference	Remarks
TYPE	INTEGER		Indicates if the P Groups is based on Roles or Groups: **1** -- Groups (Default) **2** -- Roles
ID	INTEGER KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Doc_Versions

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- DOC_VERSIONS
- **Object** -- DOC_VERSIONS

Field	Data Type	Reference	Remarks
ID	INTEGER		Specifies the primary key.
doc_ID	INTEGER	skeletons::id	Specifies the SREL to the knowledge document object.
ver_count	INTEGER		Specifies the internal version ID that indicates the number of versions created (1, 2, 3, 4...)
ver_comment	STRING (2000)		Specifies the comment text.
start_date	DATE		Specifies the date when this version started.
end_date	DATE		Specifies the date when this version ended.
started_by	UUID		Specifies the user that created this version.
published_by	UUID		Specifies the user that published this version.
status_ID	INTEGER		Specifies the document version status.
ver_status	INTEGER		Specifies the previous version's status: **0** -- Existed **1** -- Archived **2** -- Deleted (this only relates to the resolution field)
title	STRING		Specifies the document version title.
summary	STRING		Specifies the document summary text.
problem	STRING		Specifies the problem description.
notes	STRING		Specifies the document notes.

Field	Data Type	Reference	Remarks
doc_type_ID	INTEGER		Specifies the document type.
ext_doc_ID	INTEGER		Specifies the Tree ID when Decision Tree is used.
last_mod_by	Byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.

KD_Atmnt Table

Program control table used by Knowledge Management.

- **SQL Name** -- kd_attmnt
- **Object** -- kd_attmn

Field	Data Type	Reference	Remarks
ATTMNT_ID	INTEGER	Attachment::id	
DOC_ID	INTEGER	SKELETONS::id	
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
RES_ID	Long		If there is an embedded image, the RES_ID points to the resource file id in the attmnt table.

Change Request

This article contains the following topics:

Change_Act_Log Table

Change manager tables Change_Act_Log is a history of activities associated with a change request. The types of activities are listed in the Act_Type table.

- **SQL Name** -- chgalg

- **Object** -- chgalg

Field	Data Type	Reference	Remarks
action_desc	nvarchar (4000)		Shows the text description of the activity log entry.
analyst	byte(16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table. This is the Analyst who created this activity log.
change_id	INTEGER	chg id	Foreign key to the id field of the chg table to which the activity log belongs. This is a Change Order.
description	nvarchar (4000)		Textual description of this activity log
id	INTEGER		Unique numeric ID that is the Primary key of this table.
internal	INTEGER		Marks this as 'Internal' log.
knowledge_session	nvarchar (80)		The knowledge session value for this Change_Act_Log.
knowledge_tool	nvarchar (12)		The knowledge management tool value for this Change_Act_Log.
last_mod_dt	INTEGER		Specifies the date of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
system_time	INTEGER		Specifies the date and time of record creation.
time_spent	INTEGER		Specifies the time spent by the user on the activity.
time_stamp	INTEGER		Specifies the date and time time of activity by the user.
type	nvarchar (12)	Act_Type::code	Identifies the Activity log type.Note: This is the Foreign key to the code field of the act_type table.

Change_Category Table

Change Request categories can be hierarchical.

- **SQL Name** -- chgcat
- **Object** -- chgcat

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id)

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Delete flag that indicates the following:**0** -- Active**1** -- Inactive /marked as deleted
sym	STRING (1000)	S_KEY	REQUIRED Change Category symbolic description.
code	STRING (12)	S_KEY	Primary key of this table.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
last_mod_by	byte (16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
description	nvarchar (500)		Identifies the textual description of this change category.
organization	byte (16)	ca_organization::organization_uuid	Foreign key to the id field of the ca_organization table, this is the Organization.
assignee	byte (16)	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this is the Assignee.
group_id	byte (16)	ca_contact	Foreign key to the contact_uuid field of the ca_contact table. This is the Group.
children_ok	INTEGER		Specifies the handling of the change category:**0** -- Children not allowed**1** -- Children are allowed
service_type	STRING (30)	Service_Desc	
survey	INTEGER	Survey_Template	
schedule	INTEGER	Bop_Workshift	Deprecated.
auto_assign	INTEGER		Flag that enables auto assignment.
owning_contract	INTEGER	Service_Contract	Foreign key to the id field of the svc_contract table.This is the Service Contract.
flow_flag	INTEGER		Specifies the type of workflow: **0** -- Classic Workflow or none (default) **2** -- CA Process Automation
caextwf_start_id	INTEGER	caextwf_start_forms	Identifies the CA Process Automation process definition information to use when the user selects this category on a change order, issue, request.
tenant	UUID	ca_tenant	
chgtype	INTEGER	usp_change_type	

Field	Data Type	Reference	Remarks
risk_survey	INTEGER	Risk_Survey_Template	
cab	UUID	ca_contact	Reference to Contact information.
ss_include	INTEGER		REQUIRED On new default: 0
ss_sym	STRING (128)		

Change_Request Table

Change requests.

- **SQL Name** -- chg
- **Object** -- chg

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Primary key of this table, this is a unique numeric ID.
persid	STRING 30		Specifies the Persistent ID (SystemObjectName:id).
chg_ref_num	STRING 30 UNIQUE NOT_NULL S_KEY;		Shows a User visible reference number.
summary	STRING 240		Identifies the Change Order summary text.
description	STRING 4000		Provides a textual description of this Change Order.
status	STRING 12	Change_Status	Foreign key to the code field of the chgstat table, this identifies the Status.
active_flag	INTEGER NOT_NULL	Boolean_Table::benum	Flag representing whether this record is active or inactive: **0** -- Inactive **1** -- Active
start_date	LOCAL_TIME		Indicates the timestamp of when processing started.
open_date	LOCAL_TIME		Shows the timestamp of when this Change Order was created.
last_mod_dt	LOCAL_TIME		Identifies the timestamp of when this record was last modified.
last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
close_date	LOCAL_TIME		Shows the timestamp of when the Change Order was closed.
	LOCAL_TIME		

Field	Data Type	Reference	Remarks
resolve_date			Indicates the timestamp of when the Change Order was resolved.
rootcause	INTEGER	Rootcause	Foreign key to the id field of the rootcause table, this identifies the Root Cause.
est_total_time	DURATION		Identifies the sum of estimated task time.
actual_total_time	DURATION		Specifies the sum of actual task time.
log_agent	UUID NOT_NULL	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this identifies who the change request was reported by.
assignee	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this identifies the Assignee.
organization	UUID	ca_organization	Foreign key to the id field of the ca_organization table, this identifies the Organization.
group_id	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this is the Group ID.
affected_contact	UUID NOT_NULL	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this specifies the Affected End User.
requestor	UUID NOT_NULL	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this identifies the Requestor.
category	STRING 12	Change_Category	Foreign key to the code field of the chgctg table, this identifies the Category.
priority	INTEGER NOT_NULL	Priority	Foreign key to the enum field of the pri table, this identifies the Priority.
need_by	LOCAL_TIME		Shows the Need By Date timestamp.
est_comp_date	LOCAL_TIME		Shows the timestamp for the estimated completion date.
actual_comp_ date	LOCAL_TIME		Specifies the actual completion date timestamp.
est_cost	INTEGER		Specifies the estimated cost of this Change Order.
actual_cost	INTEGER		Identifies the actual cost of this Change Order.
justification	STRING 4000		Identifies the justification value for this Change_Request.
backout_plan	STRING 4000		Identifies the backout plan value for this Change_Request.
risk	INTEGER	Risk_Level	
business_case	STRING 4000		
cab	UUID	ca_contact	
closure_code	INTEGER	Closure_Code	
impact	INTEGER	Impact	

Field	Data Type	Reference	Remarks
			Foreign key to the enum field of the impact table, this defines the impact.
parent	INTEGER	Change_Request	Foreign key to the id field of the chg table to allow for hierarchical Change Order groupings (for example, "parent /child").
effort	STRING 2000		Identifies the effort value for this Change_Request.
support_lev	STRING 30	Service_Desc	Foreign key to the code field of the srv_desc table, this identifies the Classic Service Type.
template_name	STRING 30		Foreign key to the template_name field of the chg_tpl table, this identifies the Template name.
sla_violation	INTEGER		Flag indicating the following: **1** -- change order has violated its sla.
predicted_sla_violation	INTEGER		Flag that indicates the following: **1** -- change order has been predicted by neugents.
macro_predicted_violation	INTEGER		Identifies that it is likely to violate its sla (boolean) for action macros to predict sla violations.
created_via	INTEGER	Interface	Foreign key to the id field of the interface table, this identifies which interface created the Change request.
call_back_date	LOCAL_TIME		Identifies the call back timestamp for this Change Order.
call_back_flag	INTEGER		Specifies the call back flag value for this Change Order.
string1	STRING 40		This is a user-defined string field.
string2	STRING 40		This is a user-defined string field.
string3	STRING 40		This is a user-defined string field.
string4	STRING 40		This is a user-defined string field.
string5	STRING 40		This is a user-defined string field.
string6	STRING 40		This is a user-defined string field.
service_date	LOCAL_TIME		Specifies the service date value for this Change_Request.
service_num	STRING 30		Specifies the service num value for this Change_Request.
product	INTEGER	Product	Foreign key to the id field of the product table, this identifies the Product.
actions	STRING 750		
type_of_contact	INTEGER	Type_Of_Contact	
reporting_method	INTEGER	Reporting_Method	Foreign key to the id field of the repmeth table, this identifies how this Change Order was reported.
	INTEGER		

Field	Data Type	Reference	Remarks
person_ contacting		Person_ Contacting	Foreign key to the id field of the person table, this identifies the person who made the contact.
flag1	INTEGER		This is a user-defined integer flag.
flag2	INTEGER		This is a user-defined integer flag.
flag3	INTEGER		This is a user-defined integer flag.
flag4	INTEGER		This is a user-defined integer flag.
flag5	INTEGER		This is a user-defined integer flag.
flag6	INTEGER		This is a user-defined integer flag.
user1	STRING 100		This is a user-defined string field.
user2	STRING 100		This is a user-defined string field.
user3	STRING 100		This is a user-defined string field.
caextwf_ins tance_id	INTEGER	caextwf_in stances	Indicates the CA Process Automation process instance id and process definition name and reference path launched by this Service Desk object.
project	UUID	ca_owned _ resource	
tenant	UUID	ca_tenant	
sched_start _ date	LOCAL_TIME		
sched_end _ date	LOCAL_TIME		
sched_dura tion	DURATION		
actual_start _date	LOCAL_TIME		
actual_end _ date	LOCAL_TIME		
chgtype	INTEGER	usp_chang e_ type	
cab_approv al	INTEGER	Boolean_T able	
requested_ by	UUID REF	ca_contact	
external_ system_tick et	STRING 4000		
orig_user_d ept	INTEGER	ca_resourc e_ departme nt	
	UUID		

Field	Data Type	Reference	Remarks
orig_user_ organizatio n		ca_organiz ation	
orig_user_ admin_ org	UUID	ca_organiz ation	
orig_user_c ost_ center	INTEGER	ca_resourc e_ cost_cente r	
target_start _ last	LOCAL_TIME		
target_hold _ ast	LOCAL_TIME		
target_hold _ count	INTEGER		
target_reso lved_ last	LOCAL_TIME		
target_reso lved_ count	INTEGER		
target_clos ed_ last	LOCAL_TIME		
target_clos ed_ count	INTEGER		
target_start _ last	LOCAL_TIME		Time when target timer started or restarted.
target_hold _ last	LOCAL_TIME		Time of most recent ticket hold
target_hold _ count	INTEGER		Number of times ticket went into a Hold status
target_reso lved_ last	LOCAL_TIME		Time of most recent ticket resolution
target_reso lved_count	INTEGER		Number of times ticket was resolved
target_clos ed_ last	LOCAL_TIME		Time ticket was last closed
target_clos ed_ count	INTEGER		Number of times that ticket was closed

Change_Status Table

Lists the states of the change request, which you can add to at will. This table allows you to control whether the change request is active or inactive when it is changed to this status. Possible statuses include: Open, approval in process, implementation in progress, verification in progress, cancelled, suspended, and closed.

- **SQL Name** -- chgstat
- **Object** -- chgstat

Field	Data Type	Reference	Remarks
active	INTEGER		Flag that indicates the following:**0** -- Inactive**1** -- Active
code	nvarchar (12)		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Delete flag that indicates the following:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (500)		Identifies the textual description of this status.
hold	INTEGER		Flag that specifies the following:**0** -- Start events**1** -- Stop events
id	INTEGER		Unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
resolved	INTEGER		Flag that indicates the following:**0** -- Not yet resolved**1** -- Resolved
sym	nvarchar (30)		Identifies the Change Request status name.

Chg_Template Table

Maps a template name to a Change_Request that will be used as a template.

- **SQL Name** -- chg_template
- **Object** -- chg_tpl

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Delete flag that represents the following:**0** -- Active**1** -- Inactive/marked as deleted

Field	Data Type	Reference	Remarks
description	nvarchar (1000)		Describes the template.
id	INTEGER		Unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id)
quick_tmpl_type	INTEGER	Quick_Template_Types::enum	Flag that indicates the following:**1** -- Quick tmpl**2** -- Quick tmpl+review
template	INTEGER	chg id	Unique (to the table) numeric ID.
template_class	nvarchar (12)		Allows subclassing templates.
template_name	nvarchar (30)		Unique name of the template.

chg_trans Table

A transition object controls the current and next ticket status. The chg_trans table lists the status, new status, and actions that need to occur for a default transition.

- **SQL Name** -- chg_trans
- **Object** -- chg_trans

Label	Field	Description
id	INTEGER	Unique key.
status	SYMBOL	Specifies the current ticket status.
new_status	SYMBOL	Specifies the new ticket status
must_comment	INTEGER	Comment required when using a transition. On new default: 0
is_default	INTEGER	Default transition that appears when the Status field is empty. On new default: 0
condition	BOP_REF_STR_REF Macro	Site condition macro to approve transition.
condition error	STRING 255	Error message for site condition.
description	STRING 255	Description of this transition.
last_mod_dt	LOCAL_TIME	Timestamp of last update to this record.
last_mod_by	UUID REF ca_contact	User who last updated this.

Label	Field	Description
del	INTEGER nn	Logical database delete status.
tenant	UUID REF ca_tenant	Reference to Tenant information.

CI Attributes

ci_managed_attribute Table

The following table lists CI attributes that CACF manages for change verification:

- **SQL Name** -- ci_managed_attribute
- **Object** -- ci_managed_attribute

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
del	INTEGER	Active_Boolean_Table::enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
attribute_name	STRING 128		Specifies the name of the CI attribute.
attribute_label	STRING 50		Specifies the label for the attribute.
description	STRING 255		Specifies a description for the attribute.
initial_status	STRING 32	ci_planned_change_status	Specifies the initial status of the attribute.
case_sensitive	INTEGER		Specifies if the managed attribute is case sensitive.
attribute_type	INTEGER		Specifies the data type.
attribute_length	INTEGER		Specifies the maximum length of the attribute.
srel_factory	STRING 26		Specifies the factory associated with a SREL attribute.
srel_rel_attr	STRING 26		Specifies the factory attribute used as a foreign key.
srel_common_name_attr	STRING 26		Specifies the factory attribute that stores the human-readable value.
srel_show_dropdown	INTEGER	Boolean_Table	Specifies the factory to show in the drop-down list.

Change States

ci_managed_chgstat Table

The following table lists details about managed change states:

- **SQL Name** -- ci_managed_chgstat
- **Object** -- ci_managed_chgstat

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
del	INTEGER	Boolean_Table	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
code	STRING 12	chgstat	Specifies the Change Order status managed by change verification.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
can_edit_criteria	INTEGER	Boolean_Table	Specifies if the change status lets you edit criteria.
verification_active	INTEGER	Boolean_Table	Specifies if change verification is active in this state.
autopromote_chg	INTEGER	Boolean_Table	Specifies if autopromote is active for the state.
show_override_buttons	INTEGER	Boolean_Table	Specifies if the override buttons appear for the state.
is_implementation	INTEGER	Boolean_Table	Specifies if the state is an implementation state.

Change Verification

ci_verification_policy Table

The following table lists details about verification policies:

- **SQL Name** -- ci_verification_policy
- **Object** -- ci_verification_policy

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
del	INTEGER	Active_Boolean_Table::enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
attribute_name	STRING 128	ci_managed_attribute	Specifies the name of the attribute.
ci_name_pattern	STRING 255		Specifies the name of the CI pattern.
class_pattern	STRING 255		Specifies the name of the CI class pattern.
description	STRING 255		Specifies the name of the description of the policy.
mdr_name_pattern	STRING 255		Specifies the name of the MDR pattern.
mdr_class_pattern	STRING 255		Specifies the name of the MDR class pattern.
rolename_pattern	STRING 255		Specifies the name of the role pattern.
name	STRING 100		Specifies the name of the policy.
sequence	INTEGER		Specifies the order that CACF processes the policy.
location_pattern	STRING 255		Specifies the name of the location pattern.
isvariance	INTEGER	Boolean_Table	Specifies if the policy activates for a variance.
isnotverifiable	INTEGER	Boolean_Table	Specifies if the policy is not verifiable.
isrogue_insert	INTEGER	Boolean_Table	Specifies if the policy activates for rogue inserts.
isrogue_update	INTEGER	Boolean_Table	Specifies if the policy activates for rogue updates.
action	STRING 32	ci_verification_policy_act	Specifies the policy action.
write_twa	INTEGER	Boolean_Table	Specifies if you want the policy to write CI and relationship data to the TWA.
write_incident	INTEGER	Boolean_Table	Specifies if you want the policy to create an Incident.
		cr_template	Specifies the Incident template.

Field	Data Type	Reference	Remarks
incident_template	STRING 30		
autoclose_incident	INTEGER	Boolean_Table	Specifies if you want the policy to close the Incident automatically.
log_only_mode	INTEGER	Boolean_Table	Specifies if you want the policy to write to the log instead of modifying a Change Order, CI, or relationship.
start_date	LOCAL_TIME		Specifies the date to start the policy.
end_date	LOCAL_TIME		Specifies the date to end the policy.
service_type	STRING 30	Service_Desc	Specifies the service type of the policy.
priority	INTEGER	Priority	Specifies the priority of the policy.

ci_verification_policy_act Table

The following table lists information about verification policy actions:

- **SQL Name** -- ci_verification_policy_act
- **Object** -- ci_verification_policy_action

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
description	STRING 255		Specifies the long description of the policy action.
name	STRING 100		Specifies the short name of the policy action.
sym	STRING 30		Specifies the constant symbol for this action.

ci_verification_policy_log Table

The following table lists CI attributes that CACF manages for change verification:

- **SQL Name** -- ci_verification_policy_log

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
del	INTEGER	Active_Boolean_Table::enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
ci_planned_change	INTEGER	ci_planned_change	Specifies the change specification.
nr	UUID	ca_owned_resource	
ci_verification_policy	INTEGER	ci_verification_policy	Specifies the verification policy.
ci_managed_attribute	INTEGER	ci_managed_attribute	Specifies the managed attribute.
oldvalue	STRING 2000		Specifies the old attribute value.
discoveredvalue	STRING 2000		Specifies the discovered attribute value.
newvalue	STRING 2000		Specifies the new attribute value.
status	STRING 32	ci_planned_change_status	Specifies the change verification state.
ci_twa_ci	INTEGER	ci_twa_ci	Specifies the CI in the TWA.
ci_twa_relation	INTEGER	ci_twa_relation	Specifies the relationship in the TWA.
ci_mdr_provider	INTEGER	ci_mdr_provider	Specifies the provider of the MDR.
is_unverifiable	INTEGER	Boolean_Table	Specifies if the change is verifiable.
is_rogueinsert	INTEGER	Boolean_Table	Specifies if the change is a rogue insert.
is_variance	INTEGER	Boolean_Table	Specifies if the change is a variance.
is_rogueupdate	INTEGER	Boolean_Table	Specifies if the change is a rogue update.
ci_verification_policy_act	STRING 32	ci_verification_policy_act	Specifies the verification policy action.
incident	STRING 30	Call_Req	Specifies the incident associated with the verification policy.
role	INTEGER	usp_role	Specifies the role associated with the verification policy.
error_message	STRING 2000		Specifies the error message.

ci_verification_twa_act Table

The following table lists CI attributes that CACF manages for change verification:

- **SQL Name** -- ci_verification_twa_act
- **Object** -- ci_verification_twa_act

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
del	INTEGER	Active_Boolean_ Table::enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
description	STRING 255		Specifies a description for the attribute.
name	STRING 50		Specifies the name of the TWA action.
sym	STRING 32		Specifies the constant symbol for this action.

Change Specifications

This article contains the following topics:

ci_planned_change Table

The following table lists details about change specifications:

- **SQL Name** -- ci_planned_change
- **Object** -- ci_planned_change

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
del	INTEGER	Active_Boolean_ Table::enum	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
attribute_name	STRING 128		Specifies the name of the CI or relationship attribute.

Field	Data Type	Reference	Remarks
attribute_value_original	STRING 2000		Specifies the original attribute value.
attribute_value_planned	STRING 2000		Specifies the planned attribute value.
attribute_value_discovered	STRING 2000		Specifies the discovered attribute value.
chg	INTEGER	Change_Request	Specifies the Change Order associated with the planned change.
ci	UUID	ca_owned_resource	Specifies the CI associated with the change specification.
description	STRING 255		Specifies a description of the change specification.
status	STRING 32	ci_planned_change_status	Specifies the status of the change.
incident	STRING 30	Call_Req	Specifies the Incident that the change specification created.
attribute_value_disc_internal	STRING 255		Specifies the internal discovered attribute value.
attribute_value_orig_internal	STRING 255		Specifies the internal original attribute value.
attribute_value_internal	STRING 255		Specifies the internal attribute value.
last_verification_policy	INTEGER	ci_verification_policy	Specifies the last verification policy associated with the change specification.
ci_twa_ci	INTEGER	ci_twa_ci	Specifies the CI in the TWA.
ci_twa_relation	INTEGER	ci_twa_relation	Specifies the CI relationship in the TWA.
verification_msg	STRING 255		Specifies the verification message.

ci_planned_change_status Table

The following table lists details about change specification states:

- **SQL Name** -- ci_planned_change_status
- **Object** -- ci_planned_change_status

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.

Field	Data Type	Reference	Remarks
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
del	INTEGER	Boolean_Table	Indicates the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
description	STRING 255		Specifies the long description of the policy action.
name	STRING 128		Specifies the short name of the policy action.
sym	STRING 10		Specifies the constant symbol for this action.
isinitial	INTEGER	Boolean_Table	Specifies the initial state of the state.
isfinal	INTEGER	Boolean_Table	Specifies the final state of the state.
isselectable	INTEGER	Boolean_Table	Specifies the selectable state.

Events

This article contains the following topics:

Event_Delay Table

This table lists the times that events were delayed.

- **SQL Name** -- evt_dly
- **Object** -- evtdly

Field	Data Type	Reference	Remarks
description	STRING 80		Specifies the user description of delay,
act_delay	DURATION		Specifies the actual duration of delay.
cancel_time	LOCAL_TIME		Specifies when the time delay was cancelled.
create_time	LOCAL_TIME		Specifies when the time delay was created.
delay_type	INTEGER	Event_Delay_Type: enum	Event_Delay_Type : enum

Field	Data Type	Reference	Remarks
eff_delay	DURATION		Specifies the effective duration of delay.
group_name	STRING 30		Specifies the group Name of attevt (currently only SLA).
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
obj_id	STRING 30 NOT_NULL S_KEY		Specifies the persid of the object.
persid	STRING 30		Persistent ID (SystemObjectName:id)
start_time	LOCAL_TIME		Specifies when the time delay was started.
start_userid	UUID	ca_contact::uuid	Specifies the user that created and started delay.
status_flag	INTEGER		Specifies a flag for indicating an event delay status.
stop_time	LOCAL_TIME		Specifies when the time delay was stopped
stop_userid	UUID	ca_contact::uuid	Specifies the user that stopped and cancelled delay.
support_lev	STRING 30	Service_Desc::code	Specifies the service type in effect.

Event_Delay_Type Table

User-defined code for the type of event delay.

- **SQL Name** -- evtdlytp
- **Object** -- evtdlytp

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER NOT_NULL		Enumerated value for this entry - specifies ordering in lists and relative values
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
nx_desc	STRING 40		
sym	STRING 12 UNIQUE NOT_NULL S_KEY		

event_log Table

USP event log.

- **SQL Name** -- event_log
- **Object** -- event_log

Field	Data Type	Reference	Remarks
event	INTEGER	event_type::id	Event type
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
kd_id	INTEGER	SKELETONS::id	Assoc knowledge doc
log_time	LOCAL_TIME		Server log date
millitime	INTEGER		Log date millisec
numdata1	INTEGER		Smag number
numdata2	INTEGER		Smag number
sd_obj_id	INTEGER		Assoc SD id
sd_obj_type	STRING 30		Assoc SD object
session	INTEGER	session_log::id	Session with event
textdata1	STRING 500		Smag string
textdata2	STRING 500		Smag string

event_type Table

Event type.

- **SQL Name** -- event_type
- **Object** -- event_type

Field	Data Type	Reference	Remarks
description	STRING 500		Specifies the description.
code	STRING 12 UNIQUE NOT_NULL S_KEY		Specifies the noneditable string enum.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)

Events Table

Tables for Event stuff. Events attached to objects.

- **SQL Name** -- evt
- **Object** -- evt

Field	Data Type	Reference	Remarks
description	STRING 80		Specifies the event description.
condition	STRING 30	Spell_Macro:: persid	Specifies the macro function for condition.
del	INTEGER NOT_NULL	Active_Boolean_Table:: enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
delay_time	DURATION NOT_NULL		Specifies the time until condition check.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
modulo_time	DURATION NOT_NULL		Specifies the time increment to adjust.
obj_type	STRING 30		Specifies the object type for this event.
on_done_flag	INTEGER NOT_NULL		Sets the *fire_time* time directly on the attached event to indicate when the event is done.
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym			Specifies the event name.

Field	Data Type	Reference	Remarks
	STRING 30 NOT_NULL unique S_KEY		
urgency	INTEGER		Specifies the urgency of the event.
user_settime	INTEGER NOT_NULL		The user_settime allows the user (or system) to override the fire time (delay time) that is defined for an event. For example, when users add an event to a Service Type, they can redefine the fire time for the event only if the user_settime flag is set. Otherwise, the fire time defined in the event is used.
user_smag	STRING 200		Specifies the user smag field.
violate_on_false	INTEGER		
violate_on_true	INTEGER		
work_shift	STRING 30	Bop_Workshift::persid	

O_EVENTS Table

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- O_EVENTS
- **Object** -- o_events

Field	Data Type	Reference	Remarks
ACTION	STRING 32768		
ENTITY_ID	INTEGER	SKELETONS::id	
EVENT_NAME	STRING 50		
EVENT_TIMESTAMP	LOCAL_TIME		
ID			Unique (to the table) Numeric ID

Field	Data Type	Reference	Remarks
	INTEGER KEY		
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
VER_COUNT	INTEGER		Version ID indicates the number of versions created (1, 2, 3, 4...)
WF_ACTION_ID	INTEGER		
WF_USER_ID	UUID	ca_contact::uuid	

Data Partition Constraints and Controlled Table

This article contains the following topics:

Domain Table

Lists the names and descriptions of the data partitions themselves.

- **SQL Name** -- dmn
- **Object** -- dmn

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
id	INTEGER		Primary key of this table, it is a unique numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Identifies the data partition description.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (30)		Identifies the data partition name.

Domain_Constraint Table

Lists the constraints associated with a particular data partition and controlled table.

- **SQL Name** -- dcon
- **Object** -- dcon

Field	Data Type	Reference	Remarks
alias	INTEGER		Identifies the alias value for this Domain_Constraint.
constraint_majic	nvarchar (4000)		Specifies Constraint (Majic).
constraint_ SQL	nvarchar (4000)		Specifies Constraint (SQL).
del	INTEGER	Active_Boolean_Table::enum	Indicates the Delete flag, as follows:**0** -- Active**1** -- inactive/marked as deleted)
dom_id	INTEGER	Domain::id	Identifies the unique (to the table) numeric ID.
error_msg	nvarchar (150)		Specifies the message on violation.
id	INTEGER		Primary key to this table, it is a unique numeric ID.
last_mod_ by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_ dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
tbl_id	INTEGER	ctab::id	Indicates the unique (to the table) numeric ID.
type	INTEGER	Domain_ Constraint_Type :: enum	Enumerated value for this entry, this specifies ordering in lists and relative values.

Domain_Constraint_Type Table

Lists the types of constraints that can be associated with a particular data partition and controlled table.

- **SQL Name** -- dcon_typ
- **Object** -- dcon_typ

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table ::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
enum	INTEGER		Enumerated value for this entry, this specifies ordering in lists and relative values.
id	INTEGER		Indicates the unique (to the table) numeric ID.
nx_de sc	nvarchar (40)		Specifies the description of the domain contraint type.

Field	Data Type	Reference	Remarks
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (12)		Identifies the symbolic name of this constraint type.

External Entity

External_Entity_Map Table

NOT FOR CLIENT USE. Maps an external entity to an internal object where the external entity is uniquely defined in its own namespace by the xentity_id. The namspace is uniquely defined for our use by the xschema_code and xschema_ver. The semantics of the xentity_id, and parameters (*_rsrved fields) depends upon the namespace.

- **SQL Name** -- xent_map
- **Object** -- ext_entity_map

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
int1_rsrved	INTEGER		reserved for CA - do not use
int2_rsrved	INTEGER		reserved for CA - do not use
int3_rsrved	INTEGER		reserved for CA - do not use
int4_rsrved	INTEGER		reserved for CA - do not use
int5_rsrved	INTEGER		reserved for CA - do not use
int6_rsrved	INTEGER		reserved for CA - do not use
lstr1_rsrved	STRING 255		reserved for CA - do not use
lstr2_rsrved	STRING 255		reserved for CA - do not use
ob_persid	STRING 30		the "mapped to" object
ob_type	STRING 30		the "mapped to" object type
persid	STRING 30		Persistent ID (SystemObjectName:id)
str1_rsrved	STRING 80		reserved for CA - do not use
str2_rsrved	STRING 80		reserved for CA - do not use
xentity_id	STRING 180 NOT_NULL		Specifies the uniq. external entity reference.
xschema_code	STRING 12 NOT_NULL		Specifies the internal code for the namespace of the entity.
xschema_ver	INTEGER NOT_NULL		Specifies the internal ver for the namespace of the entity.

Form Group

Form_Group Table

Listing of defined form groups.

- **SQL Name** -- fmgrp
- **Object** -- fmgrp

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (100)		Specifies the textual description of this form group.
id	INTEGER		Primary key of this table, it is a unique, numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
sym	nvarchar (30)		Specifies the symbolic value for this Form_Group.

Interface Definitions

intfc Object

Interface definitions used for creating requests and change orders.

- **SQL Name** -- interface
- **Object** -- intfc

Field	Data Type	Reference	Remarks
code	nvarchar (10)		Specifies the code value for this interface.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
id	INTEGER		Primary key of this table, it is a unique numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
nx_desc	nvarchar (240)		The desc value for this interface.

Field	Data Type Reference	Remarks
persid	nvarchar (30)	Persistent ID (SystemObjectName:id).
sym	nvarchar (30)	Identifies the symbolic value for this interface.

Document Repository

Document_Repository Table

Contains Information on document repositories, which are used to store attachments.

- **SQL Name** -- doc_rep
- **Object** -- doc_rep

Field	Data Type	Reference	Remarks
description	STRING 500		Specifies the description.
archive_path	STRING 255		
archive_type	INTEGER		
cgi_path	STRING 255		Specifies the location and name of CGI.
default_rep	INTEGER		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
file_limit_size	INTEGER		Specifies the file limit size.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)
prohibited_ext	STRING 500		Specifies the prohibited file extensions.
protocol	STRING 12		HTTP or SHARE
repository_type	INTEGER		Specifies the type of repository (attachments, knowledge).
retrieve_path	STRING 255		Specifies how to get back to upload_path via protocol.

Field	Data Type	Reference	Remarks
server	STRING 30		Specifies the name of Doc Server.
servlet_path	STRING 255		Specifies the servlet URL.
sym	STRING 30 NOT_NULL S_KEY		Specifies the name of document repository.
upload_path	STRING 255		Specifies the server location of doc repository.

External Application

ext_appl Table

External application.

- **SQL Name** -- ext_appl

Field	Data Type	Reference	Remarks
description	STRING 500		Appl description
code	STRING 12 UNIQUE NOT_NULL S_KEY		Noneditable string enum
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID		Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 30 NOT_NULL S_KEY		Application name

Group Member

Group Members.

- **SQL Name** -- grpmem
- **Object** -- grpmem

Field	Data Type	Reference	Remarks
group_id	byte (16)		Foreign key to the contact_uuid field of the ca_contact table, this is the group.
id	INTEGER		Specifies the unique (to the table) numeric ID.
			Specifies the Manager flag, as follows:**0** -- No**1** -- Group manager.

Field	Data Type	Reference	Remarks
manager_flag	INTEGER		
member	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this is the Member.
notify_flag	INTEGER		Specifies the Notify flag, as follows:**0** -- No notification, **1** -- Notify.

Global Tables

This article contains the following topics:

Global_Change_Extension Table

Local copy of data that will be pushed to master's Global_Change_Queue table.

- **SQL Name** -- g_chg_ext
- **Object** -- g_chg_ext

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_Boolean::enum	**1** -- Active **0** -- Inactive
affected_contact	UUID NOT_NULL	ca_contact::uuid	Specifies the Effected End User of CO.
assignee	UUID	ca_contact::uuid	Specifies the assignee of CO.
category	STRING 30		Specifies the category symbol of CO.
chg_ref_num	STRING 30 NOT_NULL		Specifies the change ref num.

Field	Data Type	Reference	Remarks
close_date	LOCAL_TIME		Specifies the close Date of CO.
global_queue_id	INTEGER	Global_Queue_Names::id	Specifies the pointer to global queue.
group_id	UUID		Specifies the group assigned to CO.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Specifies the impact of change order.
last_mod_dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Specifies the open date of CO.
priority	INTEGER NOT_NULL	Priority::enum	Specifies the priority of CO.
remote_id	INTEGER NOT_NULL S_KEY		Specifies the regional request id.
requestor	UUID NOT_NULL	ca_contact::uuid	Specifies the requester of CO.
status	STRING 30 NOT_NULL	Change_Status:: code	Specifies the status symbol of CO.
summary	STRING 240		Specifies the summary of CO.

Global_Change_Queue Table

This table is an accumulation of all of the regional Global_Change_Extension tables.

- **SQL Name** -- g_chg_queue
- **Object** -- g_chg_queue

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_Boolean::enum	**1** -- Active **0** -- Inactive
affected_contact	UUID NOT_NULL		Specifies the Affected End User of CO.
assignee	UUID		Specifies the assignee of CO.
category	STRING 30		Specifies the category symbol of CO.
chg_ref_num	STRING 30 NOT_NULL		Specifies the change ref num.
close_date	LOCAL_TIME		Specifies the close Date of CO.
global_queue_ id	INTEGER	Global_Queue_Names::id	Specifies the pointer to global queue.
group_id	UUID		Specifies the group assigned to CO.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Specifies the impact of change order.

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Specifies the open date of CO.
priority	INTEGER NOT_NULL	Priority::enum	Specifies the priority of CO.
remote_id	INTEGER NOT_NULL S_KEY		Specifies the regional change id.
remote_sys_id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Specifies the regional system id.
requestor	UUID NOT_NULL		Specifies the requestor of CO.
status	STRING 30 NOT_NULL	Change_Status:: code	Specifies the status sybmol of CO.
summary	STRING 240		Specifies the summary of CO.

Global_Contact Table

Contain all contacts across all systems participating in the Global Service Desk.

- **SQL Name** -- g_contact
- **Object** -- g_cnt

Field	Data Type	Reference	Remarks
contact_num	STRING 30		Specifies the contact number.
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
email_address	STRING 120		Specifies the email address of the contact.
first_name	STRING 100		Specifies the first name of the contact.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
last_name	STRING 100		Specifies the last name of the contact.
loc_id	UUID		Specifies the location id.
middle_name	STRING 100		Specifies the middle name of the contact.
org_id	UUID		Specifies the organization id.
pri_phone_ number	STRING 32		Specifies the phone number of the contact.
remote_id	UUID NOT_NULL S_KEY		Specifies the regional contact id.
			Specifies the regional system id.

Field	Data Type	Reference	Remarks
remote_sys_id	INTEGER NOT_NULL S_KEY	Global_Servers :: remote_sys_id	
userid	STRING 100		Specifies the userid of the contact.

Global_Issue_Extension Table

Local copy of data that will be pushed to master's Global_Issue_Queue table.

- **SQL Name** -- g_iss_ext
- **Object** -- g_iss_ext

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_ Boolean::enum	**1** -- Active **0** -- Inactive
assignee	UUID	ca_contact::uuid	Assignee of Issue
category	STRING 30		Category symbol of Issue
close_date	LOCAL_TIME		Close Date of Issue
global_queue_id	INTEGER	Global_Queue_Names::id	Pointer to global queue
group_id	UUID		Group assigned to Issue
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Impact of Issue
last_mod_dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Open Date of Issue
priority	INTEGER NOT_NULL	Priority::enum	Priority of Issue
product	INTEGER	Product::id	Product of Issue
ref_num	STRING 30 NOT_NULL		Issue ref num
remote_id	INTEGER NOT_NULL S_KEY		Regional request id
requestor	UUID NOT_NULL	ca_contact::uuid	Affected End User of CO
status	STRING 30 NOT_NULL	Issue_Status::code	Status symbol of Issue
summary	STRING 240		Summary of Issue

Global_Issue_Queue Table

This table is an accumulation of all of the regional Global_Issue_Extension tables.

- **SQL Name** -- g_iss_queue

- **Object** -- g_iss_queue

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_ Boolean::enum	**1** -- Active **0** -- Inactive
assignee	UUID		Assignee of Issue
category	STRING 30		Category symbol of Issue
close_date	LOCAL_TIME		Close Date of Issue
global_que ue_ id	INTEGER	Global_Queue_ Names::id	Pointer to global queue
group_id	UUID		Group assigned to Issue
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Impact of Issue
last_mod_ dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Open Date of Issue
priority	INTEGER NOT_NULL	Priority::enum	Priority of Issue
product	INTEGER		Product of Issue
ref_num	STRING 30 NOT_NULL		Issue ref num
remote_id	INTEGER NOT_NULL S_KEY		Regional Issue id
remote_sys _id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Regional system id
requestor	UUID NOT_NULL		Affected User of Issue
status	STRING 30 NOT_NULL	Issue_Status::code	Status symbol of Issue
summary	STRING 240		Summary of Issue

Global_Location Table

Contains all Location names for all regions.

- **SQL Name** -- g_loc
- **Object** -- g_loc

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
	LOCAL_TIME		

Field	Data Type	Reference	Remarks
last_mod_dt			Indicates the timestamp of when this record was last modified.
loc_name	STRING 100		Location Name
remote_id	UUID NOT_NULL S_KEY		Regional location id
remote_sys_id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Regional system id

Global_Organization Table

Contains all Organizations names for all regions.

- **SQL Name** -- g_org
- **Object** -- g_org

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
org_name	STRING 100		Organization Name
remote_id	UUID NOT_NULL S_KEY		Regional organization id
remote_sys_id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Regional system id

Global_Product Table

Contains all Product names for all regions. Used by Global_Issue_Queue.

- **SQL Name** -- g_product
- **Object** -- g_prod

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
	LOCAL_TIME		

Field	Data Type	Reference	Remarks
last_mod_dt			Indicates the timestamp of when this record was last modified.
remote_id	INTEGER NOT_NULL S_KEY		Regional product id
remote_sys_ id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Regional system id
sym	STRING 60		Symbol name of product

Global_Queue_Names Table

List of queues that are considered global.

- **SQL Name** -- g_queue_names
- **Object** -- g_qname

Field	Data Type	Reference	Remarks
description	STRING 100		comments field
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
sym	STRING 30 UNIQUE NOT_NULL		Descriptive name

Global_Request_Extension Table

Local copy of data that will be pushed to master's Global_Request_Queue table.

- **SQL Name** -- g_req_ext
- **Object** -- g_cr_ext

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_ Boolean::enum	**1** -- Active **0** -- Inactive
assignee	UUID	ca_contact::uuid	Assignee of Request
category	STRING 30		Category symbol of Request
close_date	LOCAL_TIME		Close Date of Request

Field	Data Type	Reference	Remarks
customer	UUID NOT_NULL	ca_contact::uuid	Affected User of Request
global_queue_id	INTEGER	Global_Queue_Names::id	Pointer to global queue
group_id	UUID		Group assigned to Request
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Impact of Request
last_mod_dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Open Date of Request
priority	INTEGER NOT_NULL	Priority::enum	Priority of Request
ref_num	STRING 30 NOT_NULL		Request ref num
remote_id	INTEGER NOT_NULL S_KEY		Regional request id
status	STRING 30 NOT_NULL	Cr_Status::code	Status symbol of Request
summary	STRING 240		Summary of Request
type	STRING 10	crt code	ITIL record type

Global_Request_Queue Table

This table is an accumulation of all of the regional Global_Request_Extension tables.

- **SQL Name** -- g_req_queue
- **Object** -- g_cr_queue

Field	Data Type	Reference	Remarks
active_flag	INTEGER NOT_NULL	Active_Reverse_Boolean::enum	**1** -- Active **0 --** Inactive
assignee	UUID		Assignee of Request
category	STRING 30		Category symbol of Request
close_date	LOCAL_TIME		Close Date of Request
customer	UUID NOT_NULL		Affected User of Request
global_queue_id	INTEGER	Global_Queue_Names::id	Pointer to global queue
group_id	UUID		Group assigned to Request
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
impact	INTEGER	Impact::enum	Impact of Request

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME NOT_NULL		Indicates the timestamp of when this record was last modified.
open_date	LOCAL_TIME NOT_NULL		Open Date of Request
priority	INTEGER NOT_NULL	Priority::enum	Priority of Request
ref_num	STRING 30 NOT_NULL		Request ref num
remote_id	INTEGER NOT_NULL S_KEY		Regional request id
remote_sys_id	INTEGER NOT_NULL S_KEY	Global_Servers:: remote_sys_id	Regional system id
status	STRING 30 NOT_NULL	Cr_Status::code	Status symbol of Request
summary	STRING 240		Summary of Request
type	STRING 10	crt code	ITIL record type

Global_Servers Table

Maintains a list of CA SDM installations that comprise the Global Service Desk.

- **SQL Name** -- g_srvr
- **Object** -- g_srvrs

Field	Data Type	Reference	Remarks
description	STRING 100		Specifies the comments field.
chg_prefix	STRING 5		Specifies the prefix for changes for a region.
cr_prefix	STRING 5		Specifies the prefix for requests for a region.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
global_name	STRING 30 UNIQUE NOT_NULL		Value of NX_GLOBAL_NAME on region
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID

Field	Data Type	Reference	Remarks
is_master	INTEGER	Boolean_Table::enum	Indicates if this server defined as master.
iss_prefix	STRING 5		Specifies the prefix for issues for a region.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
remote_sys_id	INTEGER UNIQUE NOT_NULL		Regional system id
slump_addr	STRING 30		Specifies the CA SDM primary server hostname or IP address. A slump_addr is defined for each global region definition.
sym	STRING 30 UNIQUE NOT_NULL		Specifies the descriptive name.
web_protocol	STRING 10		Specifies the master region web access protocol (http https).
web_server	STRING 30		Specifies the web server name.
web_server_port	STRING 10		Specifies the web server port (can be blank).
web_url	STRING 100		Specifies the rest of URL to pdmweb.exe of remote system (or webdirector).

Usp_Servers Table

The usp_servers table lists all the servers in the CA SDM deployment.

Field	Data Type	Reference	Description
id	INTEGER UNIQUE		Unique key.
local_host	STRING 128 UNIQUE NOT_NULL S_KEY		Host name/Server name
timezone	STRING 30	Timezone	Timezone of server.
desc	STRING 1024		Textual description of the this host/server.
del	INTEGER NOT_NULL		Deleted flag 0 -- active 1 -- inactive/marked as deleted
server_id	INTEGER		Server ID or Slump ID

Field	Data Type	Reference	Description
slump_port	INTEGER		Slump port number for communication.
server_type	INTEGER	server_types	Type of Server 0 -- primary 1 -- Secondary 2 -- Background 3 -- Stand-By 4 -- Application Server
database_type	STRING 30		Currently unused. 0 -- SQL 1 -- Oracle
external_dns_name	STRING 30		Currently unused.
platform	STRING 30		Currently unused. 0 -- Unix/Linux 1 -- Windows
linked	INTEGER NOT_NULL		Specify whether the server is configured.
last_mod_dt	LOCAL_TIME		Timestamp of when the record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified the record.

Global_Table_Map Table

Contains list of table maps (local to master) used in global data transport.

- **SQL Name** -- g_tbl_map
- **Object** -- g_tblmap

Field	Data Type	Reference	Remarks
description	STRING 100		Comments field
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
map_definition	STRING 64 NOT_NULL		Map Definition name in xml file
sym	STRING 30 UNIQUE NOT_NULL		Name of this table map

Global_Table_Rule Table

Contains list of extract rules for global data transport.

- **SQL Name** -- g_tbl_rule
- **Object** -- g_tblrule

Field	Data Type	Reference	Remarks
description	STRING 100		Comments field
addl_query	STRING 240		Additional query
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
last_sync_dt	LOCAL_TIME		What was the last sync date
reoccur_interv	DURATION		How often to re-query
sched	STRING 30	Bop_Workshift::persid	Valid run schedule
sym	STRING 30 UNIQUE NOT_NULL S_KEY		Name for rule
table_map	INTEGER	Global_Table_Map::id	Table map

Transition Object Control

This article contains the following information:

in_trans Table

A transition object controls the current and next ticket status. The in_trans table lists the status, new status, and actions that need to occur for a default transition.

- **SQL Name** -- in_trans
- **Object** -- in_trans

Label	Field	Description
id	INTEGER	Unique key.
status	SYMBOL	Specifies the current ticket status.
new_status	SYMBOL	Specifies the new ticket status
must_comment	INTEGER	Comment required when using a transition. On new default: 0
is_default	INTEGER	Default transition that appears when the Status field is empty. On new default: 0
condition	BOP_REF_STR_REF Macro	Site condition macro to approve transition.
condition error	STRING 255	Error message for site condition.
description	STRING 255	Description of this transition.
last_mod_dt	LOCAL_TIME	Timestamp of last update to this record.
last_mod_by	UUID REF ca_contact	User who last updated this.
del	INTEGER nn	Logical database delete status.
tenant	UUID REF ca_tenant	Reference to Tenant information.

iss_trans Table

A transition object controls the current and next ticket status. The iss_trans table lists the status, new status, and actions that need to occur for a default transition.

- **SQL Name** -- iss_trans
- **Object** -- iss_trans

Label	Field	Description
id	INTEGER	Unique key.
status	SYMBOL	Specifies the current ticket status.
new_status	SYMBOL	Specifies the new ticket status
must_comment	INTEGER	Comment required when using a transition. On new default: 0
is_default	INTEGER	Default transition that appears when the Status field is empty. On new default: 0
condition	BOP_REF_STR_REF Macro	Site condition macro to approve transition.
condition error	STRING 255	Error message for site condition.
description	STRING 255	Description of this transition.
last_mod_dt	LOCAL_TIME	Timestamp of last update to this record.

Label	Field	Description
last_mod_by	UUID REF ca_contact	User who last updated this.
del	INTEGER nn	Logical database delete status.
tenant	UUID REF ca_tenant	Reference to Tenant information.

Issue Template

iss_Template Table

Table to manage Issue templates. There is one entry for each Issue that is a template.

- **SQL Name** -- iss_template
- **Object** -- iss_tpl

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (1000)		Specifies the textual description of the template.
id	INTEGER		Specifies the unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
quick_tmpl_type	INTEGER	Quick_Template_Types::enum	Specifies the quick template type, as follows:**1** -- Quick tmpl**2** -- Quick tmpl+review
template	nvarchar (30)	issue persistent_id	Persistent ID (SystemObjectName:id).
template_class	nvarchar (12)		This allow subclassing of the templates.
template_name	nvarchar (30)		Identifies the unique name of the template

Issue Table

This article contains the following topics:

Request management's analyst recording of an external user's ticket.

- **SQL Name** -- issue
- **Object** -- iss

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Specifies the unique (to the table) numeric ID.
persid	STRING 30		Specifies the Persistent ID (SystemObjectName:id).
ref_num	STRING 30 UNIQUE NOT_NULL S_KEY		Identifies the reference number.
summary	STRING 240		Identifies the Issue summary text.
description	STRING 4000		Provides a textual description of this Issue.
status	STRING 12	Issue_Status	
active_flag	INTEGER NOT_NULL		Flag representing whether this record is active or inactive: **0** -- Inactive **1** -- Active
start_date	LOCAL_TIME		Indicates the timestamp of when processing started.
open_date	LOCAL_TIME		Shows the timestamp of when this Issue was opened.
last_mod_dt	LOCAL_TIME		Identifies the timestamp of when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
close_date	LOCAL_TIME		Shows the timestamp of when the Issue was closed.
resolve_date	LOCAL_TIME		Indicates the timestamp of when the Change Order was resolved.
rootcause	INTEGER	Rootcause	Foreign key to the id field of the rootcause table, this identifies the Root Cause.
est_total_time	DURATION		Identifies the sum of estimated task time.
actual_total_time	DURATION		Specifies the sum of actual task time.
log_agent	UUID NOT_NULL	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this identifies who the change request was reported by.
assignee	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this identifies the Assignee.
organization	UUID	ca_organization	Foreign key to the id field of the ca_organization table, this identifies the Organization.
group_id	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this is the Group ID.
	UUID	ca_contact	Foreign key to the contact_uuid field of the ca_contact table.

Field	Data Type	Reference	Remarks
affected_contact			
requestor	UUID NOT_NULL	ca_contact	Foreign key to the contact_uuid field of the ca_contact table, this specifies the Affected End User.
category	STRING 12	Issue_Category	Foreign key to the code field of the isscat table, this identifies the Category.
priority	INTEGER NOT_NULL	Priority	Foreign key to the enum field of the pri table, this identifies the Priority.
need_by	LOCAL_TIME		Shows the Need By Date timestamp for this Issue.
est_comp_date	LOCAL_TIME		Shows the estimated completion date for this Issue.
actual_comp_date	LOCAL_TIME		Specifies the actual completion date timestamp.
est_cost	INTEGER		Specifies the estimated cost value for this Issue.
actual_cost	INTEGER		Identifies the actual cost of this Issue.
justification	STRING 240		Identifies the justification value for this Issue.
backout_plan	STRING 240		Identifies the backout plan value for this Issue.
impact	INTEGER	Impact	Foreign key to the enum field of the impact table, this defines the impact.
parent	STRING 30	Issue	Foreign key to the persistent_id field of the iss table, this identifies the Parent.
effort	STRING 240		Identifies the effort value for this Issue.
support_lev	STRING 30	Service_Desc	Foreign key to the code field of the srv_desc table, this identifies the Classic Service Type.
template_name	STRING 30		Foreign key to the template_name field of the iss_tpl table, this identifies the Template name.
sla_violation	INTEGER		Flag indicating the following: **1** -- Issue has violated its sla.
predicted_sla_violation	INTEGER		Flag that indicates the following: **1** -- Has been predicted by neugents.
macro_predicted_violation	INTEGER		Identifies that it is likely to violate its sla (boolean) for action macros to predict sla violations.
created_via	INTEGER	Interface	Specifies the unique (to the table) numeric ID.
call_back_date	LOCAL_TIME		Identifies the call back timestamp for this Issue.
call_back_flag	INTEGER		Specifies the call back flag value for this Issue.
string1	STRING 40		This is a user-defined string field.
string2	STRING 40		This is a user-defined string field.

Field	Data Type	Reference	Remarks
string3	STRING 40		This is a user-defined string field.
string4	STRING 40		This is a user-defined string field.
string5	STRING 40		This is a user-defined string field.
string6	STRING 40		This is a user-defined string field.
service_date	LOCAL_TIME		Specifies the service date value for this Issue.
service_num	STRING 30		Specifies the service num value for this Issue.
product	INTEGER	Product	Foreign key to the id field of the product table, this identifies the Product.
actions	STRING 750		Identifies the actions value for this Issue.
type_of_contact	INTEGER	Type_Of_Contact	Foreign key to the id field of the toc table, this identifies the Type of Contact.
reporting_method	INTEGER	Reporting_Method	Foreign key to the id field of the repmeth table, this identifies how this Issue was reported.
person_contacting	INTEGER	Person_Contacting	Foreign key to the id field of the person table, this identifies the person who made the contact.
flag1	INTEGER		This is the flag1 value for this Issue.
flag2	INTEGER		This is the flag2 value for this Issue.
flag3	INTEGER		This is the flag3 value for this Issue.
flag4	INTEGER		This is the flag4 value for this Issue.
flag5	INTEGER		This is the flag5 value for this Issue.
flag6	INTEGER		This is the flag6 value for this Issue.
user1	STRING 100		This is a user-defined string field.
user2	STRING 100		This is a user-defined string field.
user3	STRING 100		This is a user-defined string field.
caextwf_instance_id	INTEGER	caextwf_instances	Indicates the CA Process Automation process instance id and process definition name and reference path launched by this Service Desk object.
ticket_avoided	INTEGER		
tenant	UUID	ca_tenant	
requested_by	UUID	ca_contact	
external_system_ticket	STRING 4000		
orig_user_dept	INTEGER	ca_resource_department	

Field	Data Type	Reference	Remarks
orig_user_organization	UUID	ca_organization	
orig_user_admin_org	UUID	ca_organization	
orig_user_cost_center	INTEGER	ca_resource_ cost_center	
target_start_last	LOCAL_TIME		
target_hold_last	LOCAL_TIME		
target_hold_count	INTEGER		
target_resolved_ last	LOCAL_TIME		
target_resolved_ count	INTEGER		
target_closed_last	LOCAL_TIME		
target_closed_ count	INTEGER		

Issue_Act_Log Table

History of activities associated with an issue. Types of activities are listed in the Act_Type table.

- **SQL Name** -- issalg
- **Object** -- issalg

Field	Data Type	Reference	Remarks
action_desc	nvarchar (4000)		Specifies the text description of the activity log entry.
analyst	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this represents the Analyst who created this activity log.
description	nvarchar (4000)		Specifies the text description of the activity log.
id	INTEGER		Primary key of this table, this is a unique numeric ID.
internal	INTEGER		Designates the log as an Internal log.
issue_id	nvarchar (30)		Foreign key to the persistent_id field of the iss table, this is the Issue for this activity.

Field	Data Type	Reference	Remarks
		issue persistent _id	
knowledge _session	nvarchar (80)		Specifies the reference to the Knowledge Management session.
knowledge _tool	nvarchar (12)		Identifies the Knowledge Management Tool used for this activity.
last_mod_ dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Specifies the Persistent ID (SystemObjectName:id).
system_ti me	INTEGER		Represents the date and time of the record creation.
time_spen t	INTEGER		Identifies the time spent on the activity by the user.
time_stam p	INTEGER		Specifies the time spent on the activity by the user.
type	nvarchar (12)	Act_Type:: code	(Not Used) This is an acknowledgement that is also a non-editable string enum.

Issue_Category Table

Issue categories. Can be hierarchical.

- **SQL Name** -- isscat
- **Object** -- isscat

Field	Data Type	Reference	Remarks
id	INTEG ER		Unique (to the table) numeric ID.
persid	STRIN G(30)		Persistent ID (SystemObjectName:id)
del	INTEG ER	Active_Boolean_ Table::enum	Delete flag that indicates the following:**0** -- Active**1** -- Inactive /marked as deleted
sym	STRIN G (1000)		Identifies the Issue Category symbolic description.
code	STRIN G (12)		Primary key of this table.
last_mo d_dt	LOCAL _TIME		Identifies the timestamp of when this record was last modified.
	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_by			
description	STRING (500)		Identifies the textual description of this issue category.
organization	UUID	ca_organization::organization_uuid	Foreign key to the id field of the ca_organization table, this is the Organization.
assignee	UUID		Foreign key to the contact_uuid field of the ca_contact table, this is also the Assignee.
group_id	UUID		Foreign key to the contact_uuid field of the ca_contact table. This is the Group.
children_ok	INTEGER		Specifies the handling of the issue category:**0** -- Children not allowed**1** -- Children are allowed
service_type	STRING (30)	Service_Desc	
survey	INTEGER	Survey_Template::id	Foreign key of the id field of the survey_tpl table, this is the Survey.
schedule	INTEGER	Bop_Workshift	Deprecated.
auto_assign	INTEGER		Flag that enables auto assignment.
owning_contract	INTEGER	Service_Contract::id	Foreign key to the id field of the svc_contract table.This is the Service Contract.
flow_flag	INTEGER		Specifies the type of workflow:**0** -- Classic Workflow or none (default) **2** -- CA IT PAM
caextwf_start_id	INTEGER	caextwf_start_forms	Identifies the CA IT PAM process definition information to use when the user selects this category on a change order, issue, request.
tenant	UUID	ca_tenant	
chgtype	INTEGER	usp_change_type	
risk_survey	INTEGER	Risk_Survey_Template	
cab	UUID	ca_contact	
ss_include	INTEGER	bool	REQUIRED On new default: 0
ss_sym	STRING (128)		

Issue_Property Table

Property value pairs for an object.

- **SQL Name** -- issprp
- **Object** -- iss_prp

Field	Data Type	Reference	Remarks
description	nvarchar(240)		Specifies the textual description of this property.
error_msg	STRING 240		Specifies the error message produced if validation fails.
id	INTEGER		Primary key of this table, it is also a unique, numeric ID.
label	nvarchar(80)		Specifies the label value for this Issue property.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
owning_iss	nvarchar(30)	Issue	Foreign key to the persistent_id field of the iss table, this is also the Issue.
owning_macro	BOP_REF_STR NOT_NULL	Spell_Macro	Specifies the Spell_Macro for validation.
required	INTEGER	Boolean_Table::enum	Identifies the Required flag, as follows:**0** -- Not required**1** -- Required
sample	nvarchar(240)		The sample value for this property.
sequence	INTEGER		Used to order the properties for an Issue.
value_description	STRING 240		Text description of the value.
validation_rule	BOP_REF_STR NOT_NULL	Property_Validation_Rule	Identifies the valid value rule.
validation_type	BOP_REF_STR NOT_NULL	Property_Validation_Type	Identifies the type of validation rule.
value	nvarchar(240)		Identifies the value of the property.

Issue_Status Table

Lists the states of the Issue, which you can also add. This table allows you to control whether the issue is active or inactive when it is changed to this status. Possible status include: open, approval in process, implementation in progress, verification in progress, cancelled, suspended, and closed.

- **SQL Name** -- issstat
- **Object** -- issstat

Field	Data Type	Reference	Remarks
active	INTEGER		Flag that indicates the following:**0** -- Inactive**1** -- Active
code	nvarchar (12)		Primary key of this table.
del	INTEGER		Delete flag that indicates the following:**0** -- Active**1** -- Inactive /marked as deleted
description	nvarchar (500)		Identifies the textual description of this status.
hold	INTEGER		Flag that specifies the following:**0** -- Start events**1** -- Stop events
id	INTEGER		Unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
resolved	INTEGER		Flag that indicates the following:**0** -- Not yet resolved**1** -- Resolved
sym	nvarchar (30)		Identifies the symbolic name of the Issue status.

Key Control

Table of sequence numbers for requests, change orders, tickets, and foreign keys.

- **SQL Name** -- kc

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
key_name	STRING 20		
key_value	INTEGER		Indicates the next key available for handout.

Message Status

This article contains the following topics:

Mgs_Act_Log Table

History of activities associated with a managed survey. The types of activities are listed in the Act_Type table.

- **SQL Name** -- mgsalg

- **Object** -- mgsalg

Field	Data Type	Reference	Remarks
action_desc	nvarchar (700)		Specifies the text description of the activity log entry.
analyst	byte(16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this represents the Analyst who created this activity log.
description	nvarchar (1000)		Specifies the text description of the activity log.
id	INTEGER		Primary key of this table, this is a unique numeric ID.
internal	INTEGER		Designates the log as an Internal log.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
mgs_id	INTEGER	Managed_Survey::id	Specifies the unique (to the table) numeric ID.
persid	nvarchar (30)		Specifies the Persistent ID (SystemObjectName:id).
system_time	INTEGER		Represents the date and time of the record creation.
time_spent	INTEGER		Identifies the time spent on the activity by the user.
time_stamp	INTEGER		Specifies the date time spent on the activity by the user.
type	nvarchar (12)	Act_Type::code	Foreign key to the code field of the act_type table, this is the Type.

Mgs_Status Table

List of valid message status definitions.

- **SQL Name** -- mgsstat
- **Object** -- mgsstat

Field	Data Type	Reference	Remarks
active	INTEGER		Flag that indicates the following:**0** -- Inactive**1** -- Active
code	nvarchar (12)		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Delete flag that indicates the following:**0 --** Active**1 --** Inactive/marked as deleted
description	nvarchar (500)		Identifies the textual description of this status.

Field	Data Type	Reference	Remarks
hold	INTEGER		Flag that specifies the following:**0** -- Start events**1** -- Stop events
id	INTEGER		Unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (30)		Identifies the Managed Survey Status name.

Notification Table

This article contains the following topics:

Notification Table

Program control table used by Knowledge Management.

- **SQL Name** -- Notification
- **Object** -- Notification

Field	Data Type	Reference	Remarks
ALT_EMAIL	STRING 100		
ANALYST_ID	UUID	ca_contact::uuid	
DOC_ID	INTEGER		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
NTF_LEVEL	INTEGER		**0** -- External and Internal **1** -- External only **2** -- Internal only

Notification_Urgency Table

Maps internal enums to strings for representing notification urgency for contacts.

- **SQL Name** -- noturg
- **Object** -- noturg

Field	Data Type	Index	Reference	Remarks
del	INTEGER NOT_NULL		Active_Boolean_Table::enum	**0** -- Present **1** -- Gone
desc	STRING 40			Specifies the description of notification urgency.
enum	INTEGER NOT_NULL			Indicates the enumeration value.
id	INTEGER UNIQUE NOT_NULL KEY	storage hash		Indicates the key ID.
sym	STRING 60 UNIQUE NOT_NULL S_KEY	sort dsc		Indicates the notify urgency symbol.

Notify_Log_Header Table

This table keeps track of each notify, and what happened to it.

- **SQL Name** -- not_log
- **Object** -- lr

Field	Data Type	Reference	Remarks
cmth_used	INTEGER	Contact_Method ::id	
cntxt_obj	STRING 30		Specifies the termination of sequence Context for notification.
context_instance	STRING 30		Contains the persistent ID of the associated Activity Log for the notifications.
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID.
last_mod	LOCAL_TIME		Specifies the last modification time, for purging.
nlh_ack_by	LOCAL_TIME		Specifies the time deadline for ack.
	DURATION		Specifies how long for ack.

Field	Data Type	Reference	Remarks
nlh_ack_time			
nlh_c_addressee	UUID	ca_contact::uuid	Specifies the alias contact.
nlh_c_alias	UUID		
nlh_cm_method	INTEGER	Notification_Urgency::enum	
nlh_email	STRING 50		Specifies the resolved email address (the email notification sent was not associated with the proper contact).
nlh_end	LOCAL_TIME		Specifies the time of ACK or FYI final.
nlh_hdr	STRING 40		Specifies the msg header text.
nlh_msg	STRING 4000		Specifies the message text.
nlh_msg_html	STRING 32768		Specifies the html version of notification if sent through mail.
nlh_pri	INTEGER		Generating notification enum priority of transition event
nlh_start	LOCAL_TIME NOT_NULL		Specifies the notification start date.
nlh_status	INTEGER		Pending send, sent FYI.
nlh_transition	INTEGER		Specifies the notify method used - redefined in majic, points to 'noturg' object Transition point.
nlh_type	INTEGER		FYI or ack
nlh_user_ack	STRING 40		Sent ack, acked, nacked, cleared. Who acknowledged or cleared it.

Notify_Msg_Tpl Table

List of object attribute message template definitions for notification rules.

- **SQL Name** -- ntfm
- **Object** -- ntfm

Field	Data Type	Reference	Remarks
ID	INTEGER		Primary key
persid	nvarchar(30)		Object key
del	SREL integer -- > actbool		Delete indicator
sym	nvarchar(128)		Symbolic description; required field
notify_flag	INTEGER		Auto notification

Field	Data Type	Reference	Remarks
notify_level	SREL integer --> noturg		Notification level
notify_msg_title	nvarchar(255)		Notification message title (Required)
notify_msg_body	nvarchar(4000)		Notification message body
notify_msg_body_html	nvarchar(32768)		Notification HTML message
obj_type	SREL string --> ntfm_prod_list		Object type: cr, chg, iss; required field
last_mod_dt	DATE		Audit trail date
last_mod_by	SREL uuid --> cnt		Audit trail user

Notify_Object_Attr Table

List of object attribute contacts that may receive notifications.

- **SQL Name** -- ntfl
- **Object** -- ntfl

Field	Data Type	Reference	Remarks
description	STRING 240		Specifies the textual description.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
object_attr	STRING 250		Specifies the attr name in object.
object_type	STRING 30		Specifies the object name.
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 30 NOT_NULL		

Notify_Rule Table

List of object attribute contacts and definitions for notification rules.

- **SQL Name** -- ntfr
- **Object** -- ntfr

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
persid	nvarchar (30)		Specifies the object key
del	INTEGER		Delete indicator
sym	nvarchar (128)		Symbolic description REQUIRED
description	nvarchar (500)		Long description
condition	nvarchar (30)	Spell_Macro	Specifies the foreign key to the condition macro.
obj_type	nvarchar (30)		Specifies the object type as cr, chg, or iss REQUIRED
last_mod_dt	LOCAL_TIME		Audit trail date
last_mod_by	UUID	ca_contact	Audit trail user
default_rule	INTEGER		**1** -- Default rule; do not allow condition
cr_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'cr' obj_type to condition macro.
chg_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'chg' obj_type to condition macro.
iss_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'iss' obj_type to condition macro.
mgs_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'mgs' obj_type to condition macro.
kd_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'kd' obj_type to condition macro.
kd_comment_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'kd_comment' obj_type to condition macro.
krc_notify_info	nvarchar (30)	ntfm	Specifies the foreign key for 'krc' obj_type to condition macro.
sa_notify_info	nvarchar (30)	ntfm	Specifies the foreigh key for 'sa' obj_type to condition macro.
cnt_notify_info	nvarchar (30)	ntfm	Specifies the foreigh key for 'cnt' obj_type to condition macro.
ci_notify_info	nvarchar (30)	ntfm	Specifies the foreigh key for 'ci' obj_type to condition macro.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
ntfr_ntflist	LREL	ntfl	Associated Object Contacts
ntfr_ctplist	LREL	ctp	Associated Contact Types
ntfr_macrolist	LREL	macro	Macros (aty's) using this rule

Comments

This table contains the following topics:

O_COMMENTS Table

Program control table used by CA SDM Knowledge Management.

- **SQL Name** -- O_Comments
- **Object** -- O_Comments

Field	Data Type	Reference	Remarks
ASSIGNEE	UUID		SREL to the Contacts table.
CLOSE_DATE	DATE		Represents the timestamp of when this flag was closed.
CLOSE_DESC	nvarchar (50)		Displays the description when the flag is closed.
COMMENT_TEXT	nvarchar (255)		Displays comment text.
COMMENT_ TIMESTAMP	DATE		Indicates the timestamp of when this record was last created.
DEADLINE_DATE	DATE		Displays the date when the flag should be fixed by the user.
DOC_ID	INTEGER	SKELETONS :: id	Identifies the unique doc ID.
EMAIL_ADDRESS	nvarchar (75)		Identifies the email address.
FLG_CODE	nvarchar (50)		Prevents duplicate flags from being created for the same broken link.
FLG_STATUS	INTEGER	KT_FLG_ STATUS	Identifies the flag status as active or inactive.
FLG_TYPE	INTEGER		SREL to the KT_Flg_Type Table.
ID	INTEGER KEY		Unique (to the table) Numeric ID.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Indicates the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
USER_ID	UUID	ca_contact: : uuid	Identifies the unique user ID
USER_NAME			Identifies the user name.

Field	Data Type	Reference	Remarks
	STRING 50		
VER_COUNT	INTEGER		Identifies the unique version ID and displays the number of versions created (1, 2, 3, 4...)

NR_Comment Table

Standard comments table.

- **SQL Name** -- nr_com
- **Object** -- nr_com

Field	Data Type	Reference	Remarks
attr_name	nvarchar (60)		For ITIL, this contains the Asset attribute that has changed.
com_comment	nvarchar (1000)		Identifies the comment text.
com_dt	INTEGER		Acts as the pointer to the parent row (nr_did), for the dt_comment written.
com_par_id	byte(16)	ca_owned_resource::uuid	Foreign key to the id field of the ca_owned_resource table, this is the Asset.
com_userid	nvarchar (40)		Identifies the userid of the commenting author.
id	INTEGER		Primary key of this table, this is a unique numeric ID.
new_value	nvarchar (1000)		For ITIL, this contains the new value of the Asset's attribute that has changed.
old_value	nvarchar (1000)		For ITIL, this contains the old value of the Asset's attribute that has changed.
writer_id	byte(16)		Primary key to the table, this is a unique identifier.

Promotion

This table contains the following topics:

- Object_Promotion Table (see page 3664)
- Promo_Hist Table (see page 3665)

Object_Promotion Table

Object Promotion definition for CA SDM application.

- SQL Name: object_promotion
- Object: object_promotion

Field	Data Type	Reference	Remarks
id	INTEGER		Unique numeric ID.
last_mod_dt	INTEGER		Indicates when the record was last modified.
last_mod_by	Byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified the record.
delete_flag	INTEGER		Specifies the default flag value for this access type.
object_name	nvarchar (60)		Provides the name of the promotable object.
description	nvarchar (512)		Provides the description of the promotable object.
start_date	INTEGER		Indicates the start date of promotable object.
end_date	INTEGER		Indicates the end date of promotable object.

Promo_Hist Table

Promotion History definition for CA SDM application.

- SQL Name: promo_hist
- Object: promo_hist

Field	Data Type	Reference	Remarks
id	INTEGER		Unique numeric ID.
last_mod_dt	INTEGER		Indicates when the record was last modified.
last_mod_by	Byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified the record.
created_user	nvarchar (255)		Name of the user who performed the operation.
description	nvarchar (512)		Provides the description of the executed operation.
start_date	INTEGER		Indicates the start date of the executed operation.
end_date	INTEGER		Indicates the end date of the executed operation.
package_name	nvarchar (255)		Package name of the executed operation.
promo_status	nvarchar (255)		Status of the executed operation.
promotion_cmd	nvarchar (255)		Promotion command of the executed operation.
report_file	nvarchar (255)		Report file name of the executed operation.
sdm_filter	nvarchar (512)		Filter of the executed operation.

status	INTEGER	Status code of the executed operation.
updated_user	nvarchar (255)	Name of the user who performed the operation.

Property

This table contains the following topics:

Property Table

Property value pairs for an object.

- **SQL Name** -- prp
- **Object** -- prp

Field	Data Type	Reference	Remarks
description	nvarchar(240)		Identifies the textual description of this property.
error_msg	STRING 240		Specifies the error message produced if validation fails.
id	INTEGER		Primary key of this table.
label	nvarchar(80)		Identifies the label value for this property.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
object_id	INTEGER	chg id	Identifies the unique (to the table) numeric ID.
object_type	nvarchar(30)		Specifies the short name of the object to which this property belongs.
owning_macro	BOP_REF_STR NOT_NULL	Spell_Macro	Specifies the Spell_Macro for validation.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
property	INTEGER	Property_Template ::id	Foreign key to the id field of the prptpl table, this is the Template.
required	INTEGER	Boolean_Table:: enum	Specifies the Required field as follows:**0** -- Not required**1** -- Required
sample	nvarchar(240)		Indicates the sample value for this property.
sequence	INTEGER		Specifies the sequence value for this property.

Field	Data Type	Reference	Remarks
value_description	STRING 240		Text description of the value.
validation_rule	BOP_REF_STR NOT_NULL	Property_Validation_Rule	Identifies the valid value rule.
validation_type	BOP_REF_STR NOT_NULL	Property_Validation_Type	Identifies the type of validation rule.
value	nvarchar(240)		Specifies the value of the property.

Property_Template Table

Additional properties for objects.

- **SQL Name** -- prptpl
- **Object** -- prptpl

Field	Data Type	Reference	Remarks
code	nvarchar(12)		Specifies the non-editable handle for the query.
del	INTEGER	Active_Boolean_Table::enum	Deleted flag that indicates the following:**0** -- Active **1** -- Inactive/marked as deleted
description	nvarchar(240)		Specifies the textual description for the property template.
label	nvarchar(80)		Display the text for the property.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
object_attrname	nvarchar(30)		Specifies that this template belongs to the attribute name in the object.
object_attrval	INTEGER		Identifies the object attribute value, which drives the template attribute value.
object_type	nvarchar(30)		Specifies the short name of the object.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
prptbl_id			Indicates the unique (to the table) numeric ID.
required	INTEGER NOT_NULL		Identifies the Required flag as follows:**0** -- Not Required**1** -- Required
sample	nvarchar(240)		Provides a sample, or Help text.
validation_rule	BOP_REF_STR NOT_NULL	Property_Validation_Rule	Identifies the valid value rule.
sequence	INTEGER		Specifies the display order.

Property_Validation_Rule Table

Property validation rule.

- **SQL Name** -- prpval_rule
- **Object** -- prpval_rule

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Specifies the primary key of this table.
persid	BOP_REF_STR		
del	INTEGER NOT_NULL		**0** -- Present **1** -- Not present
sym	STRING 30 UNIQUE NOT_NULL S_KEY		Specifies the name of the validation rule.
description	STRING 240		
validation_type	BOP_REF_STR	Property_Validation_ Type	Specifies the type of validation rule.
error_msg	STRING 240		Specifies the error message produced if validation fails.
owning_macro	BOP_REF_STR	Spell_Macro	Specifies the spell_Macro for validation.
label	LABEL_SYM NOT_NULL		Specifies the helper to pre-populate property template.
last_mod_dt	LOCAL_TIME		Indicates the timestamp indicating when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.

Property_Validation_Type Table

Property validation type.

- **SQL Name** -- prpval_type
- **Object** -- prpval_type

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Specifies the primary key of this table.
persid	BOP_REF_STR		Persistent ID
del	INTEGER NOT_NULL		**0** -- Present **1** -- Not present

Field	Data Type	Reference	Remarks
sym	STRING 30 UNIQUE NOT_NULL S_KEY		Specifies the name of the validation rule.
description	STRING 240		
last_mod_dt	LOCAL_TIME		Indicates the timestamp indicating when this record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.

Property_Value Table

Property values for an object.

- **SQL Name** -- prpval
- **Object** -- prpval

Field	Data Type	Reference	Remarks
id	INTEGER NOT_NULL		Specifies the primary key of this table.
persid	BOP_REF_STR		Specifies the persistent ID.
del	INTEGER NOT_NULL		**0** -- Present **1** -- Not present
sym	STRING 30 NOT_NULL S_KEY		Specifies the unique name of property value.
description	STRING 240		
owning rule	BOP_REF_STR NOT_NULL	Property_Validation_ Rule	Specifies the property validation rule this value applies to.
value	LONG_SYM NOT_NULL		Specifies the valid value.
is_default	INTEGER		**1** -- Default value for the rul/Pe
last_mod_dt	LOCAL_TIME		Specifies the last modified time.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified the record.

Query Policy

This article contains the following topics:

Query_Policy Table

Identifies the stored query event data for the Automated Policies feature in Knowledge Management.

- **SQL Name** -- query_policy
- **Object** -- query_policy

Field	Data Type	Reference	Remarks
ID	Long	Primary index.	Identifies the unique (to the table) numeric ID of the primary index.
persid	nvarchar (30)	Required field.	This is the Persistent ID.
Del	INTEGER (0/1)	Required field.	Deleted flag. **0** -- Active **1** -- Inactive/marked as deleted
last_mod_dt	Long (date)		Displays the last modified date.
last_mod_by	UUID	SREL to the ca_contacts table.	Displays the last date of when a user modified the record.
obj_type	nvarchar (30)	Required field. SREL to event_prod_list.	Kind of object for this event (knowledge document, and so forth).
query	nvarchar (30)	Required field. SREL to the cr_stored_queries.	Identifies the store query name.
sym	nvarchar (30)	Required field.	Identifies the policy name.
description	nvarchar (80)		Query policy description.

Query_Policy_Actions Table

Identifies the actions attached to the stored query event data for the Automated Policies feature in Knowledge Management. Each record represents a link between the macro and a query_policy record in the database.

- **SQL Name** -- query_policy_actions
- **Object** -- query_policy_actions

Field	Data Type	Reference	Remarks
ID	Long	Primary index.	Identifies the unique (to the table) numeric ID of the primary index.
policy	Long	Required field. SREL to query_policy.	Identifies the Policy ID.

Field	Data Type	Reference	Remarks
macro	STRING	Required field. SREL to splmac.	Identifies the action macro Persistent ID.
last_mod_dt	Long (date)		Displays the last modified date.
last_mod_by	UUID	SREL to the ca_contacts.	Displays the last date of when a user modified the record.

Request Property

This article contains the following topic:

Req_Property Table

Property value pairs for a Request.

- **SQL Name** -- cr_prp
- **Object** -- cr_prp

Field	Data Type	Reference	Remarks
description	nvarchar(240)		Specifies the textual description of this property.
error_msg	STRING 240		Specifies the error message produced if validation fails.
id	INTEGER		Primary key of this table, it is a unique, numeric ID.
label	nvarchar(80)		Specifies the label value for this Request property.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
owning_cr	nvarchar(30)	Call_Req::persid	Persistent ID (SystemObjectName:id)
owning_macro	BOP_REF_STR NOT_NULL	Spell_Macro	Specifies the Spell_Macro for validation.
required	INTEGER		Identifies the Required flag, as follows:**0** -- Not required**1** -- Required
sample	nvarchar(240)		The sample value for this Request_Property.
sequence	INTEGER		The sequence value for this Request property.
value_description	STRING 240		Text description of the value.
			Identifies the valid value rule.

Field	Data Type	Reference	Remarks
validation_rule	BOP_REF_STR NOT_NULL	Property_Validation_ Rule	
validation_type	BOP_REF_STR NOT_NULL	Property_Validation_ Type	Identifies the type of validation rule.
value	nvarchar(240)		Identifies the value of the property.

Req_Property_Template Table

Templates used to specify request properties.

- **SQL Name** -- cr_prptpl
- **Object** -- cr_prptpl

Field	Data Type	Reference	Remarks
description	STRING 240		Specifies the textual description of this template.
code	STRING 12 UNIQUE NOT_NULL S_KEY		Specifies the noneditable handle for query.
del	INTEGER NOT_NULL	Active_Boolean_ Table::enum	Deleted flag **0 --** Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
label	STRING 80 NOT_NULL		Specifies the display text for property.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
owning_area	STRING 30 NOT_NULL	Prob_Category:: persid	Specifies the parent category.
persid	STRING 30		Persistent ID (SystemObjectName:id)
required	INTEGER NOT_NULL		**0** -- Not required
sample	STRING 240		Specifies the help text.
sequence	INTEGER NOT_NULL		Specifies the display order.
validation_rule	BOP_REF_STR NOT_NULL	Property_Validation_ Rule	Identifies the valid value rule.

Support Automation Table

This article contains the following topic:

sa_custom_category Table

Program control table used by Support Automation.

- **SQL Name** -- sa_custom_category
- **Object** -- sa_custom_category

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
categoryName	STRING 100		
isActive	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_patch_history Table

Program control table used by Support Automation.

- **SQL Name** -- sa_patch_history
- **Object** -- sa_patch_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
patch_name	STRING 100		NOT_NULL
release_base	STRING 50		NOT_NULL
build_version	STRING 50		
epochq	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

SA_Policy Table

Policy information for dealing with automated creation and access of CA SDM components.

- **SQL Name** -- sapolicy
- **Object** -- sapolicy

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
persid	STRING 30		
del	INTEGER		NOT_NULL
sym	STRING 60		NOT_NULL
code	STRING 20		UNIQUE NOT_NULL S_KEY
description	STRING 300		
owning_policy	INTEGER	SA_Policy	
ticket_tmpl_fac	STRING 20		
ticket_tmpl_id	INTEGER		
ticket_tmpl_name	STRING 40		
is_default	INTEGER		
ret_usr_1	STRING 500		
ret_app_1	STRING 500		
dup_action	INTEGER		
dup_interval	DURATION		
is_internal	INTEGER		
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

sa_portal_component Table

Program control table used by Support Automation.

- **SQL Name** -- sa_portal_component
- **Object** -- sa_portal_component

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
name	STRING 50		NOT_NULL
URL	STRING 255		NOT_NULL
beforeLogin	INTEGER		
afterLogin	INTEGER		
beforeProbDef	INTEGER		
afterProbDef	INTEGER		
displayColumn	INTEGER		
displayIndex	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

SA_Prob_Type Table

Problem type definitions used with automated creation policies within CA SDM applications.

- **SQL Name** -- saprobtyp
- **Object** -- saprobtyp

Field	Data Type	Reference	Remarks
description	STRING 300		Specifies the textual description.
code	STRING 20 UNIQUE NOT_NULL S_KEY		Specifies the unique code name.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
dup_action	INTEGER		Specifies the enum for action to handle ticket duplication.
dup_interval	DURATION		Indicates the time range for searching duplicate tickets.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
is_default	INTEGER		

Field	Data Type	Reference	Remarks
			Specifies the one and only one for all policies.
is_internal	INTEGER	Active_Boolean_Table::enum	Specifies that the default problem types cannot be deleted.
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
owning_policy	INTEGER	SA_Policy::id	Specifies the owner of this problem type.
persid	STRING 30		Persistent ID (SystemObjectName:id)
ret_app_1	STRING 500		Specifies the text passed back to program for ticket creation.
ret_usr_1	STRING 500		Specifies the text passed back to human for ticket creation.
sym	STRING 40 NOT_NULL		Specifies the symobolic name of problem type.
ticket_tmpl_fac	STRING 20		Specifies the factory of the ticket template.
ticket_tmpl_id	INTEGER		Specifies the id of the ticket template.
ticket_tmpl_ name	STRING 40		Specifies the name of the ticket template

sa_property Table

Program control table used by Support Automation.

- **SQL Name** -- sa_property
- **Object** -- sa_property

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
propertyName	STRING 30		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_rejoin_code_mapping Table

Program control table used by Support Automation.

- **SQL Name** -- sa_rejoin_code_mapping
- **Object** -- sa_rejoin_code_mapping

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
rejoinCode	STRING 10		
rejoinString	STRING 100		
creationDate	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_rule_conduit_rule Table

Program control table used by Support Automation.

- **SQL Name** -- sa_rule_conduit_rule
- **Object** -- sa_rule_conduit_rule

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
functionName	STRING 100		NOT_NULL
className	STRING 100		
methodName	STRING 100		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_sound Table

Program control table used by Support Automation.

- **SQL Name** -- sa_sound
- **Object** -- sa_sound

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY

Field	Data Type	Reference	Remarks
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
soundName	STRING 255		
tenant	UUID	ca_tenant	

sa_sup_desk_hour_config Table

Program control table used by Support Automation.

- **SQL Name** -- sa_sup_desk_hour_config
- **Object** -- sa_sup_desk_hour_config

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
label	STRING 100		NOT_NULL
description	STRING 1024		
active	INTEGER		NOT_NULL
workshift	STRING 30	Bop_Workshift	
usehours	INTEGER	sa_hour_operation_mode	NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_tenant_localization Table

Program control table used by Support Automation.

- **SQL Name** -- sa_tenant_localization
- **Object** -- sa_tenant_localization

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.

Field	Data Type	Reference	Remarks
toolInstanceID	INTEGER	sa_tool_instance_log	NOT_NULL
eventID	INTEGER	sa_event_history	NOT_NULL
tenant	UUID	ca_tenant	

sa_triage_script Table

Program control table used by Support Automation.

- **SQL Name** -- sa_triage_script
- **Object** -- sa_triage_script

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
queueID	INTEGER	sa_queue	NOT_NULL
scriptID	INTEGER	sa_script	NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_data_routing_server Table

Program control table used by Support Automation.

- **SQL Name** -- sa_data_routing_server
- **Object** -- sa_data_routing_server

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
label	STRING 100		NOT_NULL
host	STRING 100		NOT_NULL
port	INTEGER		NOT_NULL
cssURL	STRING 150		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_datapool_channel Table

Program control table used by Support Automation.

- **SQL Name** -- sa_datapool_channel
- **Object** -- sa_datapool_channel

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
name	STRING 250		NOT_NULL
persistent	INTEGER		NOT_NULL
channelID	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_datapool_channel_user Table

Program control table used by Support Automation.

- **SQL Name** -- sa_datapool_channel_user
- **Object** -- sa_datapool_channel_user

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
channelID	INTEGER	sa_databpool_channel	NOT_NULL
sessionID	INTEGER	sa_login_session	NOT_NULL
snoop	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_division_login_script Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_division_login_script

- **Object** -- sa_division_login_script

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptText	INTEGER		
scriptName	STRING 128		
scriptDescription	STRING 32768		
scriptLanguage	STRING 24		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_division_role_join Table

Program control table used by Support Automation.

- **SQL Name** -- sa_division_role_join
- **Object** -- sa_division_role_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleID	INTEGER	sa_role	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_division_tool_join Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_division_tool_join
- **Object** -- sa_division_tool_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
toolID	INTEGER	sa_tool	NOT_NULL
enabled	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.

Field	Data Type	Reference	Remarks
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_notif
- **Object** -- sa_notif

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
fieldType	INTEGER	sa_field_type	NOT_NULL
fieldName	STRING 50		NOT_NULL
fieldOrder	INTEGER		NOT_NULL
mandatory	INTEGER		NOT_NULL
active	INTEGER		NOT_NULL
displayName	STRING 150		
guestMandatory	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_field_type Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_field_type
- **Object** -- sa_field_type

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
fieldType	INTEGER		NOT_NULL
fieldTypeDescription	STRING 255		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt			

Field	Data Type	Reference	Remarks
	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_function_arg Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_function_arg
- **Object** -- sa_function_arg

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
functionID	INTEGER	sa_lib_function	NOT_NULL
arg_name	STRING 75		NOT_NULL
description	STRING 255		
index_value	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_default_credential Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_default_credential
- **Object** -- sa_default_credential

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
Domain	STRING 255		
Login	STRING 255		NOT_NULL
Pwd	STRING 255		NOT_NULL
label	STRING 100		
active	INTEGER		

Field	Data Type	Reference	Remarks
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_display_template_loc Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_display_template_loc
- **Object** -- sa_display_template_loc

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
localizationID	INTEGER	sa_localizatio n	NOT_NULL
eventType	INTEGER	sa_event_typ e	NOT_NULL
displayTemplat e	STRING 510		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_flow_control_rule Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_flow_control_rule
- **Object** -- sa_flow_control_rule

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
pageName	STRING 100		NOT_NULL
state	STRING 100		NOT_NULL
directedURL	STRING 500		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_alert_config_param Table

Program control table used by Support Automation.

- **SQL Name** -- sa_alert_config_param
- **Object** -- sa_alert_config_param

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
paramName	STRING 255		NOT_NULL
paramValue	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_hour_operation_mode Table

Program control table used by Support Automation.

- **SQL Name** -- sa_hour_operation_mode
- **Object** -- sa_hour_operation_mode

Field	Data Type	Reference	Remarks
id	INTEGER		NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sym	STRING 20		NOT_NULL
enum	INTEGER		NOT_NULL

sa_iss_template Table

Program control table used by Support Automation.

- **SQL Name** -- sa_iss_template
- **Object** -- sa_iss_template

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt			

Field	Data Type	Reference	Remarks
	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tpl	STRING 30	Iss_Template	NOT_NULL
is_default	STRING 50		NOT_NULL
isActive	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_large_data_record Table

Program control table used by Support Automation.

- **SQL Name** -- sa_large_data_record
- **Object** -- sa_large_data_record

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
recordID	INTEGER		NOT_NULL
recordOrder	INTEGER		NOT_NULL
originalTableName	STRING 100		
data	STRING 32768		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_lib_function Table

Program control table used by Support Automation.

- **SQL Name** -- sa_lib_function
- **Object** -- sa_lib_function

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
functionName	INTEGER		NOT_NULL
libFunction	INTEGER		NOT_NULL
funcDesc			

Field	Data Type	Reference	Remarks
	STRING 1024		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_group_event_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_group_event_join
- **Object** -- sa_group_event_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupID	INTEGER	sa_group	NOT_NULL
eventID	INTEGER	sa_event_history	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_group_history Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_group_history
- **Object** -- sa_group_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupID	INTEGER	sa_group	NOT_NULL
startEpoch	LOCAL_TIME		NOT_NULL
endEpoch	LOCAL_TIME		NOT_NULL
sessionID	INTEGER	sa_login_session	NOT_NULL

Field	Data Type	Reference	Remarks
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_group_tool_invocation Table

Program control table used by Support Automation.

- **SQL Name** -- sa_group_tool_invocation
- **Object** -- sa_group_tool_invocation

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupID	INTEGER	sa_group	NOT_NULL
toolID	INTEGER	sa_tool	NOT_NULL
toolInstanceID	INTEGER	sa_tool_instance	NOT_NULL
toolStartEpoch	LOCAL_TIME		NOT_NULL
toolStartTime	STRING 50		
toolInstanceLogID	INTEGER	sa_tool_instance_log	
extraData	STRING 100		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_keyword Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_keyword
- **Object** -- sa_keyword

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
keyname	STRING 100		

Field	Data Type	Reference	Remarks
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_keyword_queue_join Table

Program control table used by Support Automation.

- **SQL Name** -- sa_keyword_queue_join
- **Object** -- sa_keyword_queue_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
keywordID	INTEGER	sa_keyword	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
weight	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_milepost Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_milepost
- **Object** -- sa_milepost

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sessionID	INTEGER	sa_login_session	NOT_NULL
milepost	INTEGER		
epoch	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_milepost_history Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_milepost_history
- **Object** -- sa_milepost_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sessionID	INTEGER	sa_login_session	NOT_NULL
milepost	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_art_tool_avail Table

Program control table used by Support Automation.

- **SQL Name** -- sa_art_tool_avail
- **Object** -- sa_art_tool_avail

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleID	INTEGER	sa_role	
availBits	STRING 30		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_bin_temp Table

Program control table used by Support Automation.

- **SQL Name** -- sa_bin_temp
- **Object** -- sa_bin_temp

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
data	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_branding Table

Program control table used by Support Automation.

- **SQL Name** -- sa_branding
- **Object** -- sa_branding

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
localization	INTEGER	sa_localization	NOT_NULL
stylesheetURL	STRING 512		
header	STRING 32768		
footer	STRING 32768		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_comm_temp Table

Program control table used by Support Automation.

- **SQL Name** -- sa_comm_temp
- **Object** -- sa_comm_temp

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
data	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.

last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_cr_template Table

Program control table used by Support Automation.

- **SQL Name** -- sa_cr_template
- **Object** -- sa_cr_template

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tpl	STRING 30	Cr_Template	NOT_NULL
is_deafult	INTEGER		NOT_NULL
isactive	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_localization Table

Program control table used by Support Automation.

- **SQL Name** -- sa_localization
- **Object** -- sa_localization

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
localizationID	INTEGER		UNIQUE NOT_NULL
enabled	INTEGER		
name	STRING 100		
is_default	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_login_session Table

Program control table used by Support Automation.

- **SQL Name** -- sa_login_session
- **Object** -- sa_login_session

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca-contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
userID	UUID	ca_contact	
startEpoch	LOCAL_TIME		
endEpoch	LOCAL_TIME		
waitTime	INTEGER		
supportLength	INTEGER		
CanDownloadScriptApplets	INTEGER		
CanDownloadDlls	INTEGER		
CanRunAppletComms	INTEGER		
CanDownloadExes	INTEGER		
jvm	STRING 150		
NoPrompt	INTEGER		
ClientIsEXE	INTEGER		
Timezone	INTEGER		
availableTime	LOCAL_TIME		
unavailableTime	LOCAL_TIME		
browser	STRING 150		
DirectSessionCode	STRING 100		
Question	STRING 1024		
initialQueueID	INTEGER	sa_queue	
QueuedEpoch			

Field	Data Type	Reference	Remarks
	LOCAL_TIME		
QueuedTime	STRING 50		
OnHoldEpoch	LOCAL_TIME		
OnHoldTime	STRING 50		
HandledEpoch	LOCAL_TIME		
HandledTime	STRING 50		
GroupID	INTEGER	sa_group	
AbandonFlag	INTEGER		
IsCurrent	INTEGER		
SelfServe	INTEGER		
localizationID	INTEGER	sa_localization	
profileOverride	INTEGER		
AccessibilityExtEnabled	INTEGER		
IsWebClient	INTEGER		
CategoryID	INTEGER	sa_custom_category	
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_named_user_license Table

Program control table used by Support Automation.

- **SQL Name** -- sa_named_user_license
- **Object** -- sa_named_user_license

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
userID	UUID	ca_contact	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_notif Table

Program control table used by Support Automation.

- **SQL Name** -- sa_notif
- **Object** -- sa_notif

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
notif_type	INTEGER		Specifies one of the following notification types: **1** -- Queue Entry Notification - end user joins Assistance Session Queue **2** -- Queue Entry Notification - Assistance Session is transferred to an Assistance Session Queue **3** -- reserved **4** -- Invite End User to Assistance Session - Incident **5** -- Invite End User to Assistance Session - Issue **6** -- Session Ended Notification
queue_id	INTEGER	sa_queue	REQUIRED
queued_user_id	INTEGER	sa_queued_user	
queued_group_id	INTEGER	sa_queued_group	
end_user_uuid	UUID	cnt	Specifies the UUID of the end user.
analyst_uuid	UUID	cnt	Specifies the UUID of the analyst.
sd_obj_type	STRING 5		Defines if the assistance session is integrated with iss, cr, or in.
sd_obj_id	INTEGER		Defines the cr/iss related record.
cr_persid_rel	STRING 30	Call_Req	Specifies the persid of the cr.
iss_persid_rel	STRING 30	Issue	Specifies the persid of the iss.
analyst_message	nvarchar (1024)		Specifies the text of the message sent by the analyst.
session_url	Long nvarchar		Specifies the URL of the assistance session.
msg_title	nvarchar (255)		Specifies the title of the nofitication.
msg_body	Long nvarchar		Specifies the description of the notification.
survey_id	INTEGER		Specifies the ID of the survey.

Field	Data Type	Reference	Remarks
survey_persid_rel	STRING 30		
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_sdconfig Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sdconfig
- **Object** -- sa_sdconfig

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
propertyKey	STRING 50		NOT_NULL
propertyValue	STRING 512		

sa_sdgroup_map Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sdgroup_map
- **Object** -- sa_sdgroup_map

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
groupID	INTEGER	sa_group	NOT_NULL
SDTicketID	STRING 50		NOT_NULL
SDRefNum	STRING 50		NOT_NULL
tenant	UUID	ca_tenant	

sa_sdsession_ticket_map Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sdsession_ticket_map
- **Object** -- sa_sdsession_ticket_map

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NUL
SDTicketID	STRING 50		NOT_NUL
SDRefNum	STRING 50		NOT_NUL
tenant	UUID	ca_tenant	

sa_system_message Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_system_message
- **Object** -- sa_system_message

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
messageTag	STRING 100		NOT_NULL
tenant	UUID	ca_tenant	
localizationID	INTEGER	sa_localization	NOT_NULL
messageText	STRING 1024		

sa_system_property Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_system_property

- **Object** -- sa_system_property

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
propertyKey	STRING 300		NOT_NULL
propertyValue	STRING 32768		
propertyDescription	STRING 32768		
isGlobal	INTEGER		
obsolete	INTEGER		

sa_version Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_version
- **Object** -- sa_version

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
DBVersion	STRING 100		

sa_virtual_session Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_virtual_session
- **Object** -- sa_virtual_session

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt			

Field	Data Type	Reference	Remarks
	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
queueID	INTEGER	sa_queue	
userID	UUID	ca_contact	
sessionID	INTEGER	sa_login_session	
queuedEpoch	LOCAL_TIME		
handledEpoch	LOCAL_TIME		
endEpoch	LOCAL_TIME		
waitTime	INTEGER		
handledTime	INTEGER		
abandonFlag	INTEGER		
firstFlag	INTEGER		
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_wait_component Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_wait_component
- **Object** -- sa_wait_component

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
queueID	INTEGER	sa_queue	
waitURL	STRING 300		
isExternal	INTEGER		
pagetype	INTEGER	sa_wait_component_type	

sa_wait_component_type Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_wait_component_type
- **Object** -- sa_wait_component_type

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
enum	INTEGER		
sym	STRING 50		
is_optional	INTEGER		

Support Automation - Security

This article contains the following topics:

sa_security_group Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_group
- **Object** -- sa_security_group

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
groupName	STRING 50		NOT_NULL

Field	Data Type	Reference	Remarks
description	STRING 512		
rank	INTEGER		
localizationID	INTEGER		

sa_security_group_dir Table

Program control table that is used by Support Automation policies.

- **SQL Name** -- sa_security_group_dir
- **Object** -- sa_security_group_dir

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
groupID	INTEGER	sa_security_group	NOT_NULL
directory	STRING 150		
tenant	UUID	ca_tenant	

sa_security_group_function Table

Program control table that is used by Support Automation policies.

- **SQL Name** -- sa_security_group_function
- **Object** -- sa_security_group_function

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
groupID	INTEGER	sa_security_group	NOT_NULL
functionID	INTEGER	sa_security_tool_function	NOT_NULL
value	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	

sa_security_group_loc Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_group_loc
- **Object** -- sa_security_group_loc

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
groupID	INTEGER	sa_security_group	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
groupName	STRING 50		
description	STRING 512		
tenant	UUID	ca_tenant	

sa_security_grp_role_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_grp_role_join
- **Object** -- sa_security_grp_role_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
roleID	INTEGER	sa_role	NOT_NULL
groupID	INTEGER	sa_security_group	NOT_NULL
isDefault	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	

sa_security_login_function Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_login_function
- **Object** -- sa_security_login_function

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NULL
functionID	INTEGER	a_security_tool_function	NOT_NULL
value	INTEGER		NOT_NULL
localizationID	INTEGER		
tenant	UUID	ca_tenant	

sa_security_request_order Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_request_order
- **Object** -- sa_security_request_order

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolID	INTEGER	sa_tool	NOT_NULL
functionID	INTEGER	sa_security_tool_function	NOT_NULL
orderbit	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	

sa_security_text_localized Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_text_localized
- **Object** -- sa_security_text_localized

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
TextID	INTEGER		NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
TextValue	STRING 100		NOT_NULL

sa_security_tool_function Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_tool_function
- **Object** -- sa_security_tool_function

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolID	INTEGER	sa_tool	NOT_NULL
functionName	STRING 50		
canPrompt	INTEGER		
localizationID	INTEGER	sa_localization	

sa_security_tool_localized Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_tool_localized
- **Object** -- sa_security_tool_localized

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
functionID	INTEGER	sa_security_tool_function	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
functionName	STRING 100		
tenant	UUID	ca_tenant	

sa_security_user_directory Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_security_user_directory
- **Object** -- sa_security_user_directory

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NULL
directory	STRING 150		NOT_NULL
tenant	UUID	ca_tenant	

Support Automation - Script

This topic contains the following information:

sa_script Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script
- **Object** -- sa_script

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptText	INTEGER		
scriptName	STRING 128		
scriptDescription	STRING 2000		
isLocked	INTEGER		
version	INTEGER		
GUID	STRING 255		
credLogin	STRING 50		
credPswd	STRING 255		
credDomain	STRING 50		
impersonate	INTEGER		
credentialsType	INTEGER		
disclaimer	INTEGER	sa_disclaimer	
surveyID	INTEGER	sa_survey	
percentShown	INTEGER		
loginRequired	INTEGER		
restrictFunctions	INTEGER		
scriptTimeout	INTEGER		
wsEnabled	INTEGER		
groupID	INTEGER	sa_script_group	NOT_NULL
last_mod_by	UUID	cnt	

Field	Data Type	Reference	Remarks
			Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_acquired_data Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_acquired_data
- **Object** -- sa_script_acquired_data

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sessionID	INTEGER	sa_login_session	NOT_NULL
scriptID	INTEGER	sa_script	NOT_NULL
scriptInstanceID	INTEGER	sa_script_execution_log	NOT_NULL
epoch	LOCAL_TIME		NOT_NULL
acquiredData	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_exec_log_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_exec_log_join
- **Object** -- sa_script_exec_log_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptInstanceID	INTEGER	sa_script_execution_log	NOT_NULL
eventID	INTEGER	sa_event_history	NOT_NULL
last_mod_by	UUID	cnt	

Field	Data Type	Reference	Remarks
			Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_exec_status Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_exec_status
- **Object** -- sa_script_exec_status

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
eventID	INTEGER	sa_event_history	NOT_NULL
scriptID	INTEGER	sa_script	NOT_NULL
executedStatus	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_execution_log Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_execution_log
- **Object** -- sa_script_execution_log

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptID	INTEGER	sa_script	NOT_NULL
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL
sessionID	INTEGER	sa_login_session	NOT_NULL
executedEpoch	LOCAL_TIME		NOT_NULL

surveyShown	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_function_lib Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_function_lib
- **Object** -- sa_script_function_lib

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
scriptID	INTEGER	sa_script	NOT_NULL
libID	INTEGER	sa_scriptlib	NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_group Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_group
- **Object** -- sa_script_group

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupName	STRING 128		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_role_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_role_join
- **Object** -- sa_script_role_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptID	INTEGER	sa_script	NOT_NULL
roleID	INTEGER	sa_role	NOT_NULL
autorun	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_security_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_security_join
- **Object** -- sa_script_security_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
scriptID	INTEGER	sa_script	NOT_NULL
functionID	INTEGER	sa_security_tool_function	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_script_user_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_script_user_field
- **Object** -- sa_script_user_field

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
fieldID	INTEGER	sa_field	NOT_NULL
scriptID	INTEGER	sa_script	NOT_NULL
isProfileField	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	

sa_scriptlib Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_scriptlib
- **Object** -- sa_scriptlib

Field	Data Type	Reference	Remarks
id	INTEGER		NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
libName	STRING 128		NOT_NULL
libLang	INTEGER	sa_scriptlib_language	NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
active	INTEGER		NOT_NULL
version	INTEGER		NOT_NULL
islocked	INTEGER		
description	STRING 1024		

sa_scriptlib_language Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_scriptlib_language
- **Object** -- sa_scriptlib_language

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sym	STRING 30		NOT_NULL
enum	INTEGER		NOT_NULL

Support Automation - Direct Session

This topic contains the following information:

sa_direct_session Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_direct_session
- **Object** -- sa_direct_session

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
code	STRING 100		NOT_NULL
groupID	INTEGER	sa_group	
expired	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_direct_session_page Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_direct_session_page
- **Object** -- sa_direct_session_page

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
stage	INTEGER		NOT_NULL

Field	Data Type	Reference	Remarks
epoch	LOCAL_TIME		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_direct_session_preset Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_direct_session_preset
- **Object** -- sa_direct_session_preset

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
responseID	INTEGER	sa_chat_preset	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - Event

This topic contains the following information:

sa_event_history Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_event_history
- **Object** -- sa_event_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
eventEpoch	LOCAL_TIME		NOT_NULL

Field	Data Type	Reference	Remarks
eventType	ITNEGER	sa_event_type	NOT_NULL
sd_obj_type	STRING 10		
sd_obj_id	INTEGER		
cr_rel	STRING 30	Call_Req	
iss_rel	STRING 30	Issue	
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_event_history_param Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_event_history_param
- **Object** -- sa_event_history_param

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
eventID	INTEGER	sa_event_history	NOT_NULL
paramID	INTEGER	sa_event_type_param	NOT_NULL
paramValue	STRING 4000		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_event_type Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_event_type
- **Object** -- sa_event_type

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
displayTemplate	STRING 255		

Field	Data Type	Reference	Remarks
eventDescription	STRING 50		
localizationID	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_event_type_param Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_event_type_param
- **Object** -- sa_event_type_param

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
paramName	STRING 255		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - Queue

This topic contains the following information:

sa_queue Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue
- **Object** -- sa_queue

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueName	STRING 100		NOT_NULL
isDefault	INTEGER		NOT_NULL
isActive	INTEGER		NOT_NULL
enableAutoMatching	INTEGER		NOT_NULL
enableAutoEscalation	INTEGER		NOT_NULL
escalationTimeout	INTEGER		
escalationTargetQueue	INTEGER	sa_queue	
customerDisplayName	STRING 100		NOT_NULL
onDeckPriority	INTEGER		
categoryID	INTEGER	sa_custom_category	
responseID	INTEGER	sa_chat_preset	
isscat_rel	STRING 30	Issue_Category	
pcat_rel	STRING 30	Prob_Category	
cr_template	STRING 30	Call_Req	
iss_template	STRING 30	Issue	
workshift	STRING 30	Bop_Workshift	
is_special	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queue_hour_setting Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue_hour_setting

- **Object** -- sa_queue_hour_setting

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueID	INTEGER	sa_queue	NOT_NULL
url	STRING 2048		
isExternal	INTEGER		
useHours	INTEGER	sa_hour_operation_mode	
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queue_localized Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue_localized
- **Object** -- sa_queue_localized

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueID	INTEGER	sa_queue	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
customerDisplayName	STRING 100		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queue_summary_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue_summary_field
- **Object** -- sa_queue_summary_field

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
fieldID	INTEGER	sa_field	NOT_NULL
fieldOrder	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queue_tool_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue_tool_join
- **Object** -- sa_queue_tool_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueID	INTEGER	sa_queue	NOT_NULL
toolID	INTEGER	sa_tool	NOT_NULL
displayOrder	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queue_transfer_target Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queue_transfer_target
- **Object** -- sa_queue_transfer_target

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleID	INTEGER	sa_role	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queued_group Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queued_group
- **Object** -- sa_queued_group

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueID	INTEGER	sa_queue	NOT_NULL
groupID	INTEGER	sa_group	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_queued_user Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_queued_user
- **Object** -- sa_queued_user

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
queueID	INTEGER	sa_queue	NOT_NULL
sessionID	INTEGER	sa_login_session	NOT_NULL
entryEpoch	LOCAL_TIME		
status	INTEGER		
user_route_rel	INTEGER	sa_user_route	
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - User and Role

This topic contains the following information:

sa_role Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_role
- **Object** -- sa_role

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleName	STRING 100		
isAgent	INTEGER		
defaultSecurityGroup	INTEGER		
joinSession	INTEGER		
allowSecLevelChange	INTEGER		
isActive	INTEGER		NOT_NULL
onDeck	INTEGER		NOT_NULL
allow_script_ide	INTEGER		
sa_client_launch_mode	INTEGER		
description	STRING 1024		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_role_queue_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_role_queue_join
- **Object** -- sa_role_queue_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleID	INTEGER	sa_role	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
isDefault	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_role_tool_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_role_tool_join
- **Object** -- sa_role_tool_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
roleID	INTEGER	sa_role	NOT_NULL
toolID	INTEGER	sa_tool	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_role_tool_non_art_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_role_tool_non_art_join
- **Object** -- sa_role_tool_non_art_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
roleID	INTEGER	sa_role	NOT_NULL REF

Field	Data Type	Reference	Remarks
toolID	INTEGER	sa_tool_non_art	NOT_NULL REF
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.

sa_sd_user_map Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sd_user_map
- **Object** -- sa_sd_user_map

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
SDUUID	UUID		NOT_NULL
tenant	UUID	ca_tenant	

sa_group Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_group
- **Object** -- sa_group

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupName	STRING100		
startEpoch	LOCAL_TIME		
endEpoch	LOCAL_TIME		
isCurrent	INTEGER		
ownerSessionID	INTEGER	sa_login_session	
status	INTEGER		
escalationDate	LOCAL_TIME		

Field	Data Type	Reference	Remarks
creatorUserID	UUID	ca_contact	
originalGroupID	INTEGER	sa_group	
categoryID	INTEGER	sa_custom_category	
groupType	INTEGER		
sd_obj_type	STRING 10		
sd_obj_id	INTEGER		
cr_rel	STRING 30	Call_Req	
iss_rel	STRING 30	Issue_Category	
user_route_rel	INTEGER	sa_user_route	
isscat_rel	STRING 30	Issue_Category	
pcat_rel	STRING 30	Prob_Category	
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_group_current_user Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_group_current_user
- **Object** -- sa_group_current_user

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupID	INTEGER	sa_group	NOT_NULL
sessionID	INTEGER	sa_login_session	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_guest_agent_code Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_guest_agent_code
- **Object** -- sa_guest_agent_code

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
agentCode	STRING 5		NOT_NULL
groupID	INTEGER	sa_group	
createdEpoch	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_guest_profile Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_guest_profile
- **Object** -- sa_guest_profile

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sessionID	INTEGER	sa_login_session	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_guest_user_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_guest_user_field
- **Object** -- sa_guest_user_field

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
fieldID	INTEGER	sa_field	NOT_NULL

Field	Data Type	Reference	Remarks
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_agent_consult_history Table

Program control table used by Support Automation.

- **SQL Name** -- sa_agent_consult_history
- **Object** -- sa_agent_consult_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
userID	UUID	ca_contact	NOT_NULL
epoch	LOCAL_TIME		NOT_NULL
groupID	INTEGER	sa_group	
type	INTEGER		
targetID	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_user_alert_config Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sa_user_alert_config
- **Object** -- sa_sa_user_alert_config

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
userID	UUID	ca_contact	NOT_NULL
AlertType	INTEGER		NOT_NULL
AlertTrigger	INTEGER		NOT_NULL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_user_route Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_user_route
- **Object** -- sa_user_route

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
userID	UUID	ca_contact	
queue_id	INTEGER	sa_queue	
login_session_id	INTEGER	sa_login_session	
launch_type	INTEGER		
sd_obj_type	INTEGER		
sd_obj_id	STRING 10		
cr	STRING 30	Call_Req	
iss	STRING 30	Issue	
user_description	STRING 4000		
sdm_web_addrs	STRING 255		
isscat_rel	STRING 30	Issue_Category	
pcat_rel	STRING 30	Prob_Category	
priority	INTEGER	Priority	NOT_NUL
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_user_route_prop Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_user_route_prop
- **Object** -- sa_user_route_prop

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	

Field	Data Type	Reference	Remarks
			Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
login_session_id	INTEGER	sa_login_session	NOT_NULL
self_serve_session_id	INTEGER	sa_self_serve_session	
user_route	INTEGER	sa_user_route	
sequence	INTEGER		NOT_NULL
description	STRING 1024		
label	STRING 256		NOT_NULL
value	STRING 128		
required	INTEGER		
sample	STRING 128		
validation_rule	INTEGER	Property_Validation_Rule	
validation_type	INTEGER	Property_Validation_Type	
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.
persid	STRING 30		

sa_userdrserver_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_userdrserver_join
- **Object** -- sa_userdrserver_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
userID	UUID	ca_contact	NOT_NULL
drServerID	INTEGER	sa_data_routing_server	NOT_NULL

Field	Data Type	Reference	Remarks
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - Disclaimer

This topic contains the following information:

sa_disclaimer Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_disclaimer
- **Object** -- sa_disclaimer

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
disclaimerName	STRING 30		NOT_NULL
disclaimerText	INTEGER		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_disclaimer_accept_log Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_disclaimer_accept_log
- **Object** -- sa_disclaimer_accept_log

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL
scriptID	INTEGER	sa_script	NOT_NULL
disclaimerID	INTEGER	sa_disclaimer	NOT_NULL
accepted	INTEGER		NOT_NULL
epoch			NOT_NULL

Field	Data Type	Reference	Remarks
	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_disclaimer_history Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_disclaimer_history
- **Object** -- sa_disclaimer_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sessionID	INTEGER	sa_login_session	NOT_NULL
disclaimerID	INTEGER	sa_disclaimer	NOT_NULL
response	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_disclaimer_localized Table

Program control table used bySupport Automation.

- **SQL Name** -- sa_disclaimer_localized
- **Object** -- sa_disclaimer_localized

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
disclaimerID	INTEGER	sa_disclaimer	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
disclaimerText	INTEGER		NOT_NULL

last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - Chat

This topic contains the following information:

sa_chat_preset Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset
- **Object** -- sa_chat_preset

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
responseName	STRING 128		NOT_NULL
responseText	INTEGER		
responseTitle	STRING 128		
responseType	INTEGER	sa_chat_preset_type	NOT_NULL
categoryID	INTEGER	sa_chat_preset_category	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_chat_preset_agent_cat Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset_agent_cat
- **Object** -- sa_chat_preset_agent_cat

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
userID	UUID	ca_contact	NOT_NULL
groupID	INTEGER	sa_chat_preset_category	NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_chat_preset_cat_loc Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset_cat_loc
- **Object** -- sa_chat_preset_cat_loc

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupID	INTEGER	sa_chat_preset_category	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
name	STRING 256		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_chat_preset_category Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset_category
- **Object** -- sa_chat_preset_category

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
groupName	STRING 128		
lastUpdateDate	LOCAL_TIME		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_chat_preset_localized Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset_localized
- **Object** -- sa_chat_preset_localized

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
responseID	INTEGER	sa_chat_preset	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
responseName	STRING 128		NOT_NULL
responseText	INTEGER		
responseTitle	STRING 128		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_chat_preset_type Table

Program control table used by Support Automation.

- **SQL Name** -- sa_chat_preset_type

- **Object** -- sa_chat_preset_type

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
enum	INTEGER		NOT_NULL
sym	STRING 20		NOT_NULL
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.

Support Automation - Static Content

This topic contains the following information:

sa_static_cont_script_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_static_cont_script_join
- **Object** -- sa_static_cont_script_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
scriptID	INTEGER	sa_script	NOT_NULL
itemID	INTEGER	sa_static_content	NOT_NULL
tenant	UUID	ca_tenant	

sa_static_content Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_static_content
- **Object** -- sa_static_content

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID		

Field	Data Type	Reference	Remarks
		ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
GUID	STRING 255		
itemName	STRING 255		
itemDesc	STRING 255		
itemMimeType	STRING 50		
version	INTEGER		
isLocked	INTEGER		
itemContents	INTEGER		

Survey

This article contains the following topics:

sa_survey Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_survey
- **Object** -- sa_survey

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt			

Field	Data Type	Reference	Remarks
	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
surveyName	STRING 32		NOT_NULL
question	STRING 512		NOT_NULL
responseType	INTEGER		NOT_NULL
isDeleted	INTEGER		

sa_survey_localized Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_survey_localizedg
- **Object** -- sa_survey_localizedg

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
surveyID	INTEGER	sa_survey	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
question	STRING 512		NOT_NULL
tenant	UUID	ca_tenant	

sa_survey_result Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sa_survey_result
- **Object** -- sa_sa_survey_result

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
surveyID	INTEGER	sa_survey	NOT_NULL

Field	Data Type	Reference	Remarks
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL
scriptID	INTEGER	a_script	NOT_NULL
response	INTEGER		
completion	INTEGER		NOT_NULL
SurveyComment	STRING 512		
surveyEpoch	LOCAL_TIME		
tenant	UUID	ca_tenant	

Survey Table

Customer Survey.

- **SQL Name** -- survey
- **Object** -- survey

Field	Data Type	Reference	Remarks
comment_label	nvarchar (80)		Specifies the comment label value for this Survey.
conclude_text	nvarchar (400)		Indicates the text to display after the survey is completed.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (400)		Specifies the textual description for this survey.
id	INTEGER		Specifies the primary key of this table.
include_comment	INTEGER		Specifies the Include Comment flag, as follows: **0** -- No comment allowed
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_comment	nvarchar (200)		Identifies the comment value for this Survey.
object_id	INTEGER		Identifies the ID of the object for this survey.
object_type	nvarchar (10)		Identifies the object type for this survey, for eample, CR, CHG, and so on.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).

Field	Data Type	Reference	Remarks
sym	nvarchar (12)		Identifies the symbolic name of this survey.

Survey_Answer Table

Customer Survey Answer.

- **SQL Name** -- survey_answer
- **Object** -- svy_ans

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_ Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
own_srvy_ question	INTEGER	Survey_Question :: id	Unique (to the table) numeric ID.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
selected	INTEGER		Identifies the selected value for this Survey_Answer.
sequence	INTEGER		Specifies the display order of the survey answers.
txt	nvarchar (400)		Specifies the question text.

Survey_Answer_Template Table

Customer Survey Answer Template.

- **SQL Name** -- survey_atpl
- **Object** -- svy_atpl

Field	Data Type	Reference	Remarks
atbl_id	INTEGER		Identifies the unique (to the table) numeric ID.
del	INTEGER	Active_Boolean_Tabl e::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
own_srvy_question	INTEGER	Survey_Question_Template::id	Unique (to the table) numeric ID.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sequence	INTEGER		Specifies the display order of the survey answers.
txt	nvarchar (400)		Identifies the answer text.

Survey_Question Table

Customer Survey Question.

- **SQL Name** -- survey_question
- **Object** -- svy_ques

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
id	INTEGER		Primary key of this table.
include_qcomment	INTEGER		Specifies the Include Question Comment flag, as follows:**1** -- Include comment box for this question
last_mod_by	byte (16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
mult_resp_flag	INTEGER		Specifies the Multiple Response flag, as follows:**0** -- Choose 1 response (radio)**1** -- Choose "N" (check boxes)
owning_survey	INTEGER	Survey_id	Specifies the unique (to the table) numeric ID.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
qcomment_ label	nvarchar(80)		Specifies the label for the comment.
resp_required	INTEGER		Specifies the Required Response flag, as follows:**1** -- Respondents must answer the question
response	INTEGER		Specifies the sequence number of the response.
sequence			Specifies the display order.

Field	Data Type	Reference	Remarks
	INTEGER		
txt	nvarchar (400)		Identifies the question text.

Survey_Question_Template Table

Customer Survey Question Template.

- **SQL Name** -- survey_qtpl
- **Object** -- svy_qtpl

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
id	INTEGER		Primary key of this table.
include_qcomment	INTEGER		Specifies the Include Question Comment flag, as follows:**1** -- Include comment box for this question
last_mod_by	byte (16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
mult_resp_flag	INTEGER		Specifies the Multiple Response flag, as follows:**0** -- Choose 1 response (radio)**1** -- Choose "N" (check boxes)
owning_survey	INTEGER	Survey_Template::id	Specifies the unique (to the table) numeric ID.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
qcomment_label	nvarchar(80)		Specifies the label for the comment.
resp_required	INTEGER		Specifies the Required Response flag, as follows:**1 --** Respondents must answer the question
sequence	INTEGER		Specifies the display order of the survey questions.
txt	nvarchar(400)		Identifies the question text.

Survey_Stats Table

This table contains customer survey statistics.

- **SQL Name** -- survey_statistics
- **Object** -- svystat

Field	Data Type	Reference	Remarks
cyc_counter	INTEGER		Identifies the cycle counter to be compared against the cycle (described in the next field).
cycle	INTEGER		Identifies the submission cycle.
del	INTEGER	Active_Boolean_Table::enum	Specifies the status of the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked deleted)
eval_counter	INTEGER		Identifies the number of times called to evaluate for notification submission.
id	INTEGER		Primary key of this table.
persid	nvarchar (30)		Specifies the Persistent ID: (SystemObjectName:id).
sub_counter	INTEGER		Identifies the number of times notification submission was approved.
tplid	INTEGER	Survey_Template::id	Identifies the unique (to the table) numeric ID.

Survey_Template Table

Customer Survey Template.

- **SQL Name** -- survey_tpl
- **Object** -- svy_tpl

Field	Data Type	Reference	Remarks
comment_label	nvarchar (80)		Identifies the comment label value for this Survey_Template.
conclude_text	nvarchar (400)		Specifies the text to display after the survey has been completed.
cycle_counter	INTEGER		Indicates to keep a running count for Submit Cycle.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (400)		Indicates the textual description for this template.
id	INTEGER		Primary key of this table.
include_comment	INTEGER		Specifies the Include Question Comment flag, as follows: **0** -- No comment allowed
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.

Field	Data Type	Reference	Remarks
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
submit_cycle	INTEGER		Indicates to send the survey every 'nth' time.
sym	nvarchar (12)		Identifies the symbolic name of the survey template.
tracking_flag	INTEGER		Specifies the flag to track responses.

Survey_Tracking Table

Table used to tack status of managed surveys.

- **SQL Name** -- survey_tracking
- **Object** -- svytrk

Field	Data Type	Reference	Remarks
cntid	byte(16)	ca_contact::uuid	Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
id	INTEGER		Primary key of this table, this is a unique numeric ID.
notif_dt	INTEGER		Specifies the time of the last notification.
object_id	INTEGER		Identifies the ID of the object for this survey.
object_type	nvarchar (10)		Indicates the object type for this survey, such as, CR, CHG, and so on.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
recv_dt	INTEGER		Identifies the time the completed survey was received.
status	INTEGER		Identifies the Status flag, as follows:**1** -- Survey submitted
tplid	INTEGER	Survey_Template ::id	Unique (to the table) numeric ID.

Managed_Survey Table

Stores the definition of the managed surveys.

- **SQL Name** -- managed_survey
- **Object** -- mgs

Field	Data Type	Reference	Remarks
create_date	INTEGER		Identifies when the managed survey was created.
del	INTEGER	Boolean_Table ::enum	Specifies the Deleted flag, as follows:**0** -- Active **1** -- Inactive/marked as deleted
description	nvarchar (400)		Identifies the textual description of this managed survey.
end_date	INTEGER		Specifies the end of survey period.
group_id	byte(16)		Foreign key to the contact_uuid field of the ca_contact table, this is the Group.
id	INTEGER		Primary key of this table.
initial_method	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this specifies the Contact Method.
initial_msgbody	nvarchar (1000)		Identifies the message body of the initial notification message.
initial_msgtitle	nvarchar (80)		Identifies the message title of the initial notification message.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
owner	byte(16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this specifies the Owner.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id)
reminder_method	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this is the Reminder Contact Method.
reminder_msgbody	nvarchar (1000)		Identifies the reminder message body of the initial notification message.
reminder_msgtitle	nvarchar (80)		Identifies the message title of the initial notification message.
start_date	INTEGER		Specifies the start of the survey period.
status	nvarchar (12)	Mgs_Status::code	Foreign key to the code field of the mgsstat table, this is the Status.
sym	nvarchar (12)		Identifies the symbolic name for this Managed Survey.
tplid	INTEGER	Survey_Template::id	Foreign key to the id field of the survey_tpl table, this is the Survey Template.

Support Automation - Agent

This topic contains the following information:

sa_agent_present_history Table

Program control table used by Support Automation.

- **SQL Name** -- sa_agent_present_history
- **Object** -- sa_agent_present_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
agentSessionID	INTEGER	sa_login_session	NOT_NULL
eventType	INTEGER		NOT_NULL
eventEpoch	LOCAL_TIME		NOT_NULL
agentUserID	UUID	ca_contact	
eventTime	STRING 50		
presentedItemType	INTEGER		
presentedItemID	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_agent_status_history Table

Program control table used by Support Automation.

- **SQL Name** -- sa_agent_status_history
- **Object** -- sa_agent_status_history

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
agentSessionID	INTEGER	sa_login_session	NOT_NULL
newStatus	INTEGER		NOT_NULL
statusChangeEpoch	LOCAL_TIME		NOT_NULL
agentUserID	UUID	ca_contact	

Field	Data Type	Reference	Remarks
statusChangeTime	STRING 50		
nextStatusChange Epoch	LOCAL_TIME		
nextStatusChange Time	STRING 50		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_agent_availability Table

Program control table used by Support Automation.

- **SQL Name**—sa_agent_availability
- **Object**—sa_agent_availability

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
agentID	UUID	ca_contact	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
status	INTEGER		
availEpoch	LOCAL_TIME		
clientSessionID	INTEGER	sa_login_session	
matchEpoch	LOCAL_TIME		
groupID	INTEGER	sa_group	
incidentCount	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Sequence Control

Sequence_Control Table

Used to determine what to use for a prefix and suffix when generating call request numbers. Users may not create new records or delete records in this table.

- **SQL Name** -- seqctl
- **Object** -- seq

Field	Data Type	Reference	Remarks
description	STRING 240		Textual description
code	STRING 12 UNIQUE NOT_NULL S_KEY		noneditable key for record
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
prefix	STRING 5		Indicates the prefix to sequence number.
suffix	STRING 5		Indicates the suffix to sequence number.
sym	STRING 30 NOT_NULL		

Server

This topic contains the following information:

Server_Aliases Table

Contain server alias names that are valid for various server-client zones.

- **SQL Name** -- srvr_aliases
- **Object** -- srvr_aliases

Field	Data Type	Reference	Remarks
alias_name	STRING 30 NOT_NULL		Alias name

del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
host_addr	STRING 30		Translated Host Address
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
zone_id	INTEGER NOT_NULL	Server_Zones::id	Zone name

Server_Zones Table

Contain regional server zone names.

- **SQL Name** -- srvr_zones
- **Object** -- srvr_zones

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
is_default	INTEGER	Boolean_Table::enum	1 default zone
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
zone_name	STRING 30 NOT_NULL		Zone name

Service

This topic contains the following information:

Service_Contract Table

Used to track relationships between orgs, ticket attr's and svc types. Used for SLA management.

- **SQL Name** -- svc_contract
- **Object** -- svc_contract

Field	Data Type	Reference	Remarks
active	INTEGER	Active_Boolean_Table::enum	Specifies the status of the contract, as follows:**0** -- Inactive**1** -- Active
contract_num	nvarchar(50)		Identifies the Contract ID.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
dflt_chgcat_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the change category.
dflt_cnt_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the end user.
dflt_isscat_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the issue category.
dflt_nr_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the asset.
dflt_pcat_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the request area.
dflt_pri_st	nvarchar(30)	Service_Desc::code	Defines the default service type for the priority.
expiration	INTEGER		Specifies the Contract expiration date.
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
nx_desc	nvarchar(240)		Specifies descriptive information.
org_svc_type	nvarchar(30)	Service_Desc::code	Defines the service type for the organization.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id).
svc_advocate	byte(16)	ca_contact::uuid	Identifies the customer advocate for the organizations assigned to the contract.
svc_owner	byte(16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this is the service desk person responsible for contract.
sym	nvarchar(80)		Specifies the symbolic name of the contract level.

Service_Desc Table

This table contains the Call Request Service Types that are not related to service level agreements in Problem Manager. These may be used to associate the types of service call requests to receive, and are can be defined by the user. Examples include: Platinum, Gold, Silver, or Bronze.

- **SQL Name** -- srv_desc
- **Object** -- sdsc

Field	Data Type	Reference	Remarks
code	nvarchar (30)		Specifies the primary key of this table.
del	INTEGER	Active_Boolean_ Table::enum	Specifies the status of the Deleted flag as follows:**0** -- Active **1** -- Inactive/marked as deleted
description	nvarchar (500)		Provides the text description of service.
id	INTEGER		Specifies the primary key of this table.
last_mod_ by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_ dt	INTEGER		Identifies the timestamp for when this record was last modified.
owning_co ntract	INTEGER	Service_Contract :: id	Specifies the unique (to the table) numeric ID.
persid	nvarchar (30)		Identifies the Persistent ID: (SystemObjectName:id)
rank	INTEGER		Identifies the ranking status of the service type to determine level of priority.
schedule	nvarchar (30)	Bop_Workshift:: persid	Foreign key to the peristent_id field of the bpwshft table, this is the Schedule.
sym	nvarchar (30)		Identifies the name of the service type.
violation_c ost	INTEGER		Specifies the monetary cost for violation.

Session

This topic contains the following information:

session_log Table

Session log.

- **SQL Name** -- session_log

- **Object** -- session_log

Field	Data Type	Reference	Remarks
contact	byte (16)	ca_contact::uuid	Foreign key to the contact_uuid field of the ca_contact table, this is the User.
id	INTEGER		Primary key of this table
login_time	INTEGER		Indicates the time of when the session began.
logout_time	INTEGER		Indicates the time of when the session ended.
policy	INTEGER	SA_Policy::id	Specifies the session policy.
session_id	INTEGER		Displays the ID if the status is okay.
session_type	INTEGER	session_type::id	Specifies the unique (to the table) numeric ID.
status	INTEGER		Identifies the Login status: **0** -- Okay

session_type Table

Session type (Web client, Java client, and so on).

- **SQL Name** -- session_type
- **Object** -- session_type

Field	Data Type	Reference	Remarks
description	nvarchar (500)		Identifies the description of the session type.
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id)
sym	nvarchar (30)		Identifies the name of the Session type.

Severity

List of severity definitions used by CA SDM applications.

- **SQL Name** -- sevrty
- **Object** -- sev

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_ Table:: enum	Identifies the Deleted flag as follows:**0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER		Primary key of this table.
id	INTEGER		Unique (to the table) numeric ID.
last_mod_ by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_ dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Describes the severity.
sym	nvarchar (12)		Identifies the symbolic name for this severity.

Service Level Agreement

This topic contains the following information:

SLA_Contract_Map Table

Maps a service type to a reference object; used by Service_Contract objects.

- **SQL Name** -- sdsc_map
- **Object** -- sdsc_map

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_ by	UUID	ca_contact:: uuid	Specifies the UUID of the contact who last modified this record
last_mod_ dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
map_cont ract	INTEGER NOT_NULL	Service_Contra ct::id	
map_persi d	STRING 60		
map_sdsc	STRING 30	Service_Desc:: code	
persid	STRING 30		Persistent ID (SystemObjectName:id)

SLA_Template Table

Service Level Agreement Templates for Call and Change. Not related to service level agreements in problem manager. Links Service Descriptions with Events.

- **SQL Name** -- slatpl
- **Object** -- slatpl

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
elapsed	DURATION NOT_NULL		Specifies the elapsed time to delay event.
event	STRING 30	Events::persid	Specifies the event.
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified
object_type	STRING 30		Specifies the object type for this SLA (cr, chg).
persid	STRING 30		Persistent ID (SystemObjectName:id)
service_type	STRING 30 NOT_NULL	Service_Desc::code	
sym	STRING 30 NOT_NULL S_KEY		Specifies the name of the SLA.

Spell Macro

This topic contains the following information:

Spell_Macro Table

This table stores proprietary Spell macros and macro fragments.

- **SQL Name** -- splmac
- **Object** -- macro

Field	Data Type	Reference	Remarks
description	STRING 80		Identifies the text description.
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Specifies the Deleted flag status, such as: **0** -- Active **1** -- Inactive/marked as deleted
fragment	STRING 4000		
id	INTEGER UNIQUE NOT_NULL KEY		Identifies the Numeric ID that is unique to the table.
last_mod_dt	LOCAL_TIME		Indicates the timestamp for when this record was last modified.
lock_object	INTEGER NOT_NULL		Specifies the boolean of the object.
msg_html	STRING 32768		Identifies the message used to keep the html template.
ob_type	STRING 30 NOT_NULL		
persid	STRING 30		Identifies the Persistent ID: (SystemObjectName:id)
sym	STRING 30 NOT_NULL UNIQUE NOT_NULL		
type	STRING 30 NOT_NULL	Spell_Macro_Type::persid	
usr_integer1	INTEGER		
usr_integer2	INTEGER		
usr_integer3	INTEGER		
usr_string2	STRING 250		
usr_string3	STRING 125		
usr_string4	STRING 25		

Spell_Macro_Type Table

Stores type information for proprietary Spell macros and macro fragments .

- **SQL Name** -- splmactp
- **Object** -- macro_type

Field	Data Type	Reference	Remarks
description	STRING 200		Textual description
arg_list	STRING 80		
code	STRING 30 UNIQUE NOT_NULL NOT_NULL		
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
display_name	STRING 30		form name to display
execute_script	STRING 800		
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
lock_object_ flag	INTEGER		
persid	STRING 30		Persistent ID (SystemObjectName:id)
sym	STRING 30 NOT_NULL		
tech_desc	STRING 300		
validate_script	STRING 400		

Show Object

Show_Obj Table

Program control table used by Knowledge Management.

- **SQL Name** -- SHOW_OBJ
- **Object** -- SHOW_OBJ

Field	Data Type	Reference	Remarks
EXPIRE_DATE	LOCAL_TIME		
ID	INTEGER KEY		Unique (to the table) Numeric ID
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
OBJ_PERSID	STRING 255		Persistent ID (SystemObjectName:id)
PWD	STRING 255		

SQL Script

This article contains the following topics:

SQL_Script Table

Stores SQL scripts used by the CA SDM applications.

- **SQL Name** -- sql_tab

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
sql_desc	STRING 240		user title for script
sql_name	STRING 30 S_KEY		user name for script
sql_script	STRING 500		actual script

Pcat_Loc Table

The following tables are added to support many-to-many relationships between Categories, Groups that can service the Categories, and Locations that groups are able to service. This is all used for the Auto-Assignment functionality. Used to build a list of Service Locations valid for the Category.

- **SQL Name** -- pcat_loc
- **Object** -- pcat_loc

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
l_attr	STRING 30		left hand attribute name
l_persid	STRING 60		left hand key
l_sql	INTEGER		left hand sort order
r_attr	STRING 30		right hand attribute name
r_persid	STRING 60		right hand key
r_sql	INTEGER		right hand sort order

Person_Contacting Table

Reference table to denote the type of customer that made the contact. For example, the consumer, lawyer, media, and so on.

- **SQL Name** -- perscon
- **Object** -- perscnt

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL	Active_Boolean_Table::enum	Deleted flag that indicates the following:**0** -- Active **1** -- Inactive/marked as deleted
id	INTEGER		Primary key of this table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
persid	nvarchar(30)		Persistent ID (SystemObjectName:id)
sym	nvarchar(60)		The symbolic value for this Person_Contacting.

pr_trans Table

A transition object controls the current and next ticket status. The pr_trans table lists the status, new status, and actions that need to occur for a default transition.

- **SQL Name** -- pr_trans
- **Object** -- pr_trans

Label	Field	Description
id	INTEGER	Unique key.
status	SYMBOL	Specifies the current ticket status.
new_status	SYMBOL	Specifies the new ticket status
must_comment	INTEGER	Comment required when using a transition. On new default: 0
is_default	INTEGER	Default transition that appears when the Status field is empty. On new default: 0
condition	BOP_REF_STR_REF Macro	Site condition macro to approve transition.
condition error	STRING 255	Error message for site condition.
description	STRING 255	Description of this transition.
last_mod_dt	LOCAL_TIME	Timestamp of last update to this record.

Label	Field	Description
last_mod_by	UUID REF ca_contact	User who last updated this.
del	INTEGER nn	Logical database delete status.
tenant	UUID REF ca_tenant	Reference to Tenant information.

Impact

Impact is a measure of the significance of an event by the user. It is used on Incident Reports.

- **SQL Name** -- impact
- **Object** -- imp

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
enum	INTEGER		Primary key for this table.
id	INTEGER		Specifies the unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Specifies the textual description of this impact.
sym	nvarchar (12)		Identifies the symbolic value for this impact.
value	INTEGER		Shows the numeric representation of this impact.

Web Screen Painter

This article contains the following topics:

wspcol Table

There are one to three rows in this table for every column created or updated by WSP. The columns table_name+column_name+status form a unique key. See also comments in wsp.maj.

- **SQL Name** -- wspcol
- **Object** -- wspcol

Field	Data Type	Reference	Remarks
description	STRING 300		Description

Field	Data Type	Reference	Remarks
addl_info	STRING 500		Triggers, QREL stuff, and so on.
column_name	STRING 40 NOT_NULL		Column Majic name
dbms_name	STRING 40		DBMS schema name
display_name	STRING 80		Human-readable name
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
is_cluster	INTEGER		1 = DBMS cluster index
is_descending	INTEGER		1 = DBMS descending index
is_indexed	INTEGER		1 = DBMS-indexed column
is_local	INTEGER		1 = local column
is_not_null	INTEGER		1 = column cannot be null
is_order_by	INTEGER		1 = DBMS order by index
is_required	INTEGER		1 = column required
is_skey	INTEGER		1 = column is secondary key
is_unique	INTEGER		1 = DBMS unique index
is_write_new	INTEGER		1 = read-only after creation
is_wsp	INTEGER		1 = table created by WSP
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
on_ci_set	STRING 80		Value to set on update
on_new_default	STRING 80		Default value of attribute
persid	STRING 30		Persistent ID (SystemObjectName:id)
schema_name	STRING 40		CA SDM schema name
status	INTEGER NOT_NULL		Modification status
string_len	INTEGER		String len
table_name	STRING 40 NOT_NULL		Table Majic name
type	INTEGER		Column type
xrel_table	STRING 80		Operand of SRELBRELQREL

wsptbl Table

There are one to three rows in this table for every table created or updated by WSP. The columns table+name+status form a unique key. See also comments in wsp.maj for interpretation of integer codes.

- **SQL Name** -- wsptbl
- **Object** -- wsptbl

Field	Data Type	Reference	Remarks
description	STRING 300		Identifies the description of the table.
common_name	STRING 40		Specifies the name for the identification column.
dbms_name	STRING 40		Specifies the DBMS schema name.
display_group	STRING 40		Identifies the Grouping to display.
display_name	STRING 80		Specifies the user-readable name.
function_group	STRING 40		Identifies the Security function group.
id	INTEGER UNIQUE NOT_NULL KEY		Specifies the numeric ID, which is also unique to the table.
is_local	INTEGER		Identifies whether the table is local (1 = local table).
is_wsp	INTEGER		Identifies whether the table is created by WSP (1 = table created by WSP).
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Identifies the timestamp for when this record was last modified.
methods	STRING 500		Identifies Spell methods.
persid	STRING 30		Identifies the Persistent ID: (SystemObjectName:id)
rel_attr	STRING 40		Specifies the Foreign key column.
schema_name	STRING 40		Specifies the CA SDM schema name.
sort_by	STRING 150		Specifies the Default sort sequence.
status	INTEGER NOT_NULL		Identifies the Modification status.
table_name	STRING 40 NOT_NULL		Specifies the Table Majic name.
triggers	STRING 500		Identifies any Triggers for the table.

USP Window

This article contains the following topics:

usp_window Table

Contains information on the blackout and maintenance window.

- **SQL Name** -- usp_window
- **Object** -- window

Column	Type	Remarks
id	INTEGER	UNIQUE NOT_NULL KEY
sym	INTEGER	UNIQUE Name of window
window_type	INTEGER	REQUIRED References usp_window_type and specifies blackout or maintenance.
start_date	LOCAL_TIME	REQUIRED Start date of first recurrence
end_date	LOCAL_TIME	REQUIRED End date of first recurrence
final_end_date	LOCAL_TIME	REQUIRED End date of last recurrence
timezone	STRING 30	Timezone
icon	STRING 100	URL to icon
recurs	INTEGER	Specifies the following: **0** -- None **1** -- Daily **2** -- Weekly **3** -- Monthly **4** -- Annually
recurrence_interval	INTEGER	Days, weeks, months, or years
sunday	INTEGER	Restricts daily or weekly recurrence
monday	INTEGER	Restricts daily or weekly recurrence
tuesday	INTEGER	Restricts daily or weekly recurrence
wednesday	INTEGER	Restricts daily or weekly recurrence
thursday	INTEGER	Restricts daily or weekly recurrence
friday	INTEGER	Restricts daily or weekly recurrence

Column	Type	Remarks
saturday	INTEGER	Restricts daily or weekly recurrence
occurrence	INTEGER	Restricts monthly or yearly recurrence **1** -- First **2** -- Second **3** -- Third **4** -- Fourth **5** -- Last
description	STRING 400	Text of window
legend	STRING 100	Legend on the Change Calendar
color	STRING 100	Web color of text
bgcolor	STRING 100	Web background color
style	STRING 100	Text style (italic, bold or normal)
last_mod_dt	LOCAL_TIME	Indicates the timestamp of when this record was last modified.
last_mod_by	UUID	Specifies the UUID of the contact who last modified this record.
del	INTEGER	
tenant	UUID	References the ca_tenant table.

The significance of recurrence_interval, occurrence, and the weekday attributes (sunday, monday, and so on) depend on the value of recurs:

- **1 (daily)**
  Specifies the days on which the event recurs.
  If the recurrence_interval is greater than one, the weekday attributes are ignored, and the event recurs at the interval you specified. Occurrence is ignored.

- **2 (weekly)**
  Specifies the number of weeks between recurrences, and the weekday attributes specify the days within the week the window recurs. Occurrence is ignored.

- **3 (monthly)**
  Specifies the number of months between occurrences.
  If the occurrence is zero, the recurrence is always on the day of the month of the start_date. If the occurrence is non-zero, it specifies that recurrence occurs in the first, second, third, fourth, or last week of the month on the weekday of the start_date (which will be the only non-zero weekday attribute).

- **4 (yearly)**
  Specifies the number of years between occurrences.
  If the occurrence is zero, the recurrence is always on the date of the start_date. If the occurrence is non-zero, it specifies that recurrence occurs in the first, second, third, fourth, or last week of the month on the weekday of the start_date (which will be the only non-zero weekday attribute).

usp_window_type Table

Contains information on blackout and maintenance windows.

- **SQL Name** -- usp_window_type
- **Object** -- window_type

Column	Type	Remarks
id	INTEGER	UNIQUE NOT_NULL KEY
del	INTEGER	NOT_NULL
sym	STRING 60	NOT_NULL S_KEY
description	STRING 100	
last_mod_by	UUID	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME	Indicates the timestamp of when this record was last modified.

Role Table

This article contains the following topics:

usp_role Table

Contains the information on the Roles.

- **SQL Name** -- usp_role
- **Object** -- role

Column	Type	Remarks
id	INTEGER	
admin	INTEGER	Admin Function Access
call_mgr	INTEGER	Requests Function Access
change_mgr	INTEGER	Change Orders Function Access
code	STRING 30	Code
data_partition	SREL dmn	
default_flag	INTEGER	Default
description	STRING (1024)	Description
form_group	SREL fmgrp	
grant_level	SREL acc_lvls	
help_view	SREL help_set	
initial_form	STRING (256)	Initial Form

Column	Type	Remarks
interface_type	INTEGER	Interface Type
inventory	INTEGER	Inventory Function Access
issue_mgr	INTEGER	Issues Function Access
kcat	INTEGER	
kd	INTEGER	
kd_query_description	STRING (255)	
kd_query_id	SREL crsq	
kt_admin	INTEGER	Knowledge System Administrator
kt_analyst	INTEGER	Knowledge Analyst
kt_customer	INTEGER	Knowledge Customer
kt_engineer	INTEGER	Knowledge Engineer
kt_manager	INTEGER	Knowledge Manager
kt_type	INTEGER	kt type
name	STRING (80)	Role Name
notify	INTEGER	Notify Function Access
override_cnt_datapart	INTEGER	Override Contact Data Partition
pref_doc	INTEGER	Preferred Document
reference	INTEGER	Reference Function Access
sd_admin	INTEGER	CA SDM System Administrator
sd_analyst	INTEGER	CA SDM Analyst
sd_customer	INTEGER	CA SDM Customer
sd_employee	INTEGER	CA SDM Employee
security	INTEGER	Security Function Access
single_tenant	SREL tenant	
tenant	SREL tenant	
tenant_access	INTEGER	Tenant Access
tenant_group	SREL tenant_group	
tn_admin	INTEGER	
update_global	INTEGER	Update Global
view_internal	INTEGER	View Internal

usp_role_go_form Table

Links between Roles and Go Form type Web Forms.

- **SQL Name** -- usp_role_go_form
- **Object** -- role_go_form

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
is_default	INTEGER		Indicates if this is the default Go Form for the role.
role_obj	INTEGER	usp_role::id	Foreign key to the role_id field of the usp_role table.
web_form_obj	INTEGER	usp_web_form::id	Foreign key to the web form id field of the usp_web_form table.
menu_bar_obj	INTEGER	usp_menu_bar::id	Foreign key to the menu bar id field of the usp_menu_bar table.

usp_role_tab Table

Links between Roles and their Tabs.

- **SQL Name** -- usp_role_tab
- **Object** -- role_tab

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
sequence	INTEGER		Used to order the role's tabs in the web interface.
role_obj	INTEGER	usp_role::id	Foreign key to the role_id field of the usp_role table.
tab_obj	INTEGER	usp_tab::id	Foreign key to the tab id field of the usp_tab table.

usp_role_web_form Table

Links between Roles and Report type Web Forms.

- **SQL Name** -- usp_role_web_form
- **Object** -- role_web_form

Field	Data Type	Reference	Remarks
id	INTEGER		Specifies the unique (to the table) numeric ID.
role_obj	INTEGER	usp_role::id	Foreign key to the role_id field of the usp_role table.
web_form_obj	INTEGER	usp_web_form::id	Foreign key to the web form id field of the usp_web_form table.

usp_acctyp_role Table

Links between Activity Types and Roles.

- **SQL Name** -- usp_acctyp_role

- **Object** -- acctyp_role

Field	Data Type	Reference	Remarks
access_type	INTEGER	Access_Type_v2::id	Foreign key to access type id in Access_Type_v2.
id	INTEGER		Specifies the unique (to the table) numeric ID.
is_default	INTEGER		Specifies if this is the default role for this access type. 1 = default
role_obj	INTEGER	usp_role::id	Foreign key to the role_id field of the usp_role table.

Contact

This article contains the following topics:

usp_contact Table

This table provides extensions to the ca_contact table that are used only by CA SDM products.

- **SQL Name** -- usp_contact
- **Object** -- cnt

Field	Data Type	Reference	Remarks
c_acctyp_id	INTEGER	Access_Type::id	Identifies the unique (to the table) numeric ID.
c_available	INTEGER		Displays as a check box to indicate that the analyst is available.
c_cm_id1	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this identifies the low priority of the contact method.
c_cm_id2	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this identifies the next level of low priority for the contact method.
c_cm_id3	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this identifies the standard level of priority for the contact method.
c_cm_id4	INTEGER	Contact_Method::id	Foreign key to the id field of the ct_mth table, this identifies the high level of priority for the contact method.
c_domain	INTEGER	Domain:id	Foreign key to the id field of the dmn table, this is the Data Partition.
c_email_service	nvarchar 30		(Not used by CA SDM) Identifies the pointer to the access type email service (such as, PROFS, and so on).
c_nx_ref_1	byte (16)		Foreign key to the contact_uuid field of the ca_contact table, this is a user-defined field.

Field	Data Type	Reference	Remarks
c_nx_ref_2	byte (16)		Foreign key to the contact_uuid field of the ca_contact table, this is a user-defined field.
c_nx_ref_3	byte (16)		Foreign key to the contact_uuid field of the ca_contact table, this is a user-defined field.
c_nx_string1	nvarchar(40)		Identifies the emergency Workshift 4 Smag fields.
c_nx_string2	nvarchar(40)		Allows for a user-defined string field.
c_nx_string3	nvarchar(40)		Allows for a user-defined string field.
c_nx_string4	nvarchar(40)		Allows for a user-defined string field.
c_nx_string5	nvarchar(40)		Allows for a user-defined string field.
c_nx_string6	nvarchar(40)		Allows for a user-defined string field.
c_parent	byte (16)		(Not used in CA SDM) Foreign key to the contact_uuid field of the ca_contact table.
c_schedule	nvarchar 30	Bop_Workshift::persid	Foreign key to the persistent_id field of the bpwshft table, this is the Analyst's workshift for Auto Assignment.
c_service_type	nvarchar 30	Service_Desc::code	Foreign key to the code field of the srv_desc table, this identifies the Classic Service Type.
c_timezone	nvarchar(12)	Timezone::code	Foreign key to the code field of the tz table, this defines the Timezone.
c_val_req	INTEGER		Specifies a Force validation of the userid.
c_vendor	byte (16)	ca_company::company_uuid	Foreign key to the id filed of the ca_company table, this represents the Vendor.
c_ws_id1	nvarchar 30	Bop_Workshift::persid	Foreign key to the persistent_id field of the bpwshft table, this represents a workshift ID.
c_ws_id2	nvarchar 30	Bop_Workshift::persid	Foreign key to the persistent_id field of the bpwshft table, this represents a workshift ID.
c_ws_id3	nvarchar 30	Bop_Workshift::persid	Foreign key to the persistent_id field of the bpwshft table, this represents a workshift ID.
c_ws_id4	nvarchar 30	Bop_Workshift::persid	Foreign key to the persistent_id field of the bpwshft table, this represents a workshift ID.
contact_uuid	byte (16)		Primary key of this table.
global_queue_id	INTEGER	Global_Queue_Names::id	Specifies the pointer to the global queue.
ldap_dn	nvarchar(512)		Identifies the ldap dn value for this usp_contact.

usp_contact_handling Table

The usp_contact_handling table associates contacts with a special handling classification.

Attribute	Data Type	SREL References	Flags
contact	UUID	ca_contact	NOT_NULL
id	INTEGER		UNIQUE NOT_NULL KEY
special_handling	INTEGER	usp_special_handling	NOT NULL
tenant	UUID	ca_tenant	

usp_credentials_Table

The usp_credentials table contains all the UNC credential details to access UNC shared drive in the Advance availability configuration.

Attribute	Data Type	Reference	Description
id	INTEGER		Specifies the primary key of this table.
persid	STRING		Persistent ID.
del	INTEGER		Deleted flag 0 = Active 1 = Inactive or marked as deleted.
sym	INTEGER		60 NOT_NULL UNIQUE NOT_NULL S_KEY
description	STRING 500		Textual description of the UNC Credentials details.
unc userid	STRING		User name used for authentication to access the UNC shared drive.
unc password	STRING		Password in encrypted format to access UNC shared drive.
last_mod_dt	LOCAL_TIME		Timestamp of when the record was last modified.
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	

usp_rest_access Table

The following table lists the usp_rest_access attributes:

- **SQL Name** -- usp_rest_access
- **Object** -- rest_access

Field	Data Type	Reference	Remarks
id	INTEGER		Primary key to this table, it is a unique numeric ID.
access_key	INTEGER		UNIQUE

contact	UUID	ca_contact	Specifies the UUID of the contact.
secret_key	STRING 64		Encrypted shared secret key value.
expiration_date	LOCAL_TIME		Specifies the expiration date of the REST Access Key.

Resolution

This article contains the following topics:

usp_resolution_code Table

The usp_resolution_code table details the categorization of the incident/request resolution.

- **SQL Name** -- usp_resolution_code
- **Object** -- resocode

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
persid	STRING 30		Persistent ID
del	INTEGER NOT NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- active **1** -- inactive/marked as deleted
sym	STRING 128 UNIQUE NOT_NULL S_KEY		
last_mod_dt	LOCAL_TIME		Timestamp of when this record was last modified.
last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
description	STRING 240		Textual description of the root cause.
tenant	UUID REF	ca_tenant	

usp_resolution_method Table

The usp_resolution_method table details how the incident was resolved or how the service was restored.

- **SQL Name** -- usp_resolution_method
- **Object** -- resomethod

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
persid	STRING 30		Persistent ID
del	INTEGER NOT NULL	Active_Boolean_ Table::enum	Deleted flag **0** -- active **1** -- inactive/marked as deleted
sym	STRING 128 UNIQUE NOT_NULL S_KEY		
last_mod_dt	LOCAL_TIME		Timestamp of when this record was last modified.
last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
description	STRING 240		Textual description of the root cause.
tenant	UUID REF	ca_tenant	

USP Menu

This article contains the following topics:

usp_menu_bar Table

Contains the information on the menu bars used in the Role Based UI.

- **SQL Name** -- usp_menu_bar
- **Object** -- menu_bar

Column	Type	Remarks
id	INTEGER	
name	STRING (80)	Name of the role.
code	STRING 30	Code
del	INTEGER	Active_Boolean_Table::enum
description	STRING (255)	Description
htmpl_name	STRING (40)	Name of the HTMPL file containing the menu bar

usp_menu_tree Table

Each record is a node in a menu tree used in the Role Based UI.

- **SQL Name** -- usp_menu_tree
- **Object** -- menu_tree

Field	Data Type	Reference	Remarks
id	INTEGER		
caption	STRING (50)		Caption displayed for the menu tree node
description	STRING (255)		Description
has_childrenn	INTEGER		0 indicates that this is a leaf node on the menu tree. 1 indicates that this node has child nodes.
parent_id	INTEGER		The id of the parent menu_tree node if this is a child node.
mt_resource	INTEGER	usp_menu_tree_res::id	The id of the usp_menu_tree_res that contains the resource for this node. Empty if this node is a label node only.
tree_name	INTEGER	usp_menu_tree_name::id	The id of the usp_menu_tree_name record for this menu_tree.
internal	INTEGER	Boolean_Table::enum	Indicates if this menu tree is delivered out-of-box. If so, the menu tree is not customizable. User created menu trees are customizable.

usp_menu_tree_name Table

Contains the information on the named menu trees used in the Role Based UI.

- **SQL Name** -- usp_menu_tree_name
- **Object** -- menu_tree_name

Field	Data Type	Reference	Remarks
id	INTEGER		
name	STRING (80)		Name of the menu tree
code	STRING 30		Code

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	
description	STRING (255)		Description
internal	INTEGER	Boolean_Table::enum	Indicates if this menu tree is delivered out-of-box. If so, the menu tree is not customizable. User created menu trees are customizable.

usp_menu_tree_res Table

Contains the information on the menu tree resources used by menu trees in the Role Based UI.

- **SQL Name** -- usp_menu_tree_res
- **Object** -- menu_tree_res

Field	Data Type	Reference	Remarks
id	INTEGER		
name	STRING (50)		Name of the menu tree resource
del	INTEGER	Active_Boolean_Table::enum	
description	STRING (255)		Description
mtr_resource	STRING (255)		The URL that displayed the web page
mtr_type	INTEGER		Internal flag used by CA Service Desk development. User created usp_menu_tree_res records will have mtr_type = 0.

USP Mailbox

This article contains the following topics:

- usp_mailbox_violation_log_type Table (see page 3777)

usp_mb_rule_action_type Table

The usp_mb_rule_action_type table lists the types of filters in the usp_mailbox_rule table.

Field	Data Type	Description
del	INTEGER	
id	INTEGER	Specifies the REL_ATTR value of the table.
sym	STRING 60	Specifies the symbolic value for the action type.

The following values are the defaults for the usp_mb_rule_action_type table:

id	sym
1	Ignore Email
2	Ignore Email and Reply
3	Update Object
4	Create/Update Object

usp_mb_rule_filter_type Table

The usp_mb_rule_filter_type table lists the types of filters in the usp_mailbox_rule table.

Field	Data Type	Description
del	INTEGER	
id	INTEGER UNIQUE KEY	Specifies the REL_ATTR value of the table.
sym	STRING 60	Specifies the symbolic value for the filter type.

The following values are the defaults for the usp_mb_rule_filter_type table:

id	sym
1	Subject contains
2	Body contains
3	(Reserved for future use)
4	From Address contains

usp_mb_rule_subject_handling Table

The usp_mb_rule_subject_handling table lists how subjects are handled (prepend or append subjects) in the usp_mailbox_rule table.

Field	Data Type	Description
del	INTEGER	
id	INTEGER UNIQUE KEY	Specifies the REL_ATTR value of the table.
sym	STRING 60	Specifies the symbolic value for the subject handling type.

The following values are the defaults for the usp_mb_rule_subject_handling table:

id	sym
1	Prepend
2	Append

usp_mailbox Table

A mailbox object represents a connection to a mail server for a single inbox. The usp_mailbox table lists the filter, policy, and actions that must occur for an inbox.

Label	Field	Data Type	Reference	Description
id		INTEGER UNIQUE KEY		Specifies the primary key of this table.
	last_mod_dt	LOCAL_TIME		Specifies the time stamp of when this record was last modified.
	last_mod_by	UUID REF	ca_contact	Specifies the UUID of the contact who last modified this record.
Active	del	INTEGER NOT_NULL		Specifies if the mailbox is active. Inactive mailboxes are not polled.
Check Interval	check_interval	INTEGER		Specifies the number of seconds to wait between checks of the mailbox. 30 seconds is the default.
Name	name	STRING 60 UNIQUES_KEY		Names the mailbox connection
Allow Anonymous	allow_anonymous	INTEGER		Allows messages to create or update tickets with sender addresses not attached to a known Contact.

Label	Field	Data Type	Reference	Description
Email Type	email_type	STRING 10		Specifies the email type: NONE, IMAP, or POP3. If NONE is selected, the mailbox is not polled.
Hostname	host_name	STRING 128		Specifies the host name or IP address of the mail server.
Port Override	host_port	INTEGER		Specifies a port number to override the default for Email Type. The default is 110 for POP3 and 143 for IMAP.
Userid	userid	STRING 64		Specifies the userid to log in to the mail server.
Password	password	STRING 64		Specifies the password for userid.
Security Level	security_lvl	INTEGER		Specifies a security level for encoding of login information: **0** -- Clear Text **1** -- APOP (POP3 only) **2** -- NTLM **3** -- MD5
Attachment Repository	attmnt_repository	STRING 60	Document_Repository	Specifies the repository for attachments. The repository must be local to pdm_maileater_nxd. If not specified, the mailbox is not polled.
Attach Entire Email	attach_email	INTEGER		Attaches the entire email to a ticket. This option overrides the default value of splitting out attachments.
Force Attachment Splitout	split_out_attachment	INTEGER		Forces attachment split out if attach Entire Email is set. The entire message and individual attachments are all attached to the ticket.
Save Unknown Emails	save_unknown_emails	INTEGER		Saves emails that are not able to be processed in NX_ROOT/site/unknown_mails.
Description	description	STRING 1000		Describes the mailbox.
Email Address/Hour	email_address_per_hour	INTEGER		Specifies the maximum number of emails per email address per hour. You can specify the following values: **-1** -- No limit (default) **0** -- No emails allowed. **1** or more -- Maximum number of emails allowed.
Log Violation	log_policy_violation	INTEGER		

Label	Field	Data Type	Reference	Description
			usp_mailbox_violation_log_type	Controls logging of policy violations to the standard log.You can specify the following values: Do not log First violation only (default) All violations
Inclusion List	inclusion_list	STRING 32768		Specifies email addresses or domains that are allowed to process emails -- only emails matching the list are allowed. You can specify multiple addresses or domains by delimiting them with a space character or new line.
Exclusion Lists	exclusion_list	STRING 32768		Specifies email addresses or domains that are not allowed to process emails. You can specify multiple addresses or domains by delimiting them with a space character or new line.
	tenant	UUID	ca_tenant	Specifies the tenant.

usp_mailbox_artifact_type Table

The usp_mailbox_artifact_type table lists the artifacts types referenced by the filter_min_artifact_type field in the usp_mailbox_rule table.

Field	Data Type	Description
id	INTEGER UNIQUE KEY	Specifies the REL_ATTR value of the table.
sym	STRING 60	Specifies the symbolic value for the artifact type.

The following values are the defaults for the usp_mailbox_artifact_type table:

id	sym	prefix
1	Protected	A
2	Secure	B

usp_mailbox_rule Table

The usp_mailbox_rule table lists the filter, the rule, and any action, any replies, or both that must occur when the filter matches.

Label	Field	Data Type	Reference	Description
id		INTEGER UNIQUE KEY		Specifies the primary key of this table.
last_mod_by		UUIDREF	ca_contact	Specifies the UUID of the contact who last modified this record.

Label	Field	Data Type	Reference	Description
last_mod_dt		LOCAL_TIME		Specifies the time stamp of when this record was last modified.
Sequence	sequence	INTEGER		Specifies the sequence number of the rule. Rules are processed in sequence number order.
Mailbox	mailbox	INTEGER	usp_mailbox	Specifies the mailbox that this rule belongs to.
Active	del	INTEGER NOT_NULL		Specifies that the rule is active. A rules is not processed if it is inactive. Rules can be deleted, the active flags let you disable rules temporarily.
Description	description	STRING 1000		Describes the rule.
Filter	filter_type	INTEGER	usp_mb_rule_filter_type	Specifies the field to check against the Filter String.
Filter String	filter_string	STRING 255		Specifies a regular expression string to match. You can use the placeholder “{{object_id}}” to identify the object ID that the Text API can use with the Action Object field to identify the ticket.
Ignore Case	filter_ignore_case	INTEGER		Specifies case-insensitive pattern matching for Filter String.
Action	action_operation	INTEGER	usp_mb_rule_action_type	Specifies the action to perform if the filter matches.
Action Object	action_object	STRING 30	usp_ticket_type	Specifies the type of ticket object to use for the action.
Write to Stdlog	action_write_to_log	INTEGER		Writes the entire email text to the standard log (STDLOG) if the filter matches.
Log Entry Prefix	action_log_prefix	STRING 30		Specifies a prefix for log entries. Lets you match rules to logs.
Add Subject Line	action_subject_handling	INTEGER	usp_mb_rule_subject_handling	Adds a subject line to the message body before processing as follows: append, prepend, or null (do not add subject).
TextAPI Defaults	text_api_defaults	STRING 1000		Specifies additional default commands for the Text API when the filter matches. Combines with the contents of the [EMAIL_DEFAULTS] section of the text_api.cfg file.
TextAPI Ignore Incoming	text_api_ignore_incoming	STRING 1000		Specifies additional Ignore Details for the Text API when the filter matches. Combines with the contents of the [EMAIL_IGNORE_INCOMING] section of the text_api.cfg file.

Label	Field	Data Type	Reference	Description
Reply	reply_method	INTEGER	Contact_Method	Specifies the notification method to use for automatic replies. If not set, no reply is created.
Reply Subject	reply_subject	STRING 200		Specifies a subject line to use for automatic replies.
Reply Success Text	reply_success_text	STRING 10000		Specifies the message body in plain text for the automatic response that is sent when the message is processed successfully.
Reply Success HTML	reply_success_html	STRING 10000		Specifies the message body in HTML for the automatic response that is sent when the message is processed successfully.
Reply Failure Text	reply_failure_text	STRING 10000		Specifies the message body in plain text for the automatic response that is sent when a failure occurs processing the message.
Reply Failure HTML	reply_failure_html	STRING 10000		Specifies the message body in HTML for the automatic response that is sent when a failure occurs processing the message.

usp_mailbox_violation_log_type Table

The usp_mailbox_violation_log_type table lists the violation log types referenced by the Log Violation drop-down list (log_policy_violation) in the usp_mailbox table.

Field	Description
id	Specifies the REL_ATTR value of the table.
sym	Specifies the symbolic value for the violation log type.

The following values are the defaults for the usp_mailbox_violation_log_type table:

id	sym
1	First violation only
2	All violations
3	Do not log

USP Relational Table - Macros

This article contains the following topics:

usp_lrel_false_action_act_f Table

Relates macros to events. Identifies the macros to execute upon a false evaluation of the event condition.

- **SQL Name** -- usp_lrel_false_action_act_f
- **Object** -- lrel_false_action_act_f

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
evt	STRING 30	Events	
macro	STRING 30	Spell_Macro	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	

usp_lrel_false_bhv_false Table

Relates macros to workflow task behaviors. Identifies the macros to execute upon a false evaluation of a behavior condition.

- **SQL Name** -- usp_lrel_false_bhv_false
- **Object** -- lrel_false_bhv_false

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
bhvtpl	INTEGER	Behavior_Template	
macro	STRING 30	Spell_Macro	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_true_action_act_t Table

Relates macros to events. Identifies the macros to execute upon a true evaluation of the event condition.

- **SQL Name** -- usp_lrel_true_action_act_t
- **Object** -- lrel_true_action_act_t

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY

Field	Data Type	Reference	Remarks
evt	STRING 30	Events	
macro	STRING 30	Spell_Macro	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_true_bhv_true Table

Relates macros to workflow task behaviors. Identifies the macros to execute upon a true evaluation of a behavior condition.

- **SQL Name** -- usp_lrel_true_bhv_true
- **Object** -- lrel_true_bhv_true

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
bhvtpl	INTEGER	Behavior_Template	
macro	STRING 30	Spell_Macro	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

USP Relational Table - Stakeholders Notify List

This article contains the following topics:

usp_lrel_notify_list_cntchgntf Table

Relates contacts to change orders and supports the Stakeholders Notify List.

- **SQL Name** -- usp_lrel_notify_list_cntchgntf
- **Object** -- lrel_notify_list_cntchgntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chg	INTEGER	Change_Request	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		

Field	Data Type	Reference	Remarks
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_notify_list_cntissntf Table

Relates contacts to issues and supports the Stakeholders Notify List.

- **SQL Name** -- usp_lrel_notify_list_cntissntf
- **Object** -- lrel_notify_list_cntissntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
iss	STRING 30	Issue	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_notify_list_cntntf Table

Relates contacts to requests and supports the Stakeholders Notify List.

- **SQL Name** -- usp_lrel_notify_list_cntntf
- **Object** -- lrel_notify_list_cntntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
cr	STRING 30	Call_Req	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

USP Relational Table - Notification Rule

This article contains the following topics:

usp_lrel_ntfr_cntlist_att_ntfrlist Table

Relates contacts to a Notification Rule. For example, the Contacts tab on the Notification Rule Detail page uses this relational data.

- **SQL Name** -- usp_lrel_ntfr_cntl_att_ntfrl
- **Object** -- lrel_ntfr_cntlist_att_ntfrlist

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ntfr	INTEGER	Notify_Rule	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_ntfr_ctplist_att_ntfrlist Table

Relates contact types to a notification rule. For example, the Contact Types tab on the Notification Rule Detail page uses this relational data.

- **SQL Name** -- lrel_ntfr_ctplist_att_ntfrl
- **Object** -- lrel_ntfr_ctplist_att_ntfrlist

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ntfr	INTEGER	Notify_Rule	
ctp	INTEGER	ca_contact_type	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_ntfr_macrolist_att_ntfrlist Table

Relates a macro to a notification rule. Because this table contains internal data, do not change this data.

- **SQL Name** -- usp_lrel_ntfr_macrolist_att_ntfrllist
- **Object** -- lrel_ntfr_macrolist_att_ntfrllist

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ntfr	INTEGER	Notify_Rule	
macro	STRING 30	Spell_Macro	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_ntfr_ntflist_att_ntfrlist Table

Relates object contacts to notification rules. For example, the Object Contacts tab of a Notification Rule Detail page uses this relational data.

- **SQL Name** -- usp_lrel_ntfr_ntflist_att_ntfrl
- **Object** -- lrel_ntfr_ntflist_att_ntfrlist

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ntfr	INTEGER	Notify_Rule	
ntfl	INTEGER	Object_Attr	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

USP Relational Table - Service Groups

This article contains the following topics:

usp_lrel_svc_grps_svc_chgcat Table

Relates service groups to a change category for auto-assignment.

- **SQL Name** -- usp_lrel_svc_grps_svc_chgcat
- **Object** -- lrel_svc_grps_svc_chgcat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chgcat	STRING 12	Change_Category	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_grps_svc_isscat Table

Relates service groups to an issue category for auto-assignment.

- **SQL Name** -- usp_lrel_svc_grps_svc_isscat
- **Object** -- lrel_svc_grps_svc_isscat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
isscat	STRING 12	Issue_Category	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_grps_svc_pcat Table

Relates service groups to a request, problem, or incident area for auto-assignment.

- **SQL Name** -- usp_lrel_svc_grps_svc_pcat
- **Object** -- lrel_svc_grps_svc_pcat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
pcat	STRING 30	Prob_Category	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	

Field	Data Type	Reference	Remarks
tenant	UUID	ca_ tenant	

usp_lrel_svc_grps_svc_wftpl Table

Relates service groups to a classic workflow task template for auto-assignment.

- **SQL Name** -- usp_lrel_svc_grps_svc_wftpl
- **Object** -- lrel_svc_grps_svc_wftpl

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
wftpl	INTEGER	Workflow_Task_ Template	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_locs_svc_chgcat Table

Relates service locations to a change category for auto-assignment.

- **SQL Name** -- usp_lrel_svc_locs_svc_chgcat
- **Object** -- lrel_svc_locs_svc_chgcat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chgcat	STRING 12	Change_Category	
loc	UUID	ca_location	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_locs_svc_groups Table

Relates service groups and locations for auto-assignment.

- **SQL Name** -- usp_lrel_svc_locs_svc_groups
- **Object** -- lrel_svc_locs_svc_groups

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
cnt	UUID	ca_contact	
loc	UUID	ca_location	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_locs_svc_isscat Table

Relates service locations to an issue category for auto-assignment.

- **SQL Name** -- usp_lrel_svc_locs_svc_isscat
- **Object** -- lrel_svc_locs_svc_isscat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
isscat	STRING 12	Issue_Category	
loc	UUID	ca_location	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_locs_svc_pcat Table

Relates service locations to a request, problem, or incident area for auto-assignment.

- **SQL Name** -- usp_lrel_svc_locs_svc_pcat
- **Object** -- lrel_svc_locs_svc_pcat

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
pcat	STRING 30	Prob_Category	
loc	UUID	ca_location	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_tenant	

usp_lrel_svc_schedules_chgcat_svc Table

Relates workshifts to change categories and supports service schedules for auto-assignment.

- **SQL Name** -- usp_lrel_svc_sch_chgcat_svc
- **Object** -- lrel_svc_schedules_chgcat_svc

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chgcat	STRING 12	Change_Category	
wrkshft	STRING 30	Bop_Workshift	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_schedules_isscat_svc Table

Relates workshifts to issue categories and supports service schedules for auto-assignment.

- **SQL Name** -- usp_lrel_svc_sch_isscat_svc
- **Object** -- lrel_svc_schedules_isscat_svc

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
isscat	STRING 12	Issue_Category	
wrkshft	STRING 30	Bop_Workshift	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_svc_schedules_pcat_svc Table

Relates workshifts to request, problem, or incident areas and supports service schedules for auto-assignment.

- **SQL Name** -- usp_lrel_svc_sch_pcat_svc
- **Object** -- lrel_svc_schedules_pcat_svc

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
pcat	STRING 30	Prob_Category	

Field	Data Type	Reference	Remarks
wrkshft	STRING 30	Bop_Workshift	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

USP Relational Table

This article contains the following topics:

usp_lrel_asset_chgnr Table

Relates CIs to Change Orders. For example, the Configuration Items tab on a Change Order Detail page uses this relational data.

- **SQL Name** -- usp_lrel_asset_chgnr
- **Object** -- lrel_asset_chgnr

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
chg	INTEGER	Change_Request	
nr	UUID		ca_owned_resource
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_asset_issnr Table

Relates CIs to Issues. For example, the Configuration Items tab on an Issue Detail page uses this relational data.

- **SQL Name --** usp_lrel_asset_issnr

- **Object** -- lrel_asset_issnr

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
iss	STRING 30	issue	
nr	UUID	ca_owned_ resource	
last_mod_ dt	LOCAL_TIME		
last_mod_ by	UUID	ca_contact contact_uuid	
tenant	UUID		

usp_lrel_att_cntlist_macro_ntf Table

Relates contacts to notification-type macros.

- **SQL Name** -- usp_lrel_att_cntlist_macro_ntf
- **Object** -- usp_lrel_att_cntlist_macro_ntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
macro	STRING 30	Spell_Macro	
cnt	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_att_ctplist_macro_ntf Table

Relates contact types to notification-type macros.

- **SQL Name** -- usp_lrel_att_ctplist_macro_ntf
- **Object** -- lrel_att_ctplist_macro_ntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
macro	STRING 30	Spell_Macro	
ctp	INTEGER	ca_contact_type	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_att_ntflist_macro_ntf Table

Relates object contacts to notification-type macros.

- **SQL Name** -- usp_lrel_att_ntflist_macro_ntf
- **Object** -- usp_lrel_att_ntflist_macro_ntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
macro	STRING 30	Spell_Macro	
ntfl	INTEGER	Notify_Object_Attr	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_aty_events Table

Relates events to activity notifications. For example, the Events tab of the Activity Notification Detail page uses this relational data.

- **SQL Name** -- usp_lrel_aty_events
- **Object** -- lrel_aty_events

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
aty	STRING 12	Act_Type	
evt	STRING 30	Events	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_cenv_cntref Table

Relates CIs to contacts. For example, the Environment tab on a Contact page uses this relational data.

- **SQL Name** -- usp_lrel_cenv_cntref
- **Object** -- lrel_cenv_cntref

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
cnt	UUID	ca_contact	
nr	UUID	ca_owned_resource	

last_mod_dt	LOCAL_TIME	
last_mod_by	UUID	ca_contact
tenant	UUID	ca_ tenant

usp_lrel_kwrds_crsolref Table

Relates key words to request solutions.

- **SQL Name** -- usp_lrel_kwrds_crsolref
- **Object** -- lrel_kwrds_crsolref

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
crsol	STRING 30	Call_Solution	
kwrd	INTEGER	Knowledge_Keywords	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_oenv_orgref Table

Relates CIs to an organization. For example, the Environment tab of the Organization Detail page uses this relational data.

SQL Name -- usp_lrel_oenv_orgref

Object -- lrel_oenv_orgref

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
org	UUID	ca_organization	
nr	UUID	ca_owned_resource	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_status_codes_tsktypes Table

Relates change order status to workflow task types. For example, the Status Codes tab on a Workflow Task Type Detail page uses this relational data.

- **SQL Name** -- usp_lrel_status_codes_tsktypes

- **Object** -- lrel_status_codes_tsktypes

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
tskty	STRING 12	Task_Type	
tskstat	STRING 12	Task_Status	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_bm_reps_assets Table

Relates CIs to a NSM repository.

- **SQL Name** -- usp_lrel_bm_reps_assets
- **Object** -- lrel_bm_reps_assets

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
nr	UUID	ca_owned_resource	
bmrep	INTEGER	Business_Management_ Repository	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

usp_lrel_bm_reps_bmhiers Table

Relates CI relationships to a NSM repository.

- **SQL Name** -- usp_lrel_bm_reps_bmhiers
- **Object** -- lrel_bm_reps_bmhiers

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
bmhier	INTEGER	Business_Management	
bmrep	INTEGER	Business_Management_Repository	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_ tenant	

USP Relational Table - Managed Surveys

This article contains the following topics:

usp_lrel_dist_cntlist_mgs_ntf Table

Relates contact lists to managed surveys.

- **SQL Name** -- usp_lrel_dist_cntlist_mgs_ntf
- **Object** -- lrel_dist_cntlist_mgs_ntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
cnt	UUID	ca_contact	
mgs	INTEGER	Managed_Survey	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_tenant	

usp_lrel_dist_ctplist_mgs_ntf Table

Relates contact types to managed surveys.

- **SQL Name** -- usp_lrel_dist_ctplist_mgs_ntf
- **Object** -- lrel_dist_ctplist_mgs_ntf

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ctp	INTEGER	ca_contact_type	
mgs	INTEGER	Managed_Survey	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_tenant	

usp_lrel_dist_ntflist_mgs_ntf Table

Relates notifications to managed surveys.

- **SQL Name** -- usp_lrel_dist_ntflist_mgs_ntf
- **Object** -- lrel_dist_ntflist_mgs_ntfTable

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
ntfl	INTEGER	Notify_Object_Attr	
mgs	INTEGER	Managed_Survey	
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
tenant	UUID	ca_tenant	

USP Functional Access

This article contains the following topics:

usp_functional_access Table

Defines allowable functional access areas.

- **SQL Name** -- usp_functional_access
- **Object** -- func_access

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
code	STRING 30	UNIQUES_KEY	A string value that represents the functional access area. This value matches what is currently in the FUNCTION_GROUP field in object definition in Majic.
type	INTEGER	usp_functional_access_type	
sym	STRING 60	S_KEY	A synonym or localized friendly name

Field	Data Type	Reference	Remarks
description	STRING 1000		A reference (SREL) to the usp_functional_access_type table that allows for categorization of the functional access.

usp_functional_access_level Table

Defines the access permissions for a functional access area. This table is a static table and cannot be updated by the user.

- **SQL Name** -- usp_functional_access_level
- **Object** -- func_access_level

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
access_level	INTEGER		Integer value that represents the level of the access.
type	INTEGER	usp_functional_access_type	Reference to a usp_functional_access_type record. This value signifies the type this level belongs to.
sym	STRING 60		A localized friendly name for the access type.
description	STRING 1000		

usp_functional_access_role Table

Maps the many-to-many relationship between the usp_functional_access table and the usp_role table. This table also defines the access level such as None, View, and Modify.

- **SQL Name** -- usp_functional_access_role
- **Object** -- func_access_role

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY

Field	Data Type	Reference	Remarks
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
access_level	INTEGER	usp_functional_access_level	Reference to a usp_functional_access_level record that describes the access level for the relationship
func_access	STRING 30	usp_functional_access	Reference to a usp_functional_access record.
role	INTEGER	usp_role	Reference to a usp_role record
description	STRING 1000		

usp_functional_access_type Table

Categorizes the functional areas into types such as Object and Process. This table is a static table that the user cannot update.

- **SQL Name** -- usp_functional_access_type
- **Object** -- func_access_type

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE KEY
last_mod_dt	LOCAL_TIME		
last_mod_by	UUID	ca_contact	
sym	STRING 60		A localized friendly name for the access type.
default_access	INTEGER	usp_functional_access_level	Reference to a usp_functional_access record. This is the default access for new or missing usp_functional_access_role records.
description	STRING 1000		

USP Tables - KPI

This article contains the following topics:

- Kpi_Ticket_Data Table (see page 3797)

Kpi Table

Contains KPIs of Stored Query type, SQL type, and System type.

- **SQL Name** -- usp_kpi
- **Object** -- kc

Field	Data Type	Reference	Remarks
name	string		Defines the name of the KPI.
type	integer		Indicates where the KPI data is retrieved from, such as the crsq database table, BPVirtdb, or daemons in the BOP system.
status	integer		Indicates the on/off state of the KPI.
process_type	integer		Indicates the daemon process where the KPI data resides.
metric_type	integer		Indicates the type of metric the KPI produces (for example, count or sum).
stored_query_id	string		Provides a REF to the id attribute in the Crsq table. It is a SREL to REL_ATTR of object crsq, and contains the value of the code of a row in the crsq object.
user_context	string		Provides a UUID REF to the ca_contact table.
sql_query	string		Defines a SQL query.
description	string		Describes the measurement goal for the KPI.
refresh_time	integer		The time interval at which the KPI data is updated.
sys_name	string		The internal KPI name for sys type KPIs.
curr_kpi_time_stamp	integer		The last collection time of this KPI.
version_number	integer		Indicate the version of this KPI.
tenant	string		Provides a UUID REF to the ca_tenant table.
last_mod_by	string		Specifies the foreign key of the ca_contact table (UUID).
last_mod_dt	integer		Specifies the date and time of last update (integer value in UNIX ticks).

Kpi_Data Table

Contains the KPI data periodically retrieved from system daemons by the kpi_daemon. Provides raw data for web reporting.

- **SQL Name** -- usp_kpi_data
- **Object** -- kcd

Field	Data Type	Reference	Remarks
id	integer		Specifies the id of the record.
kpi_id	integer		Provides a REF to the id in the KPI.
kpi_time_stamp	integer		Indicates the time when a new KPI record is inserted into this table.
metric_type	integer		Indicates the type of metric the KPI produces (count, sum, max, or duration).
kpi_value	integer		Indicates the value of the metric produced by the KPI. The value matches the metric_type (count, sum, max, or duration).
duration_max	integer		Specifies the maximum value of duration for KPIs of duration metric_type. The time unit is millisecond.
duration_sum	integer		Specifies the total duration for KPIs of duration metric_type. The time unit is seconds.
duration_count	integer		Indicates the amount of duration data that has been collected in a period of time.
duration_average	integer		Indicates the average duration in a period of time for KPIs with duration metric_type. The time unit is milliseconds.
execute_time	integer		Indicates the total time for retrieving the KPI data, from the time the request is sent to time the result is received. The time unit is milliseconds.
version_number	integer		Indicate the version of this KPI.

Kpi_Ticket_Data Table

This table contains data retrieved from CA SDM tickets. The data can be used for reporting on ticket performance, such as how long a ticket was in each state.

- **SQL Name** -- usp_kpi_ticket_data
- **Object** -- ktd

Note: This table can collect data for custom fields when you manually add the UI_INFO flag to the custom fields in a majic file. For example, you can use the following attributes:

```
priority SREL pri REQUIRED { ON_NEW SET 0 ;
UI_INFO "KPI" ;} ;
urgency SREL urg { UI_INFO "KPI" ; };
```

Field	Data Type	Reference Remarks
id	integer	Specifies the id of the record.
end_time	integer	Indicates the time when a ticket attribute is changed. It can also be used as a unique id for identifying a ticket object in which one or more attributes are changed.
prev_time	integer	Indicates the time stamp of the last change to this ticket object.
obj_name	string	Indicates ticket objects in majic files (cr, chg, iss,in and pr). Identifies a ticket in which an attribute is changed.
obj_id	integer	Indicates the id of a ticket object in which an attribute is changed.
obj_type	string	Contains type names for call request, such as Problem, Incident, or Request.
field_name	string	Indicates an attribute name in the ticket object in majic files of which the value is changed. They are assignee, priority, customer, etc.
field_value	string	Indicates the attribute value before current value. If it is a SREL, use a common name.
next_value	string	Indicates the attribute value after current value. If it is a SREL, use a common name.
operation	string	There are three kinds of operations: insert, delete and update. Insert or delete creates a usp_kpi_ticket_data record without setting the attribute fields.
attr_obj	string	The name of the object table the SREL links to.
attr_from_id	integer	The previous attr_obj id.
attr_from_uuid	uuid	The previous attr_obj uuid.
attr_to_id	integer	The next attr_obj id.
attr_to_uuid	uuid	The next attr_obj uuid.
user_context	uuid	Whenever the attribute of a ticket object has been changed, the user_context field needs to be filled. It is an SREL to cnt.
ktd_duration	integer	Indicates the calculated time duration between two changes.

Field	Data Type	Reference	Remarks
			Note: The calculated duration is based on a change to values in a ticket in real time, not in business hours.

Transition

This topic contains the following information:

Transition_Points Table

Lists the transitions of interest to the Notification System. E.g. Incident_report creation, or reassignment, TT creation TT closure and so on.

- **SQL Name** -- nottrn

Field	Data Type	Reference	Remarks
del	INTEGER NOT_NULL		Deleted flag **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER NOT_NULL		Enumerated value for this entry - specifies ordering in lists and relative values
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
nx_desc	STRING 40		longer description of event
sym	STRING 30 UNIQUE NOT_NULL S_KEY		transition event symbol
tp_use_pri	INTEGER		flag indicating whether priority is meaningfull

Transition_Types Table

Transition types and their corresponding status transitions control when employees using self-service can close or reopen incidents or requests.

- **SQL Name** -- transition_type
- **Object** -- transition_type

Label	Field	Description
id	INTEGER	Unique key
sym		

Label	Field	Description
	STRING 80 nn	
ss_flag	INTEGER nn	Specifies whether the status transition appears in the Employee Self-Service interface.
ss_button_text	STRING 80	Displays text on the button that performs the status transition.
ss_header_text	STRING 128	Used as the form header when the employee is prompted for comments after selecting a status transition button.
description	STRING 1000	Provides a description of the record.
del	INTEGER nn	Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
last_mod_dt	LOCAL_TIME	Indicates the timestamp of when this record was last modified.
last_mod_by	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.

Timespan

List of defined time-span elements used by applications to calculate hours-of-operation time calculations.

- **SQL Name** -- tspan
- **Object** -- tspan

Field	Data Type	Reference	Remarks
code	STRING 10 UNIQUE NOT_NULL		
end_day	STRING 5		
end_hour	STRING 5		
end_minute	STRING 5		
end_month	STRING 5		
end_year	STRING 5		
id	INTEGER UNIQUE KEY		Unique (to the table) Numeric ID
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
nx_desc	STRING 240		
start_day	STRING 5		

Field	Data Type	Reference	Remarks
start_hour	STRING 5		
start_minute	STRING 5		
start_month	STRING 5		
start_year	STRING 5		
sym	STRING 30 UNIQUE NOT_NULL		
trigger_day	STRING 5		
trigger_hour	STRING 5		
trigger_minute	STRING 5		
trigger_month	STRING 5		
trigger_year	STRING 5		

Tasks

This topic contains the following information:

Task_Status Table

Workflow task states. Possible states include: Wait, pending, approve, reject, and so on.

- **SQL Name** -- tskstat
- **Object** -- tskstat

Field	Data Type	Reference	Remarks
allow_accumulate	INTEGER		Identifies the Allow Accumulate flag, as follows:**0 --** Do not accumulate**1 --** Accumulate
allow_task_update	INTEGER		Specifies the Allow Task Update flag, as follows:**0 --** Cannot update**1** -- Can update
code	nvarchar (12)		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
description	nvarchar (500)		Provides a text description of the status.

Field	Data Type	Reference	Remarks
do_next_task	INTEGER		Sets the Do Next Task flag, as follows:**0** -- No**1** -- Yes
hold	INTEGER		Sets the Hold flag, as follows:**0** -- Start events**1** -- Stop events
id	INTEGER		Specifies the unique (to the table) numeric ID.
is_internal	INTEGER		Specifies the Internal flag, as follows:**0** -- No**1** -- Yes (do not display in most status selections).
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp of when this record was last modified.
no_update_msg	nvarchar (500)		Sets the No Update Message flag to No.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (30)		Identifies the Task Status name.
task_complete	INTEGER		Sets the Task Complete, as follows:**0** -- No**1** -- Yes

Task_Type Table

This table contains the list of task types used in the workflow used by CA SDM.

- **SQL Name** -- tskty
- **Object** -- tskty

Field	Data Type	Reference	Remarks
code	nvarchar (12)		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive/marked as deleted
description	nvarchar (500)		Identifies the text description of the task.
id	INTEGER		Identifies the numeric ID, which is unique to the table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp for when this record was last modified.
persid	nvarchar (30)		Identifies the Persistent ID: (SystemObjectName:id).
sym			Identifies the name of task.

Field	Data Type Reference	Remarks
	nvarchar (30)	

Service Type

This article contains the following topics:

target_tgttpls_srvtypes Table

Links the Target Template to Service Types.

- **SQL Name** -- target_tgttpls_srvtypes
- **Object** -- tgt_tgttpls_srvtypes

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY Unique (to the table) Numeric ID.
del	INTEGER		NOT_NULL Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
last_mod_dt	LOCAL_TIME		Indicates the timestamp when this record was last modified.
last_mod_by	UUID	ca_contact	UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	UUID REF to the ca_tenant table.
tgt_time_tpl	INTEGER	target_time_tpl	NOT_NULL. The Service Target Template that is linked to a Service Type.
sdsc	STRING 30	Service_Desc	NOT_NULL.The Service Type to which the template is linked.
target_duration	DURATION		NOT_NULL. The amount of time in which this target is reached.
set_actual	INTEGER	Boolean_Table	A flag that determines whether the Set Actual Service Target Action is available on the ticket.
reset_actual	INTEGER	Boolean_Table	A flag that determines whether the Reset Actual Service Target Action is available on the ticket.
cost	STRING 255		Text information to appear on the ticket.
work_shift	STRING 30	Bop_Workshift	The workshift used in time calculations.

target_time Table

Represents a Service Target that is attached to a ticket.

- **SQL Name** -- target_time
- **Object** -- tgt_time

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY Unique (to the table) Numeric ID.
del	INTEGER		NOT_NULL Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
sym	STRING 60		NOT_NULL Identifies the symbolic value for this target.
last_mod_dt	LOCAL_ TIME		Indicates the timestamp when this record was last modified.
last_mod_by	UUID	ca_contact	UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	UUID REF to the ca_tenant table.
target_durati on	DURATI ON		NOT_NULL. The amount of time in which this target is reached.
condition	STRING 30	Macro	Identifies the condition to be detected in determining that this target has been reached.
condition_ou tcome	INTEGER	Boolean_Ta ble	Specifies the required outcome of the evaluation of the condition.
service_type	STRING 30	Service_De sc	NOT_NULL. The Service Type to which this target belongs.
object_type	STRING 30		NOT_NULL Ticket type that this target is attached.
object_id	INTEGER	S_KEY	NOT_NULL id of the ticket that this target is attached.
set_actual	INTEGER	Boolean_Ta ble	A flag that determines whether the Set Actual Service Target Action is available on the ticket.
reset_actual	INTEGER	Boolean_Ta ble	A flag that determines whether the Reset Actual Service Target Action is available on the ticket.
lock_target	INTEGER	Boolean_Ta ble	Prevents Service Target recalculations for tickets that transition to and from the Hold status.
cost	STRING 255		Text information to appear on the ticket.
target_time	LOCAL_ TIME		Deadline for the Service Target.
actual_time	LOCAL_ TIME		The time that the target completed.
time_left			Number of remaining minutes.

	DURATION		
_mapped_cr	STRING 30	Call_Req	Pointer to the Request, Incident, or Problem that uses this Service Target.
_mapped_chg	INTEGER	Change_Request	Pointer to the Change Order that uses this Service Target.
_mapped_iss	STRING 30	Issue	Pointer to the Incident that uses this Service Target.
target_tpl	INTEGER	target_tpl	Identifies the target template for this target.
work_shift	STRING 30	Bop_Workshift	Identifies the workshift to use for calculating the target.

target_time_tpl Table

Contains the Service Target template defaults to link to a Service Type.

- **SQL Name** -- target_time_tpl
- **Object** -- tgt_time_tpl

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY Unique to the table Numeric ID.
del	INTEGER		NOT_NULL Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
sym	STRING 60		NOT_NULL Identifies the symbolic value for this target.
last_mod_dt	LOCAL_TIME		Indicates the timestamp when this record was last modified.
last_mod_by	UUID	ca_contact	UUID of the contact who last modified this record.
tenant	UUID	ca_tenant	UUID REF to the ca_tenant table.
target_duration	DURATION		NOT_NULL. The amount of time in which this target is reached.
condition	STRING 30	Macro	Identifies the condition to use to determine whether the target was met.
condition_outcome	INTEGER	Boolean_Table	Specifies the required outcome of the evaluation of the condition.
object_type	STRING 30		NOT_NULL. Identifies the valid ticket type for this template.
set_actual	INTEGER	Boolean_Table	A flag that determines whether the Set Actual Service Target Action is available on the ticket.
reset_actual	INTEGER	Boolean_Table	A flag that determines whether the Reset Actual Service Target Action is available on the ticket.

cost	STRING 255		Indicates the text information to appear on the ticket.
work_shift	STRING 30	Bop_Workshift	Indicates the workshift used for time calculations.

True and False Strings

True_False_Table Table

Contains localized True or False strings that display on the UI.

- **SQL Name** -- True_False_Table
- **Object** -- true_false

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY Unique to the table Numeric ID.
del	INTEGER		NOT_NULL Deleted flag: **0** -- Active **1** -- Inactive/marked as deleted
enum	INTEGER		NOT_NULL Enumerated value for this entry **0** -- False **1** -- True
sym	STRING 60		UNIQUE NOT_NULL S_KEY Identifies the symbolic value for this target
desc	STRING 40		Describes the enum

Type of Contact

Type_Of_Contact Table

Reference table to denote the type of issue. examples: complaint, complement and so on.

- **SQL Name** -- toc
- **Object** -- typecnt

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
id	INTEGER		Primary key of this table, this is the unique numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
	INTEGER		

Field	Data Type	Reference	Remarks
last_mod_dt			Species the timestamp of when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
sym	nvarchar (60)		The symbolic value for this Type_Of_Contact.

User Query

User_Query Table

User scoreboard queries.

- **SQL Name** -- usq
- **Object** -- usq

Field	Data Type	Reference	Remarks
expanded	INTEGER		
factory	STRING 30		
id	INTEGER UNIQUE NOT_NULL KEY		Unique (to the table) Numeric ID
label	STRING 80 NOT_NULL		
last_mod_by	UUID	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
obj_persid	STRING 60		Persistent ID (SystemObjectName:id)
parent	INTEGER	usq::id	
persid	STRING 30		Persistent ID (SystemObjectName:id)
query	STRING 30	Cr_Stored_Queries::code	
query_set	INTEGER		
query_type	INTEGER		
sequence	INTEGER NOT_NULL		

Urgency

List of urgency codes/descriptions used in CA SDM applications.

- **SQL Name** -- urgncy
- **Object** -- urg

Field	Data Type	Reference	Remarks
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
enum	INTEGER		Primary key of this table.
id	INTEGER		Identifies the unique (to the table) numeric ID.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Indicates the timestamp of when this record was last modified.
nx_desc	nvarchar (40)		Provides the description of the urgency level.
sym	nvarchar (12)		Identifies the symbolic name of this urgency.
value	INTEGER		Indicates the numeric representation of this urgency.

Timezone

This table contains the Timezones used in CA SDM applications.

- **SQL Name** -- tz
- **Object** -- tz

Field	Data Type	Reference	Remarks
code	nvarchar (12)		Primary key of this table.
del	INTEGER	Active_Boolean_Table::enum	Specifies the Deleted flag, as follows:**0** -- Active**1** -- Inactive /marked as deleted
description	nvarchar (500)		Identifies the text description of the timezone.
dst_delta	INTEGER		Specifies the delta seconds for daylight saving time.
end_abs_date	LOCAL_TIME		Identifies the *absolute* start date.
end_day	INTEGER		Represents the end day of the week, such as 0-6.
end_mon	INTEGER		Represents the ending month, such as 0-11 for the month of the year.
end_pos	INTEGER		Represents the ending position, such as 0 for "First" or 1 for "Last".
	INTEGER		Represents the delta seconds from GMT.

Field	Data Type	Reference	Remarks
gmt_delta			
id	INTEGER		Identifies the numeric ID, which is unique to the table.
last_mod_by	byte(16)	ca_contact::uuid	Specifies the UUID of the contact who last modified this record.
last_mod_dt	INTEGER		Identifies the timestamp for when this record was last modified.
persid	nvarchar (30)		Persistent ID (SystemObjectName:id).
start_abs_date	INTEGER		Identifies the *absolute* start date.
start_day	INTEGER		Represents the Start day used to calculate DST, for example, 0-6 day of the week.
start_mon	INTEGER		Represents the starting month for the timezone, such as 0-11 for the month of the year.
start_pos	INTEGER		Represents the starting position, such as 0 for "First" or 1 for "Last".
sym	nvarchar (30)		Specifies the name of the service type.

Support Automation - Self Service

This article contains the following topics:

sa_self_serve_event_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_self_serve_event_join
- **Object** -- sa_self_serve_event_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL

Field	Data Type	Reference	Remarks
eventID	INTEGER	sa_event_history	NOT_NULL
tenant	UUID	ca_tenant	

sa_self_serve_keyword Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_self_serve_keyword
- **Object** -- sa_self_serve_keyword

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL
keyword	STRING 255		NOT_NULL
tenant	UUID	ca_tenant	

sa_self_serve_login_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_self_serve_login_field
- **Object** -- sa_self_serve_login_field

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
selfServeSessionID	INTEGER	sa_self_serve_session	NOT_NULL
fieldID	INTEGER	sa_field	NOT_NULL
value	STRING 500		
tenant	UUID	ca_tenant	

Support Automation - Tool

This article contains the following topics:

sa_tool Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool
- **Object** -- sa_tool

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolName	STRING 100		
URL	STRING 255		
suggestion	INTEGER		
imageName	STRING 255		
displayURL	STRING 255		
width	INTEGER		
height	INTEGER		
toolType	INTEGER		
useViewport	INTEGER		
agentDefault	INTEGER		
isAdmin	INTEGER		
isSpecial	INTEGER		
	INTEGER		

Field	Data Type	Reference	Remarks
localizationID			

sa_tool_inst_log_evt_join Table

Program control table used by Support Automation.

- **SQL Name** -- sa_tool_inst_log_evt_join
- **Object** -- sa_tool_inst_log_evt_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolInstanceID	INTEGER	sa_tool_instance_log	NOT_NULL
eventID	INTEGER	sa_event_history	NOT_NULL
tenant	UUID	ca_tenant	

sa_tool_instance Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_instance
- **Object** -- sa_tool_instance

Field	Data Type	Reference	Remarks
groupID	INTEGER	sa_group	NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolInstanceID	INTEGER		NOT_NULL
id	INTEGER	sa_group	UNIQUE NOT_NULL KEY
toolID	INTEGER	sa_tool	
toolInstanceLogID	INTEGER	sa_tool_instance_log	
lastUpdated	LOCAL_TIME		

Field	Data Type	Reference	Remarks
writeLockID	INTEGER		
tenant	UUID	ca_tenant	

sa_tool_instance_log Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_instance_log
- **Object** -- sa_tool_instance_log

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
groupID	INTEGER	sa_group	
toolID	INTEGER	sa_tool	
startEpoch	LOCAL_TIME		
endEpoch	LOCAL_TIME		
tenant	UUID	ca_tenant	

sa_tool_log Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_log
- **Object** -- sa_tool_log

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolID	INTEGER	sa_tool	NOT_NULL
logStart	LOCAL_TIME		
logEnd	LOCAL_TIME		
toolData	INTEGER		

sa_tool_log_message Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_log_message
- **Object** -- sa_tool_log_message

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolID	INTEGER	sa_tool	NOT_NULL
logStart	STRING 300		NOT_NULL

sa_tool_module Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sa_tool_module
- **Object** -- sa_sa_tool_module

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
toolID	INTEGER	sa_tool	NOT_NULL
seqID	INTEGER		NOT_NULL
moduleLocation	STRING 512		
agentModuleName	STRING 255		NOT_NULL
customerModuleName	STRING 255		NOT_NULL
delayLoading	INTEGER		

sa_tool_name_localized Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_name_localized
- **Object** -- sa_tool_name_localized

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY

last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
toolID	INTEGER	sa_tool	NOT_NULL
localizationID	INTEGER	sa_localization	NOT_NULL
name	STRING 200		

sa_tool_non_art Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_non_art
- **Object** -- sa_tool_non_art

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
sym	STRING 100		
art_pos	INTEGER		
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.

sa_tool_property Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_sa_tool_property
- **Object** -- sa_sa_tool_property

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
toolID	INTEGER	sa_tool	NOT_NULL
propertyID	INTEGER	sa_property	NOT_NULL

Field	Data Type	Reference	Remarks
valuee	STRING 100		

sa_tool_start_message Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_start_message
- **Object** -- sa_tool_start_message

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	
toolID	INTEGER	sa_tool	NOT_NULL
showMessage	INTEGER		NOT_NULL
toolStartMessage	STRING 200		

sa_tool_version Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_tool_version
- **Object** -- sa_tool_version

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
localizationID	INTEGER	sa_localization	NOT_NULL
moduleName	STRING 100		NOT_NULL
moduleVersion	STRING 30		

CA Process Automation

This article contains the following topics:

usp_caextwf_instances Table

Associates CA Process Automation process instances that launched from the CA SDM interface. Includes the CA SDM entity to which the instance belongs.

- **SQL Name** -- usp_caextwf_instances
- **Object** -- caextwf_inst

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
inactive	INTEGER		NOT_NULL
instance_id	STRING 255		CA Process Automation instance ID
object_persid	STRING 60		The persistent id of the CA SDM entity from which a CA Process Automation process instance was launched.
procname	STRING 32768		The CA Process Automation process definition name and reference path.
starttime	LOCAL_TIME		Indicates CA Process Automation workflow start time.
endtime	LOCAL_TIME		Indicates CA Process Automation workflow end time.

usp_caextwf_start_forms Table

Stores CA SDM objects with the launchable CA Process Automation process definitions. The Start Request Form indicates the process that runs on the CA Process Automation server, but CA SDM stores the process information.

- **SQL Name** -- usp_caextwf_start_forms
- **Object** -- caextwf_sfrm

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
object_persid	STRING	60	

			UNIQUE NOT_NULL KEY The CA SDM object that provides the CA Process Automation process definition information for launching a new process instance.
caextwf_form	STRING	255	CA Process Automation Process Definition name.
caextwf_path	STRING	32768	The CA Process Automation reference path where this Process Definition is stored in the CA Process Automation library.

Support Automation - Session

This topic contains the following information:

sa_session_event_join Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_session_event_join
- **Object** -- sa_session_event_join

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NULL
eventID	INTEGER	sa_event_history	NOT_NULL
tenant	UUID	ca_tenant	

sa_session_login_field Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_self_serve_login_field
- **Object** -- sa_self_serve_login_field

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
	UUID	ca_contact	

Field	Data Type	Reference	Remarks
last_mod_by			Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NULL
fieldID	INTEGER	sa_field	NOT_NULL
value	STRING 500		
tenant	UUID	ca_tenant	

sa_session_security_info Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_session_security_info
- **Object** -- sa_session_security_info

Field	Data Type	Reference	Remarks
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
sessionID	INTEGER	sa_login_session	NOT_NULL
folderAccessBit	INTEGER		
securityLevelID	INTEGER	sa_security_group	
hasCustom	INTEGER		
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Support Automation - Keyword

This topic contains the following information:

sa_keyword Table

Program control table that is used by Support Automation.

- **SQL Name** -- sa_keyword

- **Object** -- sa_keyword

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
keyname	STRING 100		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	DATE		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

sa_keyword_queue_join Table

Program control table used by Support Automation.

- **SQL Name** -- sa_keyword_queue_join
- **Object** -- sa_keyword_queue_join

Field	Data Type	Reference	Remarks
id	INTEGER		KEY
keywordID	INTEGER	sa_keyword	NOT_NULL
queueID	INTEGER	sa_queue	NOT_NULL
weight	INTEGER		
last_mod_by	UUID	cnt	Specifies the UUID of the contact who last modified this record.
last_mod_dt	LOCAL_TIME		Specifies the timestamp of when this record was last modified.
tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

Outage Table

This article contains the following topics:

usp_outage_reason Table

The usp_outage_reason table associates an outage reason with a special handling classification.

- **SQL Name** -- usp_outage_reason
- **Object** -- None

Attribute	Data Type	SREL References	Flags
del	INTEGER		NOT_NULL

Attribute	Data Type	SREL References	Flags
description	STRING 4000		
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
sym	STRING 60		NOT NULL
tenant	UUID	ca_tenant	

usp_outage_type Table

The usp_outage_type table associates outage types with a special handling classification.

- **SQL Name** -- usp_outage_type
- **Object** -- outage_type

Attribute	Data Type	SREL References	Flags
del	INTEGER		NOT_NULL
description	STRING 4000		
id	INTEGER		UNIQUE NOT_NULL KEY
last_mod_by	UUID	ca_contact	
last_mod_dt	LOCAL_TIME		
sym	STRING 60		NOT NULL
tenant	UUID	ca_tenant	

Technical Reference

This section lists all the CA Service Desk Manager commands:

CA SDM Text API Interface

This article contains the following topics:

Overview of Text API

The *Text API* is an interface that lets you use text-based input to create and update objects in the CA SDM database, such as issues, requests, contacts, and assets. Using the Text API, you can assign values to most fields that are accessible to users.

Important! CA SDM requires that all input be in UTF-8 format, or data can be corrupted. The pdm_unconv utility (see page 3882) lets you convert data from a local charset to UTF-8 and from UTF-8 to a local charset.

You can access the Text API by using the following interfaces:

- Command line
- Email
- CA NSM

Note: You can use web services as the alternative to the Text API for cross-application integration.

Command Line Interface

Use the *pdm_text_cmd* command to activate the Text API command line interface. You can then specify information such as the table to process and the operation to perform by using parameters to the pdm_text_cmd command.

The input to the Text API is passed to the pdm_text_cmd command in the form of an input file, or directly from STDIN.

Note: When passing the parameters from command prompt, use Ctrl+Z in Windows and Ctrl+D in POSIX.

Important! You cannot use single or double quotation marks as parameters for the bop_cmd and pdm_text_nxd commands.

CA Network and Systems Management Interface

When CA NSM and CA SDM are integrated and you are creating requests from CA NSM events, the user_parms parameter in writer rule definitions is passed to the Text API. The CA SDM writer process (tngwriter) defines its own replacement parameters for changing the text before sending it to the Text API. The keyword LOG_AGENT is added to the end of the input to set the log_agent for the request.

Note: You need to update the Text_API.cfg file for all additional fields that are passed from CA NSM Alert Management Systems to CA SDM. This file is used for integrations with web services, email and AHD.DLL.

Input Format

Input to the Text API is specified in the following ways:

- In the command-line interface, input is typically specified in a text file passed to the pdm_text_cmd command.
- In the email interface, input is specified in the text of the email. You specify a regular expression to find the target object identifiers.

You format the Text API input in the same way no matter which interface you use.

The basic format for input is as follows:

```
%keyword=value
```

or

```
%PROPERTY={{property_label}}value
```

The normal behavior of Text API commands has the following exceptions, where the last-appearing of two or more conflicting commands takes precedence:

- When a message contains multiple valid ticket ID artifacts matching the mailbox rule filter string, or multiple Text API ticket ID commands, the first one encountered is used. Also, a ticket ID artifact, which is identified using the mailbox rule filter string, overrides any Text API ticket ID command, regardless of which appears first.
- When a message contains multiple log comment Text API commands, all comments are posted, although the order in which they appear in the ticket activity log can vary.

All ticket ID artifacts that match the filter, valid or otherwise, and Text API ticket ID commands within the message, applicable or otherwise, applied or otherwise, are commented out before the message is posted. The ticket ID artifacts identified through the mailbox rule filters appear as -((...))-. Leading percentage signs (%) in Text API ticket ID commands are converted to two opening parentheses ((, and two closing parentheses)) follow the command. If a Text API ticket ID command appears after another Text API command with a log comment (%LOG=…), then the commented-out Text API ticket ID command is made into a separate log comment.

Note: The log comment is the only Text API command that can appear multiple times in one message and still have each occurrence applied. For any other commands, the Text API uses the last occurrence only, because multiple occurrences of other commands conflict with each other. Multiple log comment commands post separate log comment messages to the ticket, and not necessarily in any particular order.

In addition, if a Text API ticket ID command appears in the message either at the beginning of the message or in between two other Text API commands, it is converted into a log comment. If the previous command is a log comment (%LOG=…) or update description (%DESCRIPTION=…), it is appended to that command, rather than becoming a separate log comment.

Incoming messages that are sent HTML-only, without a plain-text version included, lose their message body. If the message matches any mailbox rule filters with an empty message body, a ticket can be created with an empty Description, or with the quoted message subject as the entirety of the ticket description.

How the Text API Uses Keywords

You can use two types of keywords as input to the Text API.

- Definitions in the [KEYWORDS] section of the text_api.cfg file -- This type is a group of keywords that are related directly to the fields for the various tables that you can update. For example, most of the fields on the Issue Detail form are defined the [KEYWORDS] section. Using these keywords, you can set values for fields in the record that you are updating or creating. For example, the following line sets the priority of the issue to 5:

```
%PRIORITY=5
```

The [KEYWORDS] section of the text_api.cfg file lists all keywords. You can define additional keywords (for example, to allow Text API access to fields that you have added when customizing your database schema).

- The following special keywords are always defined as follows, regardless of the contents of the text_api.cfg file:

Keyword	Description
ASSET	Used to attaches an item to a ticket (valid for requests, issues, and change orders). The value specified is the item name, which must already exist. You can specify this keyword multiple times, because a ticket can have multiple items attached to it.
ATTACHMENT	Used internally by the email interface to add email attachments to a ticket.
DESCRIPTION	Specifies the value to use for the ticket's description field. This keyword is assumed if input is sent to the Text API without an explicit keyword. This keyword is applied automatically by the Mail Eater when the message does not begin with a keyword but does contain a ticket ID artifact or keyword. You can change how the DESCRIPTION keyword is handled for updates using the following entry in the [OPTIONS] section of text_api.cfg: UPDATE_DESC_IS_LOG If this option is set to YES, the value is used to create a log comment. If the value is set to NO, the value overwrites the existing description field.
FROM_EMAILFROM_EMAIL_OVERRIDE	Used by the email interface to match against the Email Address field in the ca_contact record. It is also used as the log_agent for the ticket. If both are supplied, FROM_EMAIL is ignored. **Note:** FROM_EMAIL is set automatically by the Mail Eater with the sender address of the message.
FROM_PERSID	Used by the command line interface to define the log_agent for an operation (for example, when a ca_contact record does not have a User ID). This keyword is passed automatically by pdm_text_cmd if the -p parameter is specified. The value is matched to a ca_contact record persistent_id.
FROM_USERID	Used only in the command line interface to define the log_agent for an operation. This keyword is passed automatically by pdm_text_cmd if the -u parameter is specified. The value is matched to a contact's User ID.
LOG	Used to create a log entry (valid for requests, change orders, issues, and contacts). This keyword is applied automatically by the Mail Eater when the message does not begin with a keyword but does contain either a ticket ID artifact or keyword, or a DESCRIPTION keyword.
LOG_AGENT	Used by the CA NSM interface to define the log_agent for an operation. The value is matched to a contact record's ID field.
PROPERTY	

Keyword	Description
	Used to set the value of a property (valid only for requests, change orders, and issues). Unlike other keywords, which are followed by an equal sign and a value, the PROPERTY keyword syntax must include the property label, as follows: PROPERTY={{property_label}}value You must specify the *property_label* exactly as it appears in the database.
SEARCH	Used only in the command-line interface and the CA NSM interface to supply a list of keywords for use in a query to update multiple tickets for an asset. The value is a list of keywords used in the search. The SEARCH keyword is automatically set by the CA NSM interface.
SEARCH_EXPLICIT	Used only in the CA NSM interface to override the SEARCH keyword supplied by the CA NSM interface. The values supplied are the same as the SEARCH keyword.

Keyword Input Conventions

The following conventions apply to keyword input formatting:

- Prefix every keyword (including PROPERTY) with a percent (%) sign. The percent sign must be in column position one. If the first nonempty line of the input does not have a percent sign at the start of the line, either %DESCRIPTION= or %LOG= is used as the prefix for the incoming data, depending on whether a ticket ID artifact or keyword was found. If %DESCRIPTION is set, the contents of the message up to the first Keyword is posted as a ticket description. If %LOG= is set, the contents of the message up to the first Keyword is posted as a log comment.
- Do not use any intervening spaces within the keyword between the percent sign and the keyword, or between the keyword and the equal (=) sign.
- Do not quote values; all data after the equal sign is assumed to be the value.
- Keywords are not case sensitive.
- If the input includes duplicate keywords, the last keyword is used; otherwise, the order in which you specify the keyword/value pairs is unimportant.
- Specify keyword values as you would for the corresponding field in the web interface. For example, to specify an Analyst contact type, you use %CONTACT_TYPE=Analyst, even though in the database this value is stored as an integer. The CONTACT_TYPE keyword is defined in text_api.cfg so that it converts the specified value (see page 3832) to match the stored value.

  Note: Whether the value is case sensitive depends on your underlying DBMS.

- You can extend string data across multiple lines.

Format an Email Message To Update a Ticket

A user can format an email message to create or update a ticket.

To format an email message to create or update a ticket, use the following fields:

- **To**
  Specifies the mailbox name assigned to the CA SDM contact set up for the privileged user.

- **From**
  Specifies the person sending the email. The person must be defined in the ca_contact table unless the Allow Anonymous option is specified in the applicable mailbox rule.

  Note: The From address is typically part of your email program configuration, and it is not typically set on a per-message basis.

- **Attachments**
  Attaches documents and other files to the email to send attachments to the Text API.

- **Subject**
  Matches keywords in a mailbox rule filter string, particularly when creating a ticket.

- **Body**
  Specifies the message body of the email using the Text API. You can specify the keyword ISSUE_ID, REQUEST_ID, or CHANGE_ID, depending on the type of ticket to create or update a ticket.

Start and End Email Message Delimiters

Some email interfaces add information to the beginning or end of mail messages (for example, MIME encoding) that can cause the email interface to malfunction. If your email interface adds information, you can use the following delimiters: start-request and end-request. The email interface ignores information that is specified prior to start-request and subsequent to end-request.

Note: The Mail Eater does not support emails in the RTF or HTML-only formats.

Example: Use start-request and end-request Delimiters

```
"start-request"
message_body
"end-request"
```

How the Text API Uses Artifacts

The Text API processes the subject or body of email notifications. Mailbox rules let you identify artifacts and values that the Text API uses. For example, you can define the rule for incidents as Incident:{{object_id}}, so finding Incident:1234 translates to %INCIDENT_ID=1234 for the Text API. 1234 is the ref_num for the Incident. Because the artifact must be unique in the email and easy to find, you can make the artifact more distinctive such as %Incident:{{object_id}}%.

Follow the {{object_id}} keyword with a character which is not a letter, number, comma, forward-slash (/), plus sign (+), or equals (=) sign, because these characters can appear within an artifact. Otherwise, it is possible that characters which follow the artifact can be misinterpreted as part of the value of the artifact, or that a character within the value of the artifact can be misinterpreted as the character which follows the value.

Mail Eater does the following:

1. Finds the artifact within an email (such as Incident:1234) that maps to the appropriate ticket or other object supported by the Text API.

2. Translates the artifact to a Text API token (such as %INCIDENT_ID=1234).

3. Mail Eater submits the tagged message to the Text API. The Text API processes the email, applies the text, commands, or both which it contains to the appropriate ticket, and generates an automatic response email indicating whether the email message it received was successfully applied. Depending on the actions performed, a notification email message is also sent separately to indicate certain specific events, such as the creation of a ticket.

How to Set Up Notification Replies to Update Tickets

The Text API daemon (pdm_text_nxd) creates and updates tickets with information from external interfaces, such as the command line and email. You can set up mail to use the Text API so that users (contacts) can update tickets by replying to email notifications. The text of the reply is added as a log comment activity to the ticket.

To set up notification replies to update tickets, do the following:

1. Set the notification method that the contact uses to pdm_mail - T *reply_email_address* or pdm_mail - F *reply_email_address.* The *reply_email_address* specifies the incoming address for the mailbox. When the contact clicks reply on an email that address is filled in from the From or Reply-To address of the message to which they are replying.
   -T sets the Reply-To address. -F sets the From address, which is used as the reply address if a separate one is not specified.

   

   Note: Some mail programs do not or cannot honor a Reply-To address.

2. Create or update a mailbox rule using a Text API keyword.
   The user-defined artifacts in the mailbox rule filters replace the following Text API keywords:

Object	Text API Keyword	Identifier
Incident	%INCIDENT_ID	Ref_num
Problem	%PROBLEM_ID	Ref_num
Request	%REQUEST_ID	Ref_num
Chg_ref_num	%CHANGE_ID	Chg_ref_num
Issue	%ISSUE_ID	Ref_num

1. Create or update a notification phrase that matches the rule.
2. Create or update a message template that uses the notification phrase.
3. Update the mailbox rule that you created in Step 2 to specify the message template that you created or updated in Step 4.

After the user receives the notification and replies to it, the following actions occur:

1. When the filter string is found, the relevant ticket ID keyword and value denoted by the placeholder, if any, are appended to the message.
2. If a matching ticket ID artifact is found, the corresponding ticket is updated, with either a log comment, a new description, or other values in accordance with the text, keywords, and commands in the message.
3. If a matching ticket ID artifact is not found, a ticket is created with a description and other parameters in accordance with the text, keywords, and commands in the message.

How to Set Up a Reply to an Incident Notification Example

This example shows how to set up a reply to an incident notification.

To set up a reply to an incident notification, do the following:

1. Create a mailbox rule using the following fields and values:
   - Filter -- Body contains
   - Filter String -- %Incident:{{object_id}}%
   - Ignore Case -- YES
   - Action -- Update Object
   - Action Object -- Incident
2. Create a notification phrase that includes the rule as follows:
   - Symbol -- Incident Reply
   - Code -- IncidentReply
   - Active -- Active
   - Description -- Comment that embeds the reply for an Incident/Problem/Request.
   - Phrase -- In order to add a comment to your @{call_req_id.type.sym}, just reply to this email or include the line below (on a line by itself):

```
%Incident:{call_req_id.ref_num}%
```

Note: In auto-reply text of the mailbox rule, omit the call_req_id. prefix. This prefix applies a context which the mailbox rule text is already in, and such a context change is not valid when already acting within that context.

3. Create or update a message template that uses the notification phrase as follows:

   - Notification Message Body

```
This is a simple notification.

@{notification_phrase[IncidentURL1].phrase}
```

4. Update the mailbox rule that you created in Step 1 to specify the message template that you created in Step 3, as follows:
   Message Template -- *mailbox rule name*

How an End User Updates a Ticket Example

The following example demonstrates how an end user (John Smith) replies to an email notification to update an incident ticket.

The Body or Subject of the email includes the object identifier. The {{object_id}} placeholder within the filter string denotes the object identifier.

1. A notification is sent to John Smith and includes the following instructions:

```
In order to add a comment to your incident, just reply to this email or include
the line below (on a line by itself).
%Incident:1234%
```

2. John Smith replies to the notification as follows:

```
This is my response...
```

3. The Mail Eater receives the following text version of the John Smith's email:

```
This is my response...
From: Service Desk
Sent: Wednesday, September 18, 2009 10:22 AM
To: Smith, John
Subject: Simple Notification
This is a simple notification.
In order to add a comment to your incident, just reply to this email or include
the line below (on a line by itself).
%Incident:1234%
```

4. The Mail Eater processes rules in order and finds the %Incident:1234% artifact:

```
This is my response...
From: Service Desk
Sent: Wednesday, September 18, 2009 10:22 AM
To: Smith, John
```

```
Subject: Simple Notification
This is a simple notification.
In order to add a comment to your incident, just reply to this email or include
the line below (on a line by itself).
%INCIDENT_ID=1234
```

5. The Mail Eater adds the Text API keywords and the {{object_id}} value to an %INCIDENT_ID= statement and leaves a marker where the {{object_id}} value was found. The following text shows the data that is sent to the Text API. The bold text shows values added by the Mail Eater.

```
%LOG=This is my response...
From: Service Desk
Sent: Wednesday, September 18, 2009 10:22 AM
To: Smith, John
Subject: Simple Notification
This is a simple notification.
In order to add a comment to your incident, just reply to this email or include
the line below (on a line by itself).
%Incident:-((...))-%
%FROM_EMAIL=john.smith@company.com
%INCIDENT_ID=1234
```

6. The Text API add a log comment for Incident 1234.

Keyword Conversion Methods

Many of the keywords defined in text_api.cfg have an associated method to convert the value specified to a value that is appropriate for storage in the database. This feature lets users specify values just as they would in the web interface without having any knowledge of the underlying implementation.

The configuration file has several examples of this type of keyword definition, including ISSUE. PRIORITY and CONTACT.CONTACT_TYPE. If you need to define additional keywords (for example, to allow Text API access to fields that you have added when customizing your database schema), you can use one of the following predefined methods:

Method	Output Type
lookup_actbool	INTEGER
lookup_asset_by_name	UUID
lookup_asset_by_persid	UUID
lookup_chg_category	STRING
lookup_chg_status	STRING
lookup_cnt_by_email	UUID
lookup_cnt_by_last_first_middle	UUID
lookup_cnt_by_logonid	UUID
lookup_cnt_by_persid	UUID
lookup_cnt_meth	INTEGER

Method	Output Type
lookup_cnt_type	INTEGER
lookup_company	UUID
lookup_cr_status	STRING
lookup_cr_template	STRING
lookup_domain	INTEGER
lookup_grc	INTEGER
lookup_group	UUID
lookup_impact	INTEGER
lookup_iss_category	STRING
lookup_iss_status	STRING
lookup_loc	UUID
lookup_mfr_model	UUID
lookup_nr_family	INTEGER
lookup_org	UUID
lookup_person_contacting	INTEGER
lookup_position	INTEGER
lookup_priority	INTEGER
lookup_prob_category	STRING
lookup_product	INTEGER
lookup_resource_status	INTEGER
lookup_service_lvl	STRING
lookup_severity	INTEGER
lookup_state	INTEGER
lookup_timezone	STRING
lookup_type_of_contact	INTEGER
lookup_urgency	INTEGER
lookup_workshift	STRING

If the value you need to convert is not addressed by any of these predefined methods, you need to write a customized method. The method should take a STRING value as its input and return a value (either INTEGER, STRING or UUID) as its output. Return a value of -1 (or “-1”) to denote that the value cannot be determined and is therefore, not set. For UUID, return a “(uuid) NULL”.

For example, you might develop a method to convert a user ID to a ca_contact table reference. The incoming value, such as Administrator, would be passed to the method, and the method would return the ca_contact table id for the user ID of Administrator.

The manner in which you define keywords in the configuration file offers you the advantage of defining multiple keyword mappings to the same field, including different conversion methods, depending on the value being specified. For example, assignee can have several different keyword

mappings to define how to set its value based on different input values. One input might be user ID, another might be last name, first name, middle name, and still another might be the actual ca_contact id (for example, 793ED69B4E87A545BD8E911834D829FC). Each keyword maps to a different conversion method, except the last one, which does not need to be converted.

The Configuration File

This article contains the following topics:

The text_api.cfg file defines the keywords that are related directly to the fields of the various tables that you can update. You use this file both as a reference to find certain predefined values, such as keywords, and as a mechanism for configuring the Text API, although the default configuration file works for most installations without modification.

The text_api.cfg file is located in the following directory:

- UNIX -- $NX_ROOT/site
- Windows -- *installation-directory*\site. For example: C:\Program Files\CA\Service Desk\site

The configuration file is divided into sections, with particular attributes defined within each section. Attribute definitions are of the following form:

```
keyword=value
```

None of the keywords are case-sensitive, whereas all values (except in the [OPTIONS] section) are case-sensitive.

Note: You can view and modify the text_api.cfg file using any text editor.

Important! If you are integrating with the CA NSM Alert Management Systems component, you must update text_api.cfg for any additional fields that are passed to CA SDM.

Options

The [OPTIONS] section of the text_api.cfg file defines processing options that may differ from one site to another. For example, there are options to determine the incoming date format, which fields allow linefeeds to be retained, and whether to allow issues, requests, or change orders to be updated using the email interface. All options in this section are configurable. Be aware that although you can remove table names from the VALID_TABLE_LIST, if you do not want to support Text API access to those tables, you cannot add table names to this list.

Defaults

Use the [XX_DEFAULTS] section provided in the text_api.cfg file for each interface using the Text API (for example, [EMAIL_DEFAULTS] for the email interface and [CMD_DEFAULTS] for the command line interface). The [XX_DEFAULTS] section defines the default values for fields and properties that are required in case the user does not supply them directly. XX refers to the interface type, such as CMD or EMAIL.

To set default values, use one of the following formats:

- table_name**.**keyword**=**value
  The *keyword* must be defined either in the [KEYWORDS] section or as properties in your database. Any method associated with the keyword is automatically applied to the *value*. For example:

  ```
  ISSUE.PRIORITY=1
  ```

  The PRIORITY keyword is defined in text_api.cfg so that it performs a lookup to convert the value you specify to match the corresponding value that is stored in the database. Here, value 1 is converted to 5, which is the underlying database value for the priority symbol 1. This feature lets users specify the value just as they would in the web interface.

- table_name**.PROPERTY={{**property_label**}}**value
  The *property_label* must be defined as a property in your database.

In both formats, the *table_name* must be one of the values defined by VALID_TABLE_LIST in the [OPTIONS] section, such as Issue, Request, or Contact.

Ignore Incoming

There are several [..._IGNORE_INCOMING] sections in the text_api.cfg file, one for each interface that uses the Text API (for example [TNG_IGNORE_INCOMING] for the CA NSM interface and [EXT_IGNORE_INCOMING] for the external interface used by other CA products). These sections define fields and properties that are ignored in the input (the format is the same as described in Defaults, except no "**=***value*" is specified). This feature lets you prevent users from setting certain values, which in turn, provides you with more security for such times as letting customers use the email interface.

The IGNORE sections work well when used in conjunction with the corresponding [..._DEFAULTS] sections because you can prevent the user from setting a particular value and supply a default value at the same time. For example, if you want to prevent email interface users from setting the priority of an issue, you could set the following values:

```
[EMAIL_DEFAULTS]
ISSUE.PRIORITY=2
[EMAIL_IGNORE_INCOMING]
ISSUE.PRIORITY
```

In this case, any priority that the user specifies in the email message body is ignored, and all issues created by the email interface are automatically assigned a priority of 2.

Example Input

The following examples show input that you can use in the body of an email message or in a file serving as input to the command-line interface.

Example: First Line Does Not Include a Keyword

In this example, because the first line is missing a %keyword in the first column, the literal % DESCRIPTION= is added to the beginning of the message. This addition sets the description field to "This entire text goes to the description field" (with the line break intact, because ISSUE.DESCRIPTION is included in the list of fields for the LINEFEEDS_ALLOWED entry in the [OPTIONS] section of text_api.cfg).

```
This entire text goes
into the description field
%PRIORITY=None
```

Example: First Line Includes a Keyword

In this example, the PRIORITY keyword is defined in text_api.cfg so that it performs a lookup to convert the value you specify to match the corresponding value that is stored in the database. Here, the value None is converted to 0, which is the underlying database value for the priority symbol 1. This feature lets users specify the value as they would in the web interface.

```
%description=This is my description
%priority=None
%CATEGORY=Upgrade.PC
%PROPERTY={{Current CPU}}266 mhz
%PROPERTY={{Current Harddrive}}1 gig
%PROPERTY={{Requested Upgrade}}4 gig harddrive
```

The specified values are used to set the description and priority fields for the ticket, similar to the previous example (notice that keyword case is unimportant).

The value of Upgrade.PC is searched, and the category field for the ticket is set appropriately.

Matching the following labels sets the three property values:

- Current CPU
- Current Hard drive
- Requested Upgrade

View Field Descriptions

This article contains the following topics:

You can use the field description information in the basic and advanced views that are supplied with CA SDM.

The following points apply to many of the tables:

- You must turn on audit logging, found in Administration, Options Manager, Audit Log, to see data in the advanced views.
- pdmtime refers to date/time fields that are in GMT format (the number of elapsed seconds since 1/1/1970).
- The terms change request and change order are used interchangeably.

View_Act_Log

The following is a basic view of the request activity log table. Activity type and the analyst's full name are also listed in the view. The activity log table (act_log) was joined with the activity type table (act_type) and the contact table (ca_contact) to give the actual activity type of each activity log entry, and the analyst who performed the activity. Extracted fields from the joins that might be useful are located at the end of this list.

Field	Remarks
id	act_log.id: The unique identifier for this record in the act_log table.

Field	Remarks
persid	act_log.persid: The unique identifier for this record in the act_log table, preceeded by the object identifier (alg for act_log) and a colon.
call_req_id	act_log.call_req_id: Pointer to call request persid to which this activity belongs. act_log.call_req_id = call_req.persid.
last_mod_dt	act_log.last_mod_dt: The last modify date/time (pdmtime).
time_spent	act_log.time_spent: The duration of time spent on this activity, stored as the total number of seconds. For example, 80 = 1 minute, 20 seconds.
time_stamp	act_log.time_stamp: User modifiable date/time of activity (pdmtime).
system_time	act_log.system_time: The date/time of record creation (pdmtime).
analyst	act_log.analyst: The uuid pointer to the contact uuid to get the analyst who performed the activity. act_log.analyst = ca_contact.contact_uuid.
description	act_log.description: The text description of this activity, which can be modified by the user.
action_desc	act_log.action_desc: The text description of automated action, which cannot be modified by the user.
type	act_log.type: The text pointer to a record in the activity type table. For example, act_log.type = act_type.code.
knowledge_session	act_log.knowledge_session: An identifier for a particular session of a particular user.
knowledge_tool	act_log.knowledge_tool: An indicator of the knowledge management tool used for the search, such as NLS_FAQ or EXPERT, etc.
internal	act_log.internal: An integer flag (1 or 0), which indicates if this log entry is intended for all to see or just for internal use.
activity_type	act_type.symActivity: The type derived from act_log.type = act_type.code.
analyst_lastname	View_Contact_Full.last_name: The analyst's last name, derived from act_log.analyst = ca_contact.contact_uuid.
analyst_firstname	View_Contact_Full.first_name: The analyst's first name.
analyst_middlename	View_Contact_Full.middle_name: The analyst's middle name.

View_Audit_Assignee

The following is an advanced view of the audit log where assignee is tracked. This view shows the duration of time between assignee changes for every request and change order. Requests or change orders that are changed from a particular assignee to a null assignee, and then from null assignee back to a particular assignee, do not have the duration of the null assignee listed in this view. This view lists the following fields for both requests and change orders. There may be more than one entry for each audobj_uniqueid (request or change order).

Field	Remarks
audobj_uniqueid	audit_log.audobj_uniqueid: The audit log object unique id representing the chg.id or the call_req.id.
from_val	audit_log.attr_after_val: The 'changed from' assignee value.
to_val	audit_log.attr_after_val: The 'changed to' assignee value.
from_time	audit_log.attr_from_time: The beginning time an assignee was assigned (pdmtime).
to_time	audit_log.attr_from_time: The ending time the same assignee was assigned (pdmtime).

View_Audit_Group

The following is an advanced view of the audit log where group is tracked. This view shows the duration of time between group changes for every request and change order. Requests or change orders that are changed from a particular group to null group, and then from null group back to a particular group, do not have the duration of the null group listed in this view. This view lists the following fields for both requests and change orders. There may be more than one entry for each audobj_uniqueid (request or change order).

Field	Remarks
audobj_uniqueid	audit_log.audobj_uniqueid: The audit log object unique id which represents chg.id or call_req.id.
from_val	audit_log.attr_after_val: The 'changed from' group value.
to_val	audit_log.attr_after_val: The 'changed to' group value.
from_time	audit_log.attr_from_time: The beginning time group was assigned (pdmtime).
to_time	audit_log.attr_from_time: The ending time same group was assigned (pdmtime).

View_Audit_Priority

The following is an advanced view of the audit log where priority is tracked. This view shows the duration of time between priority changes for every request and change order. This view lists the following fields for both requests and change orders. There may be more than one entry for each audobj_uniqueid (request or change order).

Field	Remarks
audobj_uniqueid	audit_log.audobj_uniqueid: The audit object unique id, represents a request call_req.id or change order chg.id.
from_val	audit_log.attr_after_val: The 'changed from' value of priority.
to_val	audit_log.attr_after_val: The 'changed to' value of priority.
from_time	audit_log.attr_from_time: The beginning time priority was in a particular state (pdmtime).
to_time	audit_log.attr_from_time: The ending time priority was in the same state (pdmtime).

View_Audit_Status

The following is an advanced view of the audit log where status is tracked. This view shows the duration of time between status changes for every request and change order. This view lists the following fields for both requests and change orders. There may be more than one entry for each audobj_uniqueid (request or change order).

Field	Remarks
audobj_uniqueid	audit_log.audobj_uniqueid: The audit object unique id, which represents a request call_req.id or change order chg.id.
from_val	audit_log.attr_after_val: The 'changed from' value of priority.
to_val	audit_log.attr_after_val: The 'changed to' value of priority.
from_time	audit_log.attr_after_time: The beginning time status was in a particular state (pdmtime).
to_time	audit_log.attr_after_time: The ending time status was in the same state (pdmtime).

View_Change_Act_Log

The following is a basic view of all change order activity logs. This is a view of the change request activity log table (chgalg) joined with the activity type table (act_type) and the contact table (ca_contact) to give more meaningful data, such as the actual activity type description and full name of the analyst who performed the activity.

Field	Remarks
id	chgalg.id: The unique identifier for this record in the chgalg table.
persid	chgalg.persid: The unique identifier for this record in the chgalg table, preceded by the object identifier (chgalg for chgalg) and a colon.
change_id	chgalg.change_id: The pointer to the change order id to which this activity belongs. chgalg.change_id = chgalg.id
last_mod_dt	chgalg.last_mod_dt: The last modify date/time (pdmtime).
time_spent	chgalg.time_spent: The duration of time spent on this activity, stored as the total number of seconds. For example, 80 = 1 minute, 20 seconds.
time_stamp	chgalg.time_stamp: The user modifiable date/time of activity (pdmtime).
system_time	chgalg.system_time: The date/time of record creation (pdmtime).
analyst	chgalg.analyst: The uuid pointer to the contact uuid to get the analyst who performed the activity.chgalg.analyst = ca_contact.contact_uuid
description	chgalg.description: The text description of this activity, which can be modified by the user.
action_desc	chgalg.action_desc: The text description of the automated action, which cannot be modified by the user.
type	chgalg.type: The text pointer to a record in the activity type table.chgalg.type = act_type.code
internal	chgalg.internal: The integer flag (1 or 0), which indicates if this log entry is intended for all to see or just for internal use.

Field	Remarks
knowledge_session	chgalg.knowledge_session: An identifier for a particular session of a particular user.
knowledge_tool	chgalg.knowledge_tool: An indicator of the knowledge management tool used for the search, such as NLS_FAQ or EXPERT, and so on.
analyst_last name	View_Contact_Full.last_name: The analyst's last name, derived from chgalg.analyst = ca_contact.contact_uuid.
analyst_first name	View_Contact_Full.first_name: The first name of the analyst.
analyst_middlename	View_Contact_Full.middle_name: The middle name of the analyst.
activity_type	act_type.sym: The activity type referenced by chgalg.type = act_type.code.

View_Change

The following is a basic view of all change orders, listing the status, priority, category, organizations, the affected end user's full name, the requester's full name, the assignee's full name, the group name and ID, and so on. Here, the change request table (chg) was joined with many other tables to give some more meaningful data about the change order.

Field	Remarks
id	chg.id: The unique identifier for this record in the chg table.
persid	chg.persid: The unique identifier for this record in the chg table, preceded by the object identifier (chg for table chg) and a colon.
chg_ref_num	chg.chg_ref_num: The change order reference number, which is used by analysts and customers to refer to a particular change order.
description	chg.description: The long description of a change order, as dictated by an analyst or customer.
status	chg.status: The unique identifier of a change order status, which is a pointer to the chgstat table.chg.status = chgstat.code.
active_flag	chg.active_flag: The integer flag to determine whether this change record is active or not (1 or 0).
start_date	chg.start_date: The date the first task goes to a pending status (pdmtime).
open_date	chg.open_date: The change order creation date (pdmtime).
last_mod_dt	chg.last_mod_dt: The last modified date (pdmtime).
last_mod_by	chg.last_mod_by: The pointer to the contact uuid who was the last contact to modify this change order.chg.last_mod_by = ca_contact.contact_uuid.
close_date	chg.close_date: The date the change order was set to inactive (pdmtime).
resolve_date	chg.resolve_date: The date the change order was set to a status configured to indicate the change was resolved (pdmtime).
rootcause	chg.rootcause: A pointer to a record in the rootcause table, which represents the original situation which required this change order to be executed.chg.rootcause = rootcause.id.

Field	Remarks
est_total_time	chg.est_total_time: The estimated total time (pdmtime) it will take to complete this change.
actual_total_time	chg.actual_total_time: The actual total time (pdmtime) it took to complete this change.
log_agent	chg.log_agent: A binary unique identifier referencing the ca_contact table, referencing the person who was the change's original creator.chg.log_agent = ca_contact. contact_uuid.
assignee	chg.assignee: The pointer to the contact uuid who is currently assigned to the change order.chg.assignee = ca_contact.contact_uuid.
organization	chg.organization: The pointer to internal organization uuid, which represents the organization to whom this change order belongs.chg.organization = ca_organization. organization_uuid.
group_id	chg.group_id: The pointer to contact uuid, which represents the group currently assigned to the change order.chg.group_id = ca_contact.contact_uuid
affected_contact	chg.affected_contact: The pointer to the contact uuid, which represents the affected contact for this change order.chg.affected_contact = ca_contact.contact_uuid
requestor	chg.requrestor: The pointer to the contact uuid, which represents the person who ordered the change.chg.requestor = ca_contact.contact_uuid
category	chg.category: The pointer to the change category code to get the category into which this change falls.chg.category = chgcat.code
priority	chg.priority: The pointer to priority enum, which represents the priority into which this change falls.chg.priority = pri.enum
need_by	chg.need_by: The date which indicates when the affected_end_user needs to have the change completed (pdmtime).
est_comp_date	chg.est_comp_date: The estimated completion date (pdmtime) for this Change Order.
actual_comp_date	chg.actual_comp_date:The actual completion date (pdmtime) of this change order.
est_cost	chg.est_cost: The estimated cost of this change order.
actual_cost	chg.actual_cost: The actual cost to implement this change order.
justification	chg.justification: A text field which allows a requestor to document the reason(s) this change is required.
backout_plan	chg.backout_plan: A text field that allows an analyst to document a backout plan for this change.
impact	chg.impact: A pointer to an impact table record, which indicates the scope of resources that this change affects.chg.impact = impact.enum
parent	chg.parent: A pointer to another change request id, which allows creation of a hierarchy of change orders.chg.parent = chg.id
effort	chg.effort: A text field which explains the plan for implementing this change order.
support_lev	chg.support_lev: A pointer to a service desc record, which automates some constraints for which this change must be completed.chg.support_lev = srv_desc.code
template_name	chg.template_name: The name of and pointer to a change order template.chg. template_name = chg_template.template_name

Field	Remarks
sla_violation	chg.sla_violation: The integer to count the number of times slas attached to this "change has been violated".
predicted_sla_viol	chg.predicted_sla_viol: (r5.5) Neugent related technology field.
macro_predict_viol	chg.macro_predict_viol: (r5.5) Neugent related technology field.
created_via	chg.created_via: A pointer to a record in the interface table, which indicates from which interface the change order originated. chg.created_via = interface.id
call_back_date	chg.call_back_date:A date/time field (pdmtime), which indicates a future date/time the requestor is to be contacted.
call_back_flag	chg.call_back_flag: A boolean indicator displayed as a checkbox to the user, indicating whether or not to notify the analyst at the chg.call_back_date.
string1	This is a user-definable text field.
string2	This is a user-definable text field.
string3	This is a user-definable text field.
string4	This is a user-definable text field.
string5	This is a user-definable text field.
string6	This is a user-definable text field.
service_date	chg.service_date: The Date/ Time (pdmtime) that an outside vendor is expected to spend to service this change order.
service_num	chg.service_num: The text field to document an outside vendor's service or purchase order number.
product	chg.product: A pointer to a record in the product table, which indicates the product that is affected by this change.chg.product = product.id
actions	chg.actions: A big text field for documenting actions.
type_of_contact	chg.type_of_contact: A pointer to a record in the toc table, which indicates a general categorization of the affected_end_user's perspective of the change order.chg. type_of_contact = toc.id
reporting_method	chg.reporting_method: A pointer to a record in the repmeth table, which classifies the origination of the change order, and is selected by the person creating the change order.chg.reporting_method = repmeth.id
person_contacting	chg.person_contacting: A pointer to a record in the perscon table, which indicates the role of the affected_end_user or requestor.chg.person_contacting = perscon.id
status_name	chgstat.sym: The description of the status as seen by a user.chg.status = chgstat.code
priority_num	pri.sym: The description of the priority as seen by a user.chg.priority = pri.enum
category_name	chgcat.sym: The name of the Change Category as viewed by a user.chg.category = chgcat.code
organization_name	ca_organization.org_name: The name of an organization as viewed by a user.chg. organization = ca_organization.organization_uuid
affected_end_user_lastname	ca_contact.last_name: The affected end user's last name.chg.affected_end_user = ca_contact.contact_uuid

Field	Remarks
affected_end_user_firstname	ca_contact.first_name: The affected end user's first name.chg.affected_end_user = ca_contact.contact_uuid
affected_end_user_middlename	ca_contact.middle_name: The affected end user's middle name.chg.affected_end_user = ca_contact.contact_uuid
requester_lastname	ca_contact.last_name: The requestor's last name.chg.requestor = ca_contact.contact_uuid
requester_firstname	ca_contact.first_name: The requestor's first name.chg.requestor = ca_contact.contact_uuid
requester_middlename	ca_contact.middle_name: The requestor's middle name.chg.requestor = ca_contact.contact_uuid
business	ca_organization.org_name: The name of the Requester's organization as seen by users.chg.requestor = ca_organization.organization_uuid
assignee_lastname	ca_contact.last_name: The assignee's last name.chg.assignee = ca_contact.contact_uuid
assignee_firstname	ca_contact.first_name: The assignee's first name.chg.assignee = ca_contact.contact_uuid
assignee_middlename	ca_contact.middle_name: The assignee's middle name.chg.assignee = ca_contact.contact_uuid
groupID	ca_contact.contact_uuid: A binary representation of the internal id used for the group assigned to this change order.chg.group_id = ca_contact.contact_uuid
group_name	ca_contact.last_name: The name of the group assigned to this change order.chg.group = ca_contact.contact_uuid
service_type	srv_desc.sym: The name of the service type applied to this change order.chg.support_lev = srv_desc.code
impact_num	impact.sym: The description of the impact as seen by users.chg.impact = impact.enum
product_sym	product.sym: The product description as seen by users.chg.product = product.id
type_of_contact_sym	toc.sym: The Type Of Contact description as seen by users.chg.type_of_contact = toc.id
rpting_method_sym	repmeth.sym: The Reporting method description as seen by users.chg.reporting_method = repmeth.id
person_contacting_sym	perscon.sym: The Person Contacting description as seen by users.chg.person_contacting = perscon.id

View_Change_to_Assets

The following list of fields is a basic view of change orders and their assets. The change request table (chg) is indirectly joined with the network resource table (ca_owned_resource) to get a list of each change order's assets. This view may not list all change orders, particularly those that have no assets.

Field	Remarks
	All fields listed in the View_Change view defined earlier in this document.

Field	Remarks
View_Change.*	
assetID	ca_owned_resource.own_resource_uuid: The binary field which serves as the internal, unchanging unique identifier for an asset record.
asset_serial_num	ca_owned_resource.serial_number: The serial number for an asset record.
asset_class	ca_resource_class.name: A short description of the class to which an asset belongs. ca_owned_resource.resource_class = ca_resource_class.id
asset_family	ca_resource_family.name: The family of assets to which this asset belongs. ca_owned_resource.resource_class = ca_resource_class.id AND ca_resource_class.family_id = ca_resource_family.id
asset_name	ca_owned_resource.resource_name: The network name by which this asset is known.

View_Change_to_Change_Act_Log

The following is a basic view of all change orders and the activity logs that go with them. This view joins the View_Change view with the Change Order Activity Log (chgalg) to give detailed information about change orders and their activity logs.

Field	Remarks
View_Change.*	This shows all fields listed in the View_Change view defined earlier in this document.
chgalg_id	chgalg.id: The unique identifier for this record in the chgalg table.
chgalg_persid	chgalg.persid: The unique identifier for this record in the chgalg table, preceded by the object identifier (chgalg for chgalg) and a colon.
change_id	chgalg.change_id: This is a pointer to change the order id to which this activity belongs. chgalg.change_id = chgalg.id
chgalg_last_mod_dt	chgalg.last_mod_dt: The last modify date/time (pdmtime).
time_spent	chgalg.time_spent: The duration of time spent on this activity, stored as the total number of seconds. For example, 80 = 1 minute, 20 seconds.
time_stamp	chgalg.time_stamp: The user modifiable date/time of activity (pdmtime).
system_time	chgalg.system_time: The date/time of record creation (pdmtime).
analyst	chgalg.analyst: The uuid pointer to contact uuid to get the analyst who performed the activity.chgalg.analyst = ca_contact.contact_uuid
chgalg_description	chgalg.description: The text description of this activity, which can be modified by the user.
action_desc	chgalg.action_desc: The text description of automated action, which cannot be modified by the user.

Field	Remarks
type	chgalg.type: The text pointer to a record in the activity type table.chgalg.type = act_type.code
internal	chgalg.internal: The integer flag (1 or 0), which indicates if this log entry is intended for all to see or just for internal use.
knowledge_session	chgalg.knowledge_session: This is an identifier for a particular session of a particular user.
knowledge_tool	chgalg.knowledge_tool: This is an indicator of the knowledge management tool used for the search, such as NLS_FAQ or EXPERT, and so on.
chgalg_analyst_id	chgalg.analyst: This is the uuid pointer to contact uuid to get the analyst who performed the activity.chgalg.analyst = ca_contact.contact_uuid

View_Change_to_Change_WF

This view is a result of the View_Change view joined with the Workflow task table (wf) to give a basic view of change orders and their workflow tasks. This may not list all change orders, particularly when there are no workflow tasks assigned.

Field	Remarks
View_Change.*	This shows all fields listed in the View_Change view defined earlier in this document.
wf_id	wf.id: The unique identifier for a record in the wf table.
wf_persid	wf.persid: This is a unique identifier for this record in the wf table, preceded by the object identifier (wf for wf) and a colon.
del	wf.del: This is a boolean indicator. It specifies whether this record is to be displayed to the user.
object_type	wf.object_type: This is the factory name, which is used to identify the type of record (for example, chg) to which this workflow task is attached.
object_id	wf.object_id: This is the unique identifier used to identify the specific record to which this workflow task is attached.wf.object_id = chg.id
task	wf.task: This is an identifier, which references the type of task this record represents.wf.task = tskty.code
wf_template	wf.wf_template: This is an identifier, which references from which template this workflow task record was created.wf.wf_template = wftpl.id
sequence	wf.sequence: This is an integer, which indicates the order this particular workflow task record should be displayed and executed by CA SDM (for example, Ascending).
wf_status	wf.status: This is an identifier, which references a tskstat record that indicates the current status of this workflow task.wf.status = tskstat.code
group_task	wf.group_task: This is a Boolean, which indicates whether this task belongs to a group.
asset	wf.asset: This is a UUID (binary) identifier, which references a record in the ca_owned_resource table.wf.asset = ca_owned_resource.own_resource_uuid
creator	

Field	Remarks
	wf.creator: This is a UUID (binary) identifier, which references a record in the ca_contact table. It indicates the person who created this workflow task.wf.creator = ca_contact. contact_uuid
date_created	wf.date_created: This is the Date/timestampe this workflow task was created (pdmtime).
wf_assignee	wf.assignee: This is the UUID (binary) identifier, which references a record in the ca_contact table. It indicates the person who is currently assigned to this workflow task.wf.assignee = ca_contact.contact_uuid
done_by	wf.done_by: This is the UUID (binary) identifier, which references a record in the ca_contact table. It indicates the person who completed or approved this workflow task.wf.done_by = ca_contact.contact_uuid
wf_start_date	wf_start_date: This is the timestamp when the workflow task moved into an active status (pdmtime).
wf_est_comp_date	wf.est_comp_date: This is the timestamp (pdmtime) when users believe this task will be completed.
est_duration	wf.est_duration: This is the estimated duration for this workflow task.
completion_date	wf.completion_dat: This is the timestamp (pdmtime) when this workflow task was completed.
actual_duration	wf.actual_duration: This is the actual amount of time it took to complete this workflow task.
wf_est_cost	wf.est_cost: This is the estimated cost of this workflow task.
cost	wf.cost: This is the actual cost required to complete this workflow task.
wf_description	wf.description: This is the description of the workflow task.
wf_last_mod_dt	wf.last_mod_dt: This is the timestamp (pdmtime) when this workflow task was last changed.
wf_last_mod_by	wf.last_mod_by: This is the UUID (binary) unique identifier referencing a record in the contact table, which indicates the last person to make changes to this workflow task.wf. last_mod_by = ca_contact.contact_uuid

View_Change_to_Properties

This view is a result of the View_Change view joined with the Properties table (prp) to give a basic view of change orders and their assigned properties. This may not list all change orders, particularly when there are no properties assigned.

Field	Remarks
	This shows all fields listed in the View_Change view defined earlier in this document.

Field	Remarks
View_Change.*	
prp_id	prp.id: This is an integer unique identifier for the property record.
prp_persid	prp.persid: This is a unique identifier for this record in the wf table, preceded by the object identifier (prp for prp) and a colon.
object_type	prp.object_type: This is the factory name, which is used to identify the type of record (for example, chg) to which this property record is attached.
object_id	prp.object_id: This is the unique identifier used to identify the specific record to which this property is attached.prp.object_id = chg.id
sequence	prp.sequence: This is an integer that indicates the order for which this particular property record should be displayed by CA SDM (for example, Ascending).
property	prp.property: This is an identifier, which references a record in the prptpl table. It represents the template from which this property was created.prp.property=prptpl.code
value	prp.value: This is the value entered by the user in response to the prp_description and prp.label fields.
prp_last_mod_dt	prp.last_mod_dt: This is the timestamp (pdmtime) when this property was last modified.
prp_last_mod_by	prp.last_mod_by: This is a binary identifier, which references a record in the ca_contact table. It represents the person who last modified this record.prp.last_mod_by = ca_contact.contact_uuid
required	prp.required: This is a Boolean indicating whether this property must have a prp.value before the record is saved.
sample	prp.sample: This is a text field, which displays example values to guide the user in typing the most useful value in prp.value.
prp_description	prp.description: This is a text field, which explains what kind of value should be entered in prp.value.
label	prp.label: This is a short description of what should be placed in the prp.value field.

View_Change_to_Request

The following is a basic view of change orders that have assigned requests only. This view is a result of the View_Change view joined with the request table (call_req) to give details about the change order and its associated request.

Field	Remarks
View_Change.*	This shows all fields listed in the View_Change view defined earlier in this document.
cr_id	call_req.id: This is the unique identifier for this record in the call_req table.
ref_num	call_req.ref_num: This is the Request reference number, which is used by analysts and customers to refer to a particular Request.
	call_req.summary: This is a brief description of the request for quick reference.

Field	Remarks
cr_summary	
cr_persid	call_req.persid: This is a unique identifier for this record in the call_req table, preceded by the object identifier (cr for table call_req) and a colon.
cr_description	call_req.description: This is the long description of a request, as dictated by an analyst or customer.
cr_status	call_req.status: This is a unique identifier referencing a record in the cr_stat table. It indicates the status of this request:call_req.status = cr_stat.code
cr_active_flag	call_req.active_flag: This is the Integer flag used to determine whether this request record is active (1 or 0).
time_spent_sum	call_req.time_spent_sum: This is the derived total of all act_log records' time_spent fields, stored in seconds (i.e. 80 = 1 minute 20 seconds).
cr_open_date	call_req.open_date: This is the Request creation timestamp (pdmtime).
cr_last_mod_dt	call_req.last_mod_dt: This is the last modified timestamp (pdmtime).
cr_close_date	call_req.close_date: This is the Timstamp for when the request was set to inactive (pdmtime).
cr_log_agent	call_req.log_agent: This is a binary unique identifier referencing the ca_contact table. It references the person who was the request's original creator.call_req.log_agent = ca_contact.contact_uuid
cr_group_id	call_req.group_id: This is a binary unique identifier referencing a record in the ca_contact table. It represents the group currently assigned to the request.call_req.group_id = ca_contact.contact_uuid
cr_assignee	call_req.assignee: This is a binary unique identifier referencing a record in the ca_contact table. It represents the person currently assigned to the request.call_req.assignee = ca_contact.contact_uuid
customer	call_req.customer: This is a binary unique identifier referencing a record in the ca_contact table. It represents the affected end user for this request.call_req.customer = ca_contact.contact_uuid
charge_back_id	charge_back_id: This is a text field available for use as an indicator of accounting jargon for expensing this request to the appropriate cost center.
affected_rc	call_req.affected_rc: This is a binary unique identifier referencing a row in the ca_owned_resource table. It represents the asset to which this request applies.call_req.affected_rc = ca_owned_resource.own_resource_uuid.
cr_support_lev	call_req.support_lev: This is a pointer to a service desc record, which automates some constraints under which this request must be completed.call_req.support_lev = srv_desc.code
cr_category	call_req.category: This is a unique identifier referencing a record in the prob_ctg table,. It represents the category to which this request belongs.call_req.category = prob_ctg.persid
solution	call_req.solution: This is a pointer to call solution to get solution.call_req.solution = crsol.persid

Field	Remarks
cr_impact	call_req.impact: This is an integer unique identifier referencing a row in the impact table. It indicates the scope this request is affecting.call_req.impact = impact.enum
cr_priority	call_req.priority: This is an integer unique identifier referencing a record in the pri table. It indicates how analysts will prioritize the work associated with this request.call_req.priority = pri.enum
urgency	call_req.urgency: This is an integer unique identifier referencing a row in the urgncy table. It documents the user's feeling of urgency for having this request resolved.call_req.urgency = urgncy.enum
severity	call_req.severity: This is an integer unique identifier referencing a row in the severity table. It indicates the severity of the consequences of this unresolved request.call_req.severity = sevrty.enum
extern_ref	This specifies an associated ticket.
last_act_id	This is the id of the last activity.
cr_tticket	This is a pointer to a trouble ticket to get the associated ticket.
cr_parent	call_req.parent: This is a persid pointer to another request persid, which facilitates creation of a hierarchy of change orders.call_req.parent = call_req.persid
cr_template_name	call_req.template_name: This is a text value, which indicates this request is designated for and can be chosen from a list as a template for other similar requests.cr_template.template = call_req.persid
cr_sla_violation	call_req.sla_violation: This is an integer, which counts number of times slas attached to this request have been violated.
cr_predicted_sla_viol	call_req.predicted_sla_viol: (r5.5) Neugent related technology field.
cr_created_via	call_req.created_via: This is an integer pointer to a record in the interface table. It indicates from which interface the change order originated.call_req.created_via = interface.id
cr_call_back_date	call_req.call_back_date: This is a timestamp field (pdmtime), which indicates a future date /time the affected_end_user is to be contacted.
cr_call_back_flag	call_req.call_back_flag: This is a Boolean indicator displayed as a checkbox to the user, indicating whether to notify the analyst at the call_req.call_back_date.
event_token	call_req.event_token: This is used by CA NSM for message matching.
type	call_req.type: This is a text field referencing a record in the crt table. It indicates the ITIL type of this request.call_req.type = crt.code
cr_string1	This is a user-definable string.
cr_string2	This is a user-definable string.
	This is a user-definable string.

Field	Remarks
cr_string3	
cr_string4	This is a user-definable string.
cr_string5	This is a user-definable string.
cr_string6	This is a user-definable string.
change	call_req.change: This is an integer unique identifier, referencing a row in the chg table. It indicates the change order that was created as a result of this request.call_req.change = chg.id.

View_Contact_Full

The following of fields is a basic view of all contacts. This view lists all fields in the ca_contact table, plus referenced fields such as short descriptions for contact type, location name, organization names, and service type for each contact. This view has already been joined with the ca_location, ca_organization, srv_desc, and ca_contact_type tables to get the actual names and symbols for some of the fields in the ca_contact table. The actual names and symbols are located at the end of this view's field list.

Field	Remark
contact_uuid	ca_contact.contact_uuid: A binary-unique identifier for each ca_contact record.
middle_name	ca_contact. middle_name: The middle name of this contact.
alias	ca_contact.alias: The alternate, often informal name for this contact.
last_name	ca_contact.last_name: This contact's surname.
first_name	ca_contact.first_name: This contact's formal first name.
pri_phone_number	ca_contact.pri_phone_number: The contact's primary phone number.
alt_phone_number	ca_contact.alt_phone_number: The contact's alternate phone number.
fax_number	ca_contact.fax_number: The contact's facsimile number.
mobile_phone	ca_contact.mobile_phone: The contact's mobile phone number.
pager_number	ca_contact.pager_number: The number for issuing a page to the contact's page.
	ca_contact.email_address: The contact's email address.

Field	Remark
email_address	
location_uuid	ca_contact.location_uuid: A binary-unique identifier referencing a record in the ca_location table, which indicates the contact's static location.ca_contact.location_uuid = ca_location.location_uuid
floor_location	ca_contact.floor_location: A contact's floor number.
pager_email_address	ca_contact.pager_email_address: A contact's email address for their pager.
room_location	ca_contact.room_location: The contact's specific room on the floor at the static location.
contact_type	ca_contact.contact_type: An unique integer-identifier, referring to a row in the ca_contact_type table, which indicates the general function of this contact within the service desk application.ca_contact.contact_type = ca_contact_type.id
inactive	ca_contact.inactive: A boolean indicator of the state of this record, determining its inclusion or exclusion from standard searches within service desk.
creation_user	ca_contact.creation_user: The userid of the contact who created this record.ca_contact.creation_user = ca_contact.userid
creation_date	ca_contact.creation_date: A timestamp (pdmtime), indicating the date and time this contact was created.
last_update_user	ca_contact.last_update_user: The userid of the contact who last updated this contact record.ca_contact.last_update_user = ca_contact.userid
last_update_date	ca_contact.last_update_date: A timestamp (pdmtime), indicating the date and time this record was last modified.
version_number	ca_contact.version number: The internal version indicator.
department	ca_contact.department: An integer-unique identifier, referencing a row in the ca_resource_department table, that indicates the contact's department.ca_contact.department = ca_resource_department.id
comment	ca_contact.comment: A freeform text comment field for analysts to document important facts that influence the handling of this particular contact.
company_uuid	ca_contact.company_uuid: A binary-unique identifier, which references a row in the ca_company table. It indicates this contact's affiliation with a company.ca_contact.company_uuid = ca_company.company_uuid
organization_uuid	ca_contact.organizaiton_uuid: A binary-unique identifier which references a row in the ca_organization table. It indicates this contact's working organization.ca_contact.organizaiton_uuid = ca_organization.organization_uuid
admin_organization_uuid	ca_contact.admin_organization_uuid: A binary-unique identifier, which references a row in the ca_organization table. It indicates this contact's administrative organization.ca_contact.admin_organization_uuid = ca_organization.organization_uuid

Field	Remark
alternate_identifier	ca_contact.alternate_identifier: A user-defined identifier, usually an entity used by human resources to uniquely identify this contact.
job_title	ca_contact.job_title: An integer-unique identifier, which references the ca_job_title table. It indicates the standardized job title for this contact.ca_contact.job_title = ca_job_title.id
job_function	ca_contact.job_function: An integer-unique identifier, which references the ca_job_function table. It indicates a standardized general description of the contact's job function. ca_contact.job_function = ca_job_function.id
mail_stop	ca_contact.mail_stop: Mail Stop.
cost_center	ca_contact.cost_center: An integer-unique identifier, which references the ca_resource_cost_center table. It indicates this contact's primary cost center.ca_contact. cost_center = ca_cost_center.id
userid	ca_contact.userid: The user identifier this contact will use for logging into service desk.
supervisor_contact_uuid	ca_contact.supervisor_contact_uuid: A binary-unique identifier, referencing a row in the ca_contact table, that creates a hierarchy of contacts to indicate the reporting structure of each contact.ca_contact.supervisor_contact_uuid = ca_contact.contact_uuid
exclude_registration	ca_contact.exclude registration: An internal flag.
delete_time	ca_contact.delete_time: A timestamp indicating when the inactive flag was set to 1.
contact_type_name	ca_contact_type.name: A short description of this contact's ca_contact.contact_type.
location_name	ca_location.name: A short description of this contact's static location.
organization	ca_organization.org_name: A short description of this contact's ca_contact. organizaiton_uuid.
admin_organization	ca_organization.org_name: A short description of this contact's organization name. ca_contact.admin_organization_uuid
service_type	srv_desc.sym: A short description of this contact's usp_contact.c_service_type.ca_contact. contact_uuid = usp_contact.contact_uuid AND usp_contact.c_service_type = srv_desc.code
state_sym	ca_location.state: An integer-unique identifier, referencing a row in the ca_state_provice table, that indicates the State, Province, or other artificially defined geographic region. ca_contact.location_uuid = ca_location.location_uuid AND ca_location.state = ca_state_province.id

View_Contact_to_Environment

The following list of fields is a basic view of contacts and their environment (assets). This view is a view of the contact table (ca_contact), but is also joined with the owned resource table (ca_owned_resource) to get a list of all assets associated with a contact. This view may be joined with the View_Contact_Full view to get the contact type, service type, organizations and location of each contact. Or, this view may be joined with the individual tables to get that same information.

Field	Remarks
ca_contact.*	The ca_contact fields that are defined in the View_Contact_Full view definition.
asset_uuid	ca_owned_resource.own_resource_uuid: A binary-unique identifier for an asset in the ca_owned_resource table.
asset_name	ca_owned_resource.resource_name: The designated network name of this asset.

View_Group

The following list of fields is a basic view of the contact table, but lists only group contacts. Contact type id = 2308, which is for group types. You may want to join this view with other CA SDM tables to get more meaningful data for reporting. For example, you can join it with the Location (ca_location) table to find the name and address for the group's location. You can also join this view with the Organization (ca_organization) table to get the functional and administrative organization names for the group.

Field	Remarks
ca_contact.*	The ca_contact fields that are defined in the View_Contact_Full view definition.

The following example shows how joining tables works, and how reporting fields are extracted. The field from one table (on the right) is joined (->) with a field from another table (on the left). To join properly between tables and views, you need to understand the differences in joins for the database. The field defined in the parentheses, as follows, is what you may want to use in your reports if the previous tables are joined with the View_Group view:

- View_Group.contact_type -> ca_contact_type.id (ca_contact_type.sym)
- View_Group.location_uuid -> ca_location.location_uuid (ca_location.location_name)
- View_Group.organization_uuid -> ca_organization.organization_uuid (ca_organization.org_name)
- View_Group.admin_organization_uuid -> ca_organization(2).organization_uuid (ca_organization (2). org_name)

View_Group_to_Contact

The following list of fields is a basic view of all group contacts (members). It also includes managers. Here, View_Group is joined with the Group_Member table, and then joined with the ca_contact table. All fields in View_Group are listed, as well as the first, middle and last name from the ca_contact table. The Group_Member manager flag is also listed. The group member manager flag is

1 or 0, which means that the member is either (yes - 1) a manager, or (no - 0) not a manager. Most of the information in this view pertains to the group itself, not the actual members. This view is used to find information on a particular group, including the names of its members.

Field	Remarks
View_Group.*	The View_Group fields that are defined in the View_Group definition.
member_lastname	ca_contact.last_name: The surname of the group member.
member_firstname	ca_contact.first_name: The formal first name of the group member.
member_middlename	ca_contact.middle_name: The middle name of the group member.
grpmem_manager_flag	ca_contact.manager_flag: The Group Member Manager (1 or 0) indicator.

View_Issue

The following is a basic view of all issues, listing the status, priority, category, organizations, the requester's full name, the assignee's full name, the group name and ID, and so on. Here, the issue table is joined with many other tables to give some more meaningful data about the issue.

Field	Remarks
id	issue.id: The unique identifier for this record in the issue table.
persid	issue.persid: The unique identifier for this record in the issue table, preceded by the object identifier (iss for table issue) and a colon.
issue_ref_num	issue.iss_ref_num: The Issue reference number, which is used by analysts and customers to refer to a particular issue.
description	issue.description: The long description of an issue as dictated by an analyst or customer.
status	issue.status: The unique identifier of an issue status, which is a pointer to the issstat table.issue.status = issstat.code
active_flag	issue.active_flag: The integer flag used to determine whether this issue is active (1 or 0).
start_date	issue.start_date: The date the first task goes to a pending status (pdmtime).
open_date	issue.open_date: The issue creation date (pdmtime).
last_mod_dt	issue.last_mod_dt: The last modified date (pdmtime).
last_mod_by	issue.last_mod_by: The pointer to the contact uuid, which indicates the last contact to modify this issue.issue.last_mod_by = ca_contact.contact_uuid
close_date	issue.close_date: The date the issue was set to inactive (pdmtime).
resolve_date	issue.resolve_date: The date the issue was set to a status configured to indicate the issue was resolved (pdmtime).
rootcause	issue.rootcause: A pointer to a record in the rootcause table, which represents the original situation that required this issue to be logged.issue.rootcause = rootcause.id
est_total_time	issue.est_total_time: The estimated total time (pdmtime) it will take to complete this issue.
actual_total_time	issue.actual_total_time actual: The total time (pdmtime) it took to complete this issue.

Field	Remarks
log_agent	issue.log_agent: A binary-unique identifier, this references the ca_contact table, which in turn references the person who was the issue's original creator.issue.log_agent = ca_contact.contact_uuid
assignee	issue.assignee: A pointer to the contact uuid who is currently assigned to the change order.issue.assignee = ca_contact.contact_uuid
organization	issue.organization: A pointer to the internal organization uuid, which represents the organization to whom this issue belongs.issue.organization = ca_organization. organization_uuid
group_id	issue.group_id: A pointer to the contact uuid, which represents the group currently assigned to the issue.issue.group_id = ca_contact.contact_uuid
affected_contact	issue.affected_contact: A pointer to the contact uuid, which represents the affected contact for this issue.issue.affected_contact = ca_contact.contact_uuid
requestor	issue.requrestor: A pointer to the contact uuid, which represents the person who asked this issue to be logged.issue.requestor = ca_contact.contact_uuid
category	issue.category: A pointer to the issue category code to reference the category into which this issue falls.issue.category = isscat.code
priority	issue.priority: A pointer to priority enum, which represents the priority into which this issue falls.issue.priority = pri.enum
need_by	issue.need_by: The date, which indicates when the affected_end_user needs to have the issue completed (pdmtime).
est_comp_date	issue.est_comp_date: The estimated completion date (pdmtime) for this Issue.
actual_comp_date	issue.actual_comp_date: The actual completion date (pdmtime) of this issue.
est_cost	issue.est_cost: The estimated cost of this issue.
actual_cost	issue.actual_cost: The actual cost to implement this issue.
justification	issue.justification: A text field, which allows a requester to document the reason(s) this issue is required.
backout_plan	issue.backout_plan: A text field that allows an analyst to document a backout plan for this issue.
impact	issue.impact: A pointer to an impact table record, which indicates the scope of resources that this issue affects.issue.impact = impact.enum
parent	issue.parent: A pointer to another issue id, which allows creation of a hierarchy of issues.issue.parent = issue.id
effort	issue.effort: A text field which explains the plan for implementing this issue.
support_lev	issue.support_lev: A pointer to a service desc record, which automates some constraints under which this issue must be completed.issue.support_lev = srv_desc. code
template_name	issue.template_name: The name of and pointer to an issue template.issue. template_name = iss_template.template_name
sla_violation	issue.sla_violation: The integer to count the number of times slas attached to this issue have been violated.
	issue.predicted_sla_viol: (r5.5) Neugent related technology field.

Field	Remarks
predicted_sla_viol	
macro_predict_viol	issue.macro_predict_viol: (r5.5) Neugent related technology field.
created_via	issue.created_via: A pointer to a record in the interface table. This indicates from which interface the issue originated.issue.created_via = interface.id
call_back_date	issue.call_back_date: A date/time field (pdmtime), which indicates a future date/time the requester is to be contacted.
call_back_flag	issue.call_back_flag: A boolean indicator displayed as a checkbox to the user, to indicate whether to notify the analyst at the issue.call_back_date.
string1	This is a user-definable text field.
string2	This is a user-definable text field.
string3	This is a user-definable text field.
string4	This is a user-definable text field.
string5	This is a user-definable text field.
string6	This is a user-definable text field.
service_date	issue.service_date: The Date/ Time (pdmtime) that an outside vendor is expected to service this issue.
service_num	issue.service_num: The text field to document an outside vendor's service or purchase order number.
product	issue.product: A pointer to a record in the product table, which indicates the product that is affected by this issue.issue.product = product.id
actions	issue.actions: A big text field for documenting actions.
type_of_contact	issue.type_of_contact: A pointer to a record in the toc table, which indicates a general categorization of the affected_end_user's perspective of the issue.issue. type_of_contact = toc.id
reporting_method	issue.reporting_method: A pointer to a record in the repmeth table, which classifies the origination of the issue, and is selected by the person creating the issue.issue. reporting_method = repmeth.id
person_contacting	issue.person_contacting: A pointer to a record in the perscon table, which indicates the role of the affected_end_user or requester.issue.person_contacting = perscon.id
status_name	issstat.sym: The description of the status as seen by a user.issue.status = issstat.code
priority_num	pri.sym: The description of the priority as seen by a user.issue.priority = pri.enum
category_name	isscat.sym: The name of the issue category as viewed by a user.issue.category = isscat. code
organization_name	ca_organization.org_name: The name of an organization as viewed by a user.issue. organization = ca_organization.organization_uuid
affected_end_user_lastname	ca_contact.last_name: The affected End User's last name.issue.affected_end_user = ca_contact.contact_uuid
	ca_contact.first_name: The affected End User's first name.issue.affected_end_user = ca_contact.contact_uuid

Field	Remarks
affected_end_user_firstname	
affected_end_user_middlename	ca_contact.middle_name: The affected End User's middle name.issue.affected_end_user = ca_contact.contact_uuid
assignee_lastname	ca_contact.last_name: The assignee's last name.issue.assignee = ca_contact.contact_uuid
assignee_firstname	ca_contact.first_name: The assignee's first name.issue.assignee = ca_contact.contact_uuid
assignee_middlename	ca_contact.middle_name: The assignee's middle name.issue.assignee = ca_contact.contact_uuid
groupID	View_Group.contact_uuid: A binary representation of the internal id used for the group assigned to this issue.issue.group_id = ca_contact.contact_uuid
group_name	View_Group.last_name: The name of the group assigned to this issue.issue.group = ca_contact.contact_uuid
service_type	srv_desc.sym: The name of the service type applied to this issue.issue.support_lev = srv_desc.code
impact_num	impact.sym: The description of the impact as seen by users.issue.impact = impact.enum
product_sym	product.sym: The product description as seen by users.issue.product = product.id
type_of_contact_sym	toc.sym: The Type Of Contact description as seen by users.issue.type_of_contact = toc.id
rpting_method_sym	repmeth.sym: The Reporting method description as seen by users.issue.reporting_method = repmeth.id
person_contacting_sym	perscon.sym: The Person Contacting description as seen by users.issue.person_contacting = perscon.id
created_via_sym	interface.sym: issue.created_via = interface.id.
rootcause_sym	rootcause.sym: issue.rootcause = rootcause.id.

View_Issue_Act_Log

The following is a basic view of all issue activity logs. This is a view of the issue activity log table (issalg) joined with the activity type table (act_type) and the contact table (ca_contact) to give more meaningful data, such as the actual activity type and full name of the analyst who performed the activity.

Field	Remarks
id	issalg.id: The unique identifier for this record in the issalg table.
persid	issalg.persid: The unique identifier for this record in the issalg table, preceded by the object identifier (issalg for issalg) and a colon.
issue_id	

Field	Remarks
	issalg.issue_id: The pointer to issue id to which this activity belongs.issalg.issue_id = issalg.id
last_mod_dt	issalg.last_mod_dt: The last modify date/time (pdmtime).
time_spent	issalg.time_spent: The duration of time spent on this activity, stored as the total number of seconds. For example, 80 = 1 minute, 20 seconds.
time_stamp	issalg.time_stamp: The user modifiable date/time of activity (pdmtime).
system_time	issalg.system_time: The date/time of record creation (pdmtime).
analyst	issalg.analyst: A binary-unique identifier referring to the contact uuid to get the analyst who performed the activity.issalg.analyst = ca_contact.contact_uuid
description	issalg.description: The text description of this activity, which can be modified by the user.
action_desc	issalg.action_desc: The text description of the automated action, which cannot be modified by the user.
type	issalg.type: The text pointer to a record in the activity type table.issalg.type = act_type.code
internal	issalg.internal: The integer flag (1 or 0), which indicates if this log entry is intended for all to see or just for internal use.
knowledge_session	issalg.knowledge_session: An identifier for a particular session of a particular user.
knowledge_tool	issalg.knowledge_tool: An indicator of the knowledge management tool used for the search, such as NLS_FAQ or EXPERT, and so on.
analyst_lastname	View_Contact_Full.last_name: The Analyst's last name, derived from issalg.analyst = ca_contact.contact_uuid.
analyst_firstname	View_Contact_Full.first_name: The analyst's first name.
analyst_middlename	View_Contact_Full.middle_name: The middle name of the analyst.
activity_type	act_type.sym: The activity type referenced by issalg.type = act_type.code.

View_Issue_to_Assets

The following list of fields is a basic view of issues and their assets. The issue table (issue) is indirectly joined with the owned resource table (ca_owned_resource), and other asset-related tables, to get a list of each issue's assets. This may not list all issues, particularly those that have no assets.

Field	Remarks
View_Issue.*	The View_Issue view which defines all fields listed in the View_Issue view.
assetID	

Field	Remarks
	ca_owned_resource.own_resource_uuid: The binary field which serves as the internal, unchanging unique identifier for an asset record.
asset_serial_num	ca_owned_resource.serial_number: The serial number for an asset record.
asset_class	ca_resource_class.name: A short description of the class to which an asset belongs. ca_owned_resource.resource_class = ca_resource_class.id
asset_family	ca_resource_family.name: The family of assets to which this asset belongs. ca_owned_resource.resource_class = ca_resource_class.id AND ca_resource_class.family_id = ca_resource_family.id
asset_name	ca_owned_resource.resource_name: The network name by which this asset is known.

View_Issue_to_Issue_Act_Log

The following is a basic view of all issues and the activity logs that go with them. This view joins the View_Issue view with the View_Issue_Act_Log view to give detailed information about issues and their activity logs. Actual data is at the end of the fields list.

Field	Remarks
View_Issue.*	Please refer to the View_Issue view defined earlier in this document.
issalg_id	issalg.id: The unique identifier for this record in the issalg table.
issalg_persid	issalg.persid: The unique identifier for this record in the issalg table, preceded by the object identifier (issalg for issalg) and a colon.
issue_id	issalg.issue_id: The pointer to issue id to which this activity belongs.issalg.issue_id = issalg.id
issalg_last_mod_dt	issalg.last_mod_dt: The last modify date/time (pdmtime).
time_spent	issalg.time_spent: The duration of time spent on this activity, stored as the total number of seconds. For example, 80 = 1 minute, 20 seconds.
time_stamp	issalg.time_stamp: The user modifiable date/time of activity (pdmtime).
system_time	issalg.system_time: The date/time of record creation (pdmtime).
analyst	issalg.analyst: The unique binary pointer to the contact uuid to get the analyst who performed the activity.issalg.analyst = ca_contact.contact_uuid
issalg_description	issalg.description: The text description of this activity, which can be modified by the user.
action_desc	issalg.action_desc: The text description of the automated action, which cannot be modified by the user.
type	issalg.type: The text pointer to a record in the activity type table.issalg.type = act_type.code
internal	

Field	Remarks
	issalg.internal: The integer flag (1 or 0), which indicates if this log entry is intended for all to see or just for internal use.
knowledge_session	issalg.knowledge_session: An identifier for a particular session of a particular user.
knowledge_tool	issalg.knowledge_tool: An indicator of the knowledge management tool used for the search, such as NLS_FAQ or EXPERT, and so on.
issalg_analyst_id	issalg.analyst: The unique binary pointer to the contact uuid to get the analyst who performed the activity.issalg.analyst = ca_contact.contact_uuid

View_Issue_to_Issue_WF

This view is a result of the View_Issue view joined with the workflow task table (isswf) to give a basic view of issues and their workflow tasks. This may not list all issues, particularly if there are no workflow tasks assigned to them.

Field	Remarks
View_Issue.*	Please refer to the View_Issue definition earlier in this document for a description of each field.
wf_id	isswf.id: This is a unique identifier for a record in the isswf table.
wf_persid	isswf.persid: This is a unique identifier for this record in the isswf table, preceded by the object identifier (isswf) and a colon.
del	isswf.del: This is a boolean indicator of whether this record is to be displayed to the user.
object_type	isswf.object_type: This is the factory name, which is used to identify the type of record (for example, iss) to which this workflow task is attached.
object_id	isswf.object_id: This is a unique identifier used to identify the specific record to which this workflow task is attached.isswf.object_id = issue.id
task	isswf.task: This is an identifier, which references the type of task this record represents.isswf.task = tskty.code
wf_template	isswf.wf_template: This is an identifier, which references from which template this workflow task record was created.isswf.wf_template = wftpl.id
sequence	isswf.sequence: This is an integer that indicates the order for which this particular workflow task record should be displayed and executed by CA SDM (for example, Ascending).
wf_status	isswf.status: This is an identifier, which references a tskstat record. It indicates the current status of this workflow task.isswf.status = tskstat.code
group_task	isswf.group_task: This is a boolean, which indicates whether this task belongs to a group.
asset	isswf.asset: This is a unique binary identifier, which references a record in the ca_owned_resource table.isswf.asset = ca_owned_resource.own_resource_uuid
creator	isswf.creator: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who created this workflow task.isswf.creator = ca_contact.contact_uuid
date_created	isswf.date_created: This is the date/timestamp that this workflow task was created (pdmtime).

Field	Remarks
wf_assignee	isswf.assignee: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who is currently assigned to this workflow task.isswf.assignee = ca_contact.contact_uuid
done_by	isswf.done_by: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who completed or approved this workflow task.isswf.done_by = ca_contact.contact_uuid
wf_start_date	wf_start_date: This is the timestamp when the workflow task moved into an active status (pdmtime).
wf_est_comp_date	isswf.est_comp_date: This is a timestamp (pdmtime) indicating when users believe this task will be completed.
est_duration	isswf.est_duration: This is the estimated duration for this workflow task.
completion_date	isswf.completion_date: This is a timestamp (pdmtime) indicating when this workflow task was completed.
actual_duration	isswf.actual_duration: This is the actual amount of time it took to complete this workflow task.
wf_est_cost	isswf.est_cost: This is the estimated cost of this workflow task
cost	isswf.cost: This is the actual cost required to complete this workflow task.
wf_description	isswf.description: This is a description of the workflow task.
wf_last_mod_dt	isswf.last_mod_dt: This is the timestamp (pdmtime) indicating when this workflow task was last changed.
wf_last_mod_by	isswf.last_mod_by: This is the unique binary identifier, which references a record in the contact table. It indicates the last person to make changes to this workflow task.isswf. last_mod_by = ca_contact.contact_uuid

View_Issue_to_Properties

This view is a result of the View_Issue view joined with the issue properties table (issprp) to give a basic view of issues and their assigned properties. This may not list all issues, particularly if there are no properties assigned to them.

Field	Remarks
View_Issue.*	Please refer to the View_Issue definition earlier in this document, for a description of each field.
prp_id	issprp.id: This is an integer-unique identifier for the property record.
prp_persid	issprp.persid: This is a unique identifier for this record in the prp table, preceded by the object identifier (prp) and a colon.

Field	Remarks
sequence	issprp.sequence: This is an integer that indicates the order for which this particular property record should be displayed by CA SDM (for example, Ascending).
label	issprp.label: This is a short description of what should be placed in the issprp.value field.
value	issprp.value: This is a value entered by the user in response to the prp_description and issprp.label fields.
prp_last_mod_dt	issprp.last_mod_dt: This is the timestamp (pdmtime) indicating when this property was last modified.
prp_last_mod_by	issprp.last_mod_by: This is a binary identifier, which references a record in the ca_contact table. It represents the person who last modified this record.issprp.last_mod_by = ca_contact.contact_uuid
required	issprp.required: This is a boolean, indicating whether this property must have a issprp.value before the record is saved.
sample	issprp.sample: This is a text field, which displays example values to guide the user in entering the most useful value in issprp.value.
owning_iss	issprp.owning_iss: This is a unique identifier used to identify the specific record to which this property is attached.issprp.object_id = issue.persid
prp_description	issprp.description: This is a text field, which explains the type of value that should be entered in issprp.value.

View_Request

The following is a basic view of all requests. Here, the Request table has been joined with other CA SDM tables to give you more specific information, such as the request service type, severity, urgency, category, and priority. There is some additional information about the request listed, as well. All fields from the Request (call_req) table are selected. The extracted fields that are a result of the joined tables are listed at the end of this fields list.

Field	Remarks
id	call_req.id: This is the unique identifier for this record in the call_req table.
persid	call_req.persid: This is a unique identifier for this record in the call_req table, preceded by the object identifier (cr for table call_req) and a colon.
ref_num	call_req.ref_num: This is a Request reference number, which is used by analysts and customers to refer to a particular Request.
summary	call_req.summary: This is a brief description of the request for quick reference.
description	call_req.description: This is the long description of a request, as dictated by an analyst or customer.
status	call_req.status: This is a unique identifier referencing a record in the cr_stat table. It indicates the status of this request. call_req.status = cr_stat.code
active_flag	call_req.active_flag: This is an integer flag to determine whether this request record is active (1 or 0).
	call_req.open_date: This is the Request creation timestamp (pdmtime).

Field	Remarks
open_date	
time_spent_sum	call_req.time_spent_sum: This is the derived total of all of the act_log records' time_spent fields, stored in seconds (i.e. 80 = 1 minute 20 seconds).
last_mod_dt	call_req.last_mod_dt: This is the last modified timestamp (pdmtime).
close_date	call_req.close_date: This is the timstamp when the request was set to inactive (pdmtime).
resolve_date	This is the date for when the request was resolved (pdmtime).
rootcause	This is a pointer to the rootcause.id.
log_agent	call_req.log_agent: This is a binary-unique identifier, referencing the ca_contact table. It references the person who was the request's original creator.call_req.log_agent = ca_contact.contact_uuid
assignee	call_req.assignee: This is a binary-unique identifier, referencing a record in the ca_contact table. It represents the person currently assigned to the request.call_req.assignee = ca_contact.contact_uuid
group_id	call_req.group_id: This is a binary-unique identifier, referencing a record in the ca_contact table. It represents the group currently assigned to the request.call_req. group_id = ca_contact.contact_uuid
customer	call_req.customer: This is a binary-unique identifier, referencing a record in the ca_contact table. It represents the affected end user for this request.call_req.customer = ca_contact.contact_uuid
charge_back_id	charge_back_id: This is a text field available for use as an indicator of accounting jargon for expensing this request to the appropriate cost center.
affected_rc	call_req.affected_rc: This is a binary-unique identifier, referencing a row in the ca_owned_resource table. It represents the asset to which this request applies.call_req. affected_rc = ca_owned_resource.own_resource_uuid.
support_lev	call_req.support_lev: This is a pointer to a service desc record, which automates some constraints under which this request must be completed.call_req.support_lev = srv_desc. code.
category	call_req.category: This is a unique identifier, referencing a record in the prob_ctg table. It represents the category to which this request belongs.call_req.category = prob_ctg.persid
solution	call_req.solution: This is a pointer to call solution to get solution.call_req.solution = crsol. persid
impact	call_req.impact: This is an integer-unique identifier, referencing a row in the impact table. It indicates the impact scope of the request.call_req.impact = impact.enum
priority	call_req.priority: This is an integer-unique identifier, referencing a record in the pri table. It indicates how analysts will prioritize the work associated with this request.call_req. priority = pri.enum
urgency	call_req.urgency: This is an integer-unique identifier, referencing a row in the urgency table. It indicates the user's feeling of urgency for having this request resolved.call_req. urgency = urgncy.enum
severity	

Field	Remarks
	call_req.severity: This is an integer-unique identifier, referencing a row in the severity table. It indicates the severity of the consequences of this unresolved request.call_req. severity = sevrty.enum
extern_ref	This is an external reference to an associated ticket.
last_act_id	This identifies the id of the last activity.
cr_tticket	This is a pointer to the trouble ticket to get the associated ticket.
parent	call_req.parent: This is a ersid pointer to another request persid, which facilitates creation of a hierarchy of change orders.call_req.parent = call_req.persid
template_name	call_req.template_name: This is a text value, which indicates this request is designated for and can be chosen from a list as a template for other similar requests.cr_template. template = call_req.persid
sla_violation	call_req.sla_violation: This is an integer, which counts the number of times that slas attached to this request have been violated.
predicted_sla_viol	This specifies that a request has been predicted by neugents to likely violate SLA.
macro_predicted_violation	This indicates that the request has been predicted by neugents to likely violate SLA.
created_via	call_req.created_via: This is an integer pointer to a record in the interface table that indicates from which interface the change order originated.call_req.created_via = interface.id
call_back_date	call_req.call_back_date: This is a timestamp field (pdmtime), which indicates a future date /time that the affected_end_user is to be contacted.
call_back_flag	call_req.call_back_flag: This is a boolean indicator, displayed as a checkbox to the user, indicating whether to notify the analyst at the call_req.call_back_date.
event_token	call_req.event_token: This is used by CA NSM for message matching.
sched_token	call_req.sched_token: This is used by CA NSM for message matching.
type	call_req.type: This is a text field referencing a record in the crt table. It indicates the ITIL type for this request.call_req.type = crt.code
string1	This is a user-definable string.
string2	This is a user-definable string.
string3	This is a user-definable string.
string4	This is a user-definable string.
string5	This is a user-definable string.
string6	This is a user-definable string.
problem	This is an ITIL problem.
incident_priority	This is an ITIL incident priority.
change	

Field	Remarks
	call_req.change: This is an integer-unique identifier, referencing a row in the chg table. It indicates the change order that was created as a result of this request.call_req.change = chg.id.
service_type	srv_desc.sym: This indicates the actual Service Type.call_req.support_lev = srv_desc.code
severity_num	sevrty.sym: This is the actual Severity number.call_req.severity = sevrty.enum
urgency_num	urgncy.sym: This indicates the actual Urgency number.call_req.urgency = urgncy.enum
category_name	prob_ctg.sym: This is the actual Request Area (problem category).call_req.category = prob_ctg.id
asset	ca_owned_resource.resource_name: This is the actual Asset name.call_req.affected_rc = ca_owned_resource.own_resource_uuid
impact_num	impact.sym: This is the actual Impact number.call_req.impact = impact.enum
assignee_lastname	ca_contact.last_name: This is the actual Assignee last name.call_req.assignee = ca_contact.contact_uuid
assignee_firstname	ca_contact.first_name: This is the actual Assignee first name.call_req.assignee = ca_contact.contact_uuid
assignee_middlename	ca_contact.middle_name: This is the actual Assignee middle name.call_req.assignee = ca_contact.contact_uuid
customer_lastname	ca_contact.last_name: This is the actual last name of the Affected End User.call_req. customer = ca_contact.contact_uuid
customer_firstname	ca_contact.first_name: This is the actual first name of the Affected End User.call_req. customer.ca_contact.contact_uuid
customer_middlename	ca_contact.middle_name: This is the actual middle name of the Affected End User. call_req.customer = ca_contact.contact_uuid
group_name	View_Group.last_name: This is the actual Group name.
GroupID	View_Group.contact_uuid: This is the actual Group key ID.
status_name	cr_stat.sym: This is the actual status.
priority_num	pri.sym: This is the actual Priority number.

View_Request_to_Act_Log

The following is a basic view of all requests with their activity logs. The View_Request view is joined with the View_Act_Log view to give more detailed information about each activity per request.

Field	Remarks
View_Request.*	Please refer to the field defined in the View_Request section earlier in this document.
View_Act_Log.*	Please refer to the fields defined in the View_Act_Log section earlier in this document.

View_Request_to_Properties

The following is a basic view of call requests and their properties. This view lists everything from the call request (call_req) table and the request property (cr_prp) table.

Field	Remarks
View_Request.*	Please refer to the fields defined in the View_Request section of this document.
crprp_id	cr_prp.id: This is an integer-unique identifier for the property record.
crprp_persid	cr_prp.persid: This is a unique identifier for this record in the cr_prp table, preceded by the object identifier (cr_prp) and a colon.
sequence	cr_prp.sequence: This is an integer that indicates the order for which this particular property record should be displayed by CA SDM (for example, Ascending).
label	cr_prp.label: This is a short description of what should be placed in the cr_prp.value field.
value	cr_prp.value: This is a value entered by the user in response to the prp_description and cr_prp.label fields.
crprp_last_mod_dt	cr_prp.last_mod_dt: This is the timestamp (pdmtime) identifying when this property was last modified.
crprp_last_mod_by	cr_prp.last_mod_by: This is a binary identifier, which references a record in the ca_contact table. It represents the person who last modified this record.cr_prp.last_mod_by = ca_contact.contact_uuid
required	cr_prp.required: This is the boolean, indicating whether this property must have a cr_prp. value before the record is saved.
sample	cr_prp.sample: This is a text field, which displays example values to guide the user in entering the most useful value in cr_prp.value.
owning_cr	cr_prp.owning_cr: This is the unique identifier used to identify the specific record to which this property is attached.cr_prp.object_id = call_req.persid
crprp_description	cr_prp.description: This is a text field, which explains the type of value that should be entered in cr_prp.value.

View_Request_to_Request_WF

Note: This feature will only be available if you apply a patch for CA Service Management Release 14.1.01. Find the patch and the download details from CA Support Online.

This view is a result of the View_Request view joined with the workflow task table (crwf) to give a basic view of requests and their workflow tasks. This may not list all requests, particularly if there are no workflow tasks assigned to them.

Field	Remarks
View_Request.*	Please refer to the View_Request definition earlier in this document for a description of each field.
wf_id	crwf.id: This is a unique identifier for a record in the crwf table.
wf_persid	crwf.persid: This is a unique identifier for this record in the crwf table, preceded by the object identifier (crwf) and a colon.
del	crwf.del: This is a boolean indicator of whether this record is to be displayed to the user.
object_type	crwf.object_type: This is the factory name, which is used to identify the type of record (for example, cr) to which this workflow task is attached.
object_id	crwf.object_id: This is a unique identifier used to identify the specific record to which this workflow task is attached.cr.object_id = issue.id
task	crwf.task: This is an identifier, which references the type of task this record represents.crwf.task = tskty.code
wf_template	crwf.wf_template: This is an identifier, which references from which template this workflow task record was created.crwf.wf_template = wftpl.id
sequence	crwf.sequence: This is an integer that indicates the order for which this particular workflow task record should be displayed and executed by CA SDM (for example, Ascending).
wf_status	crwf.status: This is an identifier, which references a tskstat record. It indicates the current status of this workflow task.crwf.status = tskstat.code
group_task	crwf.group_task: This is a boolean, which indicates whether this task belongs to a group.
creator	crwf.creator: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who created this workflow task.crwf.creator = ca_contact.contact_uuid
date_created	crwf.date_created: This is the date/timestamp that this workflow task was created (pdmtime).
wf_assignee	crwf.assignee: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who is currently assigned to this workflow task.crwf.assignee = ca_contact.contact_uuid
done_by	isswf.done_by: This is a unique binary identifier, which references a record in the ca_contact table. It indicates the person who completed or approved this workflow task.isswf.done_by = ca_contact.contact_uuid
wf_start_date	wf_start_date: This is the timestamp when the workflow task moved into an active status (pdmtime).
wf_est_comp_date	crwf.est_comp_date: This is a timestamp (pdmtime) indicating when users believe this task will be completed.
est_duration	crwf.est_duration: This is the estimated duration for this workflow task.

Field	Remarks
completion_date	crwf.completion_date: This is a timestamp (pdmtime) indicating when this workflow task was completed.
actual_duration	crwf.actual_duration: This is the actual amount of time it took to complete this workflow task.
wf_est_cost	crwf.est_cost: This is the estimated cost of this workflow task
cost	crwf.cost: This is the actual cost required to complete this workflow task.
wf_description	crwf.description: This is a description of the workflow task.
wf_last_mod_dt	crwf.last_mod_dt: This is the timestamp (pdmtime) indicating when this workflow task was last changed.
wf_last_mod_by	crwf.last_mod_by: This is the unique binary identifier, which references a record in the contact table. It indicates the last person to make changes to this workflow task.crwf. last_mod_by = ca_contact.contact_uuid

View_Request_to_Request_WF

RFC 2251 LDAP Result Codes

This article contains the following topics:

LDAP Return Codes

LDAP has a set of operation result codes that may be generated by the LDAP server in response to various LDAP requests. These codes indicate the status of the protocol operation and are categorized by server or client return code categories.

LDAP Server Return Codes

The following table lists the server return codes:

Hex	Decimal	Description
0x00	0	LDAP_SUCCESS Indicates the requested client operation completed successfully.
0x01	1	

Hex	Decimal	Description
		LDAP_OPERATIONS_ERROR Indicates an internal error occurred. The server is unable to respond with a more specific error and is also unable to properly respond to a request. It does not indicate that the client has sent an erroneous message.
0x02	2	LDAP_PROTOCOL_ERROR Indicates that the server has received an invalid or malformed request from the client.
0x03	3	LDAP_TIMELIMIT_EXCEEDED Indicates that the operation's time limit specified by either the client or the server has been exceeded. On search operations, incomplete results are returned.
0x04	4	LDAP_SIZELIMIT_EXCEEDED Indicates that in a search operation, the size limit specified by the client or the server has been exceeded. Incomplete results are returned.
0x05	5	LDAP_COMPARE_FALSE Does not indicate an error condition. Indicates that the results of a compare operation are false.
0x06	6	LDAP_COMPARE_TRUE Does not indicate an error condition. Indicates that the results of a compare operation are true.
0x07	7	LDAP_AUTH_METHOD_NOT_SUPPORTED Indicates that during a bind operation the client requested an authentication method not supported by the LDAP server.
0x08	8	LDAP_STRONG_AUTH_REQUIRED Indicates one of the following: In bind requests, the LDAP server accepts only strong authentication. In a client request, the client requested an operation, such as delete, that requires strong authentication. In an unsolicited notice of disconnection, the LDAP server discovers the security protecting the communication between the client and server has unexpectedly failed or been compromised.
0x09	9	Reserved.
0x0A	10	LDAP_REFERRAL Does not indicate an error condition. In LDAPv3, indicates that the server does not hold the target entry of the request, but that the servers in the referral field may.
0x0B	11	LDAP_ADMINLIMIT_EXCEEDED Indicates that an LDAP server limit set by an administrative authority has been exceeded.
0x0C	12	LDAP_UNAVAILABLE_CRITICAL_EXTENSION Indicates that the LDAP server was unable to satisfy a request because one or more critical extensions were not available. Either the server does not support the control or the control is not appropriate for the operation type.
0x0D	13	LDAP_CONFIDENTIALITY_REQUIRED Indicates that the session is not protected by a protocol, such as Transport Layer Security (TLS), which provides session confidentiality.
0x0E	14	

Hex	Decimal	Description
		LDAP_SASL_BIND_IN_PROGRESS Does not indicate an error condition, but indicates that the server is ready for the next step in the process. The client must send the server the same SASL mechanism to continue the process.
0x0 F	15	Not used.
0x1 0	16	LDAP_NO_SUCH_ATTRIBUTE Indicates that the attribute specified in the modify or compare operation does not exist in the entry.
0x1 1	17	LDAP_UNDEFINED_TYPE Indicates that the attribute specified in the modify or add operation does not exist in the LDAP server's schema.
0x1 2	18	LDAP_INAPPROPRIATE_MATCHING Indicates that the matching rule specified in the search filter does not match a rule defined for the attribute's syntax.
0x1 3	19	LDAP_CONSTRAINT_VIOLATION Indicates that the attribute value specified in a modify, add, or modify DN operation violates constraints placed on the attribute. The constraint can be one of size or content (string only, no binary).
0x1 4	20	LDAP_TYPE_OR_VALUE_EXISTS Indicates that the attribute value specified in a modify or add operation already exists as a value for that attribute.
0x1 5	21	LDAP_INVALID_SYNTAX Indicates that the attribute value specified in an add, compare, or modify operation is an unrecognized or invalid syntax for the attribute.
	22-31	Not used.
0x2 0	32	LDAP_NO_SUCH_OBJECT Indicates that the target object cannot be found. This code is not returned on the following operations: Search operations that find the search base but cannot find any entries that match the search filter. Bind operations
0x2 1	33	LDAP_ALIAS_PROBLEM Indicates that an error occurred when an alias was dereferenced.
0x2 2	34	LDAP_INVALID_DN_SYNTAX Indicates that the syntax of the DN is incorrect. However, if the DN syntax is correct, but the LDAP server's structure rules do not permit the operation, the server returns the following: LDAP_UNWILLING_TO_PERFORM
0x2 3	35	LDAP_IS_LEAF Indicates that the specified operation cannot be performed on a leaf entry. (This code is not currently in the LDAP specifications, but is reserved for this constant.)
0x2 4	36	LDAP_ALIAS_DEREF_PROBLEM Indicates that during a search operation, either the client does not have access rights to read the aliased object's name or dereferencing is not allowed.
	37-47	Not used.

Hex	Decimal	Description
0x30	48	LDAP_INAPPROPRIATE_AUTH Indicates that during a bind operation, the client is attempting to use an authentication method that the client cannot use correctly. For example, either of the following causes this error: The client returns simple credentials when strong credentials are required. The client returns a DN and a password for a simple bind when the entry does not have a password defined.
0x31	49	LDAP_INVALID_CREDENTIALS Indicates that during a bind operation, one of the following occurred: The client passed either an incorrect DN or password. The password is incorrect because it has expired; intruder detection has locked the account, or some other similar reason.
0x32	50	LDAP_INSUFFICIENT_ACCESS Indicates that the caller does not have sufficient rights to perform the requested operation.
0x33	51	LDAP_BUSY Indicates that the LDAP server is too busy to process the client request at this time, but if the client waits and resubmits the request, the server may be able to process it then.
0x34	52	LDAP_UNAVAILABLE Indicates that the LDAP server cannot process the client's bind request, usually because it is shutting down.
0x35	53	LDAP_UNWILLING_TO_PERFORM Indicates that the LDAP server cannot process the request because of server-defined restrictions. This error is returned for the following reasons: The add entry request violates the server's structure rules. The modify attribute request specifies attributes that users cannot modify. Password restrictions prevent the action. Connection restrictions prevent the action.
0x36	54	LDAP_LOOP_DETECT Indicates that the client discovered an alias or referral loop, and is thus unable to complete this request.
	55-63	Not used.
0x40	64	LDAP_NAMING_VIOLATION Indicates that the add or modify DN operation violates the schema's structure rules. For example: The request places the entry subordinate to an alias. The request places the entry subordinate to a container that is forbidden by the containment rules. The RDN for the entry uses a forbidden attribute type.
0x41	65	LDAP_OBJECT_CLASS_VIOLATION Indicates that the add, modify, or modify DN operation violates the object class rules for the entry. For example, the following types of request return this error: The add or modify operation tries to add an entry without a value for a required attribute. The add or modify operation tries to add an entry with a value for an attribute which the class definition does not contain. The modify operation tries to remove a required attribute without removing the auxiliary class that defines the attribute, as required.

Hex	Decimal	Description
0x42	66	LDAP_NOT_ALLOWED_ON_NONLEAF Indicates that the requested operation is permitted only on leaf entries. For example, the following types of requests return this error: The client requests a delete operation on a parent entry. The client request a modify DN operation on a parent entry.
0x43	67	LDAP_NOT_ALLOWED_ON_RDN Indicates that the modify operation attempted to remove an attribute value that forms the entry's relative distinguished name.
0x44	68	LDAP_ALREADY_EXISTS Indicates that the add operation attempted to add an entry that already exists, or that the modify operation attempted to rename an entry with the name of an entry that already exists.
0x45	69	LDAP_NO_OBJECT_CLASS_MODS Indicates that the modify operation attempted to modify the structure rules of an object class.
0x46	70	LDAP_RESULTS_TOO_LARGE Reserved for CLDAP.
0x47	71	LDAP_AFFECTS_MULTIPLE_DSAS Indicates that the modify DN operation moves the entry from one LDAP server to another and thus requires more than one LDAP server.
	72-79	Not used.
0x50	80	LDAP_OTHER Indicates an unknown error condition. This is the default value for NDS error codes which do not map to other LDAP error codes.

LDAP Client Return Codes

The following table lists the client return codes:

Hex	Decimal	Description
0x51	81	LDAP_SERVER_DOWN Indicates that the LDAP libraries cannot establish an initial connection with the LDAP server. Either the LDAP server is down, or the specified host name or port number is incorrect.
0x52	82	LDAP_LOCAL_ERROR Indicates that the LDAP client has an error. This is usually a failed dynamic memory allocation error.
0x53	83	LDAP_ENCODING_ERROR Indicates that the LDAP client encountered errors when encoding an LDAP request intended for the LDAP server.
0x54	84	LDAP_DECODING_ERROR Indicates that the LDAP client encountered errors when decoding an LDAP response from the LDAP server.
0x55	85	LDAP_TIMEOUT Indicates that the time limit of the LDAP client was exceeded while waiting for a result.

Hex	Decimal	Description
0x56	86	LDAP_AUTH_UNKNOWN Indicates that the ldap_bind or ldap_bind_s function was called with an unknown authentication method.
0x57	87	LDAP_FILTER_ERROR Indicates that the ldap_search function was called with an invalid search filter.
0x58	88	LDAP_USER_CANCELLED Indicates that the user cancelled the LDAP operation.
0x59	89	LDAP_PARAM_ERROR Indicates that an LDAP function was called with an invalid parameter value (for example, the ID parameter is NULL).
0x5A	90	LDAP_NO_MEMORY: Indicates that a dynamic memory allocation function failed when calling an LDAP function.
0B	91	LDAP_CONNECT_ERROR Indicates that the LDAP client has lost either its connection or cannot establish a connection to the LDAP server.
0x5C	92	LDAP_NOT_SUPPORTED Indicates that the client does not support the requested functionality. For example, if the LDAP client is established as an LDAPv2 client, the libraries set this error code when the client requests LDAPv3 functionality.
0x5D	93	LDAP_CONTROL_NOT_FOUND Indicates that the client requested a control that the libraries cannot find in the list of supported controls sent by the LDAP server.
0x5E	94	LDAP_NO_RESULTS_RETURNED Indicates that the LDAP server sent no results. When the ldap_parse_result function is called, no result code is included in the server's response.
0x5F	95	LDAP_MORE_RESULTS_TO_RETURN Indicates that more results are chained in the result message. The libraries set this code when the call to the ldap_parse_result function reveals that additional result codes are available.
0x60	96	LDAP_CLIENT_LOOP Indicates the LDAP libraries detected a loop. Usually, this happens when following referrals.
0x61	97	LDAP_REFERRAL_LIMIT_EXCEEDED Indicates that the referral exceeds the hop limit. The hop limit determines how many servers the client can hop through to retrieve data. For example, suppose the following conditions: The hop limit is two. The referral is to server D which can be contacted only through server B (1 hop) which contacts server C (2 hops) which contacts server D (3 hops) With these conditions, the hop limit is exceeded and the LDAP libraries set this code.

LDAP-Associated RFC Standards

The following table describes the LDAP-associated RFC standards available for your use:

RFC	Description
1274	The COSINE and Internet X.500 Schema
1275	Replication Requirements to provide an Internet Directory using X.500
1276	Replication and Distributed Operations extensions to provide an Internet Directory using X.500
1308	Executive Introduction to Directory Services Using the X.500 Protocol
1309	Technical Overview of Directory Services Using the X.500 Protocol
1430	A Strategic Plan for Deploying an Internet X.500 Directory Service
1488	The X.500 String Representation of Standard Attribute Syntaxes
1558	A String Representation of LDAP Search Filters
1617	Naming and Structuring Guidelines for X.500 Directory Pilots
1777	Lightweight Directory Access Protocol v2
1778	The String Representation of Standard Attribute Syntaxes
1779	A String Representation of Distinguished Names
1804	Schema Publishing in X.500 Directory
1823	The LDAP Application Program Interface
1959	An LDAP URL Format
1960	A String Representation of LDAP Search Filters
2044	UTF -8, a transformation format of Unicode and ISO 10646
2164	Use of an X.500/LDAP Directory to support MIXER address mapping
2218	A Common Schema for the Internet White Pages Service
2247	Using Domains in LDAP/X.500 Distinguished Names
2251	Lightweight Directory Access Protocol (v3)
2252	Lightweight Directory Access Protocol (v3): Attribute Syntax Definitions
2253	Lightweight Directory Access Protocol (v3): UTF-8 String Representation of Distinguished Names
2254	The String Representation of LDAP Search Filters
2255	The LDAP URL Format
2256	A Summary of the X.500(96) User Schema for use with LDAPv3
2279	UTF-8, a transformation format of ISO 10646
2293	Representing Tables and Subtrees in the X.500 Directory
2294	Representing the O/R Address hierarchy in the X.500 Directory Information Tree
2307	An Approach for Using LDAP as a Network Information Service
2377	Naming Plan for Internet Directory-Enabled Applications
2531	Content Feature Schema for Internet Fax
2559	Internet X.509 Public Key Infrastructure Operational Protocols - LDAPv2
2587	Internet X.509 Public Key Infrastructure LDAPv2 Schema
2589	Lightweight Directory Access Protocol (v3): Extensions for Dynamic Directory Services
2596	Use of Language Codes in LDAP

RFC	Description
2649	An LDAP Control and Schema for Holding Operation Signatures
2657	RFC 2657 - LDAPv2 Client vs. the Index Mesh
2696	LDAP Control Extension for Simple Paged Results Manipulation
2713	Schema for Representing Java(tm) Objects in an LDAP Directory
2714	Schema for Representing CORBA Object References in an LDAP Directory
2739	Calendar Attributes for vCard and LDAP
2798	Definition of the inetOrgPerson LDAP Object Class
2820	Access Control Requirements for LDAP
2829	Authentication Methods for LDAP
2830	Lightweight Directory Access Protocol (v3): Extension for Transport Layer Security
2849	The LDAP Data Interchange Format (LDIF) - Technical Specification
2879	Content Feature Schema for Internet Fax (V2)
2891	LDAP Control Extension for Server Side Sorting of Search Results
3045	Storing Vendor Information in the LDAP root DSE
3062	LDAP Password Modify Extended Operation
3112	LDAP Authentication Password Schema
3296	Named Subordinate References in Lightweight Directory Access Protocol Directories
3377	Lightweight Directory Access Protocol (v3): Technical Specification
3384	Lightweight Directory Access Protocol (version 3) Replication Requirements

pdm_configure--Open the Configuration Window

pdm_configure opens a window containing the CA SDM configuration window. Use this window to set the CA SDM configuration after installing CA SDM, or to change the CA SDM configuration after CA SDM is running. Following are the possible reasons to change the CA SDM configuration:

- Changing the database type or server
- Reload default data
- Change passwords for the CA SDM system accounts
- Rebuild schema files to incorporate changes
- Reconfigure the following server, depending on your CA SDM configuration:
  - Conventional: Primary or secondary server
  - Advanced availability: Application or background server

Syntax

This command has the following format:

```
pdm_configure
```

Restrictions

pdm_configure can be run on any CA SDM server or a CA SDM Linux client. You must be the privileged user or root to run pdm_configure.

pdm_key_refresh--Refresh Cached Key Information

The pdm_key_refresh utility refreshes cached key information from the key control table in the database. If key control information is updated, this utility can be executed instead of stopping and restarting the system to force CA SDM to use the new keyid base value.

Important! Changing the key control table may cause data corruption. You should not attempt to change the key control without specific instructions from CA Technical Support.

Syntax

This command has the following format:

```
pdm_key_refresh
```

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_lexutil--Modify CA SDM Lexicons

The pdm_lexutil utility allows you to modify Service Desk lexicons, to add or delete words for the spell check dictionary.

Syntax

This command has the following format:

```
pdm_lexutil -a | -d [-f] [-l] wordlist
```

- **-a**
  Add words.
- **-d**
  Delete words.

- **-f**
  File or lexicon containing list of words to be added or deleted.

- **-l**
  Lexicon name.
  Default: userdict.tlx

- **wordlist**
  Words to be added or deleted.

> **Important!** On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_listconn--List Active Connections

The pdm_listconn utility can be used to list active connections for both clients and servers.

Syntax

This command has the following format:

```
pdm_listconn [-c] [-s] [ - s -c] [ - t nn] [proc1 [proc2...]]
```

The default command has the following format if no parameters are specified:

```
pdm_listconn -s -t 2
```

-c

Lists connections by client. The utility displays two lines for each client:

```
(n secs) client_type node|cproc
connected to alias (sproc) at time
```

n is the number of seconds it took for the client to respond.

client_type is "vbop," "animator daemon," or "web engine."

node is the IP address of the client's node.

cproc is the client's slump procname.

alias is the alias of the server the client is connected with.

sproc is the server's slump procname.

time is the connection time.

For example:

```
(0 secs) vbop client 141.202.211.34|vbop-0x40120000:anthill:0
         connected to CMD40120 on anthill (domsrvr) at 02/19/1999 10:44:16
```

-s

Lists connections by server (default). The utility displays two lines for each server:

```
(n secs) server  alias (node|sproc) willingness willingness
count connected clients (use pdm_listconn -c -s to list clients by server)
```

n is the number of seconds it took for the server to respond.

node is the IP address of the server's node.

alias is the alias of the server the client is connected with.

sproc is the server's slump procname.

willingness is the server's willingness to accept new clients (0 - 100).

count is the number of connected clients.

For example:

```
(0 secs) server CMD40120 on anthill (domsrvr) willingness 98
2 connected clients (use pdm_listconn -c -s to list clients by server)
   vbop client 141.202.211.34|vbop2 connected 02/19/1999 10:53:16
   vbop client 141.202.211.34|vbop-0x40120000:anthill:0 connected 02/19/1999 10:44:17
```

-s -c

Lists connections by server, including client detail for each server. The utility displays several lines for each server:

```
(n secs) server  alias (node|sproc) willingness willingness
count connected clients:
client_type node|cproc connected time
```

where:

n is the number of seconds it took for the server to respond.

node is the IP address of the server's node.

alias is the alias of the server the client is connected with.

sproc is the server's slump procname.

willingness is the server's willingness to accept new clients (0 - 100).

count is the number of connected clients.

client_type is "vbop," "animator daemon," or "web engine."

node is the IP address of the client's node.

cproc is the client's slump procname.

time is the connection time.

For example:

```
(0 secs) server CMD40120 on anthill (domsrvr) willingness 98
2 connected clients:
    vbop client 141.202.211.34|vbop2 connected 02/19/1999 10:53:16
    vbop client 141.202.211.34|vbop-0x40120000:anthill:0 connected 02/19/1999 10:44:17
```

-t nn

Specifies a timeout interval in seconds. Because pdm_listconn receives information from an unknown number of clients and servers, it terminates when the specified timeout interval elapses after the last message received.

Default: 2

proc1

Specifies one or more slump procnames, separated by spaces. The utility displays client or server information from them, as appropriate.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_logfile--Change stdlog Cutover Size

pdm_logfile lets you change your stdlog.*x* cutover size. The cutover can occur after a specified number of bytes are written. On UNIX, this value is reset with each pdm_init. On Windows, the settings are retained with each pdm_halt and pdm_init.

Syntax

This command has the following format:

```
pdm_logfile [-L|-h]
```

or

```
pdm_logfile [-g -h] [-b bytes]
```

Example

To change your stdlog.*x* files to cutover at 500,000 bytes, issue the following command:

```
pdm_logfile -f STD -b 500000
```

-L

Creates a listing of current cutovers.

-q

Runs pdm_logfile in quiet mode.

-b bytes

Specifies the number of bytes written before cutover occurs.

Restrictions

You can run pdm_load while CA SDM is active, but performance can become very slow. It is best to run pdm_load when no one is using CA SDM.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_task--Set Environment Variables

Applies to UNIX only

The pdm_task utility sets environment variables for commands that do not have wrappers. For example, the pdm_task command must precede the report command on the same command line **only** when the command is invoked through a script or the command line. If you issue the report command from a menu, you do not need to include pdm_task, because all environment variables are set by the application.

Note: Reports cannot be generated from the command line on a client.

Syntax

This command has the following format:

```
pdm_task command
```

command

Specifies a command that does not have a wrapper and, therefore, does not automatically set environment variables. See report--Generate Reports (see page 3912) for more information about issuing pdm_task with a command.

pdm_uconv--Convert Local Charset to UTF-8

The pdm_uconv utility assists you in converting data from previous releases of CA SDM or integrations with other CA Technologies products. The most common usage of this utility is to convert from a local charset to UTF-8 and from UTF-8 to a local charset.

Syntax

This command has the following format:

```
pdm_uconv -h [-V] [-s] [-v] [-l | --list-code
| --default-code | -L] [--cannon] [-x] [--to-callback | -c] [--from-callback | -i] [--
fallback | --no-fallback] [-b] [-f] [--t] [--add-signature] [--remove-signature] [-o]
[file ...]
```

- **-h**
  Opens the help menu.
- **-V**
  Prints the program version.
- **-s**
  Uses silent operation and suppresses messages.
- **-v**
  Displays the progress information of the utility.
- **-l**
  Lists all available encoding. The following are valid:
  - **--list-code**
    Lists only the given encoding.
  - **--default-code**
    Lists only the default encoding.
  - **-L**
    Lists all available transliterators.
- **--cannon**
  Prints the list in cnvrtrs.txt(5) format.
- **-x**
  Runs the progress through transliteration.
- **--to-callback *callback***
  Uses callback on destination encoding.

- **-c**
  Omits invalid characters from the output.

- **--from-callback *callback***
  Uses callback on original encoding.

- **-i**
  Ignores invalid sequences in the input.

- **--callback *callback***
  Uses callback on both encoding.s.

- **-b**
  Specifies the block size.
  Default: 4096

- **--fallback**
  Uses fallback mapping.

- **--no-fallback**
  Does not use fallback mapping.

- **-f**
  Sets theoriginal encoding.

- **-t**
  Sets the destination encoding.

- **--add-signature**
  Adds U+FEFF Unicode signature character (BOM).

- **--remove-signature**
  Removes U+FEFF Unicode signature character (BOM)

- **-o**
  Writes output to file.

Examples:

- **From local charset to UTF-8**
  pdm_uconv -t utf-8 inputfile.txt > outputfile.txt

- **From specific charset (iso-2022-jp) to UTF-8**
  pdm_uconv -f iso-2022-jp -t utf-8 inputfile.txt > outputfile.txt

- **From UTF-8 to local charset**
  pdm_uconv -f utf-8 inputfile.txt > outputfile.txt

- **From UTF-8 to specific charset**
  pdm_uconv -f utf-8 -t iso-2022-jp inputfile.txt > outputfile.txt

The pdm_uconv utility has the following are valid callbacks:

- substitute
- skip
- stop
- escape
- escape-icu
- escape-java
- escape-c
- escape-xml
- escape-xml-hex
- escape-xml-dec
- escape-unicode

pdm_webstat--Return Web Usage Statistics

Use pdm_webstat to return CA SDM session and user statistics for one or more web engine processes. The pdm_webstat command shows cumulative sessions, most sessions at a time, and current active sessions. It can also provide information about the individual users.

Syntax

This command has the following format:

```
pdm_webstat [-r] [-d | -D] [-i] [-t timeout] [-p webengine process] [-n] [-h]
```

-r

Specifies raw text mode, without titles and other formatting. Within the output for a single web engine process there are no line breaks; however, the output for each web engine process always starts on a new line.

Raw text mode displays data in exactly the same order as when you use pdm_webstat without the -r option. Use raw text mode if you want to use the resulting data in a spreadsheet or other type of report. For example, the following syntax:

```
pdm_webstat -r
```

shows the following output:

```
10/11/2005 10:31:49 web:local:0 12 4 2
10/11/2005 10:31:49 web:local:1 9 2 2
```

-d

Specifies detailed output that displays user sessions. The -d option lists all current sessions in the form of *userid@IPaddress*. If a session is displayed without a user ID, it usually means that the session has not logged on yet. For example, the following syntax:

```
pdm_webstat -d
```

shows the following output:

```
PDM_Webstat: Invoked at 10/11/2005 10:27:31
=======================================
Report from Webengine: web:local:0
=======================================
Cumulative sessions so far = 12
Most sessions at a time    = 4
Currently active sessions  = 2
  @192.168.1.16
  usery@192.168.1.20
=======================================
Report from Webengine: web:local:1
=======================================
Cumulative sessions so far = 7
Most sessions at a time    = 2
Currently active sessions  = 2
  SrvcPlus@192.168.1.14
  userx@192.168.1.8
```

-D

Provides more detailed output for debugging purposes. This option should be specified only when specifically requested by CA support. It adds internal information about each session to the detailed output. For example, the following syntax:

```
pdm_webstat -D
```

shows the following output:

```
PDM_Webstat: Invoked at 10/11/2007 10:28:10
=========================================
Report from Webengine: web:local:0
=========================================
Cumulative sessions so far = 12
Most sessions at a time    = 4
Currently active sessions  = 2
  @192.168.1.16            SessionStat   1
  userx@192.168.1.20       SessionStat   5
=========================================
Report from Webengine: web:local:1
=========================================
Cumulative sessions so far = 7
Most sessions at a time    = 2
Currently active sessions  = 2
  SrvcPlus@192.168.1.14    SessionStat   7
  userx@192.168.1.8        SessionStat  13
```

- **-i**
  Specifies an interval in seconds between successive reports. When the -i argument is specified, pdm_webstat runs continuously. The pdm_webstat command outputs its report in the format requested by other arguments, waits for the interval specified, and outputs the report again. With - i, pdm_webstat terminates only when explicitly cancelled, normally with Ctrl+C. For example, the following syntax:

  ```
  pdm_webstat  - i 5  - p web:local  - r
  ```

  shows the following output:

  ```
  09/21/2007 16:27:25 web:local 14 10 6

  09/21/2007 16:27:30 web:local 17 10 9

  09/21/2007 16:27:35 web:local 18 10 10

  09/21/2007 16:27:41 web:local 21 13 13
  ```

-t timeout

Specifies a time-out value in seconds. This parameter causes pdm_webstat to wait for a number of seconds for a response before terminating. The default is 30 seconds.

-p webengine_process

Specifies the process name of the web engine for which you want to report. By default, all web engine processes are reported. The process name (also called slump-name) is the same name that would be viewed in an slstat output and always starts with "web:".

-n

Suppresses the normal log entry for each reported web engine. By default, a log entry summarizing each web engine is created.

> **Note:** By default, if you do not specify any parameters, pdm_webstat displays summary data for all running processes.

pdm_webstat returns zero if the command completes successfully, and a nonzero value if errors occur (for example, a time-out or no active web engine processes).

Example: pdm_webstat Output When No Parameters Are Specified

The following example shows the output of pdm_webstat when it is executed with no parameters:

```
PDM_Webstat: Invoked at 10/11/2007 10:26:42
=========================================
Report from Webengine: web:local:0
=========================================
Cumulative sessions so far = 12
Most sessions at a time    = 4
```

```
Currently active sessions  = 2
=======================================
Report from Webengine: web:local:1
=======================================
Cumulative sessions so far = 7
Most sessions at a time    = 2
Currently active sessions  = 2
```

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_mail Utility--Send Email Information

The pdm_mail utility is used in notifications to send emails by sending email information to the pdm_mail_nxd process. The pdm_mail utility can also be used for commands, but not to both. If no parameters are used, then the default behavior of using the NX_NTF_xxxx variable to pass parameters is in effect.

For email, the utility is invoked as follows:

```
pdm_mail [-i [-s subject] [-e email_address] [-q]] [-p] [-M] [-F] [-T] [-B] [-H] [-N]
[-R] [-h]
```

- **-i**
  Uses STDIN instead of NTF variables. The following parameters are used for STDIN email behavior only:
  - **-e**
    Specifies the email address (for recipient).
  - **-s**
    Specifies the subject for the email.
  - **-q**
    Disables the display prompt for STDIN.
- **-p**
  Utilizes pager logic. This option includes using the pager email address instead of the regular email address. Only the plain text version of the notification is used (no HTML).
- **-M**
  Uses plain text only (no MIME) in body.
- **-F**
  Specifies the From address of the email.
- **-T**
  Specifies the Reply-To address of the email.

- **-B**
  Specifies the body charset. This might be useful for pagers that do not support the UTF-8.
- **-H**
  Specifies the header charset. This might be useful for pagers that do not support the UTF-8.
- **-N**
  Specifies the Delivery Status Notification (DSN) Notify option.
- **-R**
  Specifies the Delivery Status Notification (DSN) Return option.
- **-h**
  Displays help on the utility.

For commands, the utility is invoked as follows:

Command to mail server

```
pdm_mail -c option [parameter]
```

Command to mail eater

```
pdm_mail -x option [parameter]
```

- **check_interval**
  (-x only) Changes the check mail interval to a specified value (in seconds).
- **report_interval**
  Changes the report interval to a specified value (in seconds).
- **report_now**
  Forces a report to the logs. The counter is not reset.
- **send_q**
  (-c only) Sends local mail queue to remote mail server.
- **trace**
  Turns tracing on or off.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

CA SDM PDM Database Commands

This article contains the following topics:

pdm_replace--Replace a Database Table

pdm_replace deletes a table in a CA SDM database and replaces it with a table from a temporary file you specify with the -f option; the data from the input file is the only data that is in that table after running pdm_replace. Back up your table before running pdm_replace.

Note: As part of its processing, pdm_replace first shuts down the daemons (UNIX) or services (Windows).

pdm_replace accepts a text file as input, which is the same file format used by pdm_userload. You can create an input file for pdm_replace using pdm_extract; however, you cannot use the output of pdm_backup as input to pdm_replace.

Important! Be sure to name your input file with a name different from the table name you are attempting to replace. For example, if you are replacing a table named ca_contacts and you name the input file ca_contacts.dat, after you execute the pdm_replace command to point to the input file (ca_contacts.dat), it deletes the file after execution because it has the same name as the table.

Restrictions

- pdm_replace can be run only on the following servers, depending on your CA SDM configuration:
  - Conventional: Primary server
  - Advanced availability: Background server

    Important! Ensure that you have stopped all application and standby servers before running this command on the background server.
- Only the privileged user or root can run pdm_replace.
- Do not run pdm_replace when users are logged in to CA SDM.

Syntax

This command has the following format:

```
pdm_replace [-v] -f filename
```

-v

Specifies verbose mode.

-f *filename*

Specifies an ASCII file with the following format:

```
TABLE table_name
fieldname1 fieldname2 . . . . fieldnameN
{ "value11", "value12", . . . "value1N" }
{ "value21", "value22", . . . "value2N" }
```

```
.
.
.
{ "valueN1", "valueN2", . . . "valueNN" }
```

This format is the same file format used by pdm_userload. You can create an input file for pdm_replace using pdm_extract; however, you cannot use the output of pdm_backup as input to pdm_replace.

pdm_restore--Restore a Database

pdm_restore stops CA SDM and then deletes all records from a CA SDM database and replaces them with records from a file you specify with the -f option. The data from the input file is the only data that will be in the CA SDM database after running pdm_restore.

The input file must be created using pdm_extract or pdm_backup, or otherwise formatted for pdm_restore. pdm_backup can back up non-database data, and pdm_restore can restore this data also. pdm_backup and pdm_restore are not recommended when other backup and restoration tools are available.

Note: As part of its processing, pdm_restore first shuts down the daemons (UNIX) or services (Windows).

Syntax

This command has the following format:

```
pdm_restore [-d] [-g] [-n] [-w] [-v]  - f filename
```

Restrictions

pdm_restore can be run only on a CA SDM server. Only the privileged user or root can run pdm_restore. The following restrictions are applicable if you are using the advanced availability configuration:

If you are restoring the database, run the pdm_restore command only on the background server.

- Ensure that you have stopped all servers (application, background, and standby) before you run the pdm_restore command.

Important! Use pdm_restore only with a full database backup created by pdm_backup, because your current database is deleted and replaced by the backup file. Do not run pdm_restore when users are logged in to CA SDM.

- **-d**
  Specifies that only database data is restored.

- **-g**
  Specifies that only non-database data be restored. Only windows (forms) and other non-database data are restored.

- **-n**
  Specifies that NX.env is restored if restoring non-database data. By default, NX.env is not restored. We recommend that the NX.env file not be restored unless the restore is to the same server the backup came from. Restoring an incorrect NX.env can affect unintended databases.

- **-w**
  Specifies that web.cfg is restored if restoring non-database data. By default, web.cfg is not restored.

- **-v**
  Specifies verbose mode.

-f *filename*

Specifies an input file that contains a full backup created by pdm_backup.

pdm_load--Add, Update, and Delete Database Records

Important! Using pdm_load can be destructive so always back up your database before you perform a pdm_load, and use pdm_userload unless instructed to use pdm_load.

pdm_load updates a CA SDM database using an input file you specify, up to a maximum of 112 attributes.

Whenever you upload tickets (such as requests or issues), your ticket number should include a unique prefix or suffix in its string. CA SDM views this number as a string of characters not as a sequential number, and thus cannot guarantee that it will assign a unique number to the uploaded tickets. As long as you assign a unique prefix or suffix using awk or another text processor, you can upload tickets without CA SDM writing over previously assigned numbers.

Syntax

This command has the following format:

```
pdm_load [-c] [-h] [-m] [-r] [-u] [-v]  - f filename
```

The input file entries follow this format:

```
TABLE table_name
fieldname1 fieldname2 . . . . fieldnameN
{ "value11", "value12", . . . "value1N" }
{ "value21", "value22", . . . "value2N" }
.
.
.
```

```
{ "valueN1", "valueN2", . . . "valueNN" }
```

table_name is the name of the table to be loaded, as listed in the CA SDM database schema file, which is located in $NX_ROOT/site/sch/schema.sch (UNIX) or *installation-directory*\site\sch\schema.sch (Windows). $NX_ROOT or *installation-directory* is the directory where you installed CA SDM.

-f *filename*

Specifies an input ASCII file.

-c

Checks the input file against the database and reports on the updates that would be made, but does not make the updates.

-m

Specifies mass update. Specify when you are using pdm_load to add or delete a large number of records. This option suppresses all client notifications of updates and sends a cache refresh message for a table when pdm_load finishes processing the table.

-r

Removes database records that match input records.

Important! Make a backup copy of the database before running pdm_load with this option. After old database records are removed, you must restore the CA SDM database with this backup copy if you want to recover any deleted records.

-u

Updates existing records, but does not insert new records into the database.

CA SDM PDM Daemon Commands

pdm_halt--Terminate Daemons or Stop Services

pdm_halt cleanly terminates all CA SDM daemons (UNIX) or the System Server Service (Windows) on the system from which pdm_halt is executed. The pdm_halt utility usually takes about 30 seconds to complete. If it hangs for more than two minutes, press Ctrl+C to stop pdm_halt, and try again.

Syntax

This command has the following format:

```
pdm_halt [-w] [-a] [time]
```

- **-w**
  Waits for the daemons to stop.

- **-a**
  Stops all proctors defined in the pdm_startup file.

- **[time]**
  Specifies the number of seconds to wait until the command executes.

Restrictions

pdm_halt can be run on a CA SDM server or a CA SDM UNIX client. You must be the privileged user to run pdm_halt.

pdm_init--Start Daemons

Applies to UNIX only

pdm_init starts all CA SDM automatic processes on the system from which pdm_init is executed. These automatic processes are called *daemons* and run continually in the background while you work. Not all of the daemons are started; some are applicable only to certain operating systems.

Note: Use pdm_d_refresh to start daemons that failed to start the first time after remedying the problem that caused them not to start initially. In most cases you do not need to terminate the daemons running to start ones that initially failed.

Syntax

```
pdm_init
```

Restrictions

pdm_init can be run on a CA SDM server or a CA SDM UNIX client. You must be the privileged user to run pdm_init.

pdm_d_refresh--Start Failed Daemons

The pdm_d_refresh command line utility is used primarily for remote daemon configurations. It tells the daemon manager to try to start daemons that have failed to start ten times and that the daemon manager has flagged as "not runnable.". Running this utility flags all daemons as able to run and resets the restart counter. Then, the daemon manager tries to start all stopped daemons.

Syntax

This command has the following format:

```
pdm_d_refresh
```

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_status--Show Status of Daemons or Processes

pdm_status shows the status of all CA SDM daemons (UNIX) or processes (Windows) on the system from which the command is executed.

Output is displayed in this format:

```
DAEMON                          STATUS      HOST      PID   SLUMP CONNECT TIME
-------------------------------------------------------------------------------
Agent anthill                   Running     anthill   455   Tue Feb 17 17:55:12
Ddict_rd             (ddictrd) Completed   anthill
Data Dictionary   (ddictbuild) Completed   anthill
...
User Validation      (boplgin) Running     anthill   456   Tue Feb 17 17:55:21
```

Syntax

This command has the following format:

```
pdm_status
```

uniconv--Start UNIX CA NSM Event Converter Daemon

Applies to UNIX only

When CA SDM is integrated with CA NSM, you can use uniconv to send generic event data to filter daemons in CA SDM. uniconv is used in a message action in CA NSM Event Management.

Syntax

This command has the following format:

```
uniconv  - h &opnode  - e &'text' [-n &
nodeid] [-u &userid] [-d &datem] [-t &'
time']
```

Restrictions

uniconv must be run from $NX_ROOT/bin on UNIX. Your site must be integrated with CA NSM to use this utility.

- **-h &opnode**
  Specifies the node name of the machine on which you are executing uniconv (required).
- **-e &'text'**
  Specifies the full text of the message (required).
- **-n &nodeid**
  Specifies the node name from which the message originated (required).

- **-u &userid**
  Specifies the login ID of the person who originated the message.

- **-d &datem**
  Specifies the system date in *mm*/*dd*/*yy* format.

- **-t &'time'**
  Specifies the system time.

CA SDM PDM Server Commands

pdm_proctor_init--Start Proctor on Secondary Servers

Applies to UNIX only

Use pdm_proctor_init to start the proctor on secondary servers. All secondary servers should be started prior to starting the daemons from the primary server. After all daemons have been stopped from the primary server, use pdm_halt on the secondary server to stop this proctor.

Note: Do not use pdm_proctor_init on the primary server.

Syntax

This command has the following format:

```
pdm_proctor_init
```

pdm_server_control Utility--Identify Servers

The pdm_server_utility commands identify the server as background or standby in an advance availability configuration.

Execute the following command from the command prompt:

```
pdm_server_control -h | -b | -q interval [-s server_name] | -t | -c [-server_name]
```

- **-h**
  Displays the help page.

- **-b**
  Notifies a local standby server to become the background server. The standby server must be running. If the server is not running, it is started but no failover is performed. To start a failover, run the command again.

- **-q interval [-s server_name]**
  Notifies a local or remote application server to quiesce in a specified time interval. This interval is the number of seconds before the server shutdowns. When using this option without a server_name, the local server is notified to quiesce. This option cannot be used for a background or a standby server.

- **-t**
  Displays the type of this CA SDM advance availability Server.

- **-c [-s server_name]**
  Notifies a local or remote application server to cancel the previous quiesce the request.

pdm_rest_util--Manage the CA SDM RESTful Web Services Application

CA SDM uses this utility automatically. You can run it manually if you require the utility, such as after an unexpected error occurs. This REST web services utility deploys the REST services web application. This utility deploys the REST application to the dedicated REST Tomcat instance. A batch file in the NX_ROOT\bin directory (pdm_rest_util.bat for Windows or ./pdm_rest_util.sh for UNIX) lets you invoke the utility.

This command has the following formats and options:

```
pdm_rest_util  - h | [-deploy] | [-undeploy]
```

- **-h**
  Prints command-line help.

- **-deploy**
  Generates, compiles, and deploys all Majic factories.

- **-undeploy**
  Undeploys REST Web Services on the local server.

Undeploy the REST Web Services Application

You can undeploy the REST Web Services application with the pdm_rest_util utility. For example, you want to perform CA SDM maintenance and prefer to undeploy REST during this operation.

Follow these steps:

1. Open a command prompt.
2. Execute the following command:

   ```
   pdm_rest_util -undeploy
   ```

   The REST Web Services application is undeployed.

Important! If you undeploy the REST application with this utility, REST can redeploy automatically when CA SDM restarts. We recommend that you use the CA SDM configuration to disable REST indefinitely.

pdm_k_reindex -- Knowledge Re-Index Utility

The Knowledge reindex utility, pdm_k_reindex.exe, is located under the Knowledge Management installation directory.

Note: Reindexing the documents in the knowledge base can be a time-consuming operation, depending upon the size of your database. We recommend that you run the Knowledge Reindex utility after all the changes have been added. For advanced availability configuration, you cannot execute the knowledge re-index utility during failover.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use pdm_task to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

Follow these steps:

1. Open the command prompt.
2. Enter the following command at the command prompt to run the knowledge reindex:

For example:

```
pdm_k_reindex
```

The following options are available with this command.

- **-D**
  Defines the debug mode, such as printing to the command window.
- **-v**
  Defines the verbose mode, such as printing to the stdlog file.
- **-i**
  Does not create table indexes in the reindex table after reindexing.

Note: Parameters with a dash as a prefix, such as " - D", must precede other parameters that do not have this prefix.

The other option is as follow:

- ***File*:reindex.txt**
  Documents are reindexed to the specified file.

- **+i**
  Creates the indexes of the reindexed table only, which is the search table after reindexing. The old indexes are dropped before reindexing.

- **+t**
  Switches the names of search and reindex tables only.

> **Note:** A “+” prefix denotes only this parameter applies.

- **sdtout**
  Defines the frequency of statistic appearing in the command window. By default the knowledge reindex utility provides statistics into the command window for every 1000 documents processed. However, sometimes statistics are required to be provided more often. Use the following parameter:

  ```
  pdm_k_reindex -i sdtout:10
  ```

  In this case, statistics display in the command window for every ten documents.

The documents are reindexed in the knowledge base.

When to Use pdm_k_reindex

Run the pdm_k_reindex utility when one or more of the following search settings were changed:

- Noise words
- Synonyms
- Special terms
- Language
- Remove Similar Words
- Remove Noise Words
- Valid Character Range
- Recognize Special Terms

An appropriate message appears on Knowledge node of Administration tab when a change occurs.

Re-Index Tracking

While the re-index is running, you can view the status of the process in the Re-Index Tracking section in the lower half of the page. Each field is described as follows:

- **Document #**
  Specifies the number of documents already processed.

- **Average Size (Words)**
  Specifies the size of the current documents, calculated by the number of words minus the number of noise words.

- **Rate (Docs/Sec)**
  Specifies the number of documents processed, per second.

- **Time from Start**
  Indicates the duration of the re-index process since start.

- **Time Remaining**
  Specifies the estimated amount of time remaining for the process, based on the current rate and the remaining number of documents.

- **Failures #**
  Represents the number of failed documents (maximum=100). When the maximum number of failures is reached, the administrator is prompted to either continue or cancel the process.

> **Note:** If changes have been made to Noise Words, Special Terms, Synonyms or Parse Settings and you do not re-index, you are prompted the next time you access the Knowledge node of the Administration tab. Changes will take effect only after the Knowledge Re-index utility is run.

Import and Re-Indexing

When pdm_kit.exe is invoked from the command line, the pdm_kit utility imports the documents into the database. After pdm_kit is completed, assuming document indexing or re-indexing has not been disabled using the command-line options, the re-index utility (pdm_k_reindex.exe) is automatically invoked. The status and output of the re-indexing operation is automatically written to the "EBR_REINDEX.LOG" in the $NX_ROOT\log directory.

Index and De-Index Queue Settings for Batch and Instant Processing

Indexing and De-Indexing both run a batch process to include a predefined number of documents at one run. These batch processes are used for performance optimization. If more documents are included in the batch, system performance increases.

The number of documents you can process is limited; the limit depends on the size of the documents and the linked attachments. The document size is calculated based on the pure text and its attachments. Imagine and format elements are not calculated.

> **Note:** You can limit the size of attachments by navigating to Attachments Library, Repositories on the Administration tab and editing the repository to set the File Limit Size (KB).

The recommended batch maximum size is between 2-12 MB (per the EBR_MAX_INDEX_BATCH_SIZE parameter of the NX.env file and the average document size).

- If the average size of your document (including attachments) is approximately 0.1 MB, keep the default setting in NX.env:

```
@EBR_MAX_INDEX_BATCH_SIZE=128

@NX_EBR_INDEX_QUEUE_TIMEOUT=10

@NX_EBR_REINDEX_QUEUE_TIMEOUT=1

@NX_EBR_INDEX_QUEUE_ONLINE=Yes

@NX_EBR_NON_KD_INDEX_QUEUE_ONLINE=Yes
```

  This setting means that one batch processes 128 documents, that batch executions have ten second intervals, and when in reindex, the wait interval between two batches is one second.

- If the average size of your document (including attachments) is approximately 0.5 MB, keep the default setting in NX.env

```
@EBR_MAX_INDEX_BATCH_SIZE=25

@NX_EBR_INDEX_QUEUE_TIMEOUT=10

@NX_EBR_REINDEX_QUEUE_TIMEOUT=10

@NX_EBR_INDEX_QUEUE_ONLINE=No

@NX_EBR_NON_KD_INDEX_QUEUE_ONLINE=No
```

  This setting means that one batch processes 25 documents, that batch executions have ten second intervals, and when in reindex, the wait interval between two batches is ten seconds.

PDM-Discovered Asset Commands

pdm_discupd -- Discovered Asset Update

Batch update of non-CA SDM Discovered Assets. Use this utility to update assets that were imported by the pdm_discimp command.

Syntax

```
pdm_discupd [-t] [-v] [-d domsrvr]
```

Where

- **t**
  Test
- **v**
  Verbose/diagnostic mode.
- **d**
  Object manager (domsrvr) to use for processing.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_discimp -- Discovered Asset Import

Batch registration of non-CA SDM Discovered Assets. Use this to search the MDB for assets that were registered by other software products and register them as CA SDM assets, so they can be used in CA SDM.

Logic is similar to Discovered Assets dialog that can be launched from Asset Search/List web form. That is an interactive and batch process.

This program will query the ca_logical_asset, ca_asset, and ca_logical_asset_property tables, using various parameters, and attempt to register new CA SDM Assets from the discovered values.

Syntax

```
pdm_discimp [-l label] [-s serial number] [-t asset tag] [-n hostname] [-d dns name]
[-m mac address] [-c asset class] [-v] [-r] [-o object manager]
```

Asset selection criteria (use % for wild card):

- **l**
  Match this asset label.
- **s**
  Match this serial number.
- **t**
  Match this asset tag.
- **n**
  Match this hostname.

Asset property selection criteria (use % for wild card):

- **d**
  Match this dns name.
- **m**
  Match this mac address.

Other options:

- **c**
  Asset class to assign when registering new owned assets defaults to Discovered Hardware.
- **v**
  Verbose/diagnostic mode.

- **r**
  Register assets, otherwise runs in simulate mode.
- **h**
  Displays this information.
- **o**
  Object manager (domsrvr) to use for processing.

Note: If processing results in a blank Asset Label, the value found for the host name or DNS Name will be used as the Asset Label. Assets must have at least a Label and Asset Class to be registered for use in CA SDM.

Because of the structure of the MDB and CA SDM architecture limitations, two queries are performed to select the appropriate records to process. It is important to understand this as it could affect performance. The first query retrieves the rows from a join between the ca_logical_asset and ca_asset tables that match label, serial number, tag and hostname. Then for each resulting row, a query is performed against ca_logical_asset_property to match dns_name and mac_address. The asset from the first query is chosen for registration if the second query results in rows being returned.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

pdm_text_cmd--Text API Command Line Interface

Use the pdm_text_cmd command for the Text API, which you can use to create and update various objects such as requests, change orders, issues, assets, and contacts.

Important! You cannot use a single or double quote as the parameter of the pdm_text_nxd or bop_cmd commands.

Syntax

This command has the following format:

```
pdm_text_cmd  - t table {-u from_userid  - p from_persid} [-o operation] [-f input
file] [-T timeout] [-h]
```

-t *table*

(Required) Specifies the table to process. The *table* name can be one of the following values (not case sensitive):

- Asset
- Contact
- Change
- Issue
- Request

Note: See the [OPTIONS] section of the text_api.cfg file for a complete list of valid table names.

-u *from_userid* **| -p** *from_persid*

(One option required) Identifies the contact for this operation:

- **-u *from_userid***
  Identifies the contact using the User ID value.
- **-p *from_persid***
  Identifies the contact using the unique object identifier for the contact record. *from_persid* must be of the form **cnt:***xxxx. xxxx* is the persistent ID of the object.

Note: The value that you specify with this option is appended to the end of the input for the pdm_text_cmd command using the appropriate keyword, %FROM_USERID or % FROM_PERSID.

-o *operation*

Specifies the operation to perform. The *operation* must be one of the following values (not case sensitive):

- NEW -- Creates an object. This value is the default if no operation is specified.
- UPDATE | UPD -- Creates an object if not found or updates an existing object if found.
- UPDATE_ONLY | UPDO -- Updates object if found; otherwise, does nothing.

Both UPDATE and UPDATE_ONLY require the %SEARCH keyword in the command input. You can perform only one operation transaction with each invocation of pdm_text_cmd.

-f *input_file*

Specifies the full path of the file to process, which is a text file containing valid Text API commands. If you omit this parameter, commands are used from STDIN. The Text API uses the following basic format for input:

```
%keyword=value
```

You can issue multiple commands within the input by separating the command request by at least five percent signs (%%%%%).

Note: For more information about valid keywords and about formatting input to the Text API, see the file text_api.cfg.

-T *timeout*

Specifies the number of seconds to wait for a response from the server before timing out. The default is 30 seconds.

Note: pdm_text_cmd shows the text-based replies received back from the Text API, which include success or error messages, and the original text sent using the API for processing. pdm_text_cmd returns zero if the command completes successfully without warnings or errors or one if the command completes successfully, but with warnings. Any other return value indicates that an error occurred.

Important! On UNIX, the LIBPATH must be set before running several CA SDM utilities. Use *pdm_task* to set the LIBPATH before running a utility. For example, input "pdm_task pdm_clean_attachments ...".

Note: When passing the parameters from command prompt, use Ctrl+Z in Windows and Ctrl+D in POSIX.

Input Examples

pdm_text_cmd is the command line interface for the Text API that you can use to create and update various objects such as requests, change orders, issues, assets, and contacts.

Example: Use an Input File to Create an Issue

The following example demonstrates how to use a pdm_text_cmd input file to create an issue:

```
%DESCRIPTION=This is my Test.
%PRIORITY=3
```

To process this file, assuming its full path is c:\input.txt, issue the following command:

```
pdm_text_cmd -t Issue  - u user01 -f c:\input.txt
```

Example: Use an Input File to Update an Issue

The following example demonstrates an input file to update issue 123 to a priority of 2:

```
%SEARCH=ISSUE_ID
%ISSUE_ID=123
%PRIORITY=2
```

To process this file, assuming its full path is c:\update.txt, issue the following command:

```
pdm_text_cmd -t Issue -o UPDATE_ONLY  - u user01 -f c:\update.txt
```

Example: Use an Input File to Create Multiple Requests

The following example demonstrates creating multiple requests with one input file. This command can be helpful creating test data on a test system.

```
%DESCRIPTION=This is Test 1.
%PRIORITY=3
%%%%%
%DESCRIPTION=This is Test 2.
%PRIORITY=2
%%%%%
%DESCRIPTION=This is Test 3.
%PRIORITY=None
```

To process this file, assuming its full path is c:\testdata.txt, issue the following command:

```
pdm_text_cmd -t Request  - u user01-f c:\testdata.txt
```

pdm_log4j_config Utility--Modify the log4j properties File

The pdm_log4j_config.pl utility lets you configure the log4j properties file of CA SDM, web components, PDM_RPC, Support Automation, Rest, and CMDB Visualizer. Execute the utility batch script that is based on your environment. For Windows, execute pdm_log4j_config from the command line. For UNIX, execute the pdm_log4j_config.sh file.

This command has the following format:

```
pdm_log4j_config  - f <component> -d
pdm_log4j_config -h
pdm_log4j_config  - f <component>  [-a | -n <name>] [-l <log level>] [I <max # of log
files>] [-s <max size of log files>] [-t <log level threshold>]
```

- **-f**
  Specifies the log4j configuration of CA SDM or the component of CA SDM that you want to change. Enter one of the following values:
  SDM_WEB, SDM_RPC, REST, SA, or Viz.
  Note: Use the mandatory option along with the other options.

- **-d**
  Displays the current log4j.properties configuration.

- **-h**
  Displays help for the utility.

- **-a**
  Completes all changes to log4j.properties globally.

- **-n**
  Specifies that you only want to modify a specific class or package name.
  Specify a specific class name, such as bop_logging, or a complete package name, such as com.ca.ServicePlus.

- **-l**
  Specifies the log level that you want to set.

  Note: For the -l, -l, -s, and -t parameters, specify the -a or -n option.

- **-i**
  Specifies the max file number index that you want to set.
  -s
  Specifies the max file size that you want to set.

  Important! Change the appender in the log4j.properties file of Visualizer to Rolling File Appender before you execute the command with this parameter. If you do not change the appender, MaxFileSize generates logs in the same file.

- **-t**
  Specifies the log level threshold.

Utility Usage Examples

The following list provides examples of using the pdm_log4j_config utility:

- Modify the log verbosity level for all loggers configured in the properties file by using the -l and -a variables.
  For example, set all of the loggers configured in Support Automation to a level of DEBUG:

```
pdm_log4j_config  - f SA -a -l DEBUG
```

- Modify the log verbosity level for a specific logger class or package name in the CA SDM log4j properties file by using the -l and -n variables.
  For example, set the logger for the pdm_rpc package to DEBUG using one of the following code samples:

```
pdm_log4j_config  - f SDM_RPC -n pdm_rpc -l DEBUG

pdm_log4j_config  - f SDM_RPC -n com.ca.ServicePlus.pdm_rpc -l DEBUG
```

- Modify the maximum number of log files to create for all the appenders (MaxBackupIndex property) by using the -i and -a variables in the log4j properties file of REST.
  For example, set the maximum number of files for all appenders to 9.

```
pdm_log4j_config  - f REST -a -i 9
```

- Modify the maximum number of log files configured in the CA SDM log4j properties file to create for an appender for a specific class or set of classes (MaxBackupIndex property) by using the -i and -n variables.
  For example, set the maximum number of files for bop_logging to 7.

```
pdm_log4j_config  - f SDM_WEB -n bop_logging -i 7
```

- Modify the maximum size of each log file configured in the REST log4j properties file to create for any appender (MaxFileSize property) by using the -s and -a variables.
  For example, set the maximum size of files for all appenders to 9 MB.

```
pdm_log4j_config  - f REST -a -s 9MB
```

- Modify the maximum size of each log file configured in the CA SDM log4j properties file to create for an appender for a specific class or set of classes (MaxFileSize property) by using the -s and -n variables.
  For example, set the maximum size of files for bop_logging to 7 MB.

```
pdm_log4j_config  - f SDM_WEB -n bop_logging -s 7MB
```

- Modify the log level threshold for all the appenders configured in the Support Automation log4j properties file (Threshold property) by using the -t and -a variables.
  For example, set the log level threshold to DEBUG.

```
pdm_log4j_config  - f SA -a -t DEBUG
```

> **Note:** The -t parameter log level threshold overrides the -l parameter log level. If you modify the log level and the threshold level, the DEBUG logs from the servlet do not appear in the file.

- Modify the log level threshold for an appender for a specific class or set of classes (Threshold property) configured in the CA SDM log4j properties file by using the -t and -n variables.
  For example, set the log level threshold to WARN.

```
pdm_log4j_config  - f SDM_WEB -n bop_logging -t WARN
```

- Execute the following command to view the current logger and appender configuration of the REST log4j properties file:

```
pdm_log4j_config  - f REST -d
```

Important! Use -l, -i, -s, and -t variables together with one of the -a or -n options, Do not use both the options. The -f option is mandatory. The -h and -d options are mutually exclusive to any other option.

Modify the Log File Refresh Interval Manually

Administrators can modify how often CA SDM monitors the log4j.properties file for changes. By default, the refresh interval is set to 60 seconds. CA SDM components including SDM Servlets, PDM_RPC, Support Automation, CMDB Visualizer, and REST use log4j for logging.

Follow these steps:

1. Open the following directory on the CA SDM server:

   NX_ROOT

2. Open the NX.env file for editing.
3. Modify the NX_LOG4J_REFRESH_INTERVAL variable with a value in milliseconds.

   Note: If you enter a negative or nonnumeric value, the value defaults to 60 seconds.

4. Save the NX.env file.

Modify the jsrvr.log Appender

By default, servlets such as PDMContextListener, pdmweb, UploadServlet, and pdm_report log INFO level messages to the jsrvr.log file. You change the threshold level of the jsrvr.log appender to log any messages under the INFO level.

Follow these steps:

1. Modify the level in the log4j.properties file to the following threshold:

   ```
   log4j.appender.jsrvrlog.Threshold=debug
   ```

2. Modify the log level of UploadServlet:

   ```
   log4j.logger.com.ca.ServicePlus.uploadservlet=debug, jsrvrlog
   ```

3. Open the jsrvr.log file.

4. Confirm that the DEBUG log messages of UploadServlet appear.

Note: If you modify the log level without modifying the threshold level, the DEBUG logs from the servlet do not appear in the file. Not all servlets have explicit loggers attached. For example, the log4j.properties file does include pdmweb, BOServlet, pdm_export, pdm_report, and pdm_cache, which are part of the pdmweb servlet. To see DEBUG logs from these servlets, modify the pdmweb log level.

Modify the jstd.log Appender

All logs from nonwebapp applications dump into the jstd.log file separately. You can display logs for any of these applications, such as pdm_rpc by changing the log level of that specific application.

Follow these steps:

1. Modify the following log level:

```
log4j.logger.com.ca.ServicePlus.pdm_rpc=debug
```

2. Open log4j.properties and confirm that the log entries appear.

CA SDM Report Command

This article contains the following topics:

rpt_srv--Generate Reports

Valid for Windows only

The report program lets you generate a report from the command line on the server. To issue the report command at the command line or in a script, you must include pdm_task. The pdm_task command sets up environment variables for commands that do not have a wrapper. Enter pdm_task with the report command on the same command line only when the report is invoked through a script or the command line. If you issue the report command from a menu, you do not need to include pdm_task, because all environment variables are set by the application.

Syntax

This command has the following format:

```
rpt_srv  - m [-h] [-e] [-f] [-F ffstring] [-p pagelength] [-C] [-B] filename [
command line arguments]
```

- **-m**
  Signifies that the report is manually being run from the command line.

- **-e**
  Echoes compiled script (for debugging purposes).

- **-f**
  Uses form feeds between pages.

- **-F *ffstring***
  Sets the optional form-feed string.

- **-p *pagelength***
  Sets the page length. The default page length is 66.

- **-C**
  Changes encoding from UTF-8 to another charset. The default output is UTF-8.
  Example: To convert the output to JIS, you would run "-C iso-2022-jp"
  Example: To encode to the operating system's native charset, use "DEFAULT" or "NATIVE".

- **-B**
  Suppresses the Byte Order Mark if the variable NX_ADD_UTF8_BYTE_ORDER_MARK is set.
  The NX_ADD_UTF8_BYTE_ORDER_MARK option is a signature into a file. It allows editors that support UTF-8 to maintain the UTF-8 integrity of the file.

  

  Note: This is only needed for non-ASCII data. If this is not installed, the default behavior omits the Byte Order Mark (BOM). If installed, set it to "1" or "Yes".

- ***filename***
  Specifies the report template. If you are not running the report command from the directory in which the template file is located, include the complete file path name. The command sends the output as standard output (stdout).

- **command line arguments**
  Specifies parameters received by the report template. If the report is designed to accept command line arguments, you must enter a command line argument for each parameter in the report template. If the argument is empty, enter the null string.
  For example, the following command supplies the command line arguments Smith, Jane, and L. The report template requires these three parameters to generate the Affected Contacts Report. For example, enter the following command:

  ```
  rpt_srv  - m c:\reports\affected.rpt Smith Jane L
  ```

  In the next example, Jane Smith does not have a middle initial:

  ```
  rpt_srv  - m c:\reports\affected.rpt Smith Jane "
  ```

report--Generate Reports

Applies to UNIX only

The report program lets you generate a report from the command line on the server. To issue the report command at the command line or in a script, you must include pdm_task. The pdm_task command sets up environment variables for commands that do not have a wrapper. Enter pdm_task with the report command on the same command line *only* when the report is invoked through a script or the command line. If you issue the report command from a menu, you do not need to include pdm_task, because all environment variables are set by the application.

Syntax

This command has the following format:

```
pdm_task report [-h] [-e] [-f] [-F ffstring] [-p pagelength] filename [ command line arguments]
```

-e

Echoes compiled script (for debugging purposes).

-f

Uses form feeds between pages.

-F ffstring

Sets the optional form-feed string.

-p pagelength

Sets the page length. The default page length is 66.

filename

The report template. If you are not running the report command from the directory in which the template file is located, include the complete file path name. The command sends the output as standard output (stdout).

command line arguments

Specifies parameters received by the report template. If the report is designed to accept command line arguments, you must enter a command line argument for each parameter in the report template. If the argument is empty, enter the null string.

For example, the following command supplies the command line arguments Smith, Jane, and L. The report template requires these three parameters to generate the Affected Contacts Report.

For example, enter:

```
pdm_task report /opt/CAisd/samples/sdk/reports/affected.rpt
```

In the next example, Jane Smith does not have a middle initial:

```
pdm_task report /opt/CAisd/samples/sdk/reports/affected.rpt Smith Jane "
```

CA SDM Form Groups

This article contains the following topics:

Customer Forms Group

The following web forms are included in the Customer forms groups:

- about.htmpl

Contents of the Samples Directory

This article contains the following topics:

You can modify several files in the $NX_ROOT/samples directory for use with various external interfaces. These files are grouped into various subdirectories. None of the files in the samples directory are executable as originally shipped.

How to Modify the Message Catalog

To modify the message catalog, complete the following steps:

1. Refer to the format of pdm.xml that is located in $nx_root\bin.
2. Create a customized copy of pdm.xml and place it in the $nx_root\msg_catalog directory.
3. Add, modify, or add and modify messages in the XML message files from the previous step.

call_mgt

Contains samples for customization in request management.

- **gencr.frg**
  This file can be used in conjunction with bop_cmd to create requests from a command line. All notifications and activity log entries will occur, however no Request Form will display on the server when created. You must use the -u parameter to execute gencr.frg with the bob_cmd utility. Be sure to read the gencr_readme.txt file to learn the syntax, and how to modify it if necessary. The file should be placed in $NX_ROOT/site/mods/interp, if the directory does not exist, you should create it. Example: bop_cmd -d domsrvr -u nsm -f gencr.frg "gencr('My Description')"

- **iss_site.mod**
  This file can be used to enable activity logging of site-adapted fields in issues. This file should be placed in $NX_ROOT/site/mods/majic after it has been changed for the site-adapted fields.

- **cr_site.mod**
  This file can be used to enable activity logging of site-adapted fields in requests. This file should be placed in $NX_ROOT/site/mods/majic after it has been changed for the site-adapted fields.

- **chg_site.mod**
  This file can be used to enable activity logging of site-adapted fields in change orders. This file should be placed in $NX_ROOT/site/mods/majic after it has been changed for the site-adapted fields.

- **gencr_readme.txt**
  This file contains instructions on how to use the gencr.frg file.

- **chg_site.spl**
  This file may be modified to change the mapping of attributes when creating a change order from a request. This file should be placed in $NX_ROOT/site/mods/majic after the appropriate changes have been made.

- **audlog_site.mod**
  This file can be used to enable audit logging of site-adapted fields. This file should be placed in $NX_ROOT/site/mods/majic after it has been changed for the site-adapted fields.

- **Notify_add.spl (UNIX only)**
  This file can be used to add the request's log agent, assignee and group to the request notification list. This file should be placed in $NX_ROOT/site/mods/majic.

- **Notify_replace.spl (UNIX only)**
  This file can be used to add the request's log agent, assignee and group to the request notification list when they are changed. This file should be placed in $NX_ROOT/site/mods/majic.

data

This directory contains files depicting the Logical Data Model for most database tables in CA SDM. This data directory also includes sample data for Knowledge Management.

macro_lock

This file contains a spel fragment that can be run using a bop_cmd to turn off locks that are being held by macros.

multi-tenancy

This directory contains sample files for administering multi-tenancy.

pdmconf

- **web.xml.tpl**
- **pdm_startup.tpl**
- **pdm_edit_usage_notes.htm**
- **alias_install.bat**
- **web.cfg.tpl**
- **pdm_startup.i.tpl**

- **pdm_edit.pl**

- **README_files**
  All of these files are used by pdm_edit.pl to create startup files for a primary server and secondary servers that are configured to run a variety of daemons.

reporting

This directory contains documentation and samples for configuring offline reporting.

sdk

This directory contains a sample file for making CA SDM SOAP web service calls.

TableOfContents.doc further explains what is available, found in the following directory:

$NX_ROOT\samples\sdk\websvc

PKI_loginServiceManaged_JAVA_steps.doc and PKI_loginServiceManaged_PERL_steps.doc explain how to configure ServiceDesk for digital certificate logins in the following directory:

$NX_ROOT\samples\sdk\websvc\java\test1_pki

The following lists PERL and JAVA samples, examples, and locations:

- PERL samples
  $NX_ROOT\samples\sdk\websvc\perl\test1_pki
  Example: loginServiceManaged() web service call

- JAVA samples
  $NX_ROOT\samples\sdk\websvc\java\test1_pki
  Example: loginServiceManaged() and getBopsid() web service call
  $NX_ROOT\samples\sdk\websvc\java\test2_basic
  Example: Combined CreateRequest() and CreateChangeOrder() web service call

views

This directory contains database scripts uses for migration, multi-tenancy administration, and other processes.

Load Supplemental Content - sd_content.dat

Supplemental content for CA SDM is available in sd_content.dat. This data file contains Change Category and Root Cause records. To load the data from a command window, go to $NX_ROOT/data and run the following command:

```
pdm_load  - f sd_content.dat
```

Schema Files Syntax

This article contains the following topics:

The CA SDM database schema is defined in multiple .sch files in the $NX_ROOT/site (UNIX) or *installation-directory*/site (Windows) directory. During configuration, these .sch files along with any customized .sch files you may create are merged together into a single file called $NX_ROOT/site /ddict.sch (UNIX) or *installation-directory*/site/ddict.sch (Windows).

Review Using the Web Screen Painter (see page 1898) prior to making any changes to these files.

Note: Do not modify any .sch files in the $NX_ROOT/site (UNIX) or *installation-directory* /site (Windows) directory. Any changes you make to these files will be lost when upgrading to a new release or when certain patches are applied. If you want to make schema changes, you must create a file in the $NX_ROOT/site/mods (UNIX) or *installation-directory* /site/mods (Windows) directory with the file suffix .sch. Then add your changes to your . sch file, and your changes will then be merged with delivered schema during configuration. This is the only way to preserve your modifications when you upgrade to a new release.

TABLE Statement

Defines the logical tables in the CA SDM database schema and the logical columns (fields) in those tables. These logical tables and columns are then mapped to the physical tables and columns used by your database management system in a mapping statement that follows the TABLE statement.

Note: If you define a new table, you must define a mapping statement for that table. The Mapping Statement (see page 3950) is illustrated at the end of this chapter, followed by an example that combines the TABLE, TABLE_INFO, and mapping statements.

Syntax

TABLE *table_name* {*field value_type field_attributes*; [...]}

Arguments

- **TABLE**
  Introduces the TABLE statement. Must be uppercase. You must have one TABLE statement for each logical table in the schema.

- ***table_name***
  The name of the database table, for example, Call_Req. If adding a database table, you can specify any name beginning with a lowercase letter z. (This avoids possible conflict with existing and future CA SDM table names.) If changing an existing table, find the table in one of the .sch files and use the same name.

- ***field***
  The name of a logical column in the table, for example, id or desc. You must identify each column by name. If adding a table or adding a column to an existing table, you can specify any name beginning with a lowercase letter z; however, field names must not end with the characters "_f." (This avoids possible conflict with existing and future CA SDM column names.) If changing an existing column, find the column in one of the .sch files and use the same name.

- ***value_type***
  The field's data type. Valid values are:

Value	Description
STRING *nn*	A string that is *nn* characters long.
INTEGER	A 32-bit number.
LOCAL_TIME	The number of seconds since January 1, 1970. CA SDM automatically reformats this data type to the designated date format, for example: *mm*/*dd*/*yy hh*:*mm*:*ss*.
DURATION	A period of time, measured in seconds.
REAL	A floating point number
UUID	A 16 byte binary value.

field_attributes

A description of the field. Valid values are:

Value	Description
KEY	Identifies this field as the primary key to be used for identifying records to be updated with pdm_load. This is used if the default primary key, id, is not specified. Must be specified if the field is the primary key in the table.
NOT_NULL	Indicates that the field must contain a value. Must be specified if the field is the primary key in the table. Optional if the field is not the primary key.
REF other_table_name	Indicates that the field references another table. Optional whether the field is the primary key or not.
S_KEY	Optionally identifies this field as the secondary key to be used for identifying records to be updated with pdm_load.
UNIQUE	Indicates that the values in the field must be unique. Must be specified if the field is the primary key in the table. Optional if the field is not the primary key.

Macros are synonyms that will be converted during configuration to the value the macro represents. You can use macros for either data types or attributes. If you wish to use macros, you must add in #include statement to include the file that defines the macro including the path name (usually relative to your schema file). The include statement must be defined prior to using the macro. Example of an include statement:

```
#include "../schema.mac"
```

The following are some of the macros defined in .mac files located in the $ NX_ROOT/site (UNIX) or *installation-directory*/site (Windows) directory.

Data Type	Equivalent
nn	NOT_NULL
uniq	UNIQUE NOT_NULL
ADDR_LINE	STRING 30
EMAILADDR	STRING 120
ENT_DESC	STRING 40
ENT_NAME	STRING 30
OSI_NAME	STRING 80
OSI_TYPE_STRING	STRING 60
USERID	STRING 85
PHONENUM	STRING 32
SYMBOL	STRING 12
HIER_SYM	STRING 60
LONG_SYM	STRING 30
COMMENT	STRING 1000
LONG_STR	STRING 500
LONG_DESC	STRING 240
BOOL	INTEGER

Examples

This TABLE statement in the database schema defines severities. The macro nn indicates that a value is required in the del field. The macro uniq indicates that values are required and must be unique:

```
#include :../schema.mac"
TABLE Severity {
   id        INTEGER uniq KEY;    // key id
   del       INTEGER nn;          // 0=present,1=gone
   sym       SYMBOL uniq S_KEY; // type symbol
   desc      ENT_DESC;            // non-OSI specified column
}
```

This modified TABLE statement makes the Priority field on the Request Detail window required:

```
TABLE Call_Req {priority INTEGER NOT_NULL;}
```

This TABLE statement adds a resolution code field to the Call_Req table. The content of the field is numeric and references the Resolution_Code table. This reference allows users to double-click the Resolution Code field on the Request Detail window to display the values in the Resolution_Code table:

```
TABLE Call_Req {zres_code INTEGER REF Resolution_Code;}
```

TABLE_INFO Statement

This instructs your database management system how to store and index data in the logical tables. The extent to which these instructions are followed depends on the database management system. If no instructions are provided, the database management system follows its own storage and indexing instructions.

Syntax

```
TABLE_INFO table_name {
```

[STORAGE *storage_mtd Field* ;] [INDEX *ndx_props field1* [*field2* ...];] ...}

Arguments

- **TABLE_INFO**
  Introduces the TABLE_INFO statement. Must be uppercase. The TABLE_INFO statement is optional, but if specified, you can have only one TABLE_INFO for each TABLE statement, and it must follow the TABLE statement.

- ***table_name***
  The name of the database table in the TABLE statement.

- **STORAGE *storage_mtd***
  Identifies the storage method. Valid values are listed as follows, but note that some database management systems ignore these values:

Value	Description
BTREE	Indicates to use the balanced tree storage method.
HASH	Indicates to use the hash table storage method. This is valid only if the field is the primary key.
HEAP	Indicates to use the heap storage method.

- ***field***
  Identifies the column that is to be stored according to the specified storage method (STORAGE *storage_mtd*). Must be specified the same way as the name of the column in the TABLE statement.

- **INDEX *ndx_props***
  Identifies one or more properties for an index that consists of the fields specified. Valid values are:

Value	Description
SORT ASCENDING | DESCENDING	Indicates whether to sort the data in the fields in ascending or descending order. Data is sorted in ascending order by default; therefore, only SORT DESCENDING need be specified.
PRIMARY	Indicates to use this index as the default sort order for the table.
CLUSTER	Identifies this as a clustering index.

Value	Description
UNIQUE	Indicates that values in the index must be unique.

- ***field1* [*field2 . . .*]**

Identifies the column or columns that are to be indexed according to the specified index properties (INDEX *ndx_props*). Must be specified the same way as the name of the columns in the TABLE statement.

Examples

This TABLE_INFO statement instructs the database management system to use a hash table to store values in the id field in the Contact_Type table, and to sort the table in descending order according to the values in the sym field. It also indicates that values must be unique:

```
TABLE_INFO Contact_Type {
```

STORAGE HASH id; INDEX SORT DESCENDING PRIMARY UNIQUE sym;}

Mapping Statement

Defines the correspondence between the logical tables and columns in the CA SDM database schema and the physical tables and columns used by your database management system. This statement follows each TABLE statement in a.sch file. You must define it when you define a new table.

Syntax

```
p1 logical_table_name -> CURR_PROV physical_table_name
   [{logical_field -> physical_field ...] ;
```

Arguments

- **p1**
  Introduces the mapping statement. Must be specified as p1.
- ***logical_table_name***
  The name of the database table in the TABLE statement, for example, zManufacturer.
- **CURR_PROV**
  A required keyword.
- ***physical_table_name***
  The name of the table used by your database management system, for example, man. Short names improve performance and are required by some database management systems.
- ***logical_field***
  The name of the column in the CA SDM database schema, for example, desc. Must be the same as *field* in the TABLE statement. Omit this when the logical columns and physical columns have identical names. When omitted, the semicolon follows *physical_table_name*.
- ***physical_field***

The name of the column used by your database management system, for example, nx_desc. Omit this when the logical columns and physical columns have identical names. When omitted, the semicolon follows *physical_table_name*.

Examples

This example illustrates how TABLE, mapping (p1), and TABLE_INFO statements define a zManufacturer table:

```
TABLE zManufacturer {
        id       INTEGER  uniq KEY;       // key id
        del      INTEGER  nn;             // 0=present,1=gone
        sym      HIER_SYM uniq S_KEY;     // manufacturer name
        desc     ENT_DESC;                // manufacturer description
}

p1 zManufacturer -> CURR_PROV man   // maps logical table "zManufacturer"
{                                   // to physical table "man"
        desc -> nx_desc;            // maps logical column "desc"
}                                   // to physical column "nx_desc"

TABLE_INFO zManufacturer {
```

STORAGE HASH id; INDEX SORT ASCENDING PRIMARY UNIQUE sym;}

Object Definition Syntax

This article contains the following topics:

Many of the components of CA SDM consist of business objects. These objects are defined in a metalanguage named Majic. You can use Majic statements to create new objects and modify existing objects, thus customizing these objects to meet your needs.

Directories

The Majic files are organized in two directories:

Directory	Description
bopcfg/majic (UNIX) or bopcfg\majic (Windows)	Contains the .maj files that have been used to create windows defined in the database. These files should not be changed because changes will be overwritten by new releases of CA SDM.
site/mods/majic (UNIX) or site\mods\majic (Windows)	Contains the .mod files you use to customize windows.

Types of Statements

The following Majic statements are used in screen painter and database customization procedures.

Statement	Description
OBJECT	Defines a business object
MODIFY	Changes existing object attributes
MODIFY FACTORY	Changes existing factories

MODIFY Statement

Changes the way attributes are defined on OBJECT statements. MODIFY statements are read after OBJECT statements.

Syntax

```
MODIFY obj_name att_name [status_type;]
   [ON_NEW DEFAULT|SET value|NOW ;]|
   [ON_CI DEFAULT|SET value|NOW ;]|
   [ON_DB_INIT DEFAULT|SET value|NOW ;]
```

Arguments

- ***obj_name***
  Identifies the object whose attribute is being modified.
- ***att_name***
  Identifies the attribute being modified.
- ***status_type***
  Modifies the properties of the attribute to allow or prohibit null values. There are two valid options for this keyword:
  - **REQUIRED**
    Indicates that the attribute is required.
  - **NOT_REQUIRED**
    Indicates that the attribute is not required.
- **ON Statements**
  See ON Statements for a description of these statements.

Example

The following example changes the salary attribute in the emp object so that it is now a required attribute:

```
MODIFY emp salary REQUIRED;
```

Example

The following example changes the address2 attribute in the emp object so that is now not required.

```
MODIFY emp address2 NOT_REQUIRED;
```

MODIFY FACTORY Statement

Changes the way factories are defined on OBJECT statements. MODIFY statements are read after OBJECT statements.

Syntax

```
MODIFY FACTORY fac_name {
   [FUNCTION_GROUP name ;]
   [DISPLAY_NAME name ;]
   [STANDARD_LISTS {
       [SORT_BY index_att ;]
       [FETCH fetch_att ;]
       [WHERE string ;]
       [MLIST ON|OFF;]
       [RLIST ON|OFF;] } ;] };
```

Arguments

- ***fac_name***
  Identifies the factory, if included on the original OBJECT statement.

Optional Statements

At least one of these optional statements must be specified.

- **FUNCTION_GROUP *name***
  Indicates which security access groups are permitted to access the object. For example:

  ```
  FUNCTION_GROUP "admin" ;
  ```

- **DISPLAY_NAME name**
  Defines an external name for the table.
  DISPLAY_NAME "Call Request" ;

- **STANDARD_LISTS**
  Creates lists of objects that are kept in a cache. The parameters determine whether the lists are master lists or restricted lists, whether the objects included in the list must meet specified conditions, and how the lists can be sorted. Refer STANDARD_LISTS Optional Statements for a description of the syntax.

OBJECT Statement

Defines a business object.

Syntax

```
OBJECT obj_name {
```

```
    [ATTRIBUTES [table_name]{
        att_name [field_name] value_type [access_type[status_type]][DISPLAY_NAME
string][{
            [ON_NEW DEFAULT|SET value|NOW ;]
            [ON_CI DEFAULT|SET value|NOW ;]
            [ON_DB_INIT DEFAULT|SET value|NOW ;]} ;]};]

    [FACTORY [fac_name]{
        [REL_ATTR name ;]
        [COMMON_NAME name ;]
     [DISPLAY_NAME name ;]
        [FUNCTION_GROUP name ;]
        [STANDARD_LISTS {
           [SORT_BY index_att ;]
           [FETCH fetch_att ;]
           [WHERE string ;]
           [MLIST ON|OFF;]
           [RLIST ON|OFF;] } ;]};]
};
```

Arguments

- ***obj_name***
  The object's name (for example, cnt for contact or cr for request).

Optional Statements

Either ATTRIBUTES or FACTORY must be specified. Both can be specified.

- **ATTRIBUTES [*table_name*] { }**
  Defines the properties of the object. Most attributes map to a field (column) in a database table. The ATTRIBUTES Optional Statement describes its syntax.

- **FACTORY [*fac_name*] { }**
  Defines access to the object, like its relation attribute, a common name, the security group that can access it, the type of lists produced, and how those lists can be sorted. The FACTORY Optional Statement describes its syntax.

Example

This example defines an object named ctp. The ATTRIBUTES statement defines attributes named sym, delete_flag, and description whose values are stored in the Contact_Type table in the database. The FACTORY statement creates a master list of objects, sorted by values in the field that corresponds to the sym attribute, and specifies that the id attribute will represent ctp when it is referenced by an SREL:

```
OBJECT ctp {
   ATTRIBUTES Contact_Type {
       sym                STRING REQUIRED ;
       delete_flag del    INTEGER {
          ON_NEW DEFAULT 0 ;
       } ;
```

```
        description desc    STRING ;
    } ;
    FACTORY {
        STANDARD_LISTS {SORT_BY "sym"} ;
        REL_ATTR  id ;
    };
};
```

STANDARD_LISTS Optional Statement

This article contains the following topics:

The optional statement on the FACTORY statement that defines the object's standard lists.

Syntax (STANDARD_LISTS Optional Statement)

```
STANDARD_LISTS {
    [SORT_BY index_att ;]
    [FETCH fetch_att ;]
    [WHERE string ;]
    [MLIST ON|OFF;]
    [RLIST ON|OFF;] } ;
```

Optional Statements (STANDARD_LISTS Optional Statement)

At least one of these optional statements must be specified:

- **SORT_BY *index_att***
  Defines the attributes that can be used to sort the standard lists. If specified, a master list is produced. Attributes must be enclosed in quotes and separated by commas. When displayed in a list or select window, the list is sorted by the first attribute, by default. For example:

  ```
  SORT_BY "sym, code" ;
  ```

- **FETCH *fetch_att***
  Specifies additional attributes to keep in the cache, besides those used to sort the list. They must be enclosed in quotes and separated by commas. For example:

  ```
  FETCH "description" ;
  ```

- **WHERE *string***
  Specifies a condition, in SQL format and surrounded by quotes, that must be met for an object to be included in a restricted list. If specified, a restricted list is produced. This example specifies that the restricted list contain only records that were not deleted:

  ```
  WHERE "delete_flag = 0" ;
  ```

- **MLIST ON|OFF**
  Indicates whether to produce a master list, which includes all objects, using one of the following values:

Value	Description
ON	Produces a master list (default if SORT_BY is specified)
OFF	Does not produce a master list (default if SORT_BY is not specified or has no value defined)

Note: CA SDM web engine only uses the MLIST to populate the data in the web forms. MLIST is created on the domsrvr cache.

- **RLIST ON|OFF**
  Indicates whether to also produce a restricted list, which includes only the objects that meet the criteria in the WHERE clause, using one of the following values:

Value	Description
ON	Produces a restricted list (default if WHERE is specified)
OFF	Does not produce a restricted list (default if WHERE is not specified or has no value defined.)

Note: RLISTs can speed up access and display but they use memory. They are usually used in select windows.

Important! MLIST OFF must be specified if you specify RLIST OFF.

Example (STANDARD_LISTS Optional Statement)

This example provides both a master list and a restricted list. Both lists contain the values defined for the sym, code, and description attributes. The records in the list can be sorted according to the values in the sym and code attributes. The restricted list contains only records that were not deleted:

```
STANDARD_LISTS {
    SORT_BY "sym,code" ;
    FETCH "description" ;
    WHERE "delete_flag = 0" ;
};
```

The STANDARD_LISTS statement alone does not necessarily create entries that are listed in a dropdown field. To create the dropdown list in a web interface form, you need to customize the statement.

FACTORY Optional Statement

This article contains the following topics:

Defines access to the object, like its relation attribute, a common name, the security group that can access it, the type of lists produced, and how those lists can be sorted. If omitted, the object is treated according to default specifications.

Syntax (FACTORY Optional Statement)

```
FACTORY [fac_name]{
   [REL_ATTR name ;]
   [COMMON_NAME name ;]
   [FUNCTION_GROUP name ;]
   [DISPLAY_NAME name ;]
   [STANDARD_LISTS {
       [SORT_BY index_att ;]
       [FETCH fetch_att ;]
       [WHERE string ;]
       [MLIST ON|OFF;]
       [RLIST ON|OFF;] } ;]
};
```

Arguments (FACTORY Optional Statement)

- ***fac_name***
  The name of the factory that initiates the object. Specify this only if it is different from the name of the object. For example, the cnt object has four factories: cnt, cst, agt, grp.

Optional Statements (FACTORY Optional Statement)

At least one of these optional statements must be specified:

- **REL_ATTR *name***
  Identifies the attribute that will represent this object when it is referenced (used as an SREL) by another object. Here is an example:

  ```
  REL_ATTR id ;
  ```

- **REL_ATTR name, srel_name (attr1,attr2,...)**
  Identifies the attributes that will represent this object when it is referenced (used as an “named” SREL) by another object. where

  - **srel_name**
    matches the "named" SREL name

- **attr1**
  is mapped to by the first attribute in the "named" SREL attribute list.

- **attr2**
  is mapped to by the second attribute in the "named" SREL attribute list.

- DISPLAY_NAME name
  Defines an external name for the table.
  DISPLAY_NAME "Call Request" ;

- **COMMON_NAME *name***
  Defines the attribute to be displayed in drop-down lists or when the user double-clicks a field, as well as when the tag does not specify a complete attribute. In the first example, the value for sym appears on the window instead of the value for the REL_ATTR. The second example allows you to specify a tag as cr.customer instead of cr.customer.combo_name.

```
COMMON_NAME sym ;

COMMON_NAME combo_name ;
```

- **FUNCTION_GROUP *name***
  Indicates which security access group is permitted to access the object. For example:

```
FUNCTION_GROUP "admin" ;
```

- **STANDARD_LISTS { }**
  Creates lists of objects that are kept in a cache and can be displayed on list or select windows. The parameters determine whether the lists are master lists or restricted lists, whether the objects included in the list must meet specified conditions, how the lists can be sorted, and what additional attributes are stored. Refer STANDARD_LISTS Optional Statement (see page 3955) for the description of the syntax.

Example (FACTORY Optional Statement)

This example defines access to the object. A master list is produced. It can be sorted according to the values in the object's sym and code attributes. When first displayed, it is sorted according to the values in the sym attribute by default. When referenced by another object, this object is represented by the code attribute. When displayed in a window, the value for sym appears instead of the value for code. Only users in the admin security group can accessed it:

```
FACTORY {
    STANDARD_LISTS {SORT_BY "sym,code"} ;
    REL_ATTR code ;
    COMMON_NAME sym ;
    FUNCTION_GROUP "admin" ;
};
```

ATTRIBUTES Optional Statement

The optional statement on the OBJECT statement that defines the properties of the object.

Syntax

```
ATTRIBUTES [table_name]{
   att_name [field_name] value_type [access_type[status_type][DISPLAY_NAME string]]{
       [ON_NEW DEFAULT|SET value|NOW ;]
       [ON_CI DEFAULT|SET value|NOW ;]
    [ON_DB_INIT DEFAULT|SET value|NOW ;];]};]
```

Arguments

- ***table_name***
  The name of the table in the database that stores the values associated with the attributes in the object. If the table name is not specified, the *obj_name* in the OBJECT statement is used.

- ***att_name***
  The name of the attribute. Each attribute usually maps to a field (column) in the database table.

- ***field_name***
  The name of the field in the database table or LOCAL if the attribute does not map to a field or DERIVED (derived-expr) if the attribute is derived from other attributes. If neither LOCAL, DERIVED nor a field name is specified, the name of the field is assumed to be the same as the name of the attribute.
  A variable declared as DERIVED is constructed only when its value is retrieved. The operand of DERIVED contains a list of attribute names and string constants separated by spaces. All attributes in a derived value must be simple values (that is, they cannot be xRELs), and should be declared prior to the derived variable. The derived attribute's value is the concatenation of the values of its constituent values.
  String constants within a derived expression may contain references to environment variables in the one of the forms:
  ${var}
  ${var#pattern}
  ${var#pattern#replacement}
  Such specifications are replaced with the value of the environment variable at domsrvr startup time. The #pattern operand is optional. If provided, it is treated as a regular expression, and replaced wherever it appears in the environment variable's value. The #replacement operand defaults to null if not specified. Because # is a fixed delimeter, the pattern cannot contain a # symbol. There are no restrictions on the use of derived attributes in other messages. They behave in same way as standard attributes. A hotlink for a derived attribute fires whenever any of the attributes from which it is built changes.

- ***value_type***
  Identifies the data type of the attribute’s value as:

  - INTEGER
  - DOUBLE
  - STRING [*length*]
  - DURATION
  - UUID
  - DATE

- SREL *obj2_name*
- SREL { ob2_name_name srel_name (name, name2, ...) }

If STRING is specified, the size can be specified in an integer following STRING. If no size is specified, the value in the database is used.
UUID is 16 bytes of binary data that is used as a unique identifier for certain database records.
SREL refers the attribute to another object. If SREL is specified, *obj2_name* must be specified to identify the object that the attribute refers to.
srel_name specifies a "named" SREL. Like a "simple" SREL, a "named" is a type of MAJIC OBJECT attribute that represents a single relation, which uniquely identifies a row in another table (ob2_name). A "simple" SREL attribute normally maps to the "id" field in another table, however a "named" SREL maps two or more attributes (name, name2, …) to two or more attributes in the referenced table that uniquely identify a row in the referenced table.

- ***access_type***
  Defines access to the attribute. Valid values are:

Value	Description
CONST	Cannot be changed
PRIVATE	Read-only
PUBLIC	Read/write access (the default)
WRITE_NEW	Can be written only when the object is created, before the object is saved

- ***status_type***
  Indicates the status of the attribute as:
  - REQUIRED
  - NOT_REQUIRED (the default)
- **DISPLAY_NAME string**
  Specifies a string to be used in place of the attribute name in messages concerning this attribute, such as"required attribute missing"

ON Statements

Use one of these only when *value_type* is INTEGER, STRING, DATE, or SREL.

- **ON_NEW DEFAULT|SET *value*|NOW**
  Indicates to set the value of an attribute when the object is being created for the first time:

Value	Description
DEFAULT	Changes a null current value to *value* or NOW.
SET	Changes any current value to *value* or NOW.
value	Specifies a numeric value or a string value, depending on the data type of the attribute.
NOW	Specify this if the attribute is of type DATE; it sets the attribute to the current date and time.

In the following example, 90 is the value set as a default when the object is created:

```
ON_NEW DEFAULT 90 ;
```

- **ON_CI DEFAULT|SET *value*|NOW**
  Indicates to set the value of an attribute when the attribute is being checked into the database. See the description of each parameter for ON_NEW.

- **ON_DB_INIT DEFAULT|SET *value*|NOW**
  Indicates to set the value of an attribute when the attribute is being instantiated from the database. See the description of each parameter for ON_NEW.

Example

This example defines attributes with names like start_date whose values are stored in fields like nlh_start in the Notify_Log_Header table in the database. The field names are followed by each attribute's data type. Optional parameters define access to some of the attributes, indicate that the attribute is required, and tell when to set the value of some of the attributes to the current date and time.

For example, an attribute named last_mod is defined; its value is set to the current date and time when the attribute is checked into the database. An attribute named contact is also defined; its value is a single relation stored in database field nlh_c_addressee. The object referred to is cnt:

```
ATTRIBUTES Notify_Log_Header {
   start_date          nlh_start          DATE WRITE_NEW {ON_NEW DEFAULT NOW;} ;
   last_mod                               DATE {ON_CI SET NOW ;} ;
   msg_hdr             nlh_hdr            STRING 20 WRITE_NEW ;
   msg_text            nlh_msg            STRING WRITE_NEW ;
   msg_ack             nlh_user_ack       STRING ;
   contact             nlh_c_addressee    SREL cnt WRITE_NEW ;
   notify_method       nlh_cm_method      INTEGER WRITE_NEW ;
   activity_notify     nlh_transition     INTEGER WRITE_NEW ;
   pri_event           nlh_pri            INTEGER WRITE_NEW ;
   notify_type         nlh_type           INTEGER WRITE_NEW ;
   ack_time            nlh_ack_time       DURATION ;
   status              nlh_status         INTEGER REQUIRED ;
   end_date            nlh_end            DATE {ON_NEW DEFAULT NOW ;} ;

};
```

Where Clauses

This article contains the following topics:

Several Web Services methods, such as doSelect() and doQuery(), require *the Where clauses* for searching by CA SDM and Knowledge Management. A Where clause is the string appearing after the 'WHERE' keyword in an SQL statement. For example, a where clause to find contacts (the 'cnt' object) by last name:

```
last_name = 'Jones'
```

or

```
last_name LIKE 'Jone%'
```

The second example finds all contacts with names beginning with ‘Jone’, while the first just finds the Jones’.

CA SDM supports only a subset of the standard SQL parameters for where clauses, and are listed as follows:

- Logical operators AND, OR, and NOT
- LIKE and IS
- NULL
- IN
- Wildcard characters ‘%’ and ‘_’ for string matches
- All comparison operators: <, >, <=, >=, !=, <>

Note: Parenthesis is used for grouping. Explicit joins, EXISTS, and GROUP BY elements are not supported by CA SDM. String value must be enclosed in quotes, for example, ‘Jones’.

The column names denote the object attribute names. CA SDM data types,data and duration, are treated as integers. For example:

```
creation_date > 38473489389
```

Note: You must use the attribute names at the object Level. Do not use the actual DBMS column names.

Dot-notation is allowed in the Where clause to search through SREL (foreign key) types. For example, a query against the Request (‘cr’) object, returns all Requests assigned to contacts with a specific last name, as illustrated by the following example:

```
assignee.last_name like 'Martin%'
```

Dot-notation is very helpful in forming the where clauses, but you must ensure that the query is an efficient one. The query in the example *assignee.last_name like 'Martin%'* can be inefficient if the contact’s last_name attribute is not indexed in the DBMS. To ensure indexes are used to their best advantage when searching through SRELs, make use of the ID attributes of the CA SDM objects. All tables in CA SDM have an index on the ID attribute.

The ID attribute of an object can be easily obtained from the object's handle. An object's handle is a string of the form "<*objectName*>:<*id*>", where <*id*> is the value of the ID attribute found in every CA SDM object. Extract the ID portion and use "<attributeName>.id" in the Where clause.

An object's ID is either an integer or a UUID. If it is an integer, simply use it as such. For example, to search for Requests with the *rootcause* pointing to a Root Cause object with handle, "*rc:1234*", the Where clause is:

```
rootcause.id = 1234
```

If the ID attribute of an object is a UUID type, you must format it as:

```
U'<uuid>'
```

The string representation of a UUID is enclosed in single quotes and prefixed with capital 'U'. This string is the <id> part of an object handle. For example, if you know that the handle for a particular contact is cnt:913B485771E1B347968E530276916387, you can form the query as:

```
assignee.id = U'913B485771E1B347968E530276916387'
```

Do not form the Where clauses by querying the 'persistent_id' attribute, as in the following example:

```
rootcause.persistent_id = 'rc:1234'
```

For more information about handles, see Default Handles (see page 1855).

IN Clause

The IN clause requires some special explanation. The two syntactic forms are:

```
SREL_attr_name.subq_WHERE_attr[.attr] IN ( value1 [, value2 [,...]] )
SREL_attr_name.[subq_SELECT_attr]LIST_name.subq_WHERE_attr IN (value1, [,value2
[,...]] )
```

The left side of the clause must begin with an SREL-type attribute of the table being queried, which is represented by *SREL_attr_name*. *subq_WHERE_attr* is an attribute of the foreign object, which itself may be another SREL pointer.

For example, a query against the request ('cr') object may be coded as follows:

```
category.sym IN ('Soft%', 'Email')
```

This translates to the following pseudo-SQL:

```
SELECT ... FROM cr WHERE cr.category IN (SELECT persistent_id FROM pcat WHERE sym
LIKE 'Soft%' OR sym = 'Email')
```

In the previous sub query , 'pcat' is the object name pointed to by cr.category.

The second form of the IN clause can search through BREL lists. For example, to find all requests assigned to an analyst in a specific group, the clause is as follows:

```
assignee.[member]group_list.group IN (U'913B485771E1B347968E530276916387')
```

The first part of the clause, assignee, is an SREL (foreign key) of the cr object, pointing to the cnt object. Next, group_list, which is an attribute of the cnt object, is a list of cnt objects that represent groups to which a contact belongs. The last part, group, forms the first part of the where clause for the IN sub query. ‘U’913B485771E1B347968E530276916387is the foreign key value to match on group. The sub query return is specified by [member]. This translates to the following pseudo-SQL statement:

```
SELECT ... FROM cr WHERE cr.assignee IN (SELECT member from grpmem WHERE group =
U'913B485771E1B347968E530276916387')
```

You can specify multiple foreign keys for matching multiple objects by providing a comma-separated list:

```
assignee.[member]group_list.group IN (U'913B485771E1B347968E530276916387',
U'913B485771E1B347968E530276916300')
```

You cannot extend the dot notation for this use of the IN clause, for example, the following is not valid:

```
assignee.[member]group_list.group.last_name IN ('Account Center')
```

One use of IN is to avoid Cartesian products. For example, the following query results in a Cartesian product and is very inefficient:

```
assignee.last_name LIKE 'MIS%' OR group.last_name LIKE 'MIS%'
```

Using IN, the query can be coded as follows:

```
assignee.last_name IN 'MIS%' OR group.last_name IN 'MIS%'
```

This query does not create a Cartesian product; in fact, it creates no joins at all.

Note: The parentheses that normally enclose the list of values on the right side of IN can be omitted if there is only one value in the list. Similarly, you should avoid joins by converting queries.

```
assignee.last_name LIKE 'Smith'
```

to:

```
assignee = U'913B485771E1B347968E530276916387'
```

This avoids the join with some loss in clarity. Using IN, the same partition can be written as follows, with the clarity of the first version and almost the same efficiency as the second version:

```
assignee.last_name IN 'Smith'
```

The ‘NOT’ keyword cannot be in conjunction with IN, for example, “NOT IN”.

Lists

Some Web Services methods return *lists*, represented by a unique integer handle. A list is simply a collection of same-type objects. Lists are especially useful when dealing with a large collection of objects (for example, all the contacts in the system) because you can retrieve information about items in a range of the list. The disadvantage is that you must make more method calls to obtain a list handle, retrieve information, and finally, free the list handle. If the expected number of list rows is small, use methods that do not involve list handles, such as doSelect().

The following describes more details about lists:

- **Lists are homogenous**
  List may only contain objects of a single type, for example, lists of contacts, list of organizations, and so on.

- **Lists are Static**
  For example, if a list object is obtained for all contacts and another contact is added to the system, the update is not reflected in the list. Another list handle must be obtained to get the most current data.

- **List Handles**
  A request for a list returns an integer handle representing the list of same-type objects. No other information is sent to the client. The client may query the list for specific information about its rows. When a client is finished with a list, the handle must be released with freeListHandles(). The CA SDM server maintains the list, consuming system resources. Therefore, it is important to free lists. Unlike object handles, list handles are not persistent across sessions.

- **Integer Index**
  Several methods require an integer index into a list. Lists are zero-based so the first element is at index = 0.

As previously mentioned, using list handles is most useful for larger sets of data that may be queried multiple times. For some operations, however, lists are excessive. Several methods are provided, but the most notable is doSelect(), as it returns requested information about a set of data without the overhead of list handles.

The decision to use list handles versus methods, such as doSelect(), is one of performance and convenience. For example, suppose your application does processing on all 15,000 Contacts in your system. The doSelect() method can retrieve all the contact data in one call, but the reply will be delayed and will negatively impact overall system performance while it assembles and returns a very large data set. The doQuery() method, in this case, will return a list reference very quickly. Ranges of data can be queried from the list to improve response times from the server. A good practice to follow is to use list references if the data set exceeds 250 items.

Sometimes it does not make sense to use list handles. For example, an issue has a list of Activity Logs. Depending on the installation, the number of logs can range from a few to several dozen. It is probably faster to request the data all at once instead of requesting a list reference, querying it for data, and then releasing the list.

Examples of methods that return data sets instead of list references include the following:

- doSelect()

- getRelatedListValues()
- getLrelValues()
- getTaskListValues()
- getValidTaskTransitions()

As previously stated, queries that return a large number of rows can severely impact the performance of the server. To protect against this, CA SDM limits the number of rows returned to 250. This affects all CA SDM Web Services methods that return lists of objects, including the following:

- doSelect()
- doSelectKD()
- getGroupMemberListValues()
- getListValues()
- getPropertyInfoForCategory()
- getRelatedListValues()
- getTaskListValues()
- getValidTaskTransitions()

This limit applies even if you request one of these methods to retrieve more than 250 rows.

To retrieve large numbers of rows, you should obtain a handle to the list of results and use getListValues() to retrieve chunks of 250 or fewer rows each. This strategy helps keep the server from becoming slow while serving huge amounts of data.

Attribute Data Types

This article contains the following topics:

Each attribute of an object is of a specific type that has meaning to the CA SDM application, such as string, date, or integer. Knowing the attribute type is essential to correctly retrieving and updating attribute values.

The CA SDM uses an enumeration to identify each data type. These enumeration values are returned in various web methods, as illustrated by the following table:

Data Type	Value
Integer	**2001**
String	**2002**
Duration	2003
Date	2004
SREL	2005
UNKNOWN	2006
List (QREL/BREL)	2007
Lrel (many-to-many)	2008
UUID	2009

Integer

The Integer data type represents a 32-bit signed integer. Null an integer attribute by passing the empty string.

String

The String data type represents a character string, where the maximum length is defined by the database storage allocated for a particular string attribute.

If you attempt to set a string attribute to a value that exceeds its length, the value is truncated and an error message is written to the CA SDM log.

Duration

The Duration data type is an integer representing time duration in seconds. For example, “90” represents one minute and 30 seconds. To set a duration type, use an integer representing the number of seconds for the duration. Negative values are not permitted. To make a duration attribute null, pass the empty string.

Date

The Date data type represents a date value. This is stored as a UNIX-like UTC value in the database (the number of seconds since 1-1-1970). When retrieving date values, the integer UTC is returned. Similarly, use a UTC value to set a date. Negative values are not permitted. Null a date attribute by passing the empty string.

SREL

The SREL data type represents an SREL (Single RELation), which is a pointer to another object. It is a foreign key to another table in a database. For example, an Issue object has a pointer attribute to a Contact representing the Assignee.

Most CA SDM Web Services methods permit dot-notation to retrieve information about objects to which an SREL points. For example, to specify the name of a Contact's organization from the context of the Contact, use the following:

```
organization.name
```

You may expand to an arbitrary number of levels as shown in the following example:

```
organization.contact.first_name
```

Dot-notation can only be used to retrieve attribute values, such as using getObjectValues(), or in a Where clause. You cannot use dot-notation to set values.

To set an SREL attribute, such as with updateObject(), you can pass the persistent id of the object to which you want to point. In order to simplify this action, this release of CA SDM has been enhanced so that the REL_ATTR (foreign key) value may be used to set an SREL.

For example, as the REL_ATTR of the crt object (Request Type) is its code attribute, the values "R", "I" and "P" can be used to set the type attribute of a cr object to specify that the ticket is a Request, Incident or Problem. The cr's type attribute can be set to "R" instead of "crt:180", "I" instead of "crt: 182" and "P" instead of "crt:181".

To set an SREL attribute to null, pass the empty string ("").

List (QREL/BREL)

An object can have a list attribute that represents a one-to-many relationship. These are defined in majic files with the QREL or BREL keywords. A list exists at the object level -- it does not take any additional storage in the DBMS.

The CA SDM system handles list collections as abstract data types. The Web Services provides several methods to interact with lists -- for references and queries to lists defined in an object, use getRelatedList() and getRelatedListValues(). For more information about lists, see CA SDM Lists in this chapter.

LREL

The LREL data type represents a many-to-many relationship between two object types. An LREL has two names, one for each side of the relationship. The CA SDM Web Services provides special functions for interacting with LRELs.

UNKNOWN

The Unknown data type represents an unknown data type.

UUID

A UUID is a 128-bit integer (16 bytes) or a 32-byte character that can be used across all computers and networks wherever a unique identifier is required. Such an identifier has a very low probability of being duplicated (for example, a contact ID). UUIDs are used mostly with primary keys.

Web Services Methods

This article contains the following topics:

This section provides the details for using the Web Services methods. Each method explains the parameters, description, and returns.

Web Services Method Summary

The following table provides a summary of web services methods in the product:

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
addAssetLog (int sid, String assetHandle, String contactHandle, String logText)	void		Adds a new log entry to an asset.
addBookmark (int sid, String contactId, int docId)	String [UDSObject]		Adds a bookmark to a knowledge document.
addComment (int sid, String comment, int docId, String email, String username, String contactId)	String [UDSObject]		Adds a comment to a knowledge document.
addMemberToGroup (int sid, String contactHandle, String groupHandle)	void		Adds a contact to a group.
attachChangeToRequest (int sid, String creator, String requestHandle, String changeHandle, ArrayOfString changeAttrVals, String description)	String		Attaches a new or existing change order to a request.
attachURLLink (int sid, int docId, String url, String attmntName, String description)	int		Attaches a URL link to a knowledge document.
attmntFolderLinkCount (int sid, int folderId)	int		Returns the number of attachment links for a folder.
callServerMethod (int sid, String methodName, String factoryName, String formatList, ArrayOfString parameters)	String [ServerReturn]		Invokes any arbitrary server-side method.
changeStatus (int sid, String creator, String objectHandle, String description, String newStatusHandle)			

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
	String [UDSObject (Handle only)]		Performs an update status activity on a ticket.
clearNotification (int sid, String lrObject, String clearBy)	int		Clears a notification message.
closeTicket (int sid, String description, String ticketHandle)	String [UDSObject (Handle only)]		Sets the status of the ticket to Closed.
createActivityLog (int sid, String creator, String objectHandle, String description, String logType, int timeSpent, boolean internal)	String [UDSObject (Handle only)]		Creates an activity log entry for a ticket.
createAsset (int sid, ArrayOfString attrVals, ArrayOfString attributes, StringHolder createAssetResult, StringHolder newAssetHandle, StringHolder newExtensionHandle, StringHolder newExtensionName)	void	createAssetResult [UDSObject] newAssetHandle newExtensionHandle newExtensionName	Creates a configuration item (asset).
createAssetParentChildRelationship (int sid, String parentHandle, String childHandle)	String		Creates an asset parent-child relationship.
createAttachment (int sid, String repositoryHandle, String objectHandle, String description, String fileName)	String		Uploads a file to the back-end server and attaches it to a ticket.
createAttmnt (int sid, String repositoryHandle, int folderId, int objectHandle, String description, String fileName)	String		Uploads a file to the back-end server and attaches it to a knowledge document.
			Creates a Change Order ticket.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
createChangeOrder (int sid, String creatorHandle, ArrayOfString attrVals, ArrayOfString propertyValues, String template, ArrayOfString attributes, StringHolder newChangeHandle, StringHolder newChangeNumber)	String [UDSObject]	newChangeHandle newChangeNumber	
createDocument (int sid, ArrayOfString kdAttributes)	String [UDSObjectList]		Creates a knowledge document.
createFolder (int sid, int parentFolderId, int repId, int folderType, String description, String folderName)	String [UDSObject]		Creates a folder in an attachment repository.
createIssue (int sid, String creatorHandle, ArrayOfString attrVals, ArrayOfString propertyValues, String template, ArrayOfString attributes, StringHolder newIssueHandle, StringHolder newIssueNumber)	String [UDSObject]	newIssueHandle newIssueNumber	Creates an Issue ticket.
createLrelRelationships (int sid, String contextObject, String lrelName, ArrayOfString addObjectHandles)	void		Adds one or more many-to-many relationships.
createObject (int sid, String objectType, ArrayOfString attrVals, ArrayOfString attributes, StringHolder createObjectResult, StringHolder newHandle)	void	createObjectResult [UDSObject] newHandle	Creates any CA SDM object.
createQuickTicket (int sid, String customerHandle, String description, StringHolder newTicketHandle, StringHolder newTicketNumber)	String [UDSObject]	newTicketHandle newTicketNumber	Creates a ticket based on the preferred document type of the given end user.
createRequest (int sid, String creatorHandle, ArrayOfString attrVals, ArrayOfString propertyValues, String template, ArrayOfString attributes, StringHolder newRequestHandle, StringHolder newRequestNumber)	String [UDSObject]	newRequestHandle newRequestNumber	Creates a Request ticket.
createTicket (int sid, String description, String problem_type, String userid, String asset, String duplication_id, StringHolder newTicketHandle, StringHolder newTicketNumber, StringHolder returnUserData, StringHolder returnApplicationData)	String [UDSObject (empty)]	newTicketHandle newTicketNumber returnUserData returnApplicationData	Creates a ticket based on the rules defined in the Service Aware Policy and the given Problem Type.
	void		

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
createWorkFlowTask (int sid, ArrayOfString attrVals, String objectHandle, String creatorHandle, String selectedWorkFlow, String taskType, ArrayOfString attributes, StringHolder createWorkFlowTaskResult, StringHolder newHandle)		createWorkFlowTaskResult [UDSObject] newHandle	Creates Workflow Task.
deleteBookmark (int sid, String contactId, int docId)	int		Deletes a bookmark from a knowledge document.
deleteComment (int sid, int commentId)	int		Deletes a comment for a knowledge document.
deleteDocument (int sid, int docId)	int		Flags a knowledge document for deletion.
deleteWorkFlowTask (int sid, String workFlowHandle, String objectHandle)	void		Removes a workflow task from its associated ticket.
detachChangeFromRequest (int sid, String creator, String requestHandle, String description)	String		Detaches a change order from a request.
doQuery (int sid, String objectType, String whereClause)	ListResult [listHandle, listLength]		Performs a SQL-like select on the specified object type.
doSelect (int sid, String objectType, String whereClause, int maxRows, ArrayOfString attributes)	String [UDSObjectList]		Performs a SQL-like select on the specified object type.
doSelectKD (int sid, String whereClause, String sortBy, boolean desc, int maxRows, ArrayOfString attributes, int skip)	String [UDSObjectList]		Performs a SQL-like select on the knowledge document object.
escalate (int sid, String creator, String objectHandle, String description, boolean setAssignee, String	String [UDSObject (Handle only)]		Performs an escalate activity on a ticket.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
newAssigneeHandle, boolean setGroup, String newGroupHandle, boolean setOrganization, String newOrganizationHandle, boolean setPriority, String newPriorityHandle)			
faq (int sid, String categoryIds, int resultSize, String propertyList, String sortBy, boolean descending, String whereClause, int maxDocIDs)	String [UDSObjectList]		Performs a faq search on knowledge documents.
findContacts (int sid, String userName, String lastName, String firstName, String email, String accessType, int inactiveFlag)	String [UDSObjectList]		Retrieves a list of contacts.
freeListHandles (int sid, ArrayOfInt handles)	void		Frees the server-side resources for lists and invalidates the list handles.
getAccessTypeForContact (int sid, String contactHandle)	String		Returns a handle for the Access Type of a contact.
getArtifact (int sid, String contact, String password)	String		Returns an artifact for appending to URLs.
getAssetExtensionInformation (int sid, String assetHandle, ArrayOfString attributes, StringHolder getAssetExtInfoResult, StringHolder extensionHandle, StringHolder extensionName)	void	getAssetExtInfoResult [UDSObject] extensionHandle extensionName	Returns extension information for an asset.
getAttmntInfo (int sid, int attmntId)	String [UDSObjectList]		Returns the attributes for an attachment.
getAttmntList (int sid, int folderId, int repId)	String [UDSObjectList]		Returns a list of attachments under a given attachment folder.
getAttmntListPerKD (int sid, int docId)	String [UDSObjectList]		Returns a list of attachments for a given knowledge document.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
getBookmarks (int sid, String contactId)	String [UDSObjectList]		Retrieves bookmarks for a given contact.
getBopsid (int sid, String contact)	String		Returns a token for appending to URLs.
getCategory (int sid, int catId, boolean getCategoryPaths)	String [UDSObjectList]		Retrieves information for a knowledge category.
getComments (int sid, String docIds)	String [UDSObjectList]		Retrieves all comments from the list of knowledge documents.
getConfigurationMode (int sid)	String		Returns confirmation if CA SDM is running in ITIL mode.
getContact (int sid, String contactId)	String [UDSObject]		Retrieves information for a given contact.
getDecisionTrees (int sid, String propertyList, String sortBy, boolean descending)	String [UDSObjectList]		Retrieves all Decision Tree knowledge documents.
getDependentAttrControls (int sid, String handle, ArrayOfString attrVals)	String [UDSObjectList]		Returns a list of locked and required attributes for the Status object.
getDocument (int sid, int docId, String propertyList, boolean relatedDoc, boolean getAttmnt, boolean getHistory, boolean getComment, boolean getNotiList)	String [UDSObject]		Retrieves information for a knowledge document.
getDocumentsByIDs (int sid, String docIds, String propertyList, String sortBy, boolean descending)	String [UDSObjectList]		Retrieves information for one or more knowledge documents.
getDocumentTypes (int sid)			

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
	String [UDSObjectList]		Returns a list of all knowledge document types.
getFolderInfo (int sid, int folderId)	String [UDSObject]		Retrieves information for a given attachment folder.
getFolderList (int sid, int parentFolderId, int repId)	String [UDSObjectList]		Returns a list of folders under a given parent folder.
getGroupMemberListValues (int sid, String whereClause, int numToFetch, ArrayOfString attributes)	String [UDSObjectList]		Queries the group of the system and member relationship.
getHandleForUserid (int sid, String userID)	String		Returns the persistent handle for a contact.
getKDListPerAttmnt (int sid, int attmntId)	String [UDSObjectList]		Returns a list of knowledge documents with reference to a given attachment.
getListValues (int sid, int listHandle, int startIndex, int endIndex, ArrayOfString attributeNames)	String [UDSObjectList]		Returns attribute values for a range of objects in a list.
getLrelLength (int sid, String contextObject, String lrelName)	int		Returns the number of objects on one side of a many-to-many relationship.
getLrelValues (int sid, String contextObject, String lrelName, int startIndex, int endIndex, ArrayOfString attributes)	String [UDSObjectList]		Returns attribute values for a range of objects in a many-to-many relationship.
getNotificationsForContact (int sid, String contactHandle, int queryStatus)	ListResult [listHandle, listLength]		Returns a list handle of notifications (lr objects) for a given contact.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
getObjectTypeInformation (int sid, String factory)	String [UDSObject (special)]		Returns a list of all attribute names for a given object.
getObjectValues (int sid, String objectHandle, ArrayOfString attributes)	String [UDSObject]		Returns the attribute values for a given object handle.
getPendingChangeTaskListForContact (int sid, String contactHandle)	ListResult [listHandle, listLength]		Returns all the pending change order workflow tasks assigned to a given contact.
getPendingIssueTaskListForContact (int sid, String contactHandle)	ListResult [listHandle, listLength]		Returns all the pending issue workflow tasks assigned to a contact.
getPermissionGroups (int sid, int groupId)	String [UDSObjectList]		Retrieves info for a permission group.
getPolicyInfo (int sid)	String [SAPolicy]		Returns information about the access policy for the current session.
getPriorities (int sid)	String [UDSObjectList]		Retrieves all the knowledge priorities.
getPropertyInfoForCategory (int sid, String categoryHandle, ArrayOfString attributes)	String [UDSObjectList]		Retrieves property information for a given category.
getQuestionsAsked (int sid, int resultSize, boolean descending)	String [UDSObjectList]		Retrieves historical knowledge document search text.
getRelatedList (int sid, String objectHandle, String listName)			Returns a list handle for a list (QREL or BREL) of an object.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
	ListResult [listHandle, listLength]		
getRelatedListValues (int sid, String objectHandle, String listName, int numToFetch, ArrayOfString attributes, StringHolder getRelatedListValuesResult, IntHolder numRowsFound)	void	getRelatedListValuesResult [UDSObjectList] numRowsFound (IntHolder)	Returns values for lists of an object.
getRepositoryInfo (int sid, int repositoryId)	String [UDSObject]		Returns information of a repository.
getStatuses (int sid)	String [UDSObjectList]		Retrieves all the knowledge statuses.
getTaskListValues (int sid, String objectHandle, ArrayOfString attributes)	String [UDSObjectList]		Returns values for tasks associated with a given issue or change order.
getTemplateList (int sid)	String [UDSObjectList]		Retrieves all the document templates.
getValidTaskTransitions (int sid, String taskHandle, ArrayOfString attributes)	String [UDSObjectList]		Returns all possible status transitions for a particular task.
Returns all possible status transitions for a particular task.	String [UDSObjectList]		Returns all possible status transitions for a particular ticket.
getWorkflowTemplateList (int sid)	String [UDSObjectList]		Retrieves all the knowledge workflow templates.
getWorkFlowTemplates (int sid, String objectHandle, ArrayOfString attributes)	String [UDSObjectList]		Returns all the workflow templates

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
			associated with the category of a change order or issue.
impersonate (int sid, String userid)	int		Invalidates the old session and returns a new session ID for the new user.
isAttmntLinkedKD (int sid, int attmntId)	int		Returns the number of attachment links to all knowledge documents.
logComment (int sid, String ticketHandle, String comment, int internalFlag)	void		Performs a log comment activity on a ticket.
login (String username, String password)	int		Authenticates a user and returns a unique session ID.
loginService (String username, String password, String policy)	int		Authenticates a user and returns a unique session ID.
loginServiceManaged (String policy, String encrypted_policy)	String		Performs user authentication for PKI configurations and returns a session ID.
loginWithArtifact (String userid, String artifact)	int		Authenticates a user with artifact and returns a unique session ID.
logout (int sid)	void		Invalidates and frees a session ID.
modifyDocument (int sid, int docId, ArrayOfString kdAttributes)	String [UDSObject]		Updates a knowledge document.
notifyContacts (int sid, String creator, String contextObject, String messageTitle, String messageBody, int notifyLevel, ArrayOfString notifyees, boolean internal)	String [UDSObject (Handle only)]		Sends a notification to one or more contacts.

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
rateDocument (int sid, int docId, int rating, int multiplier, String ticketPerId, boolean onTicketAccept, boolean solveUserProblem, boolean isDefault)	String [UDSObjectList]		Rates a particular knowledge document.
removeAttachment (int sid, String attHandle)	int		Removes an attachment from a ticket.
removeLrelRelationships (int sid, String contextObject, String lrelName, ArrayOfString removeObjectHandles)	void		Removes one or more many-to-many relationships.
removeMemberFromGroup (int sid, String contactHandle, String groupHandle)	void		Removes a contact from a group.
search (int sid, String problem, int resultSize, String properties, String sortBy, boolean descending, boolean relatedCategories, int searchType, int matchType, int searchField, String categoryPath, String whereClause, int maxDocIDs)	String [UDSObjectList (nested)]		Searches for knowledge document solutions.
serverStatus (int sid)	int		Returns the status (up or down) of the CA SDM server.
transfer (int sid, String creator, String objectHandle, String description, boolean setAssignee, String newAssigneeHandle, boolean setGroup, String newGroupHandle, boolean setOrganization, String newOrganizationHandle)	String [UDSObject (Handle only)]		Performs a transfer activity on a ticket.
updateObject (int sid, String objectHandle, ArrayOfString attrVals, ArrayOfString attributes)	String [UDSObject]		Updates one or more attributes for a given object.
updateRating (int sid, int buId, int rate)	String [UDSObject]		Updates an existing rating of a knowledge document.
loginWithArtifact (String userid, String artifact)	int		Authenticates a user with artifact and returns a unique session ID.
	String		

Method Name (Input Parameters)	Return Type [XML Root Element]	Output Parameters (Type: StringHolder) [XML Root Element]	Description
getArtifact (int sid, String contact, String password)			Returns an artifact for appending to URLs.

XML Object Returns

Many of the Web Services methods return an XML representation of CA SDM objects. The Web Services uses a standard XML structure beginning with the following root element:

```
<UDSObject>
```

The format of the XML representation is described in the following table:

XML Element	Type	Description
<UDSObject>	N/A	Identifies the root node.
<Handle>	String	Identifies the object's handle.
<Attributes>	Sequence	Identifies the attribute values. This holds zero or more elements for the object's attribute values.
<*attrName0* DataType = *"typeEnum"*>	String	Identifies the *AttrName0,* which is an object attribute name as defined in the CA SDM majic (.maj) or mod (.mod) file. This name may use dot-notation depending on the web method used. The element's value is the attribute's value. An empty element indicates a null/empty value for this object's attribute. The DataType attribute is an integer indicating the attribute's data type in the CA SDM environment.

For example, a call to getObjectValues() can return information illustrated by the following:

```
<UDSObject>
    <Handle>cnt:555A043EDDB36D4F97524F2496B35E75</Handle>
    <Attributes>
        <Attribute DataType="2003">
            <AttrName>first_name</AttrName>
            <AttrValue>first name</AttrValue>
            <DisplayValue>Yaakov</DisplayValue>
        </Attribute>
        <Attribute DataType="2005">
            <AttrName>organization</AttrName>
                <AttrValue>342</AttrValue>
        <DisplayValue>Accounting Crew</DisplayValue>
    </Attribute>
</Attributes>
```

```
    <Lists>        <List name="mylist1">
            <UDSObject>...</UDSObject>
            <UDSObject>...</UDSObject>
        </List>
    </Lists>
</UDSObject>
```

Some methods, such as doSelect(), return a sequence of <UDSObject> elements contained inside a <UDSObjectList> element.

The <Lists> section holds zero or more <List> nodes. A <List> node holds zero or more <UDSObject> nodes. <List> elements are generally returned only when a specific request for list values is made.

When you want to return a list of values related to a specific object, you should use the *getRelatedListValues* method.

If a request is made just for a list with no attribute name, such as actlog, then the entire <UDSObject> is returned in the <List> section.

Specialized methods, like getDocument(), can of course be different. When a request is made for an attribute, the database value is returned. For SREL attributes, this may not be so useful. Requesting the assignee attribute of a Request returns an integer because the Contact REL_ATTR (foreign key) is its ID. For CA Service Desk Manager r11.0, the return data for attributes includes elements for the DBMS and common name value of SREL references.

REST HTTP Methods

This article contains the following topics:

The REST API supports the following HTTP methods to manipulate resources:

- POST (CREATE) creates a resource.
- GET (READ) returns a representation of a resource.
- PUT (UPDATE) updates an existing resource.
- DELETE deletes the resource.

Refer to this basic set of methods as CRUD. Each method works in the same manner on all CA SDM resources. You require an HTTP client library, available with most programming languages. Use the HTML client library to complete the following tasks:

- Access and modify associated (or related) resources using a multilevel URI path.
- Send an HTTP request to the server for the resource that you want to manipulate.
- Control the object attributes to be returned by using HTTP headers.

After you update Majic object definitions and recycle CA SDM, the product automatically regenerates and redeploys the corresponding Plain Old Java Objects (POJOs) into the REST Tomcat *webapps* directory.

Note: The pdm_rest_util command line utility lets you *manually* generate, compile, and deploy Java code that REST web services require.

Important! Requests for attributes that do *not* respond indicate a null attribute value. Modify your client code accordingly because REST does *not* display null attribute values in responses.

REST Web Services provide a scalable configuration and better flexibility to our users by letting you connect to a dedicated domsrvr on the local server. By default, CA SDM Release 12.9 provides the NX_REST_WEBSERVICE_DOMSRVR variable to domsrvr. You can edit NX.env to change this setting.

CA SDM disables the REST sample mobile user interface and exposes all Majic factories through REST Web Services by default.

Important! The REST API does not support Majic attributes of type DOUBLE.

The following table shows how the REST API uses HTTP methods on resources.

Resource	CREATE	READ	UPDATE	DELETE
Collection URL For example: http://myweb site.com /resources/	Creates an entry in the collection. Assigns a new entry URL automatically and returns it by the operation.	Lists the URLs and other details of the collection members.	N/A	N/A
Element URL For example: http://myweb site.com /resources /item1	N/A	Retrieves a representation of the addressed member of the collection.	Updates the addressed member of the collection, and when the member does not exist, creates it.	Deletes the addressed member of the collection.

Sample URI Paths for CRUD Operations

The following table shows sample URI paths for CRUD operations:

CRUD Operation	HTTP Method	Noun	Sample URI Path
CREATE	Post	URI	/caisd-rest/chg
READ (Multiple)	GET	Collection URI	/caisd-rest/chg
Read (Multiple with Filter)	GET	Collection URI	/caisd-rest/chg?WC=status%3D6001
Read (Single ID)	GET	Entry URI	/caisd-rest/chg/400001
Read (Single COMMON_NAME)	GET	Entry URI	/caisd-rest/chg/COMMON_NAME-21
Read (Single REL_ATTR)	GET	Entry URI	/caisd-rest/chgstat/REL_ATTR-OP
Update	PUT	Entry URI	/caisd-rest/chg/40001
Delete	DELETE	Entry URI	/caisd-rest/grpmem/400001

Important! COMMON_NAME and REL_ATTR are case-sensitive. If you do not use upper case, REST returns the HTTP-404 error code.

REST Considerations

Consider the following information about REST methods:

- POST operations create a resource from the provided representation, but CA SDM can add or modify attribute values internally. These values are based on business object logic that attribute triggers, SPEL code, methods, or both set. The result causes the POST operation to return the actual representation that it created to the client. This behavior lets clients reconcile the representation that they sent to the server with the actual representation that they created.
- For GET operations, enter **%20** instead of a space in the WHERE clause.

REST Limitations

The REST API does *not* support dotted attribute name references in its resource queries or attributes. REST does *not* expose any BREL, QREL or LREL attribute that contains a dotted attribute in its relationship query. For example, the chg object in base.maj contains the following QREL attributes:

```
workload_chg QREL chg DYNAMIC {
WHERE "assignee = ? and active = 1" ;
PARAM_NAMES { id } ;
DOMSET chg_list;
} ;
change_tasks QREL wf DYNAMIC {
WHERE "assignee = ? AND status.allow_task_update = 1 " ;
PARAM_NAMES { id } ;
DOMSET wf_list ;
} ;
```

In this example, workload_chg QREL attributes are available. The change_tasks QREL is unavailable because it contains a dotted attribute (status.allow_task_update) in its WHERE clause.

REST and Object Access

Many CA SDM components consist of objects. A metalanguage named Majic defines these objects. Majic statements let you create objects and modify existing objects, so you can customize these objects to meet your business requirements. You can customize the exposure of the CA SDM objects through REST to determine the following:

- Objects accessible through REST
- Permitted operations for each object

After you install CA SDM, all objects are accessible through REST. The REST_OPERATIONS keyword specifies the operations that you can perform on an object. By default, all objects allow the CREATE, READ, and UPDATE operations. Some default objects also permit the DELETE operation, as indicated in the REST_OPERATIONS list in their object definition. You do *not* need to use the REST_OPERATIONS keyword for the default setup. You can refine object access to perform the following tasks:

- Override the REST_OPERATIONS list by using a Majic MODIFY statement to remove or add operations, except for the DELETE operation.
  Note: You cannot add the DELETE operation to any default object.
- Remove an object from REST entirely by specifying NONE in the REST_OPERATIONS list.

rest_access resource

The rest_access resource contains REST API access information for the authenticated users. It is an administrative table and contains the list of users allowed through the REST API.

The following list shows the deviations from the default behavior:

- **POST**
  Creates a REST access object and returns access key, secret key and expiration date as part of default values.
- **GET**
  Retrieves REST access information (except for secret key).
- **DELETE**
  Deletes the REST access object.
- **PUT**
  Does not allow updates to secret_key, access_key, and contact due to the Majic WRITE_NEW property.

REST_OPERATIONS Keyword

The Majic keyword, REST_OPERATIONS, uses a parenthesized list of tokens. These tokens let you specify the REST operations that are permitted for an object. You use an object definition and a MODIFY clause to customize the keyword.

The REST_OPERATIONS keyword has the following syntax:

```
REST_OPERATIONS "[<OP>],[<OP>] | NONE";
```

- **OP**
  Specifies the CREATE, READ, UPDATE, and DELETE operations.

This keyword produces the following statements:

```
REST_OPERATIONS "CREATE, READ, UPDATE DELETE";
REST_OPERATIONS "NONE";
```

At run time, CA SDM allows overrides by using the following Majic MODIFY statement:

```
MODIFY FACTORY cr {
             REST_OPERATIONS "READ, UPDATE";
       };
```

REST_OPERATIONS Syntax Examples

The following example modifies the cr object to limit the operations to READ and UPDATE. Any attempt to create or delete the object returns an error of *HTTP error code 405 Method Not Allowed*.

Important! CA SDM sets the default value for a REST_OPERATIONS property as “CREATE READ UPDATE” for most Objects. For example, cr, iss, and chg. For some object, CA SDM sets the default REST_OPERATIONS value to “CREATE READ UPDATE DELETE.” For example, rest_access and KCAT.

```
MODIFY FACTORY cr {
REST_OPERATIONS "READ UPDATE";
};
```

The following example removes announcements from REST completely:

```
MODIFY FACTORY cnote {
REST_OPERATIONS "NONE";
};
```

Note: You cannot use DELETE in a MODIFY statement. The NONE operation is standalone and not allowed with the CREATE READ UPDATE combination in the MODIFY statement.

Working with BLRELs

The BLREL keyword refers to Majic attributes that point to an LREL table. These attributes are part of a three-factory relationship. BLREL attributes were known as LREL attributes in previous releases of CA SDM, but they have changed to BREL attributes. This name helps distinguish BLRELs from the classic BREL attributes which are only a two-factory relationship.

An example of this three-factory relationship is the group and members relationship. This relationship consists of a grp object, a cnt object, and the LREL table object that the grpmem object represents. In this three-factory relationship, two BLREL attributes always point to a common LREL table. In the group/member relationship, both BLREL attributes are frequently part of the same object, but not always.

The following example shows how CA SDM defines BLREL attributes in Majic files.

```
OBJECT cnt {
    ...
    member_list         BREL  grpmem group DYNAMIC { LREL member; } ;
    group_list          BREL  grpmem member DYNAMIC { LREL group; } ;
}
```

You can always view the attributes of an object by executing the bop_sinfo command on an active system:

```
bop_sinfo -d grpmem
```

The LREL table record creates an association between records of two other tables. For the group /member relationship, the grpmem record is the LREL table that creates this association. It is a many-to-many relationship, where groups can have many members, and members can be part of many groups.

WHERE Clause Resource Search

REST Web Services let you use a *WC* (WHERE clause) query for the GET request. REST only supports the SQL query notation, not the Majic query notation. For example, you cannot use a dotted attribute notation. If you do not add a WC parameter to the URL, all records return up to the page size and maximum size limits.

Consider the following information:

- Use percent-encoding for all requests before you send them to the server. For example, enter **%3D** instead of =, the equals sign.
- The WC parameter is part of the URI instead of a message header to allow bookmarking.
- The WC query parameter only applies to Collection GET requests.

Example: Search for Contact Records with a Last Name that Equals ServiceDesk

```
http://<host>:<REST port>/caisd-rest/cnt?WC=last_name%3D'ServiceDesk'
```

Example: Search for Priority 2 Incidents

```
/in?WC=priority%3D4
```

The 4 value in the example specifies the REL_ATTR value for the Priority 2 record.

Important! Use REL_ATTR values in the WC parameter when you reference SREL attributes such as priority.

Example: Search for Incidents that Contain test% in the Summary Field

```
/in?WC=summary%20LIKE%20'test%25'
```

Valid URI Path Patterns

Not all resource paths and subresource paths expose all four HTTP methods, depending on the URI path level and the resource. The following list shows the exposed methods:

- **/caisd-rest/<factory>**

Example: /caisd-rest/cr

GET searches for objects and returns a collection of objects.

POST creates an object and returns the object that you created.

- **/caisd-rest/<factory>/<object id>**

Example: /caisd-rest/cr/400001

GET returns details for one object.

PUT updates the object.

DELETE removes the object. If allowed.

- **/caisd-rest/<factory>/<object id>/<attribute name (SREL)>**

Example: /caisd-rest/chg/400001/status

GET returns Details for the SREL attribute object, same as going directly to the SREL object if you know the ID. For example, /caisd-rest/crs/5200

- **/caisd-rest/<object>/<object id>/<attribute name (BREL)>**

Example: /caisd-rest/chg/400001/act_log

GET returns a collection of objects of the type the BREL points to.

- **/caisd-rest/<factory>/<object id>/<attribute name (BLREL)>**

Example: /caisd-rest/chg/400001/attachments

GET returns a collection of objects of the type the BLREL points to (the LREL record).

- **/caisd-rest/<factory>/<object id>/<attribute name (QREL)>**

Example: /caisd-rest/chg/400001/workflow

GET returns a collection of objects of the type the QREL points to.

Search Result Sorting

CA SDM Web Services let you sort search results by using the SORT query parameter, included as part of the URI. You can specify a list of attributes as the sort order. You can also specify ASC for ascending order, or specify DESC for descending order.

For default behavior, the SORT parameter provides that same support that the DBMS provides for the ORDER BY clause. For example, if you omit ASC or DESC, the DBMS may use ASC automatically. If you do not provide a SORT parameter in the URI, the DBMS uses *id ASC* by default.

This behavior only applies to collection GET requests, such as the example:

```
GET http://<host>:<REST-port>/caisd-rest/<fac name>
GET http://myserver:8080/caisd-rest/cr?SORT=priority DESC, severity ASC
```

Consider the following information:

- You *must* encode all requests before sending them to the server. For example, enter **%20** instead of spaces.
- All object attributes specified in the SORT parameter add to the X-Obj-Attrs list of object attributes automatically. This behavior helps ensure that the attributes selected for sorting are part of the response.
- The SORT parameter is part of the URI instead of a message header to allow for bookmarking.

Note: If you do not provide the X-Obj-Attrs header, id, REL_ATTR, and COMMON_Name list by default, as they always appear as part of the response.

Search Result Navigation

Provide ATOM links to improve navigating search and list results. These links take the user to the previous or next step when more records become available. By default, the Collection GET result contains up to 25 records. Use the rest_webservice_list_page_length and rest_webservice_list_max_length options to configure the page length and maximum number of records to display.

The ATOM links appear only for available records for that purpose. REST does not provide the *previous* link if the current page contains the first record in the list. Similarly, REST only provides the *next* and *all* links when you have more available records.

Users can also provide their own list return size with the *size* parameter. If the user does not provide *size*, REST defaults to the value of rest_webservice_list_page_length. If you do not provide start, REST defaults to 1.

Example Request Returns a Specific Number of Records

In this example, you request a return of 10 records:

```
http://myserver:8050/caisd-rest/cnt?start=11&size=10
```

If this result set contained 50 records, the following links appear:

```
<link href="http://myserver:8050/caisd-rest/cnt?start=1&size=10" rel="previous"/>
<link href="http://myserver:8050/caisd-rest/cnt?start=21&size=10" rel="next"/>
<link href="http://myserver:8050/caisd-rest/chg?start=1&size=50" rel="all"/>
```

Note: When the result set contains more than the maximum number allowed, the all link does not appear.

HTTP Status and Error Codes

Every HTTP response contains an HTTP status code. Successful HTTP response code numbers range from 200 to 399. Standard HTTP error response code numbers range from 400 to 599.

The following list shows the successful and error code numbers that the REST API returns for each of the HTTP methods.

- **GET (single)**
  200, 400, 401, 404, 409
- **GET (collection)**
  200, 400, 401
- **PUT**
  200, 400, 401, 404, 409
- **DELETE**
  204, 400, 401, 409
- **POST**
  201, 400, 401, 409

Note: For the PUT and DELETE operations, the API does *not* try to determine the validity of the ID initially. Instead, the API tries to run the update and delete queries directly. If an error occurs, the API returns the *409 Conflict* code. If the API returns a *404 Not Found* code in this situation, performance degrades.

In addition, the following error messages return under the following cases:

- If the HTTP request contains an invalid or inaccessible URI address, the server responds with a *404 Not Found* response code.
- If the HTTP request contains an unsupported HTTP method for a valid URI, the server responds with a *405 Method Not Allowed* response code.
- If the HTTP request requests an unsupported media type (Accept header), the server responds with a *406 Not Acceptable* response code.
- If the HTTP request sends an unsupported media type (Content-Type header), the server responds with a *415 Unsupported Media Type* response code.
- Various syntax or internal Web Server errors can return a 500 internal error.

Code Matching Limitations

Because of a limited number of available HTTP codes, not all CA SDM errors match to an HTTP error code. Matching errors return the corresponding HTTP error codes whenever possible, but most backend process errors return a generic *400 Bad Request* code. A message summarizes the error.

The following error messages match the corresponding HTTP error code. All others use error code 400.

- A request for a resource that does not exist in CA SDM returns a *404 Not Found* error code.
- A request for a resource that returns multiple matches, such as when using a nonunique COMMON_NAME value returns a *409 Conflict* error code.
- A request for an unaccessible resource due to Authentication Failure or Function Access security return a *401 Unauthorized* error code.

Known Status Codes

The following list describes the known status codes that the API returns. Other codes may exist from the web server or the CXF framework, but it depends on the type of error.

- **200**
  OK
  Indicates a successful return.
- **201**
  Created
  Indicates a new record.
- **204**
  No Content
  Indicates an empty response body.
- **304**
  Not Modified
  Indicates that the record did not update.
- **400**
  Bad Request
  Indicates that an error occurred due to a user or backend server issue.
- **401**
  Unauthorized
  Indicates a function Access error or any authentication failure.
- **404**
  Not Found
  Indicates that a record is not found.
- **405**
  Method Not Allowed
  Indicates an unsupported HTTP method.
- **406**
  Not Acceptable
  Indicates an unsupported requested format.

- **409**
  Conflict
  Indicates that multiple records were found for the given identifier.

- **415**
  Unsupported Media Type
  Indicates that the provided format is not supported.

- **500**
  Internal Server Error
  Indicates an error on the server or CXF framework.

Atom Feeds

CA SDM supports Atom feeds through the collection GET URI path because Atom feeds represent a list of records. This implementation supports all query parameters that REST Web Services support, such as the WC, start, and size query parameters. This implementation supports two additional query parameters, EntryTitle and EntrySummary, which let you specify a mapping between the Atom entry Title and Summary elements to Majic attributes.

```
EntryTitle=<Majic attribute name>
EntrySummary=<Majic attribute name>
```

Note: If you do *not* specify these parameters, REST uses the COMMON_NAME as the default title and summary values.

The following sample displays these query parameters:

```
GET /caisd-rest/cnt?size=2&EntryTitle=userid&EntrySummary=notes HTTP/1.1
Accept: application/atom+xml
```

The following sample displays the Atom response:

```
<?xml version="1.0" encoding="UTF-8"?>
<feed xmlns="http://www.w3.org/2005/Atom">
  <author>
    <name>CA Service Desk Manager</name>
  </author>
  <title type="text">REST API Atom feed</title>

      </cnt>
    </content>
  </entry>
</feed>
```

Additional REST Support when Requesting Data Formats

REST Web Services also supports other ways of specifying the representation format using the URI. The Web Services work similarly specifying the representation format in the Accept HTTP header.

Example 1:

GET /caisd-rest/chg/400001.xml HTTP/1.1

GET /caisd-rest/chg/400001.json HTTP/1.1

GET /caisd-rest/chg.feed HTTP/1.1

Example 2:

GET /caisd-rest/chg/400001?_type=xml HTTP/1.1

GET /caisd-rest/chg/400001?_type=json HTTP/1.1

GET /caisd-rest/chg?_type=atom HTTP/1.1

Consider the following information:

- If the representation format is specified on the URI and through the “Accept” header, the one in the URI takes precedence over the Accept header.
- If a representation format is not specified in any way, the representation returns in the XML format by default.
- The *_type=* query parameter supersedes all parameters.

CA SDM Role Authorization

As with SOAP Web Services, part of the REST Web Services Access Key creation (login operation) includes verifying the user has authorization to access REST Web Services. In SOAP, the Web Service and API Role lookup field controls this verification in the Access Type detail form. In REST, a new lookup field named REST Web Service API Role controls the verification for REST. You can only associate one role to this field, and this field is the default role for the user. If this lookup field is empty, the users belonging to this Access Type do not have access to CA SDM through the REST Web Services interface.

In addition, REST Web Services supports the same list of Attached Roles that are part of the Web Client interface. A REST user can select a different role from the list of Attached Roles (including the roles in its Contact record) by passing in an additional message header as part of the request.

Example: Use the Administrator role for the request

```
POST /caisd-rest/cnt HTTP/1.1
Host: hostname
Date: Mon, 21 Apr 2011 19:37:58 +0000
X-Role: 10002
```

REST Java Sample Code

CA SDM provides REST Java sample code in the NX_ROOT\samples\sdk\rest\java directory. These sample files let you build custom Java client code in your environment, similar to SOAP web service samples. This directory contains instructions for compiling and executing the sample programs in the README.txt file. Each Java file documents additional instructions and sample input parameters. The following directories in \rest\java provide the following samples:

- **test1_basic**
- SampleBasicAuth.java
  Demonstrates how to get an Access Key using a username/password through the Basic Authentication scheme.
- SampleCRUDOperations.java
  Demonstrates how to perform simple CRUD operations (Create, Read, Update and Delete) on Incident tickets. The same can be used for any other object in CA SDM.
- **test2_auths**

- SampleBOPSIDAuth.java
  Demonstrates how to get an Access Key using a BOPSID token. This CA SDM token can be obtained from other CA SDM Interfaces such as SOAP Web Services.

- SampleEEMAuth.java
  Demonstrates how to get an Access Key using an CA EEM artifact/token. This token can be obtained from other applications that use CA EEM as their authentication server.

- SampleSDMAuth.java
  Demonstrates how to get an Access Key and a Secret Key using a username/password through the CA SDM custom authentication scheme.

- SampleUsingSecretKey.java
  Demonstrates how to make a REST API request (get a list of Contacts) using the Secret Key. It uses the Secret Key obtained from the CA SDM custom authentication operation to encrypt a configurable amount of data. All requests using this scheme are verified against the Secret Key.

- **test3_attachments**

- SampleNewResourceWithAttachment.java
  Demonstrates how to create a new Change Order ticket with an attachment document all in one step.

- SampleAttachFileToResource.java
  Demonstrates how to attach a document to an existing Change Order ticket.

- **test4_xrels**

- SampleGetQRELDetails.java
  Demonstrates how to retrieve details on a QREL attribute. In this sample, details for chg.children are retrieved. The same approach works for BREL and BLREL attributes.

- SampleCreateBRELResource.java
  Demonstrates how to create a new record for a BREL attribute. In this sample, a new Log Comment activity is added to an existing Change Order. The same approach works for creating a new record for BLREL attributes.

Build and Execute the Sample Programs

You can build and execute the sample Java programs to test them in your environment.

Follow these steps:

1. Copy rest_java_test.bat.txt (Windows) or rest_java_test.sh.txt (UNIX) to the subdirectory where the sample program exists.

2. Rename the copied file by removing the .txt extension.

3. Edit the copied file and verify that the first three SET variables are correct for your CA SDM installation.

4. In addition, edit the Java file that you want to run and verify that the configurable variables are set for your CA SDM installation. Also, read the comments at the top of the page.

CA SDM Authentication Scheme

CA SDM provides sample code in the NX_ROOT/samples/sdk/rest/java directory. This directory also contains instructions about how to compile and execute the sample programs. REST Web Services support the following security authentication schemes:

- REST Secret Key Authentication (see page 3996) that uses SSL and HMAC for login
- REST BOPSID Authentication (see page 3997) that validates CA SDM BOPSIDs
- REST Basic Authentication (see page 3997) that uses clear text encoded username and password
- External (CA EEM) Artifact Authentication (see page 3998) that uses a CA EEM artifact token

REST Secret Key Authentication

REST Secret Key authentication uses a custom, secure HMAC mechanism. This authentication lets CA SDM verify the identity of a user and also verifies that the request came from a registered, verified user. To complete this authentication successfully, each request must provide information about the identity of the request sender.

HMAC_ALGORITHM supports the HmacSHA1, HmacSHA256, HmacSHA384, HmacSHA512, and HmacMD5 valid HMAC algorithms. By default, REQUEST_METHOD, REQUEST_URI, and QUERY_STRING (if present) are used to compute the signature. You can also use other header fields to compute the signature, such as date, x-obj-attrs, and content-type. To add these fields set the following NX variable in NX.env file:

```
@NX_STRING_TO_SIGN_FIELDS=date,x-obj-attrs,content-type
```

Note: When you compute the signature on the Client side, use the same fields exactly in the same order as specified the fields for the STRING_TO_SIGN_FIELDS option.

- **Access Key**
  The Access Key is an assigned value to CA SDM clients after a successful login authentication. Requests use the Access Key to identify the client responsible for the request. However, because an Access Key is sent as a request parameter, the Access Key is not secret. A possibility exists that anyone could use the Access Key by sending a request to CA SDM. As a result, this authentication requires a Secret Key. REST uses the CA SDM session ID as the Access Key.

- **Secret Key**
  After you log in to CA SDM successfully, the product assigns a Secret Key and Access Key to the client. To protect users from impersonation, the client must provide additional information that CA SDM can use to verify the identity. CA SDM generates the 40-character Secret Key during the REST Access Key creation automatically.

The following steps describe the authentication process:

1. The client obtains the Access Key and Secret Key through the REST URI (POST /caisd-rest /rest_access) by providing user credentials using the basic authentication style over SSL.

2. For every subsequent HTTP request, the client uses the Secret Key, NX_STRING_TO_SIGN_FIELDS provides the header fields, and the NX_HMAC_ALGORITHM variable provides the hash function. This function calculates the request signature, a Keyed-Hash based Message Authentication Code (HMAC).

3. The client sends the request data, the signature, and the Access Key to CA SDM.
4. CA SDM uses the Access Key to look up the Secret Key from the persistence store.
5. CA SDM uses the request data and the Secret Key to generate the signature using the same hash algorithm that the client used.
6. If the signature that CA SDM generates matches the signature that the Client sent, CA SDM considers the request as authentic. Otherwise, CA SDM discards the request and returns an error response.

REST BOPSID Authentication

After a user logs in to CA SDM through one interface, they can access CA SDM from a different interface by using a BOPSID token. The BOPSID token provides a way for the invoked application to authenticate the user without requiring a login, such as Single Sign-On. After CA SDM authenticates a user, the application can request a BOPSID from boplgin. This single-use token identifies the user and session. Boplgin returns the userid and session when it receives the BOPSID. Boplgin also cancels the BOPSID if it does not receive a verification request within 5 minutes of token creation.

The following example shows the HTTP message header for passing the BOPSID token:

```
POST /caisd-rest/rest_access HTTP/1.1
Host: hostname
Date: Mon, 21 Apr 2012 19:37:58 +0000

X-BOPSID: <BOPSID token>
```

Note: To obtain a BOPSID token through REST Web Services, you send a POST request (see page 4002) to /caisd-rest/bopsid.

REST Basic Authentication

The basic authentication scheme assumes that the credentials of a client contain a username and password, where the password is a secret known only to the client and server.

If the incoming request does not contain the client credentials, the server sends back a 401 response that contains an authentication challenge. This challenge consists of the "Basic" token and a name-value pair that specifies the name of the protected realm, such as the following example:

```
WWW-Authenticate: Basic realm="<USDK> 12.9"
```

After receiving the 401 response from the server, the client (such as a browser) prompts for the username and password associated with that realm. The Authentication header of the client follow-up request should contain the "Basic" token and the base64-encoded group of the username, password, and a colon.

```
POST /caisd-rest/rest_access HTTP/1.1
Host: hostname
Date: Mon, 21 Apr 2012 19:37:58 +0000

Authorization: Basic QWRtaW46Zm9vYmFy
```

REST decodes credentials using base64 and compares them against the username/password and validates the credentials through boplgin. If this validation succeeds, the server provides access to the requested resource.

If the user sends the BOPSID instead of the username and password, CA SDM uses the the boplgin method validate_bopsid(). If you are concerned about using basic authentication scheme, you can disable it by setting the Options Manager option NX_REST_WEBSERVICE_DISABLE_BASIC_AUTH to Yes.

Important! Basic authentication is not as secure as the Secret Key method. However, you can use Basic authentication over an SSL connection for increased security.

External CA EEM Artifact Authentication

You can use CA EEM Artifact Authentication for REST requests. Clients send the CA EEM Artifact with the username using predefined customer headers (X-ExtAuthArtifact, X-UserName). When this header entry appears in an incoming request, the security interceptor performs the login validation by sending a VALIDATE_ARTIFACT message to boplgin.

The following example shows how to use the CA EEM Artifact:

```
POST /caisd-rest/rest_access HTTP/1.1
Host: hostname
Date: Mon, 21 Apr 2012 19:37:58 +0000

X-ExtAuthArtifact: <EEM Artifact token>
X-UserName: <username>
```

CRUD Operations on Tickets

The REST API provides sample Java code (see page 3994) for the user to work with tickets through the REST API. These files contain the following operations:

- Create a Change Order with hard-coded sample data.
- Update a recent Change Order with a status update.
- Create an Incident and display the Incident number on the console.
- Get a list of Incident numbers using a where clause and display on the console.

BREL, QREL, and BLREL Processing

The REST API provides the sample Java code (see page 3994) for the user to work with tickets through the REST API with BREL and QREL attributes. The BREL, QREL, and BLREL attributes only support the Get operation. The files contain the following operations:

- Create BREL using the documented, multistep process. For example, add activity logs to a Change Order. For QREL, create multiple Change Orders as children to a Change Order. For BLREL, add multiple CIs to a Change Order.
- Get a list of attributes that returns the URI for a BREL, QREL, or BLREL attribute, and display them on the console.

- Get the collection of the BREL, QREL, or BLREL attribute with the URI and display it on the console. For example, /caisd-rest/chg/40001/act_log.

Managing Attachments for Tickets

The REST API provides the sample Java code (see page 3994) for the user to work with tickets through the REST API. The files contain the following operations:

- Create an Incident.
- Create an attachment.
- Add the attachment to the Incident (2 step).
- Create an Incident with the attachment (1 step).
- Delete the attachment from the Incident.

CA SDM Resource Examples

Examples demonstrate how REST API uses basic Create, Read, Update, and Delete (CRUD) HTTP operations on CA SDM objects. Use the examples to understand how each REST operation works in the same manner on all CA SDM objects.

Note: For readability, the examples do not show all HTTP message headers -- only the relevant information.

Example Create a Change Order With an Attachment

This REST API example provides a complex use case: create a change order ticket and an attachment.

Note: MIME types application/xml and text/xml are often used interchangeably. We recommend that you use application/xml. All text/*-MIME types have an us-ascii character set unless otherwise explicitly specified in the HTTP headers. In effect, any encoding defined in the XML prolog (for example, <?xml version=”1.0” encoding=”UTF-8”?>) is ignored.

The following example shows the request:

```
POST /caisd-rest/chg/?
repositoryId=1002&AttachmentId=att1&serverName=HOSTNAME&mimeType=doc&description=Desc
HTTP/1.1
Content-Type: multipart/form-data
X-AccessKey: 51461077
User-Agent: Jakarta Commons-HttpClient/3.0.1
Host: hostname:8050
```

```
Content-Length: 1045

--Vschb1Sy2JD93ODUnWVAkRxp3IoXIMgXd
Content-Disposition: form-data; name="chg"
Content-Type: application/xml; charset=US-ASCII
Content-Transfer-Encoding: 8bit

<chg><description>Attachments Testing</description><status COMMON_NAME="RFC"
REL_ATTR="RFC" id="40020"><link rel="self" href="http://hostname:8050/caisd-rest
/chgstat/40020"/></status><summary>Attachment test</summary><requestor COMMON_NAME="
ServiceDesk" REL_ATTR="U'279B25DD051D0A47B54880D86700397F'" id="
U'279B25DD051D0A47B54880D86700397F'"><link rel="self" href="http://hostname:8050
/caisd-rest/cnt/U'279B25DD051D0A47B54880D86700397F'"/></requestor></chg>
--Vschb1Sy2JD93ODUnWVAkRxp3IoXIMgXd
Content-Disposition: form-data; name="Test.txt"; filename="Test.txt"
Content-Type: application/octet-stream; charset=ISO-8859-1
Content-Transfer-Encoding: binary
```

The following example shows the response:

```
HTTP/1.1 201 Created
Content-Type: application/xml;charset=UTF-8
Location: http://hostname:8050/caisd-rest/chg/400202

<chg id="400202" REL_ATTR="400202" COMMON_NAME="1047">
    <link href="http://hostname:8050/caisd-rest/chg/400202" rel="self"/>
</chg>
```

Example Create a Resource

This REST API example demonstrates how to create a resource. In this example, the REST API creates a change order ticket.

The following example shows the request:

```
POST /caisd-rest/chg HTTP/1.1
Host: hostname
Accept: application/xml
Content-Type: application/xml;charset=UTF-8
X-Obj-Attrs: chg_ref_num
<chg>
  <summary>Created via REST API</summary>
  <requestor REL_ATTR="U'793ED69B4E87A545BD8E911834D829FC'"/>
</chg>
```

The following example shows the response:

```
HTTP/1.1 201 Created
Content-Type: application/xml;charset=UTF-8
Location: http://hostname:8050/caisd-rest/chg/400001

<?xml version="1.0" encoding="UTF-8"?>
<chg id="400003" REL_ATTR="400003" COMMON_NAME="23">
```

```
  <link href="http://hostname:8050/caisd-rest/chg/400003"
        rel="self"/>
  <chg_ref_num>23</chg_ref_num>
</chg>
```

Example Delete a Resource

This REST API example demonstrates how to delete a resource.

Note: Not all objects are available for deletion. Most objects only support updating the delete_flag to true or false, or status equal to active or inactive. You perform these actions using an UPDATE request rather than a DELETE request.

The following example shows the request:

```
DELETE /caisd-rest/grpmem/400001 HTTP/1.1
Host: hostname
```

The following example shows the response:

```
HTTP/1.1 204 No Content
Content-Type: application/xml;charset=UTF-8
Content-Length: 0
```

Example Delete an Access Key

This REST API example demonstrates how to delete a CA SDM access key.

The following example shows the request:

```
DELETE /caisd-rest/rest_access/1201703106 HTTP/1.1
Host: hostname
```

The following example shows the response:

```
HTTP/1.1 204 No Content
Content-Type: application/xml;charset=UTF-8
Content-Length: 0
```

Example Mark a Resource Inactive

This REST API example demonstrates how to mark a resource as inactive.

Note: Most CA SDM objects only support marking them inactive and not actually deleting them.

The following example shows the request:

```
PUT /caisd-rest/loc/U'0502D608F9122B48B7C9DAB9E0457F94' HTTP/1.1
Host: hostname
Content-Type: application/xml;charset=UTF-8
X-Obj-Attrs: delete_flag

<loc id="U'0502D608F9122B48B7C9DAB9E0457F94'">
  <delete_flag COMMON_NAME="Inactive"/>
</loc>
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8

<?xml version="1.0" encoding="UTF-8"?>
<loc id="U'0502D608F9122B48B7C9DAB9E0457F94'"
     REL_ATTR="U'0502D608F9122B48B7C9DAB9E0457F94'"
     COMMON_NAME="Stadium 1">
  <link href="http://hostname:8050/caisd-rest/loc/U'0502D608F9122B48B7C9DAB9E0457F94'"
        rel="self"/>
  <delete_flag id="4552" REL_ATTR="1"
               COMMON_NAME="Inactive">
    <link href="http://hostname:8050/caisd-rest/actbool/4552"
          rel="self"/>
  </delete_flag>
</loc>
```

Example Obtain a BOPSID Token

A BOPSID token is single use authentication token that provides a single sign-on capability. This REST API example demonstrates how to obtain a BOPSID token to use for logging in to the web client.

The following example shows the request:

```
POST /caisd-rest/bopsid HTTP/1.1
Host: hostname.ca.com
Accept: application/xml
<bopsid/>
```

The following example shows the response:

```
HTTP/1.1 201 OK
Content-Type: application/xml;charset=UTF-8

<bopsid>
  <bopsid_val>987982618</bopsid_val>
</bopsid>
```

Example Obtain an Access Key

This REST API example demonstrates how to obtain an access key (login) for userid ServiceDesk. Perform this operation using SSL to avoid risking an unauthorized user stealing your secret key. Keep the force_unique_userid Options Manager option enabled at all times. When you disable this option, and multiple contact records with the same login ID exist, problems with data partitions, multi-tenancy, security, and other functions can occur.

The following example shows the request:

```
POST /caisd-rest/rest_access HTTP/1.1
Host: hostname
Content-Type: application/xml;charset=UTF-8
Authorization: Basic QWxhZGRpbjpvcGVuIHNlc2FtZQ==
<rest_access/>
```

The following example shows the response:

```
HTTP/1.1 201 Created
Content-Type: application/xml

<?xml version="1.0" encoding="UTF-8"?>
<rest_access id="400001" REL_ATTR="400001" COMMON_NAME="770921656">
    <link href="http://hostname:8050/caisd-rest/rest_access/400001"
    rel="self"/>
    <access_key>770921656</access_key>
    <expiration_date>1335276895</expiration_date>
</rest_access>
```

Example Retrieve a Collection of Resources

This REST API example demonstrates how to retrieve a collection of resources. In this example, the REST API retrieves a collection of all change order ticket objects.

Note: The root node (for example, collection_chg) also has other link elements such as previous, next, and all for navigating lists.

The following example shows the request:

```
GET /caisd-rest/chg HTTP/1.1
Host: hostname
Accept: application/xml
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8

<?xml version="1.0" encoding="UTF-8"?>
```

```
<collection_chg>
  <chg id="400001" REL_ATTR="400001" COMMON_NAME="21">
    <link href="http://hostname:8050/caisd-rest/chg/400001"
          rel="self"/>
  </chg>
  <chg id="400002" REL_ATTR="400002" COMMON_NAME="22">
    <link href="http://hostname:8050/caisd-rest/chg/400002"
          rel="self"/>
  </chg>
</collection_chg>
```

Example Retrieve a Collection of Resources Using a Where Clause

This REST API example demonstrates how to retrieve a collection of resources using a where clause. In this example, the REST API retrieves a collection of all request (cr) ticket objects with the Closed status.

Note: BREL queries are supported.

The following examples show the request:

```
GET /caisd-rest/cr?WC=status%3D'cl'
GET /caisd-rest/cr?WC=status%3D'op'%20and%20active%3D0
Host: hostname
Accept: application/xml
X-Obj-Attrs: ref_num, priority
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8

<?xml version="1.0" encoding="UTF-8"?>
<collection_cr COUNT="3" TOTAL_COUNT="3">
  <cr id="2903" REL_ATTR="cr:2903" COMMON_NAME="AM:12">
    <link href="http://hostname:8050/caisd-rest/cr/2903"
          rel="self"/>
    <priority id="502" REL_ATTR="3" COMMON_NAME="3">
      <link href="http://hostname:8050/caisd-rest/pri/502"
            rel="self"/>
    </priority>
    <ref_num>AM:12</ref_num>
  </cr>
  <cr id="2907" REL_ATTR="cr:2907" COMMON_NAME="AM:14">
    <link href="http://hostname:8050/caisd-rest/cr/2907"
          rel="self"/>
    <priority id="502" REL_ATTR="3" COMMON_NAME="3">
      <link href="http://hostname:8050/caisd-rest/pri/502"
            rel="self"/>
    </priority>
```

```
    <ref_num>AM:14</ref_num>
  </cr>
  <cr id="3105" REL_ATTR="cr:3105" COMMON_NAME="UAPM:13">
    <link href="http://hostname:8050/caisd-rest/cr/3105"
          rel="self"/>
    <priority id="502" REL_ATTR="3" COMMON_NAME="3">
      <link href="http://hostname:8050/caisd-rest/pri/502"
            rel="self"/>
    </priority>
    <ref_num>UAPM:13</ref_num>
  </cr>
</collection_cr>
```

Example Retrieve a Specific Resource

This REST API example demonstrates how to retrieve a specific resource using ID, COMMON_NAME, or REL_ATTR. In this example, the REST API retrieves details about the unique change order ticket object ID 400001.

The following example shows the request when you use ID:

```
GET /caisd-rest/chg/400001 HTTP/1.1
Host: hostname.ca.com
Accept: application/xml
X-Obj-Attrs: chg_ref_num, summary, requestor, status
```

The following example shows the request when you use COMMON_NAME:

```
GET /caisd-rest/chg/COMMON_NAME-32 HTTP/1.1
```

The following example shows the request when you use REL_ATTR:

```
GET /caisd-rest/chg/REL_ATTR-chg:400001 HTTP/1.1
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8

<?xml version="1.0" encoding="UTF-8"?>
<chg id="400001" REL_ATTR="400001" COMMON_NAME="21">
  <link href="http://hostname:8050/caisd-rest/chg/400001"
        rel="self"/>
  <chg_ref_num>21</chg_ref_num>
  <requestor id="U'793ED69B4E87A545BD8E911834D829FC'"
             REL_ATTR="U'793ED69B4E87A545BD8E911834D829FC'"
             COMMON_NAME="System_AHD_generated">
    <link href="http://hostname:8050/caisd-rest/cnt
/U'793ED69B4E87A545BD8E911834D829FC'"
          rel="self"/>
  </requestor>
  <status id="40020" REL_ATTR="RFC" COMMON_NAME="RFC">
    <link href="http://hostname:8050/caisd-rest/chgstat/40020"
```

```
        rel="self"/>
  </status>
  <summary>Testing</summary>
```

Example Retrieve a Subresource

This REST API example demonstrates how to retrieve a subresource.

The following example shows the request:

```
GET /caisd-rest/chg/400001/status HTTP/1.1
Host: hostname
Accept: application/xml
X-Obj-Attrs: code, sym, description
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8

<?xml version="1.0" encoding="UTF-8"?>
<chgstat id="40020" REL_ATTR="RFC" COMMON_NAME="RFC">
  <link href="http://hostname:8050/caisd-rest/chgstat/40020"
        rel="self"/>
  <code>RFC</code>
  <description>Request for Change is in draft form</description>
  <sym>RFC</sym>
</chgstat>
```

Example Update a Resource

This REST API example demonstrates how to update a resource. In this example, the REST API updates the summary field for the change order ticket ID 400003.

The following example shows the request:

```
PUT /caisd-rest/chg/400003 HTTP/1.1
Host: hostname
Content-Type: application/xml;charset=UTF-8
X-Obj-Attrs: chg_ref_num, summary
<chg id="400003">
  <summary>Summary updated via REST API</summary>
</chg>
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml

<?xml version="1.0" encoding="UTF-8"?>
<chg id="400003" REL_ATTR="400003" COMMON_NAME="23">
  <link href="http://hostname:8050/caisd-rest/chg/400003"
        rel="self"/>
  <chg_ref_num>23</chg_ref_num>
  <summary>Summary updated via REST API</summary>
</chg>
```

Example Get a BLREL Record

This example shows how to retrieve a BLREL record:

The following example shows the request:

```
GET /caisd-rest/grpmem HTTP/1.1
Host: localhost
Accept: application/xml
X-Obj-Attrs: *
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8
<?xml version="1.0" encoding="UTF-8"?>
<collection_grpmem COUNT="3" START="1" TOTAL_COUNT="3">
    <grpmem id="400001" REL_ATTR="grpmem:400001" COMMON_NAME="400001">
        <link href="http://localhost:8050/caisd-rest/grpmem/400001"
        rel="self"/>
        <group id="U'CFCC2DC94B3A66448C085B07E7286CAA'" REL_ATTR="

        COMMON_NAME="Apache">
            <link href="http://localhost:8050/caisd-rest/grp
/U'55E3CCE805756B4F8084D63E05E6C216'"
            rel="self"/>
        </group>
        <manager_flag>0</manager_flag>
        <member id="U'16226C765005B94E957E0F477DEF1B1C'" REL_ATTR="
U'16226C765005B94E957E0F477DEF1B1C'"
        COMMON_NAME="System_AM_User">
            <link href="http://localhost:8050/caisd-rest/cnt
/U'16226C765005B94E957E0F477DEF1B1C'"
            rel="self"/>
        </member>
        <notify_flag>1</notify_flag>
        <persistent_id>grpmem:400003</persistent_id>
        <producer_id>grpmem</producer_id>
    </grpmem>
</collection_grpmem>
```

This sample returns three grpmem records that represent the following associations:

- Group Unicef <-> Member System_SD_User
- Group Apache <-> Member System_MA_User
- Group Apache <-> Member System_AM_User

Example Retrieve a List of LREL Records Associated with a Group

The following example returns two grpmem records associated with the Group Apache whose REL_ATTR value is U'55E3CCE805756B4F8084D63E05E6C216'. Note that

- Group Apache <-> Member System_MA_User
- Group Apache <-> Member System_AM_User

The WHERE clause (WC) query parameter does not support dotted notation.

The following example shows the request:

```
GET /caisd-rest/grpmem?WC=group%3DU%2755E3CCE805756B4F8084D63E05E6C216%27 HTTP/1.1
Host: hostname
Accept: application/xml
X-Obj-Attrs: *
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8
<?xml version="1.0" encoding="UTF-8"?>
<collection_grpmem COUNT="2" START="1" TOTAL_COUNT="2">
    <grpmem id="400002" REL_ATTR="grpmem:400002" COMMON_NAME="400002">
        <link href="http://hostname:8050/caisd-rest/grpmem/400002"
        rel="self"/>

            rel="self"/>
        </member>
        <notify_flag>1</notify_flag>
        <persistent_id>grpmem:400003</persistent_id>
```

```
        <producer_id>grpmem</producer_id>
    </grpmem>
</collection_grpmem>
```

Example Create a BLREL Record

The following example adds an existing contact System_SA_User as a member of group Apache. It uses the COMMON_NAME value of each of those records.

Group Apache <-> Member System_SA_User

The following example shows the request:

```
POST /caisd-rest/grpmem HTTP/1.1
Host: hostname
Accept: application/xml
Content-Type: application/xml;charset=UTF-8
X-Obj-Attrs: *
<grpmem>
    <group id="U'55E3CCE805756B4F8084D63E05E6C216'"/>
    <manager_flag>0</manager_flag>
    <member id="U'E70DFE4817614C06BE9E5991A96A6015'"/>
    <notify_flag>1</notify_flag>
</grpmem>
```

The following example shows the response:

```
HTTP/1.1 201 Created
Content-Type: application/xml;charset=UTF-8
<?xml version="1.0" encoding="UTF-8"?>
<grpmem id="400005" REL_ATTR="grpmem:400005" COMMON_NAME="400005">
    <link href="http://hostname:8050/caisd-rest3/grpmem/400005"
    rel="self"/>
    <group id="U'55E3CCE805756B4F8084D63E05E6C216'" REL_ATTR="
U'55E3CCE805756B4F8084D63E05E6C216'"
    COMMON_NAME="Apache">
        <link href="http://hostname:8050/caisd-rest3/grp
/U'55E3CCE805756B4F8084D63E05E6C216'"
        rel="self"/>
    </group>
    <manager_flag>0</manager_flag>
    <member id="U'E70DFE4817614C06BE9E5991A96A6015'" REL_ATTR="
U'E70DFE4817614C06BE9E5991A96A6015'"
    COMMON_NAME="System_SA_User">
        <link href="http://hostname:8050/caisd-rest3/cnt
/U'E70DFE4817614C06BE9E5991A96A6015'"
        rel="self"/>
    </member>
    <notify_flag>1</notify_flag>
    <persistent_id>grpmem:400005</persistent_id>
    <producer_id>grpmem</producer_id>
</grpmem>
```

Example Update a BLREL Record

The following example updates the relationship of the added record and sets member System_SA_User as a Manager.

The following example shows the request:

```
PUT /caisd-rest/grpmem/400005 HTTP/1.1
Host: hostname
Accept: application/xml
Content-Type: application/xml;charset=UTF-8
X-Obj-Attrs: *
<grpmem>
    <manager_flag>1</manager_flag>
</grpmem>
```

The following example shows the response:

```
HTTP/1.1 200 OK
Content-Type: application/xml;charset=UTF-8
<?xml version="1.0" encoding="UTF-8"?>
<grpmem id="400005" REL_ATTR="grpmem:400005" COMMON_NAME="400005">
    <link href="http://hostname:8050/caisd-rest3/grpmem/400005"
    rel="self"/>
    <group id="U'55E3CCE805756B4F8084D63E05E6C216'" REL_ATTR="
U'55E3CCE805756B4F8084D63E05E6C216'"
    COMMON_NAME="Apache">
        <link href="http://hostname:8050/caisd-rest3/grp
/U'55E3CCE805756B4F8084D63E05E6C216'"
        rel="self"/>
    </group>
    <manager_flag>1</manager_flag>
    <member id="U'E70DFE4817614C06BE9E5991A96A6015'" REL_ATTR="
U'E70DFE4817614C06BE9E5991A96A6015'"
    COMMON_NAME="System_SA_User">
        <link href="http://hostname:8050/caisd-rest3/cnt

</grpmem>
```

Example Delete a BLREL Record

The following example removes member System_MA_User from group Apache. This example does not delete the member record or the group record. It only removes the association between them. It does physically remove the grpmem record.

The following example shows the request:

```
DELETE /caisd-rest/grpmem/400002 HTTP/1.1
```

```
Host: hostname
```

The following example shows the response:

```
HTTP/1.1 204 No Content
Content-Type: application/xml;charset=UTF-8
Content-Length: 0
```

Web Services Attachment-Related Methods

This article contains the following topics:

This section describes the Web Services attachment-related methods. Only file attachments are handled by these methods; link type attachments are handled by generic methods, such as CreateObject(). In addition, file uploads through Web Services employ the Direct Internet Message Encapsulation (DIME) protocol. Your SOAP implementation must support DIME in order to use these methods.

createAttachment

The following parameters apply to the createAttachment method:

Parameter	Data Type	Description
SID	INTEGER	Identifies the session retrieved from logging in.
repositoryHandle	STRING	Identifies the object handle of a document repository.
objectHandle	STRING	Identifies the object handle of a call request, change order, or issue, to which this attachment is attached. This parameter can be NULL, however, you must manage the attachment ID that is returned because the attachment is not associated to a ticket when NULL is passed in.
description	STRING	Identifies the description for the attachment object.
fileName	STRING	Identifies the full path of the file to be uploaded.

Description

Uploads a file to the back-end server. An uploaded file is stored in a document repository specified by the repositoryHandle. An attachment object is then created and attached to a ticket object specified by the objectHandle. The attachment object has all the information for accessing the newly uploaded file in the repository.

Returns

createAttachment has the following returns:

Parameter	Type	Description
<Handle>	STRING	Identifies the object handle of the newly created attachment object.

Could not perform the operation, policy limit exceeded

- **Symptom:**

When using the createAttachment() web service method to attach a document to an existing request or incident, you receive this error, even when the web services policy setting for attachments is set to -1(unlimited), which is the out-of-the-box default setting. You may receive this error when calling the web service method when there are no attached files in the received SOAP message. You must attach at least one file to the SOAP message before calling the createAttachment() web service method.

- **Solution:**

Set your SOAP implementation to support Direct Internet Message Encapsulation (DIME), and attach the file to be uploaded manually using DIME support before calling the createAttachment() method.

You can refer to the examples on how to support DIME from the $NX_ROOT\samples\sdk\websvc\java\test3_attachments directory.

Example: Visual Basic .NET

This code example illustrates sample Visual Basic .NET code to attach a file using DIME support before calling the createAttachment() web service method.

```
Dim reqContext As SoapContext = objCA SDM_WS.RequestSoapContext
Dim dimeAttach As New DimeAttachment("image/gif",
TypeFormat.MediaType, "c:\test.txt")
reqContext.Attachments.Add(dimeAttach)

strResult = objCA SDM_WS.createAttachment(sid, "doc_rep:1002",
"cr:400001", "my desc", "c:\test.txt")
```

Note: For information about the DIME attachment methods used in the previous sample code, see the Microsoft website. For programs written in other languages, see your documentation for the SOAP implementation that supports DIME.

Example: Java

This code example illustrates sample Java code to attach a file using DIME support before calling the createAttachment() web service method.

```
FileDataSource fds = new FileDataSource(filename);
DataHandler dhandler = new DataHandler(fds);
CA SDM._setProperty(Call.ATTACHMENT_ENCAPSULATION_FORMAT,
Call.ATTACHMENT_ENCAPSULATION_FORMAT_DIME);
```

```
CA SDM.addAttachment(dhandler);

String handle = CA SDM.createAttachment(sid, repHandle, objHandle,
description, filename);
```

removeAttachment

The following parameters apply to the removeAttachment method:

Parameter	Type	Description
SID	Integer	Identifies the SID of the current login session.
attHandle	String	Identifies the object handle of an attachment to be removed.

Description

Removes an attachment from a ticket object. The attached file is then removed from the repository.

Returns

Nothing.

attachURLLinkToTicket

The following parameters apply to the attachURLLinkToTicket method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the unique ID of the ticket.
URL	String	Indicates the URL to attach to the ticket.
attmntName	String	Identifies the name of the attachment.
Description	String	Indicates the description of the attachment.

Description

Attaches a URL link to a ticket.

Example:

```
CA SDM.attachURLLinkToTicket(sid, "cr:400001", "http://www.ca.com", "ca.com", "CA
Technologies Website");
```

Web Services Knowledge Attachment Methods

This article contains the following topics:

This section describes the Web Services Knowledge attachment methods.

createAttmnt

The following parameters apply to the createAttmnt method:

Parameter	Data Type	Description
SID	Integer	Identifies the session retrieved from logging in.
repositoryHandle	String	Identifies the object handle of a document repository.
folderId	Integer	Identifies the folder handle ID.
objectHandle	Int	Identifies the object handle of a Knowledge document to which this attachment is attached.
description	String	Identifies the description for the attachment object.
fileName	String	Identifies the name of the full path of the file to be uploaded.

Description

Uploads a file to the back-end server. An uploaded file is stored in a document repository specified by the repositoryHandle. An attachment object is then created and attached to a document object specified by the objectHandle. The attachment object has all the information for accessing the newly uploaded file in the repository.

Returns

The following:

Parameter	Type	Description
<Handle>	String	Identifies the object handle of the newly created attachment object.

attmntFolderLinkCount

The following parameters apply to the attmntFolderLinkCount method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
folderId	Integer	Identifies the unique ID of the folder

Description

Describes the number of attachment links under a specific folder to be attached.

Returns

Returns the number of attachments found under the specific folder.

attachURLLink

The following parameters apply to the attachURLLink method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the unique ID of the Knowledge document.
URL	String	Indicates the URL to attach to the Knowledge document.
attmntName	String	Identifies the name of the attachment.
Description	String	Indicates the description of the attachment.

Description

Attaches a URL link to a Knowledge document.

Returns

Returns error codes only for *individual* errors. For additional information, see Error Codes.

getKDListPerAttmnt

The following parameters apply to the getKDListPerAttmnt method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
attmntId	Integer	Identifies the unique ID of the attachment.

Description

Returns a list of Knowledge documents with reference to a given attachment.

Returns

A <UDSObject> node with zero or more <UDSObject> nodes describing the Knowledge document with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the Knowledge document.

getAttmntListPerKD

The following parameters apply to the getAttmntListPerKD method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the unique ID of the Knowledge document.

Description

A list of attachments with reference to a given Knowledge document.

Returns

A <UDSObject> node with zero or more <UDSObject> nodes describing the attachment with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the attachment

isAttmntLinkedKD

The following parameters apply to the AttmntLinkedKD method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
attmntId	Integer	Identifies the unique ID of the attachment.

Description

Checks if an attachment is linked to any Knowledge document, and returns the number of links found.

Returns

Any number of links found.

createFolder

The following parameters apply to createFolder method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
parentFolderId	Integer	Identifies the unique ID of the parent folder (zero if no parent).
repId	Integer	Identifies the unique ID of the repository.
folderType	Integer	Identifies the type of folder to be created.
description	String	Identifies the description of the folder.

Parameter	Type	Description
folderName	String	Identifies the name of the folder.

Description

Creates a new folder in the Service Desk repository that is accessed through the Attachments Library.

Note: Folder types other then 0 are hidden folders and can be viewed only by navigating to Attachments Library on the Administration tab. These folders are automatically created by the system during upload and should not be created by the user or Web Services, because their files are private and cannot be shared with other Knowledge Documents, QA or Knowledge Files.

Returns

A <UDSObject> describing the folder created, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
repository	SREL	Identifies the repository name.
parent_id	SREL	Identifies the unique ID of the parent folder.
folder_type	Integer	Identifies the type of folder created.
folder_name	String	Identifies the name of the folder.
description	String	Identifies the description of the folder.

getFolderList

The following parameters apply to getFolderList method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
parentFolderId	Integer	Identifies the unique ID of the parent folder (0 if no parent).
repId	Integer	Identifies the unique ID of the repository.

Description

Returns a list of folders under a given parent folder

Returns

A <UDSObjectList> with zero or more <UDSObject> describing the attachment folder, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
repository	SREL	Identifies the repository name.
parent_id	SREL	Identifies the unique ID of the parent folder.
folder_type	Integer	Identifies the type of folder created.
folder_name	String	Identifies the name of the folder.

XML Element Value	Type	Description
description	String	Identifies the description of the folder.

getFolderInfo

The following parameters apply to the getFolderInfo method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
folderId	Integer	Identifies the unique ID of the attachment folder.

Description

Returns the attributes of a folder.

Returns

A <UDSObject> describing the attachment folder, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
repository	SREL	Identifies the repository name.
parent_id	SREL	Identifies the unique ID of the parent attachment folder.
folder_type	Integer	Identifies the type of attachment folder.
folder_name	String	Identifies the name of the attachment folder.
description	String	Identifies the description of the attachment folder.

getAttmntList

The following parameters apply to the getAttmntList method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
folderId	Integer	Identifies the unique ID of the attachment folder.
repId	Integer	Identifies the unique ID of the repository. This parameter is required only when the folder ID is zero, which indicates the root folder.

Description

Returns a list of attachments under a given attachment folder.

Returns

A <UDSObjectList> with zero or more <UDSObject> describing the attachment, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
repository	SREL	Identifies the repository name.
parent_id	SREL	Identifies the unique ID of the parent folder.
folder_type	Integer	Identifies the type of folder created.
folder_name	String	Identifies the name of the folder.
description	String	Identifies the description of the folder.

getAttmntInfo

The following parameters apply to the getAttmntInfo method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
attmntId	Integer	Identifies the unique ID of the attachment folder.

Description

Returns the attributes of an attachment.

Returns

A <UDSObject> describing the attachment, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the attachment.
description	String	Identifies the description of the attachment.
attmnt_name	String	Identifies the name of the attachment.
file_name	String	Identifies the name of the file.
folder_id	Integer	Identifies the unique ID of the attachment folder.
repository	SREL	Identifies the unique ID of the repository.

getRepositoryInfo

The following parameters apply to the getRepositoryInfo method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
repositoryId	Integer	Identifies the unique ID of the repository.

Description

Returns the attributes of a repository.

Returns

A <UDSObject> describing the repository, with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
repository	SREL	Identifies the repository name.
parent_id	SREL	Identifies the unique ID of the parent attachment folder.
folder_type	Integer	Identifies the type of attachment folder.
folder_name	String	Identifies the name of the attachment folder.
description	String	Identifies the description of the attachment folder.

Web Services Miscellaneous Methods

This article contains the following topics:

This section describes the Web Services Miscellaneous methods.

callServerMethod

The following parameters apply to the callServerMethod method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
methodName	String	Identifies the name of the method to call.
factoryName	String	Identifies the factory name of the object type containing the method.
formatList	String	Identifies the format list, a series of characters describing the intended data types for the incoming parameters. It is related to the Parameter() description in this table).
parameters	String[]	Indicates zero or more parameter values for the method.

Description

Use this method to invoke an arbitrary server-side method. These are methods defined in the proprietary “spell” scripting language.

Only factory methods can be called and the caller must be logged in with full administrative rights.

The format list is a series of zero or more characters that indicate (in order) the data types of the parameters to follow. The character codes are as follows:

- 0 S -- string
- 0 I -- integer (covers dates and duration)
- 0 N -- null

For example, suppose a spell method is defined as follows:

```
cr::DoStuff(int in_one, string in_two, string in_three);
```

Invoke it with the following:

```
callServerMethod("DoStuff", "cr", "ISS", [3, "a string", "another one"]);
```

This method is intended for CA Development and services for customizations only; it is not recommended for most sites.

Returns

Each return message component in its own XML element. The elements are all string representations of the value. The elements are ordered in the return order from the server using the following format:

```
<ServerReturn>
   <Paramx>
```

This call does not support object reference returns. If an object reference is returned by the spell method, the return data is the string, “OBJECT”. This is not an error and any other parameters are also returned.

XML Element	Type	Description
<ServerReturn>	N/A	Indicates the outer element, which contains zero or more <ParamX> elements for return values.
<Paramx>	String	Indicates zero or more for the return values, where *x* is an integer starting at zero and increments for each return element.

You can validate BOPSIDs using check_bopsid. This is invoked with callServerMethod as follows:

```
String bopsid; // somehow gets populated with the BOPSID value
String [] stuff  = new String [] { bopsid };

String ret = usd.callServerMethod
(sid, "check_bopsid", "api", "I", stuff);
```

If the BOPSID validation fails, a SOAP Fault is returned. If validation succeeds, the return value is a small XML structure of the following form:

```
<ServerReturn>
<Param0>CONTACT_PERSID</Param0>
<Param1>SESSION_TYPE</Param1>
<Param2>SESSION_ID</Param2>
```

```
</ServerReturn>
```

- **CONTACT_PERSID**
  Defines the unique persistent id of the validated/trusted contact. It is of the form, "cnt:<uuid>".

- **SESSION_TYPE**
  Defines a small integer id indicating the type of session that generated the BOPSID. This is typically not used by integrators

- **SESSION_ID**
  Defines an optional session id. This is the id of the session that generated the BOPSID. It may or may not be set. This is useful to maintain a user's logical session within CA SDM, especially if the user is "passed" back to CA SDM by another BOPSID.

Note: If the BOPSID validation returns a success, log into CA Support Automation bypassing the login screen, else the CA Support Automation Login screen will be displayed.

createObject

The following parameters apply to the createObject method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ObjectType	String	Identifies the type of object to create (the majic factory name).
attrVals	String[]	Identifies a sequence of name-value pairs used to set the initial attribute values for the new issue. **Note:** Dotted names are not permitted.
attributes	String[]	Identifies a sequence of attribute names from the new object for which to return values. Dot-notation is permitted. If this field is empty, all attribute values are returned.
createObjectResult	StringHolder	Identifies the String Holder object for capturing returned data. See the XML Element Return list below for details.
newHandle	StringHolder	Identifies the String Holder object for capturing returned data. See the XML Element Return list below for details.

Description

Creates a CA SDM object. The caller is responsible for setting any required fields in the *attrVals* parameter. Dotted-names are not permitted.

- **ObjectType**
  Identifies the name for an object type (factory).

- **attrVals**
  Describes the array of name-value pairs used to initialize the new object. For example, the following pseudo-code shows how to create a contact and return a <UDSObject> element with values for all its attributes:

```
String [4] attrVals;

attrVals[0] = "first_name";    // attribute name

attrVals[1] = "Edgar";

attrVals[2] = "last_name";

attrVals[3] = "Martin";

string [0] emptyArray;

CreateObject(sid, "cnt", attrVals, emptyArray, createObjectReturn, newHandle);
```

Note: Do not use this method for new assets, issues, requests, or change orders. Use the specialized createXXX() methods for those object types. This comment also applies if you are using the ITIL methodology -- use the appropriate methods to create Configuration Items, Incidents, and Problems.

Returns

A <UDSObject> element containing the new objects handle, along with attribute values specified in the *attributes* parameter. If the *attributes* parameter is empty, *all* attribute values are returned. List and LREL types are also returned, but as empty elements.

XML Element	Type	Description
<createObjectResult>	N/A	Identifies the standard UDSObject element containing the handle and requested attribute values.
<newHandle>	String	Identifies the new objects handle.

serverStatus

The following parameter applies to the serverStatus method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.

Description

Returns the status of the CA SDM server, that is, whether it is up and ready or shut down.

Note: This method executes rapidly on the server. Calling this method periodically is a good way to keep a SID active.

Returns

The following values apply:

- **1** -- Indicates the Service Desk server is not available
  Note: Any non-zero return code indicates that the server is unavailable, such as 1010.
- **0** -- Indicates the Service Desk server it is running

XML Element	Type	Description
<ServerStatus>	Integer	Identifies the value associated with the server status, zero or 1.

updateObject

The following parameters apply to the updateObject method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
objectHandle	String	Identifies the handle of a CA SDM object to update.
attrVals	String[]	Identifies the name-value pairs for the update.
attributes	String[]	Identifies the sequence of attribute names from the object for which to return values. Dot-notation is permitted. If this field is empty, all attribute values are returned.

Description

Updates one or more attributes for the specified object.

To set values for the object, the caller passes a single-dimensional array of attribute name-value pairs. The first half of the pair is an attribute name; the second is the actual value. Dotted-names are not permitted.

To update an attribute that is a Pointer type (for example, the customer field on a request) a handle must be used for the value. For Integer, Date, and Duration types, pass the string representation of an integer.

For example, to update a request with a new assignee, description and priority, the array would appear as follows:

```
[0]  -  "assignee"
[1]  -  "cnt:555A043EDDB36D4F97524F2496B35E75"  (a contact Handle)
[2]  -  "description"
[3]  -  "My new description"
[4]  -  "priority"
```

```
[5]  -  "pri:38903"  (a priority Handle)
```

If the update fails for any reason, the entire operation aborts and no changes occur.

Note: When updating a task, set the status value last in the attribute array.

Returns

A <UDSObject> element containing the updated object's handle, along with attribute values specified in the *attributes* parameter. If the *attributes* parameter is empty, *all* of the attribute values are returned. List and LREL types are also returned (see page 3980), but as empty elements.

Web Services Knowledge Management

This article contains the following topics:

To use the Web Services Knowledge Management, it is helpful if you are familiar with the database structure.

Table Types

Some of the more important tables are described as follows:

Table Type	Description
skeleton	Stores all information pertaining to documents with each row representing one document. Field names from this table can be used when passing the PropertyList and SortBy parameters to methods such as FAQ() and Search(). The field names are case-sensitive so make sure you pass them just as they are in the database.
o_indexes	Stores all information pertaining to categories with each row representing one category.

Knowledge Management General Methods

This section describes Knowledge Management general methods. Valid Knowledge document sorting properties (when available) are as follows:

- RELEVANCE
- AUTHOR_ID
- BU_RESULT
- CREATION_DATE
- DOC_TYPE_ID
- EXPIRATION_DATE
- HITS
- id
- MODIFY_DATE
- OWNER_ID
- PRIORITY_ID
- ACCEPTED_HITS
- ASSET_ID
- SD_ASSET_ID
- ASSIGNEE_ID
- PRODUCT_ID

- START_DATE
- STATUS_ID
- SUBJECT_EXPERT_ID

faq

The following parameters apply to the faq method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
categoryIds	String	Identifies the category ID used to perform the faq. Use 1 for the 'Root' category. **Note:** Multiple ids are supported, for example, "1, 2, 3".
resultSize	Integer	Identifies the number of documents for which you want to retrieve detailed information. For the rest of the documents, only their IDs return. Detailed information for these documents can be accessed later using the getDocumentsByIDs() method. The default is 10.
propertyList	String	Identifies the comma-separated list of database fields from which you want to retrieve information. The following fields are always returned, regardless of the propertyList parameter: id DOC_TYPE_ID BU_RESULT
sortBy	String	Identifies the database field that you want to use for sorting the results. Multiple sort fields are not supported. The default is BU_RESULT, meaning that the faq rating sorts it. When id is used as a secondary sort, it always sorts the results.
descending	Boolean	Identifies an indicator available for sorting the results in descending order.
whereClause	String	Use this to add your own 'SQL where clause' for filtering the results of the search.
maxDocIds	Integer	Identifies the maximum amount of document IDs to be returned (the default is 100). For example, if you specify a resultSize of 10 and a maxDocIds of 50, if there are 100 matching documents in the database, then 10 have their detailed information retrieved and 40 have just their IDs returned. The remaining 50 are not returned at all.

Description

Use to perform a faq search. Documents are retrieved based on the category ID that is passed. Any documents residing in that category or in any sub-category are returned. To improve performance, these methods only retrieve detailed information on a user-defined set of documents, which is controlled through the resultSize parameter. The rest of the documents return their IDs only. Using this method, you can for example, set up a paging mechanism where the user can click on 'Top', 'Previous', 'Next', and 'Bottom' links. When you need to retrieve the next set of information, you can use the getDocumentsByIDs() method. The maximum number of 100 IDs is returned.

Returns

A <UDSObjectList> node with the following sections:

<UDSObject> node from the <UDSObject> Node Description section of this chapter. There is a <UDSObject> node with all the given properties for the first *n* documents that the method finds where *n* equals the resultSize parameter.

For example, if the resultSize parameter is 10, the maxDocIDs parameter is 50, and the method finds 100 documents, then there are 10 <UDSObject> with <Attributes> nodes in the first<UDSObject> section with detail attribute information from propertyList parameter and 40 <UDSObject> nodes with only ID <Attributes> in the following section. If you want to retrieve detailed ID <AttrName> information for documents numbering 11-20, you have to make a call to the getDocumentsByIDs() method and pass it those IDs from <AttrValue>.

search

The following parameters apply to the search method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
problem	String	Identifies the problem description to which you want to find solutions.
resultSize	Integer	Identifies the number of documents for which you want to retrieve detailed information. The remaining documents have their IDs returned only. Detailed information for these documents can be accessed later using the getDocumentsByIDs() method. The default is 10.
propertyList	String	Identifies the comma-separated list of database fields from which you want to retrieve information. The following fields are always returned, regardless of the propertyList parameter: id DOC_TYPE_ID
sortBy	String	Identifies the database field that you want to use for sorting the results. Multiple sort fields are not supported. The default is RELEVANCE. When id is a secondary sort, it always sorts the results. For a valid sort property, see the faq method.
descending	Boolean	Identifies an indicator you can use for sorting the results in descending order.
relatedCategories	Boolean	Returns a list of all related categories for the documents found.
searchType	Integer	Type of search to perform: 1 = Natural Language Search (NLS) 2 = Knowledge Management search
matchType	Integer	Represents the type of match: 0 = OR type match 1 = AND type match 2 = Exact match **Note:** If NLS is selected for the searchType parameter, then only the OR and AND matchTypes are valid.
searchField	Integer	

Parameter	Type	Description
		Represents the binary combination of fields in which to search: Title = 1 Summary = 2 Problem = 4 Resolution = 8 For example, to search all fields, specify 15 (1+2+4+8). To search in Summary and Problem only, specify 6 (2+4). **Note:** The default is to search Problem. If you set the searchType parameter to NLS, the searchFields parameter is ignored because NLS searches can only search the Problem field.
categoryPath	String	Limits the results of the search to a specific category or categories. You need to specify the full ID path to the category and separate multiple categories with commas. For example, 1-3-5, 1-4-8 to limit the search to categories 5 and 8 (and their sub-categories).
whereClause	String	Use this to add your own 'SQL where clause' for filtering the results of the search.
maxDocIds	Integer	Represents the maximum amount of document IDs allowed to be returned. For example, if you specify a resultSize of 10 and a maxDocIds of 50, if there are 100 matching documents in the database, then 10 have their detailed information retrieved, and 40 have just their IDs returned. The remaining 50 are not returned at all. The default is 100.

Description

Searches for solutions to a problem. Documents are retrieved based on the problem that is passed. Any documents matching the description of the problem or a similar description, are returned. To improve performance, these methods only retrieve detailed information on a user-defined set of documents, which is controlled through the resultSize parameter. The rest of the documents return their ids only. Using this method, you can for example, set up a paging mechanism, where the user can click on 'Top', 'Previous', 'Next', and 'Bottom' links. When you need to retrieve the next set of information, you can use the getDocumentsByIDs() method.

Returns

A <UDSObjectList> node with the following sections:

<UDSObject> node from the <UDSObject> Node Description section of this chapter. There will be a <UDSObject> node with all the given properties for the first *n* documents that the method finds, where *n* equals the resultSize parameter. For example, if the resultSize parameter is 10, the maxDocIds parameter is 50, and the method finds 100 documents, then there are 10 <UDSObject> nodes with all the properties requested in the <Attributes> section and 40 <UDSObject> with only the ID property in the <Attributes> section. If you want to retrieve detailed <UDSObject> information for documents 11-20, you need to make a call to the getDocumentsByIDs() method and pass it those IDs.

If the getRelatedCategories parameter is set to True, the <UDSObjectList> node is included in the <Attributes> section for related categories. Each <INDEX_DOC_LINKS> node contains the relational ID of the category, as shown by the following example:

```
1-70
```

doSelectKD

The following parameters apply to the doSelectKD method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
whereClause	String	(Optional) Identifies the where clause for the query.
sortBy	String	Identifies the database field that you want to use for sorting the results. Multiple sort fields are not supported. The default is BU_RESULT, meaning that the faq rating sorts it. When id is used as the secondary sort, it always sorts the results.
desc	Boolean	Identifies the indicator available for sorting the results in descending order. Use True for descending and False for ascending the document order.
maxRows	Integer	Indicates the maximum number of rows to return. Specify -1 to return all rows. **Note:** Regardless of the integer specified, CA SDM will return a maximum of 250 rows per call.
attributes	String[]	Identifies the attribute list from which to fetch values. Dotted-attributes are permitted. If this field is blank, all value-based attributes are returned. These attributes cannot be defined as LOCAL in the majic definition file. LOCAL attributes are temporal; they have no database storage.
skip	Integer	Identifies the number of knowledge documents to skip from the beginning. Enter zero (0) to return all documents.

Description

Performs an SQL-like select on a Knowledge Document table. Supply one or more attributes you want fetched from the objects that match the supplied where clause.

Returns

A sequence of <UDSObject> elements. The following format applies:

```
<UDSObjectList>
<UDSObject>
 <Handle>
 <Attributes>
<AttributeName0>
<AttributeName1>
```

XML Element	Type	Description
<UDSObject>	Sequence	Contains a <Handle> element and an <Attributes> sequence.
<UDSObjectList>		Signifies the outer element, which contains a sequence of <UDSObject (see page 3980)> elements.

createDocument

The following parameters apply to the createDocument method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.
kdAttributes	String[]	Identifies an array of name-value pairs used to set the initial attribute values for the new Knowledge document, as illustrated by the following: `"SUMMARY","Summary text",` "TITLE","Title text"

As part of the createDocument method, the following table reflects examples of valid, commonly used attribute values for a document. Data in the Type column reflect the actual type, which must be parsed to the method in string format in the attrVals string array.

Attribute Value	Type	Description
PRIMARY_INDEX	Integer	Identifies the category ID in which to create the document. Use 1 for the *Root* category.
USER_DEF_ID	String	Identifies any ID that you would like to use to represent the document.
TITLE	String	Identifies the title of the document.
SUMMARY	String	Identifies the summary of the document.
PROBLEM	String	Identifies the problem of the document.
RESOLUTION	String	Identifies the resolution of the document. This can contain html.
STATUS_ID	Integer	Identifies the status ID for the document. The default is 10 (Draft).
PRIORITY_ID	Integer	Identifies the priority ID for the document. The default is 20 (Normal).
CREATION_DATE	Date (String)	Identifies the date and time the document was created. Leave blank to assign current date.
MODIFY_DATE	Date (String)	Identifies the date and time the document was last modified. Leave blank to assign the current date.
START_DATE	Date (String)	Identifies the date the document becomes active and is used in conjunction with Expiration_Date. Leave blank to specify no start date and the document will be active as long as the expiration date has not been reached.

Attribute Value	Type	Description
EXPIRATION_DATE	Date (String)	Identifies the date the document expires, and it is used in conjunction with Start_Date. Leave blank to specify no expiration date.
PUBLISHED_DATE	Date (String)	Identifies the date and time the document was published. Leave blank to assign current date if the status is Published. If the status is not Published, this parameter is ignored.
SD_PRODUCT_ID	Integer	Identifies the product ID from CA SDM with which to associate this document.
ASSIGNEE_ID	UUID	Identifies the unique assignee ID from CA SDM to which this document is assigned.
SD_ASSET_ID	UUID	Identifies the asset ID from CA SDM with which to associate this document.
SD_ROOTCAUSE_ID	Integer	Identifies the root cause ID from CA SDM with which to associate this document.
SD_PRIORITY_ID	Integer	Identifies the priority ID from CA SDM with which to associate this document.
SD_SEVERITY_ID	Integer	Identifies the severity ID from CA SDM with which to associate this document.
SD_IMPACT_ID	Integer	Identifies the impact ID from CA SDM with which to associate this document.
SD_URGENCY_ID	Integer	Identifies the urgency ID from CA SDM with which to associate this document.
AUTHOR_ID	UUID	Identifies the unique ID of the contact who authored this document. If the author is not an internal contact, you can set this field to zero and use the Author parameter instead.
OWNER_ID	UUID	Identifies the unique ID of the contact who owns this document.
SUBJECT_EXPERT_ID	UUID	Identifies the unique ID of the contact who is the subject expert for this document.
NOTES	String	Identifies the notes for the document.
READ_GROUP_LIST	String	Identifies the dash-separated list of group IDs that have read permission for this document (for example: 1-3-4). Use *A* to assign permission to everyone.
WRITE_GROUP_LIST	String	Identifies the dash-separated list of group IDs that have write permission for this document (for example: 1-3-4). Use *A* to assign permission to everyone.
INHERITPERMISSIONS	Boolean	Indicates the status of the flag to inherit permissions from the category in which the document is being created. Set to True if you want to inherit permissions, and then ReadPermissions and the WritePermissions parameters will be ignored.

Attribute Value	Type	Description
DOC_TYPE_ID	Integer	Identifies the ID for the type of document that this document will be; a regular document or a tree document. The default is a regular document.
HITS	Integer	Identifies the number of times that the document has been viewed.
DOC_TEMPLATE_ID	Integer	Identifies the ID for the template you want to assign to this document.
WF_TEMPLATE	Integer	Identifies the ID for the workflow template you want to assign to this document.
CUSTOM1	String	Specifies a custom field.
CUSTOM2	String	Specifies a custom field.
CUSTOM3	String	Specifies a custom field.
CUSTOM4	String	Specifies a custom field.
CUSTOM5	String	Specifies a custom field.
CUSTOM_NUM1	Double	Specifies a numeric custom field.
CUSTOM_NUM2	Double	Specifies a numeric custom field.

Description

Creates a new document.

Returns

A <UDSObject> node describing the Knowledge Document created.

modifyDocument

The following parameters apply to the modifyDocument method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the unique ID of the document you want to modify.
kdAttributes	String[]	Specifies the name-value pairs for the update, for example, “SUMMARY”, ”Summary text”, “TITLE”, and “Title text”.

As part of the modifyDocument method, the following table reflects examples of valid, commonly used attribute values for a document. Data in the Type column reflect the actual type, which must be parsed to the method in string format in the attrVals string array.

Parameter	Type	Description
MODIFY_DATE	(String)	Indicates a special field used for "record locking" purposes to make sure that someone else is not updating the document at the same time that you are. You must pass in the existing MODIFY_DATE of the document. If you leave the modify date blank, you receive an error that another user has updated the document.
USER_DEF_ID	String	Specifies any ID that you want to use to represent the document.
TITLE	String	Indicates the title of the document.
SUMMARY	String	Indicates the summary of the document.
PROBLEM	String	Indicates the problem of the document.
RESOLUTION	String	Indicates the resolution of the document. This can contain html.
STATUS_ID	Integer	Indicates the status ID for the document. The default is 10 (Draft).
PRIORTY_ID	Integer	Indicates the priority ID for the document. The default is 20 (Normal).
START_DATE	Date (String)	Indicates the date that the document becomes active, which is also used in conjunction with ExpirationDate. Leave blank to specify no start date and the document becomes active as long as the expiration date is not exceeded.
EXPIRATION_DATE	Date (String)	Indicates the date that the document expires, which is used in conjunction with StartDate. Leave blank to specify no expiration date.
SD_PRODUCT_ID	Integer	Indicates the product ID from CA SDM with which to associate this document.
ASSIGNEE_ID	UUID	Indicates the unique ID from CA SDM to which this document is assigned.
SD_ASSET_ID	UUID	Indicates the asset ID from CA SDM with which to associate this document.
SD_ROOT CAUSE_ID	Integer	Indicates the root cause ID from CA SDM with which to associate this document.
SD_PRIORITY_ID	Integer	Indicates the priority ID from CA SDM with which to associate this document.
SD_SEVERITY_ID	Integer	Indicates the severity ID from CA SDM with which to associate this document.
SD_IMPACT_ID	Integer	Indicates the impact ID from CA SDM with which to associate this document.
SD_URGENCY_ID	Integer	Specifies the urgency ID from CA SDM with which to associate this document.

Parameter	Type	Description
AUTHOR_ID	UUID	Identifies the unique ID of the contact who authored this document. If the author is not an internal contact, you can set this filed to zero (0) and use the Author parameter instead.
OWNER_ID	UUID	Identifies the unique ID of the contact who owns this document.
SUBJECT_EXPERT_ID	UUID	Indicates the unique ID of the contact who is the subject expert for this document.
NOTES	String	Indicates notes for the document.
READ_GROUP_LIST	String	Indicates the dash-separated list of group ids that have read permission for this document (for example: 1-3-4). Use *A* to assign permission to everyone.
WRITE_GROUP_LIST	String	Indicates the dash-separated list of group IDs that have write permission for this document (for example: 1-3-4). Use *A* to assign permission to everyone.
INHERIT_PERMISSION	Boolean	Indicates the status of the inherit permissions flag. Set to True if you want to inherit permissions from the category in which the document is being created. If set to True, the ReadPermissions and WritePermissions parameters are ignored.
DOC_TYPE_ID	Integer	Identifies the ID for the type of document that this document is to become; a regular document or a tree document. The default is a regular document.
HITS	Integer	Indicates the number of times that the document has been viewed.
DOC_TEMPLATE_ID	Integer	Identifies the ID for the template you want to assign to this document.
WF_TEMPLATE	Integer	Identifies the ID for the workflow template you want to assign to this document.
WF_ACTION	String	Identifies the action for the workflow you want to assign to this document. For example, wf_unpublish lets the document become unpublished.
WF_COMMENT	String	Identifies the comment for the workflow you want to assign to this document. For example, unpublish.
WF_CONTACT_ID	UUID	Identifies the user id for the workflow you want to assign to this document.
WF_REJECT_TO_ID	Integer	Identifies the task id for the workflow you want to assign to this document, matching its approval process. Task ids are stored in the CI_ACTIONS table.
CUSTOM1	String	Indicates a custom field.
CUSTOM2	String	Indicates a custom field.
CUSTOM3	String	Indicates a custom field.
CUSTOM4	String	Indicates a custom field.
CUSTOM5	String	Indicates a custom field.

Parameter	Type	Description
CUSTOMNUM1	Double	Indicates a numeric custom field.
CUSTOMNUM2	Double	Indicates a numeric custom field.

Description

Modifies a document.

Returns

A <UDSObject> node describing the Knowledge Document modified.

deleteDocument

The following parameters apply to the deleteDocument method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the unique ID of the document you want to delete.

Description

Flags a document for deletion. The Knowledge Management Windows Service permanently deletes the document.

Returns

Returns error codes only when there are *individual* errors. For additional information, see Error Codes.

Use the Knowledge Management Web Services

The login process and any error codes that may display for the Knowledge Management Web Services are the same as those found for the CA SDM Web Services. For additional information, see Login and Error Codes.

Access the Knowledge Management Web Services

The Knowledge Management Web Services uses Apache Axis implementation of standards set forth by the W3C. Ideally, a client on any type of platform should be able to access the services, but vendor implementations vary. For example, Java and .NET both provide tools for generating proxy classes from a WSDL service description. If you experience any issues using the Web Services with a different technology, consult your platform vendor or Microsoft's knowledge base.

addComment

The following parameters apply to the addComment method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
comment	String	Identifies the comment to add.
docId	Integer	Identifies the document ID for the comment you want to add.
email	String	Indicates the email address of the person who submitted the comment. Leave blank if you want the email address retrieved from the database based on the user ID parameter.
username	String	Indicates the user name of the person who submitted the comment. Leave blank if you want the user name retrieved from the database based on the user id parameter.
contactId	String	Indicates the ID of the person submitting the comment. If this contact ID exists in the database, the associated email and user name are retrieved and placed in the email and user name fields. If this ID does not exist, the email and user name parameters are used instead, if supplied. Use zero (0) if you are not using this parameter. Contact ID is UUID in string format.

Description

Adds a comment to a particular document.

Returns

A <UDSObject> node with the following<Attributes> child nodes describing the comment most recently added:

XML Element Value	Data Type	Description
id	Integer	Identifies the unique identifier for the comment most recently added.
DOC_ID	Integer	Identifies the document ID for the comment most recently added.
USER_ID	Integer	Identifies the ID of the person who submitted the comment.
USER_NAME	String	Identifies the user name of the person who submitted the comment.
EMAIL_ADDRESS	String	Identifies the email address of the person who submitted the comment.
COMMENT_TEXT	String	Identifies the text for the comment recently added.
COMMENT_TIMESTAMP	Date	Identifies the date and time the comment was added.

deleteComment

The following parameters apply to the deleteComment method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
commentId	Integer	Identifies the unique ID for the comment you want to delete.

Description

Deletes a comment.

Returns

Returns error codes only for *individual* errors. For additional information, see Error Codes.

rateDocument

The following parameters apply to the rateDocument method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docId	Integer	Identifies the document ID to rate.
rating	Integer	Identifies the rating to give the document (a scale of 0-4, where 0 is the worst and 4 is the best).
multiplier	Integer	Identifies the multiplier parameter. This parameter can be used to simulate many ratings at once. Use the default of 1 for a single rating and any other number for multiples. For example, if you submit 3, it acts as if you called the method 3 times. Three ratings with the value you supplied in the rating parameter is added to the database.
ticketPerId	String	Identifies the persistent ID of a ticket related to this Knowledge document.
onTicketAccept	Boolean	Identifies whether the document was accepted as a solution for the ticket.
solveUserProblem	Boolean	Identifies whether this document solved the user's problem. It signifies how the user responded to the question "Did this document solve your problem?" on the Solution Survey.
isDefault	Boolean	Indicates a default rating status. If you are setting the rating just because the user viewed the document and not because he actually rated it, set this to True. This is used for reporting reasons.

Description

Rates a particular document.

Returns

A <UDSObject> node with the following <Attributes> children nodes describing the rating BU_TRANS :

XML Element Value	Data Type	Description
id	Integer	Identifies the unique identifier for the rating most recently added. Use this with the updateRating() method if you want to modify the rating at a later time.
DOC_ID	Integer	Identifies the document ID.
INDEX_ID	Integer	Identifies the category ID.
BU_RATING	String	Identifies the rating given to the document.
HIT_NO_VOTE	Integer	Identifies the rating set because a user viewed the document and not actually rated it, or vice versa.

updateRating

The following parameters apply to the updateRating method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
buID	Integer	Identifies the unique ID of the rating you want to modify. This ID is returned by the rateDocument() method.
rate	Integer	Identifies the new rating to apply to the document (a scale of 0 -- 4, where 0 is the worst and 4 is the best).

Description

Updates one of the ratings of a particular document.

Returns

A <UDSObject> node describing BU_TRANS with the updated rating attribute.

getQuestionsAsked

The following parameters apply to the getQuestionsAsked method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.
resultSize	Integer	Identifies the number of searched text for which you want to retrieve detailed information.
Descending	Boolean	Indicates an option available for sorting the results in descending order of the ASKED_DATE.

Description

Retrieves historical Knowledge document search text.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing EBR_LOG with the following <Attributes> child nodes:

XML Element Value	Data Type	Description
id	Integer	Indicates the unique identifier of the question asked.
SEARCH_TEXT	Integer	Indicates the search text of the question asked.

getBookmarks

The following parameters apply to the getBookmarks method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.
contactId	String	Identifies the unique ID of the contact for which you want to retrieve bookmarks. Contact ID is UUID in string format.

Description

Retrieves bookmarks for a particular contact.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing CI_BOOKMARKS with the following <Attributes> child nodes:

XML Element Name	Type	Description
DOCUMENT_ID	Integer	Identifies the unique ID of the document.
id	Integer	Identifies the bookmark ID
USER_ID	String	Identifies the user ID for the owner of this bookmark.
BOOKMARK_TITLE	String	Identifies the bookmark title from the document.

addBookmark

The following parameters apply to the addBookmark method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contactId	String	Identifies the unique ID of the contact for which you want to retrieve bookmarks. Contact ID is UUID in string format.
docId		Identifies the document ID you want to bookmark.

Parameter	Type	Description
	Integer	

Description

Adds a bookmark for a particular contact.

Returns

A <UDSObject> node describing the newly created bookmark.

deleteBookmark

The following parameters apply to the deleteBookmark method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contactId	String	Identifies the unique ID of the contact for which you want to delete a bookmark. Contact ID is UUID in string format
docId	Integer	Identifies the document ID of the bookmark you want to remove.

Description

Deletes a bookmark for a particular contact.

Returns

Returns error codes only for *individual* errors. For additional information, see Error Codes.

getStatuses

The following parameter applies to the getStatuses method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.

Description

Retrieves the list of statuses.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing CI_STATUSES with the following <Attributes> child nodes:

XML Element Values	Data Type	Description
id	Integer	Identifies the unique ID of the status.
STATUS	String	Identifies the name for the status.
STATUS_DESCRIPTION	String	Identifies the description for the status.
PREDEFINED	Integer	Indicates whether the status is predefined by the Knowledge Management system, meaning that it cannot be deleted.
STATUS_ORDER	Integer	Describes the order by which the status should appear in the Workflow task list. Workflows can only be created when they follow this order.

getPriorities

The following parameter applies to the getPriorities method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.

Description

Retrieves the list of priorities.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing CI_PRIORITIES with the following <Attributes> child nodes:

XML Element Values	Data Type	Description
id	Integer	Identifies the unique ID of the priority.
PRIORITY	String	Identifies the name for the priority.

getDocumentTypes

The following parameter applies to the getDocumentTypes method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.

Description

Retrieves the list of document types.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing CI_DOC_TYPES with the following <Attributes> child nodes:

XML Element Values	Data Type	Description
id	Integer	Identifies the unique ID of the document type.
DOC_TYPE_TXT	String	Identifies the name for the document type.

getTemplateList

The following parameter applies to the getTemplateList method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.

Description

Retrieves the list of document templates

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing CI_DOC_TEMPLATES with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the document type.
TEMPLATE_NAME	String	Identifies the name for the document template.
IS_PREDEFINED	Integer	Indicates whether the template is predefined by the Knowledge Management system and cannot be deleted.
IS_DEFAULT	Integer	Indicates whether the template is the default that will be assigned to new documents.

getWorkflowTemplateList

The following parameter applies to the getWorkflowTemplateList method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.

Description

Retrieves the list of workflow templates.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing WF_TEMPLATE with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the workflow template.
WF_NAME	String	Identifies the name for the workflow template.
WF_DESCRIPTION	String	Identifies the description for the workflow template.
IS_DEFAULT	Integer	Indicates that the default template is to be assigned to new documents.

getCategory Method

This article contains the following topics:

The following parameters apply to the getCategory method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
categoryId	Integer	Identifies the category ID in which to create the document.
getCategoryPaths	Boolean	Indicates the path for which to get category information. It returns category information and the full text category path for each category.

Description

Retrieves information for a category, including a listing of all of its child categories.

Returns

A <UDSObjectList> node with an <UDSObject> node describing the category requested.

getPermissionGroups

The following parameters apply to the getPermissionGroups method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
groupID	Integer	Returns only the group with this ID. Pass zero (0) when you do not want to use this parameter. **Note:** This groupID relates to a knowledge category, and differs from the groupID for contacts.

Description

Retrieves the list of Permission Groups.

Returns

A <UDSObject> node with zero or more <UDSObject> nodes describing Permission Group with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	Integer	Identifies the unique ID of the group.
GRP_LIST_KEY	String	Shows a list of the IDs of CA SDM groups, separated by commas.
GRP_LIST	String	Displays a field containing the entire group list.

getComments

The following parameters apply to the getComments method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docIds	String	Identifies the document IDs for all the comments you want to retrieve. **Note:** Use commas to separate, for example, "400001,400002".

Description

Gets all the comments from documents.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing O_COMMENTS with the following <Attributes> child nodes:

XML Element Value	Data Type	Description
id	Integer	Identifies the unique identifier for the comment most recently added.
DOC_ID	Integer	Identifies the document IDs for the comment recently added.

XML Element Value	Data Type	Description
USER_ID	Integer	Identifies the ID of the person who submitted the comment.
USER_NAME	String	Identifies the user name of the person who submitted the comment.
EMAIL_ADDRESS	String	Identifies the email address of the person who submitted the comment.
COMMENT_TEXT	String	Identifies the text for the comment recently added.
COMMENT_TIMESTAMP	Date	Identifies the date and time the comment was added.

getDecisionTrees

The following parameters apply to the getDecisionTrees method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
propertyList	String	Identifies the comma-separated list of database fields for which you want to retrieve information. The following fields are always returned, regardless of the propertyList parameter: id DOC_TYPE_ID BU_RESULT
sortBy	String	Identifies the database field that you want to use for sorting the results. The default is id. Multiple sort fields are not supported. If you specify another field, id as a secondary sort always sorts the results.
descending	Boolean	Identifies an indicator available for sorting the results in descending order.

Description

Retrieves all Decision Trees. Decision trees are Knowledge Documents that provide users with resolutions after answering specific questions on the document.

Returns

A <UDSObjectList> node with the following sections:

```
<UDSObject> nodes with requested <Attributes> nodes
```

getDocument

The following parameters apply to the getDocument method:

Parameter	Type	Description
SID		Identifies the session retrieved from logging in.

Parameter	Type	Description
	Integer	
docId	Integer	Identifies the document ID to retrieve.
propertyList	String	Identifies the comma-separated list of database fields from which you want to retrieve information. Leave blank to retrieve all fields.
relatedDoc	Boolean	Indicates whether to retrieve a list of documents that are related to this document.
getAttmnt	Boolean	Indicates whether to retrieve the list of attachments and URL links for the document.
getHistory	Boolean	Indicates whether you want to retrieve the complete history for the document.
getComment	Boolean	Indicates whether you want to retrieve all comments for the document.
getNotiList	Boolean	Indicates whether you want to retrieve the email notification list for the document.

Description

Retrieves information for a document.

Returns

A <UDSObject> node, as described in the <UDSObject> Node Description, with requested <Attributes> provided by the propertList parameter.

getDocumentsByIDs

The following parameters apply to the getDocumentsByIDs method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
docIds	String	Identifies the comma-separated list of document IDs to retrieve.
propertyList	String	Identifies the comma-separated list of database fields for which you want to retrieve information. The following fields are always returned, regardless of the propertyList parameter: id DOC_TYPE_ID BU_RESULT
sort By	String	Identifies the database field that you want to use for sorting the results. The default is id, but multiple sort fields are not supported. If you specify another field, id as a secondary sort always sorts the results.
descending	Boolean	Identifies an indicator available for sorting the results in descending order.

Description

Retrieves information on one or more documents by passing the document IDs for which you want to retrieve information. This is usually used after calling the faq() or search() methods. In order to improve performance, these methods only retrieve detailed information on a user-defined set of documents. The rest of the documents return their IDs only. For example, you can set up a paging mechanism, where the user can click on Top, Previous, Next, and Bottom links. When you need to retrieve the next set of information, you can use the getDocumentsByIDs() method.

Returns

A <UDSObjectList> node with the following section:

```
<UDSObject> nodes with requested <Attributes> nodes describing Knowledge Document
```

You should pass the IDs into the getDocumentsByIDs() docIds parameter in this same format.

getBopsid

The following parameters apply to the getBopsid method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contact	String	Identifies the name of the user associated with the returned BOPSID. **Note:** This is the system login name, not the CA SDM contact name.

Description

Facilitate the building of Web Interface URLs, which may be used to launch the Web Interface in the context of a given user without a login challenge. The URL may look similar to the following:

```
http://host/CAisd/pdmweb.exe?BOPSID=nnnnn+OP=xxxx...
```

To launch the Web Interface in the context of a given user (for example, an analyst), a calling application must first construct a Web Interface URL, which includes a BOPSID token (a web-interface security token). Failure to provide a BOPSID token may result in an interactive login challenge when attempting to launch the Web Interface in the chosen context (such as, a detail view of a given ticket). The getBopsid method allows the BOPSID to be generated in the context of the user provided by the Name parameter. If the Name parameter is not provided, it uses the user associated with the current Web Interface BOPSID.

Note: To prevent unauthorized elevation of privileges, the BOPSID of the current login must have equal or greater access rights than the name of the user entered.

Returns

A BOPSID based on the name of the user entered. You must use the BOPSID to launch the Web Interface within 30 seconds of it being generated.

Note: The BOPSID of the current login must have equal or greater access rights than the name of the user entered.

getConfigurationMode

The following parameters apply to the getConfigurationMode method:

Parameter	Type	Description
SID	Integer	Identifies the SID of the current login session.

Description

This method returns a string indicating if the CA SDM installation is in the ITIL mode.

Returns

A string "itil" if the installation is in ITIL mode. Otherwise, an empty string is returned.

getObjectValues

The following parameters apply to the getObjectValues method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
objectHandle	String	Identifies the handle of a CA SDM object to query.
attributes	String[]	Identifies the names of attributes to fetch. If this field is empty, all the attributes for the object are returned. **Note:** Dot-names for attributes are only supported for SREL type attributes, and not for LREL/BREL/QREL type attributes.

Description

This method returns the attribute values of an object. The caller passes one or more attribute names to fetch the object and dotted-names are permitted.

All values are returned as a string. Empty/null attributes are returned as empty strings.

Returns

A <UDSObject (see page 3980)> element.

XML Element	Type	Description
<UDSObject>	N/A	Contains a <Handle> element and zero or more <AttributeNameX> elements.

getObjectTypeInformation

The following parameters apply to the getObjectTypeInformation method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
factory	String	Identifies the object type (known as 'factory') to query. This is the majic name of the object, for example: "cr" = Request

Description

A list of all attribute names for a given object type, along with type information for each attribute. Information returned for the attribute's type includes the Integer, String, Date, Pointer, List, and so on, if the attribute is required for back-storing its storage space requirements (if appropriate).

Callers should cache the type information requested per object type to avoid multiple, redundant (and expensive) calls. The attribute information can change only after modifications are performed on the CA SDM server and the service is recycled.

Returns

The following:

XML Element	Type	Description
<UDSObject>	N/A	Indicates the root node.
<Attributes>	Sequence	Indicates zero or more elements for each attribute.
<attrName DataType="dataType" Size="storageSize" Required="Boolean" Factory="factoryName">	EmptyElement	Indicates an element with a name matching an object attribute name. The element has several attributes: **DataType**Signifies the integer representation of the data type. **Size**Represents the maximum size needed to store this attribute in a string. **Required**Represents the flag status of True if this attribute must be set for the object to back store. **Factory**Represents the Type name of the object if the attribute is a List, Lrel or Pointer type. It is not written unless it is a Llist, Lrel, or Pointer type data type.

getArtifact

The following parameters apply to the getArtifact method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.

Parameter	Type	Description
contact	String	Identifies the name of the user associated with the returned ARTIFACT. **Note:** This is the system login name, not the contact name for CA Service Desk Manager.
password	String	Identifies the password.

Description

Facilitates the building of Web Interface URLs, which may be used to launch the Web Interface in the context of a given user without a login challenge. The URL may look similar to the following:

```
http://host/CAisd/pdmweb.exe?USERNAME=xxxxx+ARTIFACT=nnnnn+OP=xxxx....
```

To launch the Web Interface in the context of a given user (for example, an analyst), a calling application must first construct a Web Interface URL, which includes an CA EEM ARTIFACT token (a web-interface security token). Failure to provide a CA EEM ARTIFACT token may result in an interactive login challenge when attempting to launch the Web Interface in the chosen context (such as, a detail view of a given ticket). The getArtifact method allows the CA EEM ARTIFACT to be generated in the context of the user provided by the contact parameter.

Note: Service Desk needs to be integrated with CA EEM to perform this operation.

Returns

An CA EEM ARTIFACT based on the name of the user entered. You can use the ARTIFACT to launch the Web Interface only once.

LREL Methods

This article contains the following topics:

LREL methods supply information about object relationships. Objects with relationships have a left-hand side (lhs) and right-hand side (rhs) definition to describe many-to-many relationships. Some examples of many-to-many relationships include the following:

- Issues and configuration items
- Contacts and configuration items
- Task types and status codes

When working with LREL methods, the BREL or LREL attribute describe many-to-many relationships. The BREL attribute replaces the LREL attribute to define many-to-many relationships. However, the LREL attribute remains backward compatible with previous releases. You declare each relationship in a .maj file and then your code uses the LREL methods, such as *CreateLrelRelationship()*, with the existing web service client code.

Note: When working with group object management, you can use the special web methods to define a member that belongs to a group.

You declare the relationship using the BREL attribute to define relationships in majic files. For example, the following statement declares a many-to-many relationship for the Change Order (chg) object in change.maj:

```
asset BREL lrel_asset_chgnr chg {LREL nr;};
```

The *BREL* attribute for the change order named, "asset" is a list of all associated configuration items. The optional, LREL flag is an attribute that describes a set of owned resources. The corresponding majic definition of the Configuration Item (nr) includes the following:

```
chgnr BREL lrel_asset_chgnr nr {LREL chg;};
```

The *chgnr* attribute is a list of all change orders for a configuration item.

In your code, you can discover how many configuration items are associated with a change order, call *getLrelLength()* with the following parameters:

```
getLrelLength(sid, ChangeHandle, "asset")
```

You use the *sid* parameter for the Service ID from a login method. The *ChangeHandle* parameter is a string handle to a particular change order. Similarly, the following statement describes how to get the names of all configuration items that are related to a change order:

```
String attrs[] = {"name"};
getLrelValues(sid, ChangeHandle, "asset", 0, -1, attrs);
```

The *getLrelValues()* method provides the relationships in the *attrs* array.

Note: For more information about LREL tables and objects, see the Data Element Dictionary and Objects and Attributes.

getLrelLength

The following parameters apply to the getLrelLength method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contextObject	String	Identifies the object on one side of the LREL.
LrelName	String	Identifies the LrelName. Use the name.

Description

Returns the number of objects on one side of a many-to-many relationship:

- **contextObject**
  Specifies it as a handle to an object on one side of the LREL relationship.
- **LrelName**
  Specifies it as the name of the side of the relationship identified by *ObjHandle*.

Returns

The following:

XML Element	Type	Description
<Length>	Integer	Specifies the number of objects.

getLrelValues

The following parameters apply to the getLrelValues method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contextObject	String	Identifies the object on one side of the LREL.
LrelName	String	Identifies the Lrel Name. Use the name.
startIndex	Integer	Identifies the position in the “list” from which to begin fetching.
endIndex	Integer	Identifies the Last “list” position from which to fetch. Specify -1 to fetch all rows from startIndex.
attributes	String[]	Identifies an array of one or more attribute names for which to fetch values.

Description

Returns attribute values for a range of objects in an LREL relationship. Remember that items involved in an LREL relationship have no specific ordering. In fact, it is not really a “list”, as defined in this document.

The start and end index parameters are there to help throttle a large number of items. The format is as follows:

```
< UDSObjectList >
   <UDSObject>
   <Handle>
   <AttributeName0>
   <AttributeName1>
```

Returns

This method has the following returns:

XML Element	Type	Description
<UDSObjectList>	Array	Specifies the outer element, which contains a sequence of <UDSObject> elements.
<UDSObject (see page 3980)>	Sequence	Contains a <Handle> element and zero or more *<AttributeNameX>* elements.

createLrelRelationships

The following parameters apply to the createLrelRelationships method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contextObject	String	Identifies the object on one side of the LREL.
LrelName	String	Identifies the Lrel Name as seen by *contextObject*.
addObectHandles	String []	Identifies the handles of objects for the other side of the LREL relationships.

Description

Adds one or more many-to-many relationships. *contextObject* is one side of the LREL relation. The caller passes one or more object handles for the other side.

If a relationship already exists between the two objects, no change is made and the system continues to process the *addObjectHandles* array. If an invalid object handle is passed, the entire operation is canceled.

The following example shows how to add several assets to a contact's environment:

```
createLrelRelationships(sid, ContactHandle, "cenv",
 ["nr:655A043EDDB36D4F97524F2496B35E75", "nr:755A043EDDB36D4F97524F2496B35E75"])

ContactHandle is a string handle to a contact, and
"nr:655A043EDDB36D4F97524F2496B35E75" and
 "nr:755A043EDDB36D4F97524F2496B35E75" are Asset handles.
```

Returns

Nothing.

removeLrelRelationships

The following parameters apply to the removeLrelRelationships method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contextObject	String	Identifies the object on one side of the LREL.
LrelName	String	Identifies the Lrel Name (as seen by *contextObject).*
removeObjectHandles	String[]	Identifies the handles of objects to remove from the other side of the LREL relationships.

Description

Removes one or more many-to-many relationships. *contextObject* is one side of the LREL relationship. The caller passes one or more object handles for the other side.

It is not an error if no relationship existed between the two objects. If an invalid object handle is passed, the entire operation is canceled.

For a usage example, see createLrelRelationships() in this chapter.

Returns

Nothing.

dbmonitor_nxd--Database Monitoring Daemon

The Database Monitoring daemon (dbmonitor_nxd) provides a mechanism to allow CA SDM cache of specific database tables to be refreshed when changes are made externally from CA SDM.

The main function of dbmonitor_nxd is to generate CHANGE notifications for changes in specified tables that did not occur through CA SDM. In order to perform this function, the monitor periodically queries the database, determines what was changed externally and then sends CHANGE notifications to the bpvirtdb_nxd server. The bpvirtdb_nxd server notifies all domsrvr servers of the change, which causes each domsrvr to update its cache of specific database objects and then notify all other processes that subscribe for changes in the specified tables.

This mechanism works well for the occasional external change in tables that are monitored. However, in cases where mass updates are made externally a storm of CHANGE notifications are broadcast which leads to many database queries from various CA SDM processes which significantly impacts CA SDM's performance.

In order to eliminate this impact on CA SDM performance, dbmonitor_nxd has been updated for this release of the product. The Monitor supports a command line interface that allows the user to start and stop the monitoring of specified tables.

Syntax

This command has the following format:

```
dbmonitor_nxd  -c <command> -t <tables>
```

- **<command>**
  Enter start or stop.

- **<tables>**
  Specifies a table name or a comma delimited list of table names that must match one or more of the tables specified in the NX_DBMONITOR_TABLES environment variable.

Each request is sent to the dbmonitor_nxd daemon. The daemon takes the appropriate action and returns a message to the user indicating the action taken.

- If a start request is invoked for a table that is already started, no action is taken.
- If a stop request is made for a table that is already stopped, no action is taken.
- If monitoring is successfully stopped or started for a table, a log message is also written to stdlog.

Note: When the Monitor is paused for a table, all CA SDM processes that cache data from these tables may become out of date and no provision is made to update this cache.

For example, BOPLGIN caches Contact records (from the ca_contact and usp_contact tables) and this cache would not be updated if the Monitor was paused for the ca_contact table during the time external updates were loaded into the database. In the BOPLGIN case this will have little consequence because the essential Contact attributes cached in BOPLGIN are taken from the usp_contact table and not the ca_contact table.

Note: When the Monitor is paused for a table, Web Users will not be able to see changes in the table while viewing a detail form that were made externally while the Monitor was paused.

List/Query Methods

This article contains the following topics:

- getPendingIssueTaskListForContact (see page 4064)
- getNotificationsForContact (see page 4064)

Two paradigms are available for working with lists. One paradigm uses a list handle for referring to and making queries on a server-side list and the other simply performs a SQL-like select.

If you need to maintain reference to a static list, use the methods that return list handles. These methods are especially useful when working with very large lists. For example, your application may need to perform operations using the entire table of 10,000 Contacts. Downloading values for all 10,000 at once could result in an unacceptable performance lag (this condition is actually prevented by the system -- see Where Clauses). With a list handle, however, you can select a range of rows upon which to query.

The primary drawback to using a list handle is the extra method calls it requires. At least two or three calls are necessary, as indicated by the following:

- One to get the handle
- A second (or third) to retrieve values
- A final call to free the list

You need to balance the amount of remote method calls versus the expected amount of data returned.

Note: CA SDM restricts the amount of data that can be returned from any one list. For more information, see Where Clauses.

doSelect

The following parameters apply to the doSelect method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
objectType	String	Identifies the object type (factory) to query.
whereClause	String	(Optional) Identifies the where clause for the query.
maxRows	Integer	Indicates the maximum number of rows to return. Specify -1 to return all rows. **Note:** Regardless of the integer specified, CA SDM will return a maximum of 250 rows per call.
attributes	String[]	Identifies the attribute list for which to fetch values. Dotted-attributes are permitted. If this field is blank, all value-based attributes are returned. These attributes cannot be defined as LOCAL in the majic definition file. LOCAL attributes are temporal; they have no database storage.

Description

Performs an SQL-like select on a specified object table. Supply one or more attributes you want fetched from the objects that match the supplied where clause.

Returns

A sequence of <UDSObject> elements. The following format applies:

```
<UDSObjectList>
   <UDSObject>
    <Handle>
    <Attributes>
   <AttributeNameA>
   <AttributeValueA0>
   <AttributeValueA1>
   <AttributeNameB>
   <AttributeValueB0>
   ...
```

XML Element	Type	Description
<UDSObject (see page 3980)>	N/A	Specifies the standard UDSObject element containing the handle and requested attribute values.
<UDSObjectList>	Sequence	Contains a <Handle> element and an <Attributes> sequence.

For example, if the method used is the following:

```
String[] myArray = ["last_name", "first_name"]
doSelect(mySID, "cnt", "last_name LIKE 'J%'", 2, myArray)
```

The return could be the following:

```
<UDSObjectList>
   <UDSObject>
   <Handle>cnt:555A043EDDB36D4F97524F2496B35E75</Handle>
   <Attributes>
   <AttributeName>last_name</AttributeName>
   <AttributeValue>Johnson</AttributeValue>
   <AttributeName>first_name</AttributeName>
   <AttributeValue>Carol</AttributeValue>
   </Attributes>
</UDSObject>
<UDSObject>
   <Handle>cnt:555A043EDDB36D4F97524F2496B35E76</Handle>
   <Attributes>
   <AttributeName>last_name</AttributeName>
   <AttributeValue>Jones</AttributeValue>
   <AttributeName>first_name</AttributeName>
   <AttributeValue>Ron</AttributeValue>
   </Attributes>
</UDSObject>
```

```
</UDSObjectList>
```

doQuery

The following parameters apply to the doQuery method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ObjectType	String	Identifies the object type (factory) to query.
WhereClause	String	(Optional) Identifies the where clause for the query.

Description

Performs an SQL-like select for the specified object type. It also returns a *list handle* that points to a list of the rows returned from the query, where each row represents a CA SDM object that matched the supplied where clause. The caller can fetch values for the list rows using getListValues ().

Note: For more information about where clauses, see Where Clauses.

Important! The object list is stored on the CA SDM server and consumes system resources. The caller is responsible for freeing the list with freeListHandles(). Leaving a list in memory may increase memory for the process beyond the 2GB limit, resulting in memory leaks and can cause system failure.

Lists created with this function are homogenous, meaning the objects are all the same type, and they are static, meaning the list never changes even if a data change to an object excludes it from the initial where clause.

Returns

A list handle that must be freed with freeListHandle().

XML Element	Type	Description
<listHandle>	Integer	Identifies the list handle.
<listLength>	Integer	Identifies the length of the list generated.

getListValues

The following parameters apply to the getListValues method:

Parameter	Type	Description
SID		Identifies the session retrieved from logging in.

Parameter	Type	Description
	Integer	
ListHandle	Integer	Identifies the list handle obtained with a previous call.
StartIndex	Integer	Identifies the position in the list from which to begin fetching.
EndIndex	Integer	Identifies the last list position from which to fetch. Specify -1 to fetch all rows from StartIndex. **Note:** Regardless of the integer specified, Web Services will return a maximum of 250 rows per call.
AttributeNames	String[]	Identifies an array of one or more attribute names for which you want to fetch values.

Description

Returns attribute values for a range of objects in a list. For example:

```
< UDSObjectList >
   <UDSObject>
   <Handle>
   <Attributes>
       <AttributeName0>
       <AttributeName1>
```

Returns

This method has the following returns:

XML Element	Type	Description
<UDSObjectList>	Sequence	Identifies the outer Element, which contains a sequence of <UDSObject> elements.
<UDSObject (see page 3980)>	N/A	Contains a <Handle> element and <Attributes> sequence.

freeListHandles

The following parameters apply to the freeListHandles method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
Handles	Integer[]	Identifies an array of list handles to free.

Description

Frees the server-side resources for a list and invalidates the list handles. This method should be called whenever a list reference is no longer needed.

Returns

Nothing.

getRelatedList

The following parameters apply to the getRelatedList method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ObjectHandle	String	Identifies the object handle.
ListName	String	Identifies a list-type attribute name of the object.

Description

Returns a list handle for list (QREL or BREL) attribute of an object. For example, the request object has a related list named “children”, which is a list of its child requests. The Request’s Activity Log (“act_log” or “act_log_all”) is another example.

To retrieve information about an object’s list attributes, refer to the object schema (majic) documentation or use getObjectTypeInformation().

Returns

The following:

XML Element	Type	Description
<listHandle>	Integer	Identifies the list handle.
<listLength>	Integer	Identifies the length of the list generated.

getRelatedListValues

The following parameters apply to the getRelatedListValues method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
objectHandle	String	Identifies the object handle.
listName	String	Identifies a list-type attribute name for the object.
numToFetch	Integer	Signifies the maximum number of rows to return. Cannot be zero Specify -1 to return all rows **Note:** Regardless of the integer specified, Web Services can return a maximum of 250 rows per call.
attributes	String[]	Identifies an array of one or more attribute names for which to fetch values. Dotted names are permitted.
		Identifies the String Holder object for capturing returned data.

Parameter	Type	Description
getRelatedListValuesResult	String Holder	
numRowsFound	Integer Holder	Identifies the Integer Holder object for capturing returned data.

Description

Returns values for lists related to a specific object. The lists must be defined as a QREL or BREL. Use the LREL methods to query LREL types.

For example, the request object has a related list named “children”, that is a list of its child requests. This method is a list handle-free alternative to getRelatedList(). The return format is similar to getListValues(), as indicated by the following:

```
<numRowsFound>
< UDSObjectList >
   <UDSObject>
   <Handle>
   <AttributeName0>
   <AttributeName1>
```

You can retrieve information for object list attributes using object schema (majic). An alternative method is to use getObjectTypeInformation().

Returns

This method has the following returns:

XML Element	Type	Description
<getRelatedListValuesResult>	N/A	Identifies the outer element, <UDSObjectList>, that contains a sequence of <UDSObject> elements. Each <UDSObject (see page 3980)> element contains a <Handle> element and zero or more <AttributeNameX> elements.
<numRowsFound>	Integer	Indicates the total number of rows in the queried list. **Note:** The total number of rows is not necessarily the number of rows returned.

getPendingChangeTaskListForContact

The following parameters apply to the getPendingChangeTaskListForContact method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contactHandle	String	Identifies the contact handle.

Description

Returns a list handle representing all the “pending” change order workflow tasks assigned to a contact. A “pending” task is an active workflow task with a status that permits task updates.

Returns

The following:

XML Element	Type	Description
<listHandle>	Integer	Identifies the list handle.
<listLength>	Integer	Identifies the length of the list generated.

getPendingIssueTaskListForContact

The following parameters apply to the getPendingIssueTaskListForContact method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contactHandle	String	Identifies the contact handle.

Description

Returns a list handle representing all the “pending” Issue tasks assigned to a contact. A “pending” task is an active task with a status that permits task updates.

Returns

The following:

XML Element	Type	Description
<listHandle>	Integer	Identifies the list handle.
<listLength>	Integer	Identifies the length of list generated.

getNotificationsForContact

The following parameters apply to the getNotificationsForContact method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
contactHandle	String	Identifies the contact handle.
queryStatus	Integer	(Optional) Identifies the target of the notifications.

Description

Returns a list of notifications (‘lr’ objects) for a contact.

You can query on a specific status for the notifications with the *queryStatus* field, which is useful for returning, for example, only non-cleared messages. The possible *queryStatus* values are as follows:

- **-1** -- Fetch all notifications
- **0** -- Fetch non-cleared notifications (those with a status value of less than 7)
- **1** -- Fetch cleared notifications (those with a status value of 7, 8 or 9)

Returns

The following:

XML Element	Type	Description
<listHandle>	Integer	Identifies the list handle.
<listLength>	Integer	Identifies the length of the list generated.

Asset Management Methods

This article contains the following topics:

It is possible for a client site to enhance the asset object using *extensions*. Asset extensions are separate tables that hold extra attribute information for an asset. The extension table is linked to a particular asset by using the asset ID as a foreign key. CA SDM Web Services ships two predefined extensions, Computer and Software. For more information, read the text executed by the following command:

```
/bopcfg/majic/assetx.maj
```

The asset's family attribute determines if the asset has an extension. Setting the Class attribute generally sets the family at asset creation time. To determine if an asset has an extension, query the 'extension_name' attribute of the asset's family (for example, "family.extension_name").

To retrieve values from an extension object, query it like any other object by using the following method:

```
getObjectValues()
```

To get the handle for a particular extension object, use the following method:

```
getAssetExtensionInformation()
```

Update an extension object like you would any other object by using the following method:

```
updateObject()
```

We do not recommend that you create your own extension objects. One is created for you, if needed, when createAsset() is called. Because of this automatic creation, we recommend that you only use createAsset() to create asset objects.

Note: If you are using the ITIL methodology, remember that Asset and Configuration Item are interchangeable in this context.

createAsset

The following parameters apply to the createAsset method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
attrVals	String	Identifies the array of name-value pairs used to set the initial attribute values for the new asset.
attributes	String Holder	Identifies the String Holder object for caputring returned data.
createAssetResult	String	Identifies the name for the new asset's extension. If no extension was created, this field is empty.
newAssetHandle	String Holder	Identifies the String Holder object for capturing returned data.
newExtensionHandle	String Holder	Identifies the String Holder object for capturing returned data.
newExtensionName	String Holder	Identifies the String Holder object for capturing returned data.

Description

Describes the recommend method for creating an asset. If you intend to create an asset with an extension, be sure to set the Asset Class attribute in the *attrVals* section.

Note: If you are using the ITIL methodology, use this method to create a Configuration Item.

Returns

A <UDSObject> element containing the handle for the new object, with attribute values specified in the *attributes* parameter. If the *attributes* parameter is empty, *all* attribute values are returned (see page 3980). List and LREL types are also returned, but as empty elements.

XML Element	Type	Description
<createAssetResult>	N/A	Identifies the standard <UDSObject> element containing the handle and requested attribute values.
<newAssetHandle>	String	Identifies the new request's handle.
<newExtensionHandle>	String	Identifies the handle for the new Asset's extension. If no extension was created, this field is empty.
<newExtensionName>	String	Identifies the name for the new asset's extension. If no extension was created, this field is empty.

getAssetExtensionInformation

The following parameters apply to the getAssetExtensionInformation method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
assetHandle	String	Identifies the asset to query.
attributes	String[]	Identifies the standard array of attributes from the asset extension object from which to request values. If this value is empty, all attributes are returned.
getAssetExtInfoResult	String Holder	Identifies the String Holder object for capturing returned data.
extensionHandle	String Holder	Identifies the String Holder object for capturing returned data.
extensionName	String Holder	Identifies the String Holder object for capturing returned data.

Description

Returns extension information for an asset. If the asset does not have an extension, nothing is returned.

An asset has an extension if a value exists for its "family.extension_name" property. This property is empty if the asset does not have an extension.

Returns

The following elements return (see page 3980)with empty values when the asset does not have an extension:

XML Element	Type	Description
<getAssetExtInfoResult>	String	Identifies all the attribute values for the extension.
<extensionHandle>	String	Identifies the extensions handle.
<extensionName>	String	Identifies the name for the assets extension.

addAssetLog

The following parameters apply to the addAssetLog method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
assetHandle	String	Identifies the asset handle.
contactHandle	String	(Required) Identifies the handle of the contact used for the log's author.
logText	String	Identifies the text for the new asset log.

Description

Adds a new log entry for an asset. The log's author is the user associated with the SID.

Returns

Nothing.

createAssetParentChildRelationship

The following parameters apply to the createAssetParentChildRelationship method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
parentHandle	String	Identifies the asset handle for the parent.
childHandle	String	Identifies the asset handle for the child.

Description

Makes *assetParent* a parent of *assetHandle*. Web Services creates a separate object (the *hier* object, which is the *Assignment* table) for parent-child relationships between assets. These are stored in related lists, *child_hier* and *parent_hier,* in the Asset (nr) object.

Returns

Handle of the new hier (Assignment) object.

Web Services Business Methods

This article contains the following topics:

This section describes the Web Services Business methods.

createIssue

The following parameters apply to the createIssue method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creatorHandle	String	Identifies the handle of the contact responsible for the creation of the issue (the log agent). Pass an empty string to specify the default CA SDM user.
attrVals	String[]	Identifies the array of name-value pairs that is used to set the initial attribute values for the new issue. **Note:** Dotted names are not permitted.
propertyValues	String[]	(Optional) Identifies the array of values for any properties that are attached to the new issue.
template	String	(Optional) Identifies the handle of an issue template (iss_tpl object) from which to create the issue.
attributes	String[]	Identifies the sequence of attribute names from the new object for which to return values. Dot-notation is permitted. If this field is empty, all attribute values are returned.
newIssueHandle	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list below for details.
newIssueNumber	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list below for details.

Description

Creates a CA SDM Issue (iss) object. For more information about creating an Issue object with properties, see createRequest().

Note: You *must* use this function to create a Issue; do not use createObject().

Returns

Returns the new object handle, along with *all* of its attribute values. List and LREL types are also returned, but as empty elements.

XML Element	Type	Description
<UDSObject>	N/A	Identifies the standard UDSObject element containing the handle and requested attribute values.
<newIssueHandle>	String	Identifies the new issue's handle.
<newIssueNumber>	String	Identifies the new issue's number (its "ref_num" attribute).

createRequest

The following parameters apply to the createRequest method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creatorHandle	String	Identifies the handle of the contact responsible for the creation of the request (the log agent). Pass an empty string to specify the default CA SDM user.
attrVals	String[]	Identifies an array of name-value pairs that is used to set the initial attribute values for the new request. **Note:** Dotted names are not permitted.
propertyValues	String[]	Identifies the array of values for any properties that are attached to the new request.
template	String	(Optional) Identifies the handle of the request template (cr_tpl) from which to create the request.
attributes	String[]	Specifies the sequence of attribute names from the new object for which to return values. Dot-notation is permitted. If this field is empty, all value-based attribute values are returned.
newRequestHandle	String Holder	Specifies the String Holder object for capturing returned data. See the XML Element Return list below for details.
newRequestNumber	String Holder	Specifies the String Holder object for capturing returned data. See the XML Element Return list below for details.

Description

Creates a CA SDM Request (cr) object. You *must* use this function to create a Request; do not use createObject().

propertyValues is a list of values for each Property object that will be attached to the new Request. The Properties that are attached are determined by the new Request's 'category' attribute value. All properties created from the CA SDM Web Services interface will have a default value (for more information, see Categories and Properties), which is important because a Request will not save until all of its Properties marked "required" have a value.

You may override the default by supplying values for any properties that will be attached when the Request is created. You must supply this information before the Request is created, since createRequest() attempts to back-store the object you most recently create. Use getPropertyInfoForCategory() to get a list of properties for a specific Category. This function returns the properties in order of their 'sequence' attribute, which is the expected order of the *propertyValues* array. For example, if the sequences and symbols of the properties are as follows:

```
100  -  Hard Drive Size
200  -  CPU
300  -  Memory
```

The *propertyValues* array, depending on the programming language, may appear as follows:

```
["40 GB", "Pentium 4 1.7 Ghz", "256"]
```

getPropertyInfoForCategory() indicates which Properties are marked *required*.

If you do not set the Request category or do not want to set any Property values, pass an empty string for *propertyValues.*

If you do not want to rely on the default property values, the following is the suggested order for creating a new Request (or Issue or Change Order):

1. Retrieve a list of Categories/Areas. The object name for Request Area is 'pcat'.
2. Call getPropertyInfoForCategory() and examine the list of properties for the category of the new Request/Issue/Change.
3. Create a value array for each of the properties returned. This is identified by the *propertyValues* parameter for the create operation.
4. Assemble the *attrVals* array and call the create method.

As an alternative to the previous procedure, you can retrieve the list of properties using getRelatedListValues() after createRequest() returns. Properties are stored in the 'properties' list for a Request.

Depending upon the application, it may be faster to at least cache the list of Categories, since this data does not change often at many client sites.

Note: By default, this method creates a Request. If you are using the ITIL methodology, you need to set the 'type' attribute in the attrVals array to define whether you are creating an Incident or a Problem ticket. For more information about ITIL procedures, see ITIL Methodology (see page 1873).

Returns

Returns the new objects handle with *all* of its attribute values. List and LREL types are also returned, but as empty elements.

XML Element	Type	Description
<UDSObject (see page 3980)>	N/A	Identifies the standard UDSObject element containing the handle and requested attribute values.
<newRequestHandle>	String	Identifies the new request handle.
<newRequestNumber>	String	Identifies the new request's number (its "ref_num" attribute).

createChangeOrder

The following parameters apply to the createChangeOrder method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creatorHandle	String	Identifies the handle of the contact responsible for the creation of the change order (the log agent). Pass an empty string to specify the default CA SDM user.
attrVals	String[]	Identifies an array of name-value pairs that is used to set the initial attribute values for the change order. **Note:** Dotted names are not permitted.
propertyValues	String[]	(Optional) Identifies the array of values for any properties that are attached to the new change order.
template	String	(Optional) Identifies the handle of the change template (chg_tpl object) from which to create the change order.
attributes	String[]	Specifies the sequence of attribute names from the new object for which to return values. Dot-notation is permitted. If this field is empty, all value-based attribute values are returned.
newChangeHandle	StringHolder	Specifies the String Holder object for capturing returned data.
newChangeNumber	StringHolder	Specifies the String Holder object for capturing returned data.

Description

Creates a CA SDM Change Order (chg) object. You *must* use this function to create a change order (see page 4070); do not use createObject().

Returns

The new object handle with *all* of its attribute values. List and LREL types are also returned (see page 3980), but as empty elements.

XML Element	Type	Description
<UDSObject>	N/A	

XML Element	Type	Description
		Identifies the standard UDSObject element containing the handle and request attribute values.
<newChangeHandle>	String	Identifies the new change order handle.
<newChangeNumber>	String	Identifies the new change order number (its 'chg_ref_num' attribute).

createActivityLog

The following parameters apply to the createActivityLog method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
objectHandle	String	Identifies the handle for a request, issue, or change order. Any other object type is rejected.
description	String	Identifies the description for the activity, which will appear in the activity log.
LogType	String	Identifies the type of log to create -- see the following Description.
TimeSpent	Integer	Sets the Time Spent field for the activity log, which is the duration of the activity. Pass zero for the default.
Internal	Boolean	Identifies the values that apply: True = Internal-only activity False = Non-internal activity that can be viewed by everyone.

Description

Creates an activity log for a specified request, issue or change order. This method corresponds to, "Activities - Log Comment/Research/Callback" on a Change/Request/Issue detail in the CA SDM interface. *LogType* is the code attribute for the activity type of the new log. The most common codes are as follows:

- "CB" (Callback)
- "RS" (Research)
- "LOG" (Log Comment)

The CA SDM Administrative Client also shows the code values. To access the code values, select from the Main Menu Administration, then select Notification, Activity Notifications.

Returns

The handle to the activity log object created.

XML Element	Type	Description
<LogHandle>	String	Identifies the handle for the new activity log.

transfer

The following parameters apply to the transfer method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
objectHandle	String	Identifies the handle for a request, issue, or change order. Any other object type is rejected.
description	String	Identifies the description for the activity, which will appear in the activity log.
setAssignee	Boolean	Used to update the assignee field with the value in newAssignee, if the value is true.
newAssigneeHandle	String	Identifies the new assignee for the object.
setGroup	Boolean	Updates the group field, if true.
newGroupHandle	String	Identifies the new group for the object.
setOrganization	Boolean	Update the organization, if the value is true.
newOrgnizationHandle	String	(Issues and Change Orders only) Identifies the new organization for the object.

Description

Performs a transfer activity on an Issue, Request or Change Order. This method corresponds to the “Activities -- Transfer” command in the CA SDM interface. This method generates an activity log and optionally sets a new assignee, group, or organization.

The assignee, group or organization is not updated unless one or more of the corresponding *setAssignee/setGroup/setOrganization* parameters is set to true.

If the companion parameter is false, then transfer will not attempt to update the field, even if a value is passed for that field. For example, if *setAssignee* is passed as false, transfer will not update the assignee even if *newAssignee* specifies a value. If the *setXXXX* parameter is true, then the field is updated. Pass the empty string to set a field to empty/null.

Returns

One or more handles to the activity log objects created. The returns are under a parent element named <Logs>.

XML Element	Type	Description
<LogHandle>	String	Identifies the handle for the new activity log (zero or more of these can be returned).

escalate

The following parameters apply to the escalate method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
objectHandle	String	Identifies the handle for a request, issue, or change order. Any other object type is rejected.
description	String	Identifies the description for the activity, which will appear in the activity log.
setAssignee	Boolean	Updates the assignee field, if true.
newAssigneeHandle	String	Identifies the handle of the new assignee for the object.
setGroup	Boolean	Updates the group field with the value in newGroupHandle, if true.
newGroupHandle	String	Identifies the handle of the new group for the object.
setOrganization	Boolean	Sets the organization field with the value specified in the newOrganizationHandle, if true.
newOrgnizationHandle	String	(Issues and Change Orders only) Identifies the handle of the new organization for the object.
setPriorityHandle	Boolean	Updates the priority field with the value specified in newPriority, if true.
newPriority	String	Identifies the handle of the new priority for the object.

Description

Performs an escalate activity on an Issue, Request or Change Order. This method generates an activity log and optionally sets a new assignee, group, priority and/or organization.

It corresponds to the “Activities -- Escalate” command in the CA SDM interface.

The assignee, group, or organization is not updated unless one or more of the corresponding *setAssignee/setGroup/setOrganization* parameters is set to true. If the companion parameter is false, then escalate will not attempt to update the field, even if a value is passed for that field. For example, if *setAssignee* is passed as false, escalate will not update the assignee even if *newAssignee* specifies a value. If the *setXXXX* parameter is true, then the field is updated. Pass the empty string to set a field to empty/null.

Note: Organization is not used for Requests.

Returns

One or more handles to the activity log objects created.

XML Element	Type	Description
<LogHandle>	String	Identifies the handle for the new activity log (zero or more of these can be returned).

changeStatus

The following parameters apply to the changeStatus method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
objectHandle	String	Identifies the handle for a request, issue, or change order. Any other object type is rejected.
description	String	Identifies the description for the activity, which will appear in the activity log.
newStatusHandle	String	Identifies the handle of the status for the object.

Description

Performs a status change activity on an issue, request, or change order. This method generates an activity log and optionally sets the status value. It corresponds to the “Activites -- Update Status” command in the CA SDM interface.

Returns

The handle to the activity log object created.

XML Element	Type	Description
<LogHandle>	String	Identifies the handle for the new activity log (zero or more of these can be returned).

getPropertyInfoForCategory

The following parameters apply to the getPropertyInfoForCategory method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
categoryHandle	String	Identifies a category handle.
attributes	String[]	Identifies the names of one or more attributes from the property template object for which to fetch values. If this is empty, all value-based attributes are fetched.

Description

Information about Properties for the specified category. This method is used to help pre-populate Request/Issue/Change Order properties on insert operations with user-defined data.

Depending on the category, this method queries either the 'prptpl' or the 'cr_prptpl' object types. Both types are nearly identical. The suggested attributes to fetch are 'sequence', 'label', 'description' and 'required'.

Returns

A <UDSObject> element containing a sequence of <UDSObject> elements, in the order of the 'sequence' attribute.

logComment

The following parameters apply to the logComment method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ticketHandle	String	Identifies the handle of the ticket where the activity log should be added.
Comment	String	Identifies the comment text.
internal_flag	String	Identifies the internal flag. Set to True if the new activity log should be marked as internal.

Description

Attaches a 'Log Comment' activity log to a ticket. It is a simplified version of createActivityLog().

Returns

Nothing.

notifyContacts Method

This article contains the following topics:

The following parameters apply to the notifyContacts method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
contextObject	String	Identifies the handle for a request, issue, or change order. The following applies: It is the context for the notification. Any other object type is rejected. An activity log is added to the object to record the notification.
messageTitle	String	Identifies the title of the notification message.
messageBody	String	Identifies the body of the notification message.
notifyLevel	Integer	Indicates the notification level. Specify an integer from 1 (Low) to 4 (Emergency).
notifyees	String[]	Identifies the array of contact handles to notify.
Internal	Boolean	Indicates internal-only notification. Set to True to flag for an internal-only notification, which guarantees that the message is sent only to those who can view internal logs, and the resulting activity log is flagged as internal.

Description

Sends a notification to one or more contacts. This is equivalent to the Manual Notify activity on requests, issues, and change orders.

Returns

The following is returned:

XML Element	Type	Description
<LogHandle>	String	Identifies the handle for new activity log.

clearNotification

The following parameters apply to the clearNotification method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
lrObject	String	Identifies the handle to a Notify Log Header (lr) object.
clearBy	String	Identifies the name of the contact responsible for the clear operation.

Description

Clears a notification message.

Returns

The new status of the notification message.

attachChangeToRequest Method

This article contains the following topics:

The following parameters apply to the attachChangeToRequest method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
requestHandle	String	Identifies the request to which you attach the change.
changeHandle	String	Identifies the handle of the change to add. If this is blank, a new change order is created.
changeAttrVals	String[]	Identifies the attribute-value pairs used to initialize a new change order if the changeHandle is blank.
description	String	(Optional) Identifies the description of the activity.

Description

Attaches a new or existing change order to a request. It corresponds with “Activities -- New Change Request” or “Activities -- Attach to Existing Request” on a Request detail in the CA SDM interface.

To create a new change order, pass the empty string in *changeHandle*. The system will create a new change order with values initialized from the request, including the change’s Requestor, Affected End User, Description, and Priority (you can see this effect in the CA SDM interface). You can override these or set additional values with *changeAttrVals,* which is a name-value array similar to what is passed for *createObject().*

To attach an existing change order, specify a handle in the *changeHandle* parameter. In this case, *changeAttrVals* is ignored.

If a new change order is created, *description* is used on the new change order’s activity log. If an existing change is attached, *description* is used on the request’s activity log.

If the request already has an attached change order, the following error is returned:

```
UDS_CREATION_ERROR
```

Note: This method works exactly the same for the ITIL methodology -- simply verify that you are passing the appropriate handle of an ITIL Incident or Problem to the method.

Returns

The following is returned:

XML Element	Type	Description
<changeHandle>	String	Identifies the handle for the change order, created or attached.

detachChangeFromRequest

The following parameters apply to the detachChangeFromRequest method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
creator	String	Identifies the handle of the contact responsible for the activity.
requestHandle	String	Identifies the handle of a request.
Description	String	(Optional) Identifies the description of the activity.

Description

Detaches a change order from a request. This method corresponds with “Activities -- Detach Change Order” on the CA SDM client. The change order is not deleted from the system.

There is no effect if the request did not have an attached change.

Returns

The handle of the request’s activity log marking the event.

createTicket Method

This article contains the following topics:

The following parameters apply to the createTicket method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
Description	String	(Optional) Identifies the description of the ticket.
problem_type	String	Specifies the code (not the persistent ID) for an existing problem type for the policy under which a Web Services application is running. If this is blank or contains a bad value, the default problem type is used.
Userid	String	(Optional) Specifies the user ID of the end user for the new ticket. If this is blank or the supplied user ID is not found, the proxy contact defined in the access policy is used and the ticket is still created.

Parameter	Type	Description
Asset	String	(Optional) Identifies the handle of an asset to be attached to the ticket.
DuplicationID	String	(Optional) Allows callers to assist the duplication handling routines used for classifying tickets as being unique or different. If duplicate handling is on, this string is inspected after other duplicate handling criteria match to determine whether this is a unique or duplicate call to this method.
newTicketHandle	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list on this page for details.
newTicketNumber	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list on this page for details.
returnUserData	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list on this page for details.
returnApplicationData	String Holder	Identifies the String Holder object for capturing returned data. See the XML Element Return list on this page for details.

Description

Creates a ticket based on the rules defined in both the Service Aware Policy and the specified Problem Type. The Problem Type specifies the type of ticket created by a Request/Change/Issue template. The supplied description is copied in and the user is set from the access policy proxy contact.

If input problem_type does not exist, the policy default problem type is used. The problem type also defines how to handle duplicate ticket creation, and additional returned data.

Returns

Returns the new ticket handle, ticket number, and the user-specified return data defined in the problem type that is used to create the ticket.

XML Element	Type	Description
<UDSObject>	N/A	Returns the XML element so that it is consistent with the returns of these other methods: createRequest() createChange() createIssue() The body of this tag is empty.
	String	Identifies the new ticket handle.

XML Element	Type	Description
<newTicketHandle>		
<newTicketNumber>	String	Identifies the new ticket number (its “ref_num” or “chg_ref_num” attribute).
<returnUserData>	String	Identifies the user-specified data for the problem type intended for display to the end user, or for log entries. You can set this value in the User Data Return field on the Returned Data tab of the Problem Type Detail window.
<returnApplicationData>	String	Identifies the user-specified data for the problem type intended for use within the application code, especially for actions. You can set this value in the Application Data Return field on the Returned Data tab of the Problem Type Detail window.

createQuickTicket

The following parameters apply to the createQuickTicket method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
customerHandle	String	Identifies the customer handle used to create the ticket.
description	String	(Optional) Identifies the description of the ticket.
newTicketHandle	String Holder	String Holder object for capturing returned data. See the XML Element Return list on this page for details.
newTicketNumber	String Holder	String Holder object for capturing returned data. See the XML Element Return list on this page for details.

Description

Creates a ticket based on the preferred document type of the user represented by customerHandle. Contact access rights are determined by an Access Type record, which also sets the contact preferred document type (Request, Incident, Problem, Issue or Change Order). If a contact document type is Issue, this method will create an Issue; if the document type is Request, a Request is created, and so on. The contact represented by customerHandle is used to set the end user/customer field of the new ticket. The ticket description is set to the input *description* value.

Returns

Returns the new ticket handle, ticket number, and a brief representation of the new ticket in <UDSObject> format.

XML Element	Type	Description
<UDSObject>	N/A	Returns a partial set of attributes because it is a high-level method designed to simplify the process. Their values come from the following methods, and the XML element is returned so it is consistent with the returns of these methods:

XML Element	Type	Description
		createRequest() createChange() createIssue()
<newTicketHandle>	String	Identifies the new ticket handle.
<newTicketNumber>	String	Identifies the new ticket number (its “ref_num” or “chg_ref_num” attribute).

closeTicket

The following parameters apply to the closeTicket method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
description	String	(Optional) Identifies the description of the ticket, which can be used in the Close activity log.
ticketHandle	String	Identifies the ticket to close.

Description

Sets the status of the ticket to “Closed” and adds an activity log with the input description.

Returns

The handle to the activity log object created. It provides the same return as the changeStatus() method.

XML Element	Type	Description
<LogHandle>	String	Specifies the handle for new activity log (0 or more of these can be returned).

Group Management Methods

This article contains the following topics:

This section explains the Web Services Group Management Methods.

addMemberToGroup

The following parameters apply to the addMemberToGroup method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ContactHandle	String	Identifies the handle of the contact to add as a member.
GroupHandle	String	Identifies the group to which you will add the contact.

Description

Adds a contact to a group. Nothing happens if the contact is already a member.

Returns

Nothing.

removeMemberFromGroup

The following parameters apply to the remove MemberFromGroup method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ContactHandle	String	Identifies the handle of the contact to remove.
GroupHandle	String	Identifies the group from which you will remove the contact.

Description

Removes a contact from a group. Nothing happens if the contact is not a member.

Returns

Nothing.

getGroupMemberListValues

The following parameters apply to the getGroupMemberListValues method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
whereClause	String	Identifies the SQL where clause.
numToFetch	Integer	Determines the maximum number of records to return. This cannot be zero (0). Use ‘1’ to return all.
attributes	String []	Identifies the array of attribute names for which to retrieve values.

Description

Functions similarly to getListValues(), except that it queries the system's group and member relationships. The system uses a special 'Group Member' (grpmem) object for each group/member relationship. The CA SDM system administers grpmem objects behind the scenes (you do not manipulate them directly), and they are essential for certain queries.

The grpmem object simply contains two pointers, one to a Contact and the other to a Group, which in itself is a Contact object. The attribute names are 'member' and 'group', respectively. Because these are pointers, you must use dot-notation to form a query as normal. For example, to find all Contacts with a last name beginning with 'B' and in a group with the name, "Seattle", you would use the following:

```
member.last_name LIKE 'B%' AND group.last_name = 'Seattle'
```

You may also use handles as normal, illustrated by the following:

```
member.last_name LIKE 'A%' AND group.id = U'555A043EDDB36D4F97524F2496B35E75'
```

It is important to note that this method can retrieve values from all members and groups, not just a single group. To simply get information about all the members of a specific group or member, just specify a handle in the where clause. For example, the following would retrieve values from a specific group:

```
group.id = U'555A043EDDB36D4F97524F2496B35E75'
```

The following concepts are important to remember:

- grpmem object contains two pointer attributes, one is to member and the other is to group
- grpmem object exists for each group/member relationship

The grpmem method actually queries the grpmem object table, thereby returning an object representing a relationship between two contacts. Therefore, the attribute values you want to fetch in attributes must use dot-notation from the grpmem object. To fetch values from the member, all your attribute names should be of the form, 'member.*ATTRNAME*', as illustrated by the following example:

```
'member.last_name'
```

To fetch values from the group, use 'group.*ATTRNAME*'.

Note: For an example of efficient querying of groups and members, see Where Clauses.

Returns

Automatically returns no handles. The <Handle> element in the return is always empty. To request the member or group handle for each row, use one of the following in the attributes parameter described in the table.

- “member.persistent_id”
- “group.persistent_id”

XML Element	Type	Description
<UDSObjectList>	N/A	Identifies the outer element, which contains an array of <UDSObject (see page 3980)> elements. Each object is really a grpmem object.

Contact Management Methods

This article contains the following topics:

This section explains the Web Services Contact Management methods.

login

The following parameters apply to the login method:

Parameter	Type	Description
username	String	Identifies the user ID.
password	String	Identifies the password.

Description

Login validates a user with CA SDM login validation and returns a unique session ID that is required for most other web method calls. This key should be freed with logout(). A SID may expire if it is not used before a time out elapses.

The username/password is validated exactly the same as the CA SDM Web client; the contact’s Access Type specifies the validation method. The default access policy will be applied to control and manage all subsequent accesses after a successful call of this function. The login user (not proxy contact specified in the default policy) is then responsible for subsequent web service activities. All function group security and data partition are enforced for the login user.

Returns

The following is returned:

Parameter	Type	Description
<SID>	Integer	Identifies the unique SID to use for all other Web Services calls.

loginService

The following parameters apply to the loginService method:

Parameter	Type	Description
username	String	Identifies the user ID.
password	String	Identifies the password.
policy	String	(Required) Identifies the policy code, which must be in plain text. Although it is required, it may be empty.

Description

Lets users log in with a conventional username/password authentication scheme where if valid, the system returns a unique session ID. This key should be freed with logout(). A SID may expire if it is not used before a timeout elapses.

User authentication is performed on the username and password while access control is applied based on the policy specified. The authentication is performed as described in login(). Empty policy will allow default policy to be applied automatically. The login user (not the proxy contact specified in the policy) is responsible for subsequent web service activities. All function group security and data partitions are enforced for the login user.

Returns

The following is returned:

Parameter	Type	Description
SID	Integer	Specifies the unique SID to use for all other Web Services calls.

impersonate

The following parameters apply to the impersonate method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
username	String	(Required) Identifies the user name of the user being impersonated.

Description

Lets an administrator switch the user responsible for all web services activities in a current web services session without additional user authentication. Invoking this method is allowed only if the current web services session is started by using the PKI access authentication scheme and the access policy is defined to allow impersonation.

The Access Type of the user to be impersonated is checked against the Access Type of the proxy user of the policy used in the current web services session. If the access_level of the new user's access type is less than or equal to the grant_level of the proxy user's access type, this method will replace the current user with the new user. A new web services session starts while the old session ends. A new SID is then returned. In addition, the new user is given the responsibility for all subsequent activities initiated in this new session. The function group security and data partition are enforced for the new user.

Returns

The following is returned:

Parameter	Type	Description
SID	Integer	Identifies the unique SID to use for all other Web Services calls.

logout

The following parameter applies to the logout method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.

Description

Invalidates a SID obtained from login(), loginService(), and loginServiceManaged().

Returns

Nothing.

loginWithArtifact

The following parameters apply to the loginWithArtifact method:

Parameter	Type	Description
userid	String	Identifies the user ID.
artifact	String	Identifies the Artifact obtained from CA EEM.

Description

Performs the user authentication by the provided CA EEM Artifact and opens a session with the back-end server. The Artifact can be used only once for authentication. The returned session ID (SID) can be used for subsequent web services method invocations. The Artifact can be acquired directly from CA EEM or can be obtained by the getArtifact method.

Note: Service Desk needs to be integrated with CA EEM to perform this operation.

The SID should be freed with logout(). A SID may expire if it is not used before a timeout elapses.

Returns

The following is returned:

Parameter	Type	Description
SID	String	Identifies the unique session ID (SID) to use for all other Web Services calls. It is in plain text format.

getPolicyInfo

This article contains the following topics:

The following parameters apply to the getPolicyInfo method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.

Description

Returns information about the access policy that is controlling and managing the current CA SDM Web Services session.

Returns

The following XML string:

XML Element	Type	Description
<SAPolicy>	N/A	Identifies the detailed information of this access policy and its related problem types.

The content of <SAPolicy> is shown as follows:

```
<SAPolicy>
<Name> name of policy </Name>
```

```
<Code> policy code </Code>
<ContactName> policy proxy contact's combo name </ContactName>
<ContactHandle> handle of policy's contact </ContactHandle>
<Access>
       <TicketCreation> limitation </TicketCreation>
       <ObjectCreation> limitation </ObjectCreation>
       <ObjectUpdate> limitation </ObjectUpdate>
       <Attachments> limitation </Attachments>
       <Queries> limitation </Queries>
       <Knowledge> limitation </Knowledge>
</Access>
<ProblemTypes> (zero or more <ProblemType> elements)
    <ProblemType>
        <Code>code of a problem type </Code>
        <Status>active or inactive </Status>
    </ProblemType>
</ProblemTypes>
</SAPolicy>
```

getTaskListValues

The following parameters apply to the getTaskListValues method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
objectHandle	String	Identifies the object handle for an issue or change order.
attributes	String	Identifies the sequence of attribute names for which to fetch values. Dotted-attributes are permitted. If this is blank, all attributes are fetched.

Description

Returns values for all the tasks associated with the specified issue or change order.

Note: This is a convenience method. The same list could be obtained using doSelect().

Returns

This method has the following returns:

XML Element	Type	Description
<UDSObjectList>	N/A	Outer element -- contains zero or more <UDSObject (see page 3980)> elements. Each <UDSObject> node represents a Task. The nodes are ordered by the Task's 'sequence' attribute.

getValidTaskTransitions

The following parameters apply to the getValidTaskTransitions method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
taskHandle	String	Identifies the handle to a Workflow task (for an issue or change order).
attributes	String[]	Identifies the names of attributes to fetch from the 'tskstat' object. If this field is empty, all value-based attributes are returned.

Description

Returns all of the possible values for the 'status' attribute of a particular task. The Status codes to which a task may be set depend upon several factors, such as the current status of the task, and restrictions set by the administrator.

Note: *taskHandle* can be a task owned by either a change order or an issue. The objects returned are Task Status ('tskstat') objects used for both types of tasks.

Returns zero or more Status objects to which a task can be set.

Returns

This method has the following returns:

XML Element	Type	Description
<UDSObjectList>	N/A	Identifies the outer element, which contains zero or more <UDSObject (see page 3980)> elements with the requested attribute values.

getValidTransitions

The getValidTransitions method lets you list the transitions for a ticket.

The following parameters apply:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
handle	String	Identifies the handle for a ticket or status. If a ticket handle is provided, the method retrieves the valid transitions for the current status of the ticket.

Parameter	Type	Description
ticketFactory	String	Identifies the factory of the ticket. Valid values are only “cr” for Request, “in” for Incident, “pr” for Problem, “chg” for Change Order and “iss” for Issue.

Description

Returns all of the possible transition values for the status of a ticket. Administrators can configure valid status transitions for all ticket types.

Returns zero or more request/incident/problem/change/issue transition objects, depending on the values passed for handle and ticketFactory. If zero objects are returned, there are no transitions on the status of the ticket.

Returns

This method has the following return:

XML Element	Type	Description
<UDSObjectList>	N/A	Identifies the outer element, which contains zero or more <UDSObject (see page 3980)> elements.

getDependentAttrControls

The getDependentAttrControls method lets you list the locked and required attributes for the Status record (either the ticket’s current status or any status record). At this time, the only attribute supported is the Status attribute. If the attrVals parameter is passed as empty, the method returns the dependent attributes for the current status of the ticket (assuming that a valid handle is used). Otherwise, you can request the dependent attributes for any status record by using the attrVals parameter.

Enter the attrVals parameter syntax as follows:

- Specify the word "status" for the first item.
- For the second item, specify the code of the status record, for example, WIP.

The following parameters apply:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
handle	String	Identifies the handle for a ticket.
attrVals	String	Identifies the name-value pairs of a ticket attribute for this method to get its dependent attribute controls.

Description

Returns all of the possible dependent attribute controls for the Status field of a ticket. Administrators can configure attribute restrictions.

Returns zero or more attribute control objects depending on the values specified. If zero objects are returned, there are no attribute restrictions on the object.

Returns

The following:

XML Element	Type	Description
<UDSObjectList>	N/A	Identifies the outer element, which contains zero or more <UDSObject (see page 3980)> elements.

getHandleForUserid

The following parameters apply to the getHandleForUserid method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
userID	String	Identifies the user ID upon which to query.

Description

Returns the persistent handle for a Contact represented by userID.

Returns

The following is returned:

Parameter	Type	Description
<Handle>	String	Identifies the contact's handle.

getAccessTypeForContact

The following parameters apply to the getAccessTypeForContact method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
ContactHandle	String	Identifies the contact handle upon which to query.

Description

Returns a handle for the Access Type for a Contact.

Every Contact is assigned an Access Type object, which defines a Contact's permissions and security. Note the access_type field on a Contact is not required. To accommodate this, a single Access Type is marked as the default for Contacts who do not have an object specifically assigned.

This method returns the Access Type directly assigned to a Contact (that is, the information to which the access_type field points in the Contact record) or it returns the default. Typical value methods, such as getObjectValues() or getListValues(), may not return the correct Access type; therefore, these are not the accurate methods for retrieving the Contact's Access.

Returns

A string handle for an Access Type object.

getContact

The following parameter applies to the getContact method:

Parameter	Type	Description
SID	String	Identifies the session retrieved from logging in.
contactId	String	Identifies the unique ID of the contact to retrieve. contactId is UUID in string format.

Description

Retrieves information on all contacts.

Returns

A <UDSObject> node with a <UDSObject> node describing a contact with some of the following child <Attributes> nodes:

XML Element Value	Type	Description
contactid	String	Specifies a unique ID of the contact. contactId is UUID in string format.
userid	String	Indicates the user name of the contact.
last_name	String	Indicates the last name of the contact.
first_name	String	Specifies the first name of the contact.
middle_name	String	Specifies the middle name of the contact.
location	String	Indicates the location of the contact.
dept	String	Identifies the department of the contact.
organization	String	Identifies the organization of the contact.
email_address	String	Identifies the email address of the contact.
pemail_address	String	Signifies the alternate email address of the contact.
phone_number	String	Indicates the phone number of the contact.
alt_phone	String	Indicates the alternate phone number of the contact.
address1	String	Specifies the address of the contact.
address2	String	Specifies the alternate address of the contact.
city	String	Identifies the city of the contact.

XML Element Value	Type	Description
state	String	Identifies the state of the contact.
zip	String	Indicates the ZIP code of the contact.
country	String	Indicates the country of the contact.
delete_flag	Integer	Indicates whether the contact is active: **0** -- Active **1** -- Inactive

findContacts

The following parameters apply to the findContacts method:

Parameter	Type	Description
SID	Integer	Identifies the session retrieved from logging in.
userName	String	Returns only the contacts with this user name. You can do wildcard searches by using the percent (%) sign. For example, to search for all contacts where the User Name begins with Smi, specify Smi%.
lastName	String	Returns only the contacts with this last name. You can do wildcard searches by using the percent (%) sign.
firstName	String	Returns only the contacts with this first name. You can do wildcard searches by using the percent (%) sign.
email	String	Returns only the contacts with this email address. You can do wildcard searches by using the percent (%) sign.
accessType	String	Returns only the contacts with this access type. You can specify multiple roles by separating them with commas. Specify the following: 10002 - Administration 10004 - Customer 10005 - Employee 10009 - IT Staff 10013 - Knowledge Management 10014 - Process Management 10010 - Service Desk Management 10008 - Service Desk Staff 10020 - Vendor Staff
inactiveFlag	Integer	Returns only the contacts that are inactive or active. Specify the following: 0 for active - 999 for all other for inactive

Description

Retrieves the list of contacts.

Returns

A <UDSObjectList> node with zero or more <UDSObject> nodes describing contacts with the following <Attributes> child nodes:

XML Element Value	Type	Description
id	UUID	Specifies the unique ID of the contact.
userid	String	Specifies the user name of the contact.
last_name	String	Identifies the last name of the contact.
first_name	String	Identifies the first name of the contact.
access_type	Integer	Specifies the Role ID of the contact.
delete_flag	Integer	Indicates whether the contact is active or inactive: 0 - Active 1 - Inactive

loginServiceManaged Method

This article contains the following topics:

The following parameters apply to the loginServiceManaged method:

Parameter	Type	Description
policy	String	(Required) Identifies the policy, which must be must be in plain text.
encrypted_policy	String	(Required) Identifies the digital signature of the policy code, encrypted with the policyholder's private key. It is in BASE64 text format.

Description

Performs the user authentication by locating the policy through the plain text policy code, finding the policyholder's public key associated with the policy, decrypting the encrypted policy code, matching decrypted content with the policy code, and finally, opening a session with a back-end server. The returned session ID (SID) can be used for subsequent web services method invocations. Proxy contact specified in the policy is responsible for all subsequent web service activities initiated. All function group security and data partition are enforced for the proxy contact defined in the policy.

It is also important to note that the encrypted_policy parameter is in the BASE64 text format, and it is necessary to perform proper conversion from the binary format. The SID should be freed with logout(). A SID may expire if it is not used before a timeout elapses.

Returns

The following is returned:

Parameter	Type	Description
SID	String	Identifies the unique session ID (SID) to use for all other Web Services calls. It is in plain text format.

Implement loginServiceManaged in Java

The following shows how to generate Certificates and then use these generated Certificates to access the CA SDM web services.

In the following example, the login process completes using the CA SDM Certificate and then performs two common web services calls. The getBopsid() web services method call allows you to obtain a token that is linked to a specific user. This token can be used to login to the CA SDM web interface as the linked user without being prompted for a password. This allows seamless integration to be enabled between different applications.

Important! The generated BOPSID token expires after 30 seconds, so it must be used promptly.

Important! There is a known issue when using the 1.4 version of the AXIS tool. For more information, see the *Release Notes*.

Follow these steps:

1. Generate the stub classes with AIXS Tool WSDL2Java. For more information, see the Generating Stub Classes with AXIS Tool WSDL2Java section from the PKI_loginServiceManaged_JAVA_steps file. Find the file in the following location:

   ```
   $NX_ROOT/samples/sdk/websvc/java/test1_pki
   ```

2. Start the CA SDM service.

3. Run pdm_pki -p DEFAULT.
   DEFAULT.p12 is created in the current directory. This policy will have the password equal to the policy name (in this case DEFAULT).

   Note: This command will also add the Certificate's public key to the field pub_key field (public_key attribute) in the sapolicy table/object.

4. Log into CA SDM

5. Select **SOAP Web Services Policy**, **Policies** on the **Administration** tab.
   The **SOAP Web Services Access Policy List** page opens.

6. Click **DEFAULT**.
   The **SOAP Web Services Access Policy Detail** page opens.

7. Complete the **Proxy Contact** field (in this example, ServiceDesk) and confirm that the DEFAULT policy record Has Key field displays "Yes."

8. Copy DEFAULT.p12 (from the directory where command pdm_pki is executed), the JSP file called *pkilogin.jsp* and the HTML file called *pkilogin.htm* (from the $NX_ROOT/samples/sdk /websvc/java/test1_pki directory) to the following directory:

   ```
   $NX_ROOT/bopcfg/www/CATALINA_BASE/webapps/axis
   ```

9. Open the HTML form (from the axis directory). For example, http://localhost:8080/axis /pkilogin.htm
   Complete the appropriate fields.

   Note: The Directory field identifies the location of the Certificate file. Modify the path to the correct location.

10. Click Log me in!
    The results page opens.

11. Click the BOPSID URL.

    Important! Click this immediately! The BOPSID has a limited life token of about 30 seconds.

    The format of a URL using a BOPSID is as follows:
    http://<server name>:CA Portal/CAisd/pdmweb.exe?BOPSID=<BOPSID value>

Note: In order to use the loginServiceManaged method for a Java client program running on AIX, you may need to replace a pair of security policy files within your JAVA_HOME. Go to http://www.ibm.com (http://www.ibm.com) and search for "developerworks java technology security information AIX". In the "developerWorks : Java technology : Security" document, follow the link to "IBM SDK Policy files". Download the unrestricted policy files, local_policy.jar and US_export_policy.jar. Use these files to replace the original files in your JAVA_HOME/lib/security directory."

Generate Stub Classes with WSDL2Java

You can generate the stub classes for the CA SDM web services.

To generate stub classes with WSDL2Java

1. Open a command prompt and navigate to the "<drive>:\program files\CA" directory.
   The directory appears.

2. Run the dir /x command.
   The short form of the CA SDM directory appears. For example, the short name is "SERVIC~1."

3. Search for javac.exe on all of the server's local drives. If you locate the file, make note of its location because you will need to reference it in a batch file.

   Note: If you do not locate javac.exe, go to Http://java.sun.com and search for Java J2SE SDK to download. This may require a reboot.

4. Build a batch file called build_wsdl.bat and place it in the following directory:

   ```
   $NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\axis
   ```

5. Use the following code for the batch file, updating the bold items as appropriate:

```
@echo off
::#####################################################################
::# Simple bat file to Build Unicenter Service Desk Version 11.0 USD Stub classes
::# Use it to create the required USD Unicenter Service Desk Version 11.0 Java Web
Services classes
::#
::#  Usage: build_wsdl
::#####################################################################
@REM Update this with the PATH to USD NX_ROOT location
@SET USD_SHORT_PATH=C:\Progra~1/CA/Servic~1/

@REM Update this with the PATH to the JDK javac.exe compiler
@REM (this is used in the 2nd part of this file)
@SET JAVAC_EXE="C:\j2sdk1.4.2_13\bin\javac.exe"
@REM Update this to the path to the USD <USDK> <rellevel> NX_ROOT/java/lib location
@SET USD_TOMCAT=%USD_SHORT_PATH%java/lib
@SET CP=%USD_TOMCAT%/axis.jar;%USD_TOMCAT%/commons-discovery.jar;%USD_TOMCAT%/commons-
logging.jar;%USD_TOMCAT%/jaxrpc.jar;%USD_TOMCAT%/saaj.jar;%USD_TOMCAT%/log4j-1.2.8.
jar;%USD_TOMCAT%/xml-apis.jar;%USD_TOMCAT%/xercesImpl.jar;%USD_TOMCAT%/wsdl4j.jar;%
USD_TOMCAT%/axis-ant.jar
@REM Please specify the path to java.exe file below
@REM You can obtain this by reviewing the NX.env file use the @NX_JRE_INSTALL_DUR
@REM variable to derive this info
@SET JAVA_PATH=C:\Program Files(x86)\CA\SC\JRE\1.6.0_30
@SET JAVA_EXE="%JAVA_PATH%\bin\java.exe"
@cd WEB-INF\classes
%JAVA_EXE% -cp %CP% org.apache.axis.wsdl.WSDL2Java http://localhost:8080/axis/services
/USD_Unicenter Service Desk Version 11.0_WebService?wsdl
@cd ..\..
::#####################################################################
::# This next section compiles the Service Desk stub code
::# Once complete, you should recycle tomcat with the following
::# commands or by recycling Service Desk:
::#       pdm_tomcat_nxd -c STOP
```

```
::#       pdm_tomcat_nxd -c START
::#####################################################################
@SET CP=".\classes;%CP%"
@SET STUBS_DIR=classes\com\ca\www\UnicenterServicePlus\ServiceDesk
@cd WEB-INF
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\ArrayOfInt.java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\ArrayOfString.java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\ListResult.java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\USD_WebService.java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\USD_WebServiceLocator.
java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%\USD_WebServiceSoap.
java
%JAVAC_EXE% -classpath %CP% -deprecation -d classes %STUBS_DIR%
\USD_WebServiceSoapSoapBindingStub.java
@cd ..
```

After running the batch file from the command prompt, the stub classes are in place and compiled.

- Recycle Tomcat as follows:
  - pdm_tomcat_nxd -c STOP
  - pdm_tomcat_nxd -c START

Using the Automated Tasks Editor

This article contains the following topics:

You can author, debug, test, and upload automated tasks in your support environment using the Automated Tasks Editor. You can create automated tasks by customizing default templates and components. Modifying these defaults requires minimal or no coding, but if any errors occur, the application displays the line of code reporting the error.

The editor uses web services to access automated tasks depending on provided credentials during CA SDM authentication. An Administrator can permit analysts to access the server with the Automated Task Editor, and allow analysts to modify and upload public or tenant-specific scripts. The editor provides dialogs to edit the basic automated task settings, security settings, and dependencies on libraries and static content items. The automated task framework implements three objects used by the automated task author: Task, Step, and Logger.

You can do the following with automated tasks:

- Create and customize steps based on automated task step templates provided by CA Technologies.
- Customize an automated task by editing the step template properties in a property sheet, or by editing the code directly. The code editor supports syntax highlighting and automatic code completion functionality while typing.

- An Administrator can run reports that show whether automated tasks were successful or not. The definition of success varies considerably depending on what the automated task is trying to do. CA SDM provides the *Functions.SetExecutionState()* function call that enables the task to declare its execution state as being success, fail, or not setting it at all. The automated task execution state field filters the report.

- Send emails to end users or to an external system using the CA SDM mail daemon.

Localize automated tasks by declaring all strings to localize as automated task step properties. You can edit these step properties in the Automated Task Editor for each supported locale separately. The values of these properties are accessed from automated task step script code using Step. GetProperty() which returns the correct localized version of the specified property based on the localization ID of the customer running the automated task.

Edit an Automated Task

You can download automated tasks from the server and edit them in the Automated Task Editor. Any content that is newer in the version than the existing content on the server is imported into the database and made available to administrators of that tenant.

To edit an automated task

1. Open the Automated Task Editor.
   The Support Automation Task Editor appears.

2. On the toolbar, select the Upload Automated Task icon.
   The Open Automated Task from Server pane appears.

3. Select the automated task that you want to download.
   Note: If you are a privileged user in a multi-tenancy environment, you can edit public or tenant-specific automated tasks.

4. Click Open Task.
   The Support Automation Task Editor downloads the task to the client and opens it in the application.
   The download creates a text file on the computer of the task author that contains the dependent content.

Upload an Automated Task

You can upload automated tasks that you created in the application. When you select a task, all dependent content automatically uploads, such as libraries and static content.

To upload an automated task

1. Open the Automated Task Editor.
   The Support Automation Task Editor appears.

2. Select the automated task you want to upload.

3. Select the classification where you want to upload the task.
   Note: If you are a privileged user in a multi-tenancy environment, select the appropriate tenant when uploading the automated task, or make the task public.

4. On the toolbar, select the Upload Automated Task icon.
   The Support Automation Task Editor uploads the task to the server.

How an Automated Task Runs

This article contains the following topics:

CA SDM provides a framework which is a block of script code responsible for the code that deals with presenting user interfaces and retrieving user input from user interface steps. The framework exists so that you can do complex things with automated tasks, interface-related, using simple code, rather than complex code that would otherwise be necessary. The framework includes two objects (Task and Step). You can use these objects to interact with the framework and control how automated tasks execute, including setting up and accessing the user interface.

Note: When running an automated task in the Automated Task Editor, the editor acts as both server and client.

The following process describes what happens when you execute an automated task:

1. Use the framework to assemble the script code to execute together with the step code in the automated task definition, and any dependent library code.

2. The server assembles and distributes the code to the end-user environments.

3. Both the end user and the analyst receive the entire assembled automated task.

4. The server initiates each step in turn at the relevant client.

How Analysts Receive Data

You can have an automated task gather data and store it in the Support Automation database associated to the specific task execution. The data can be picked up by a post session integration that can use the data or pass it to an external system. In such a case, typically you construct this data as an XML fragment.

Use Functions.SetAcquiredData() to store data (text), associated with a task execution. Support Automation allows one such text field of any length to be stored for each execution of an automated task. You can store data in one step and access it in a subsequent step as follows:

1. The server sends the initial state of this data storage to the client with the instruction to execute a step.

2. At the end of the step, the client sends the persisted data state back to the server so the server can send this data to whichever client is executing the next step.

3. An analyst user interface step can gather input from the analyst and store it.

4. The end-user user interface step can access the data that was supplied by the analyst.

Automated Task Elements

This article contains the following topics:

You create automated tasks by defining steps in an automated process. Automated tasks predefine routines with specific actions on the end-user computer without the need for the analyst or end user to do the process. Common routines include gathering telemetry information, diagnosing problems, and implementing resolutions.

An automated task consists of the following elements:

- **Task Settings**
  Specifies the title, description, dimensions of the step windows, HTML headers and footers, and a CSS style sheet applied to the end-user interface.

- **Dependencies**
  Specifies the libraries and static content items that the task depends on, such as images or CSS files.

- **Task Steps**
  Specifies the executed code for each step. You can author steps by selecting automated task step templates and modify them to fit your needs.

- **Security Settings**
  Specifies the appropriate security settings to run the automated task on an end-user computer, such as read/write permissions, registry privileges, and so on.

- **XSDF Files**
  Specifies automated task definitions saved to an XML schema in XSDF files (XML Script Definition Format). The XSDF file contains all automated task settings, dependencies, security settings, and step code information.
  If the automated task is dependent on a particular library, the full script code of that library is written to the XSDF file, not only the dependency information. Dependencies are also imported when XSDF files are loaded into the Automated Task Editor or imported into CA SDM, unless a later version of the same dependent library exists in the target environment. The same is true for dependent static content. Script libraries can also be saved on their own to XSDF files for distribution between systems.

The editor lets you define CSS styles for all automated task elements. You can control the appearance by using CSS Styles.

Example Default CSS Styles

The following CSS styles are defined by default.

Note: If you use a custom CSS file, you can override the default values.

```
#header {
                padding: 2px 8px;
                font-size: 16pt;
                font-weight: bold;
                border-bottom: 2px solid green;
}
#title {
                background-color: #eee;
                padding: 2px 8px;
                font-size: 12pt;
                font-weight: bold;
                border-bottom: 1px solid green;
}
#content {
                padding: 8px;
}
#buttons {
                background-color: #eee;
                border-top: 1px solid green;
                text-align: right;
                padding: 2px 8px;
}
#buttons input {
                font-family: Verdana;
                font-size: 10pt;
}
#footer {
                border-top: 2px solid green;
                padding: 2px 8px;
                font-size: 9pt;
}
```

The supplied HTML components declare a CSS Style for an HTML DIV that encloses the component. This declaration allows all elements of the components to be styled through CSS.

The name of this style can usually be set through automated task step template properties for steps that use these HTML components.

Task Object Reference

The task object is directly referenced as Task [e.g., Task.End();]

Methods

Task	Description
End()	Ends the Task immediately.
GetNamedDataItem(key)	Returns the value previously stored with the specified key.
SetNamedDataItem(key, value)	Stores the value against the specified key. These values can be stored in one step and accessed in another using GetNamedDataItem(). The specified value can be JavaScript primitive type (number, boolean, string) or an object or an array of objects. In VBScript, only primitive types can be stored.
GetNextElementId()	Returns a unique identifier that can be used for HTML DOM objects.
GetPageBodyElementById(id)	Returns the HTML DOM object corresponding to the specified ID.
ReplaceDataItems(string)	Returns a copy of the specified string with all instances of stored data items in the format ${key} replaced by their stored values.
CloseIEWindow()	Closes the UI window if it is open.

Properties

Property	Description
Title	The title of the automated task.
HeaderHtml	The HTML placed in the header section of the UI window.
FooterHtml	The HTML placed in the footer section of the UI window.
Height	The height, in pixels, of the UI window.
Width	The width, in pixels, of the UI window.
NextStepIndex	The index (0-based) of the next step to be executed.

Step Object Reference

The step object is directly referenced as Step [e.g., Step.End();]

Methods

Step Object	Description
End()	Ends the step immediately. The next step will be invoked.
Controls.Add()	Adds a string or HTML component to the UI content. Strings are automatically converted to Label HTML components.
GetProperty (propertyKey)	Returns the value of the specified property key for the current localization. If no value exists for the current localization, the value of the property in the default localization will be returned.

SetProperty (localizationID, propertyKey, value)	Sets the value of the specified property to the specified value for the specified localization ID.
RegisterEventHandler(controlId, eventHandler, tag)	Registers the specified event handler as the function to be invoked when the IE window's raiseUIEvent(controlId) function is called. Any data passed as tag will be made available when the event handler is dispatched as Step.EventData.
IsUIStep()	Returns true if the current step is a UI step; false otherwise.

Properties

Property	Description
Title	The title of the step - displayed in the UI header section.
NextButtonLabel	The label for the "Next" button. Defaults to "Next".
NextButtonVisible	True to show the "Next" button. False to hide it.
PreviousButtonLabel	The label for the "Previous" button. Defaults to "Previous."
PreviousButtonVisible	True to show the "Previous" button. False to hide it.
FinishButtonLabel	The label for the "Finish" button. Defaults to "Finish."
FinishButtonVisible	True to show the "Finish" button. False to hide it.
EventData	When a UI event is raised (by calling raiseUIEvent() from HTML within the IE window) the event handler function previously registered with RegisterEvenHandler() is invoked. The data stored as the "tag" when the event handler was registered will be available as Step.EventData when the handler is dispatched.

Logger Object Reference

The Logger object is accessed as Trace.Framework.

Example:

Trace. Framework.Level = TraceLevels.Info

Trace.Framework.Error("An error has occurred")

Methods

Logger Object	Description
Fatal(msg)	Log the specified message if the current trace level is set at Fatal, Error, Warning, Info, Debug, or Verbose.
Error(msg)	Log the specified message if the current trace level is set at Error, Warning, Info, Debug, or Verbose.
Warning (msg)	Log the specified message if the current trace level is set at Warning, Info, Debug, or Verbose.
Info(msg)	Log the specified message if the current trace level is set at Info, Debug, or Verbose.
Debug (msg)	Log the specified message if the current trace level is set at Debug or Verbose.
Verbose (msg)	Log the specified message if the current trace level is set at Verbose.

Properties

Property	Description
Level	The current trace level. Set to one of the values in the TraceLevels enumeration (None, Fatal, Error, Warning, Info, Debug, or Verbose).

Global Functions

The following global functions are used in Support Automation procedures.

Function	Description
AnyArrayToVBArray(array)	Converts any array (VBScript or JavaScript) to a VBArray. Arrays in JavaScript are different objects to VBScript arrays so it is necessary to convert between them.
AnyArrayToJSArray(array)	Converts any array to JavaScript array.
CreateHashMap()	Returns an object that can be used as a hashmap for storing arbitrary data (key/value pairs). The returned object implements the following methods:
	Get(key) - Returns the value stored against the specified key.
	Set(key,value) - Stores the value for the specified key.
	GetAllKeys() - Returns an array of the keys.

Automated Task Step Templates

Automated task step templates are the script code for a given automated task step that can also define automated task step properties. You can customize the behavior of the automated task step template by changing the values of automated task step properties in the property sheet. You can accomplish more extensive customization by editing the code directly, but the intent is to minimize the amount of coding you do.

Steps are end-user action steps or user interface steps that show either to the end user or analyst. The automated task step templates are either end-user action, analyst interface, or end-user interface templates. CA Technologies provides automated task step templates, both action and user interface, to form the building blocks of tasks and enable you to create functional automated tasks with minimal coding.

For steps that define properties, you are prompted to provide values for these properties when the step is first created from the template. You can modify these values using the property sheet.

User Interface Steps

All user interface steps must implement an OnLoad function called by the framework before the step is displayed. The OnLoad function sets up the user interface. The step object exposes several properties and methods that you can use to set up the user interface.

You can control the visibility of the buttons on the step footer using Step.NextButtonVisible, Step. FinishButtonVisible, and Step.PreviousButtonVisible. When you set these properties to True, it makes the button appear. If a button is shown, a handler must be implemented for it. You can add the actual user interface controls to the page body using HTML components.

Example Text Input Box as an HTML Component

The step object has a controls array that is populated with a series of HTML components. These script objects render in HTML, and when the framework renders a user interface page, each HTML component in its controls array renders itself and adds the returned HTML fragment to the HTML body of the page.

HTML components let you write complex user interfaces without extensive HTML knowledge. Using an HTML component, you can create and configure commonly used controls with minimal coding.

Example: Text Input box as an HTML Component

An example of an HTML component is a text input box. The following example combines a label called PromptText and an HTML input box. If you want to prompt the customer or technician to supply a user name for example, the user interface page is constructed in an OnLoad function as follows:

```
Function OnLoad
    Dim myInputBox
    Set myInputBox = UI.MakeInputBox()
    myInputBox.PromptText = "Please enter your name:"
    Step.Controls.Add(myInputBox)
End Function
```

CA Technologies supplies samples, but you can also create custom HTML components. An HTML component is a script object that implements a method called GetHtml. Here, for example, is the implementation of that *MakeInputBox()* method call used in the previous example:

```
function InputBox() {
    // public properties
    this.PromptText = "";
    this.CssClass = "UIInputBox";
    this.InputMaxLength =50;
    this.InputSize = 50;

    // private member props
    var textboxId = Task.GetNextElementId();

    // privileged methods
    // (For example, publicly accessible with access to private props)
    this.GetHtml = function () {
        var inputHtml =
            "<DIV class = '" + this.CssClass + "'>\n";
        if(this.PromptText.length>0) {
            inputHtml +=
"<SPAN class ='PromptText'>" + this.PromptText + "</SPAN>\n" +
                "<BR>\n";
        }
        inputHtml +=
            "<INPUT type = text class = 'InputText' id = '"+textboxId+
            "' size = '"+this.InputSize+
"' maxlength='"+this.InputMaxLength+"'></INPUT>" +
            "<BR><BR>\n" +
            "</DIV>\n";
        return inputHtml;
    }

    this.GetUserInput = function() {
        var textBox = Task.GetPageBodyElementById(textboxId);
        if (textBox) {
            return textBox.value;
        }
        else {
            throw new Exception (Severity.Error,
"Could not read textbox value",
"Could not read textbox value");
        }
    }
}
return new InputBox();
```

This automated task library function defines a constructor for an object of type InputBox. The last line of the function constructs an instance of the InputBox class and returns it.

Object definitions differ in JavaScript and VBScript. In VBScript, the class keyword is used to declare a class. In JavaScript the function keyword declares the class, because in JavaScript functions are objects. Both languages let the class have public and private member variables and methods. A full description of how object syntax is handled in the two languages is beyond the scope of this chapter, but the internet can provide examples and tutorials on this subject.

In the example above, the code declares the InputBox class with some public and private properties and two public methods, GetHtml and GetUserInput.

The Framework calls GetHtml when rendering user interface steps. The InputBox control also exposes GetUserInput which you can use to access the value that the end user enters into the text box. Each HTML component can expose different methods for configuring it and accessing any user input values.

The HTML coding is abstracted from you by these HTML components so that creating user interface pages is simplified.

You can write your own HTML entirely for a particular automated task. In such a case, you have two choices: Write a new HTML component for the case you require, or construct the HTML code in a string variable and wrap it in a special HTML component called RawHTMLContainer as follows:

```
Function OnLoad
    Dim myRawHtmlContainer, myHtml
    myHtml = "<H1>Hello <B>World</B></H1>"
    Set myRawHtmlContainer = UI.MakeRawHtmlContainer(myHtml)
    Step.Controls.Add(myRawHtmlContainer)
End Function
```

Example End-User Input Handling

After the user interface page displays, in many cases it is necessary to handle end-user input when the user clicks one of the footer buttons, such as Next, Previous, or Finish. You implement handler functions to handle end-user input. You implement a function named *NextButtonHandler* to handle the clicking of the Next button. You can use the *PreviousButtonHandler* and *FinishButtonHandler* functions to handle the Previous and Finish buttons.

The handler performs the following actions:

- Retrieves input data from HTML components on the page
- Validates the end-user input
- If end-user input is invalid, display an error message and refresh the page
- If end-user input is valid, logs stores it for use in a later step
- Controls the sequence of step execution

Example: End-User Input Handling

HTML components that wrap input controls, such as the InputBox component, expose methods to access the values supplied by the end user. In this case, the *GeUserInput()* function is exposed.

You can control the next step that the framework presents as follows:

- Return True from the handler to present the default next step (currentStep+1 for NextButtonHandler, currentStep-1 for PreviousButtonHandler, end the automated task for FinishButtonHandler).
- Return False from the handler to refresh the current step.
- Set Step.NextStepIndex to the step index (1 based) to skip or repeat steps.

You can handle the Next button being clicked by supplying a NextButtonHandler. Because the NextButtonHandler has to access the HTML component that was created in the OnLoad, the declaration (Dim statement) of this variable is placed outside these functions. Thus, the entire step code would look as follows:

```
Dim myInputBox

Function OnLoad
    Set myInputBox = UI.MakeInputBox()
    myInputBox.PromptText = "Please enter your name:"
    Step.Controls.Add(myInputBox)
End Function
Function NextButtonHandler
    Dim userInputValue

    ' Retrieve the data supplied by the user
userInputValue = myInputBox.GetUserInput()

' Validate the data
If Len(userInputValue) = 0 Then
    ' Show error message
    Functions.ShowMessage "You must supply a name"

    ' Re-present current step
    NextButtonHandler=False
Else
    ' Log the data
    Functions.LogMessage "User name set to: " & userInputValue

    ' Store the data
    Task.SetNamedDataItem "UserName", userInputValue

' Proceed to next step
NextButtonHandler=True
End If
End Function
```

Script Library Management

This article contains the following topics:

You can use the same script functionality that gathers specific data or impacts certain changes on a remote machine in many various automated tasks. Support Automation provides the concept of script library to package such reusable code. You use script libraries to help you reuse and maintain code. These libraries contain functions written in JavaScript or VBScript that automated tasks can call. The automatic code completion feature of the Automated Task Editor provides a function description text and argument descriptions when you edit automated task step script code.

You can create your own libraries. The Automated Task Editor displays defined JavaScript and VBScript libraries on the left pane. Script libraries let you do the following:

- Create libraries and functions
- Provide descriptions of the Function arguments
- Export and Import from XSDF files or directly from the Support Automation server
- Define the function name, description, arguments, and script text

Return Objects from Library Functions

You can return an instance of an object from a library function, such as for library functions that manufacture HTML Components. Returning an object requires you to declare a class and instantiate an instance of that class. Class declarations are done differently in JavaScript and VBScript.

In JavaScript, you define classes by declaring a function that is actually the constructor for the class. Public properties and methods are added to the class using the *this* keyword. You declare private properties by using the *var* keyword. In JavaScript, you can declare a class inside a function definition.

In VBScript, class definitions are not permitted inside functions, however, you can provide the code that forms the implementation of a given function. You create class definitions using one of the following techniques:

- Constructing the class definition code in a string and executing it with *ExecuteGlobal*.
- Calling a second function and returning whatever it returns. End the function. Declare the class, then the second function.

Local File System/Registry Access

Many automated tasks require reading or modifying the file system or registry. The Windows Script Host (WSH) provides some scriptable COM components (such as FileSystemObject) to enable scripts to read or modify the file system or registry. Some antivirus programs implement script blocker utilities that interfere with those COM components, often flagging any script that tries to instantiate the relevant component as being malicious. Clearly, it is not desirable to have script blockers interfere with the activities of analysts who are trusted and trying to repair a problem. The CA SDM functions library contains functions for interacting with the file system and registry that enable much the same functionality that the Windows components expose, without being subject to the action of script blocker programs.

The standard WSH components are used when you write automated tasks for an internal corporate environment where the end-user computer state is known, and assumed that script blockers are not present. You can use the functionality in the CA SDM Functions COM component to implement any file system or registry activity for external environments (customers at home or on the public Internet) when the organization that is providing support does not control the end-user computer configuration.

Windows Management Instrumentation (WMI) Support

Automated tasks support Windows Management Instrumentation (WMI), a component of the Windows operating system that provides management information and control in an enterprise environment. By using industry standards, you can use WMI to query and set information about desktop systems, applications, networks, and other enterprise components.

WMI lets you access and modify the operating system. WMI is based upon SQL-style queries that allow an automated task to query information from the operating system and then, using objects, to manipulate that data. WMI is a powerful system and is often the preferred method for automated tasks to carry out their purposes.

Example: Script fragment that enumerates the currently configured Operating System Services.

```
strComputer = "."
Set objWMIService = GetObject("winmgmts:" _
    & "{impersonationLevel=impersonate}!\\" & strComputer & "\root\cimv2")

Set colRunningServices = objWMIService.ExecQuery("Select * from Win32_Service")

For Each objService in colRunningServices
    Wscript.Echo objService.DisplayName  & VbTab & objService.State
Next
```

Static Content Management

Automated tasks can present a user interface that requires you to use images or CSS files to appear correctly. This static content (images and CSS files) is associated with the automated task definition as the task is dependent on them. You can do the following:

- Import static content and associate it to automated tasks.
- Add, edit, delete, and upload to the Support Automation server.
- Select an image or text file to import and assign a globally unique identifier (GUID).
- Use the Automated Task Editor to assign static content items to automated tasks.

When you assign the static content item, you associate the automated task and it is saved in the XSDF with the task. The static content automatically deploys to the server when the dependent automated task deploys.

Static content is stored in the Support Automation database on the server. A servlet provides access to these images based on their ID. The Functions library call *Functions.GetStaticContentItemRef()* returns the URL to that servlet, which takes the ID as a parameter. The Automated Task Editor provides a toolbar button that brings up the Static Content Items dialog, which allows you to select the desired item. When you click OK, the *Functions.GetStaticContentItemRef()* call is automatically inserted into the code with the relevant ID.

Note: Status content has a limit of 50 KB per item.

Functions and WScript Usage

The framework provides two scriptable COM components that are accessible to all automated tasks running in CA SDM. These COM components are Functions and WScript.

Functions

The functions component is a collection of procedure calls that are used for the following:

- Accessing the local file system and or registry without triggering antivirus script blocker programs
- Accessing the Support Automation server functionality such as:
  - Writing session log entries
  - Storing automated task acquired data
  - Setting automated task execution state
  - Sending email
  - Escalating between products
  - Executing custom server routines

Functions COM Object Methods

This article contains the following topics:

The following Functions COM Object Methods are available for use in Support Automation automated tasks.

Function	Description
B64Encode (BSTR data, VARIANT *varResult)	Base64 encodes the specified data.
B64Decode (BSTR data, VARIANT *varResult)	Decodes the specified data.

CheckIfServerExists (BSTR URL, USHORT port, VARIANT *varResult)	Makes a request on the specified server to determine if it is accepting connections.
Eof (LONG fileno, VARIANT *varResult)	Determines if there is unread data in the specified text file
EscalateToLive (VARIANT *varResult)	Escalates the customers session from Self-Serve to Live Session
ExecuteRC (BSTR MethodName, BSTR ParamStr, int ParamCount, VARIANT *varResult)	Executes a RuleConduit call on the server allowing arbitrary server methods to be executed.
ExecuteWaitAndCaptureStream (BSTR strProg, int nStream, VARIANT *varResult)	Executes the specified command and waits for the process to exit, capturing the output from the process execution.
FileAddAttributes (BSTR szFilePath, LONG dwAttr, VARIANT *bvarResult)	Call to add attributes (Read-Only, Compressed, Archived, etc…) to a file without changing attributes already there.
FileCloseTextFile (LONG fileno)	Closes a text file previously opened with FileCreateTextFile or FileOpenTextFile.
FileCopyTo (BSTR szSourceFilePath, BSTR szDestFilePath, VARIANT_BOOL bcanOverwrite, VARIANT *bvarResult)	Call FileCopyTo to copy a file from one place to another.
FileCreateTextFile (BSTR szFilePath, BOOL overwrite, VARIANT *varResult)	Creates a new text file in the specified location returning a handle that can be used to interact with the file.
FileDelete (BSTR szFilePath, VARIANT *bvarResult)	Call to permanently delete a file.
FileExecute (BSTR szCommand, VARIANT *bvarResult)	Call to execute a file.
FileExecuteAndWait (BSTR szCommand, LONG dwMilliseconds, VARIANT *bvarResult)	Call to execute a file and wait for it to exit.
FileExists (BSTR szFilePath, VARIANT *bvarResult)	Checks whether a file exists or not.
FileGetAttributes (BSTR szFilePath, VARIANT *dwvarResult)	Call to retrieve the attributes (Read-only, archive, compressed, etc…) of a file.
FileGetDirectoryContents (BSTR pathName, BOOL showFiles, BOOL showDirs, VARIANT *varResult)	Returns the selected contents of the specified directory.
FileGetDrives (VARIANT *varResult)	Call to get a list of drives mounted.
FileGetDriveType (BSTR driveName, VARIANT *varResult)	Returns the type of the specified drive.
FileGetInfo (BSTR szFilePath, VARIANT *varResult)	Call to get the size and date information for a file.
FileGetINISectionContents (BSTR filename, BSTR sectionName, VARIANT *varResult)	Gets a pipe delimited list of the contents of the specified INI section.
	Gets the value of the specified item in the INI file.

FileGetINIValue (BSTR fileName, BSTR sectionName, BSTR keyName, BSTR defaultValue, VARIANT *varResult)	
FileGetInternetFile (BSTR szURL, BSTR szFilePath, VARIANT *bvarResult)	Call to download a file from the internet.
FileGetSize (BSTR szPath, VARIANT *varResult)	Gets the size of a file in bytes.
FileGetVersion (BSTR szFilePath, VARIANT *szvarResult)	Retrieves the version number of a file.
FileGetVolumeInfo (BSTR szVolumeRootPath, VARIANT *varResult)	Gets the information for a drive.
FileMakeDir (BSTR szDirPath, VARIANT *bvarResult)	Creates a directory.
FileMoveTo (BSTR szSourceFilePath, BSTR szDestFilePath, VARIANT_BOOL bcanOverwrite, VARIANT *bvarResult)	Moves a file from one place to another.
FileOpenTextFile (BSTR szFilePath, BSTR szMode, VARIANT *varResult)	Opens the specified text file returning a handle that can be used to interact with the file.
FileReadLine (LONG fileno, VARIANT *varResult)	Reads a line of text from the text file.
FileRecycle (BSTR szFilePath, VARIANT *bvarResult)	Recycles a file. Recycling places the file in the recycle bin and removes it from its original folder.
FileRenameTo (BSTR szSourceFilePath, BSTR szDestFilePath, VARIANT_BOOL bcanOverwrite, VARIANT *bvarResult)	Call FileRenameTo to change the name of a file.
FileSetAttributes (BSTR szFilePath, LONG dwAttr, VARIANT *bvarResult)	Sets the attributes (Read-only, archived, compressed, etc…) of a file.
FileSetINIData (BSTR filename, BSTR sectionName, BSTR keyName, BSTR data, VARIANT *varResult)	Sets the data for the specified key in the INI file.
FileWriteLine (LONG fileno, BSTR value, VARIANT *varResult)	Writes a line of text into the text file.
GetChildWindowCaption (int index, VARIANT *varResult)	Gets the caption for the specified child window.
GetChildWindowHandle (int index, VARIANT *varResult)	Gets the handle for the specified child window.
GetChildWindowProcessName (int index, VARIANT *varResult)	Gets the name of the process that owns the specified child window.
GetChildWindows (int hwnd, VARIANT *varResult)	Enumerates the windows that are children of the specified window storing the results for future querying, returning the count.
GetExecutionEnvironment (VARIANT *varResult)	Gets a string indicating where the script is being executed.
GetLocalization (VARIANT *varResult)	Gets the localization of the current user.
GetRootUrl (VARIANT *result)	Return the Server Root URL.

GetStaticContentUrl (VARIANT *result)	Return the Server Static Content URL.
GetStaticItemURL (BSTR itemGuid, VARIANT *varResult)	Retrieves the root URL of the given static content item.
GetSupportDeskOpen (VARIANT *varResult)	Gets the hours of operation status of the support desk.
GetWindowCaption (int index, VARIANT *varResult)	Gets the caption for the specified window.
GetWindowHandle (int index, VARIANT *varResult)	Gets the handle for the specified window.
GetWindowProcessName (int index, VARIANT *varResult)	Gets the name of the process that owns the specified window.
GetWindows (VARIANT *varResult)	Enumerates the system top level window handles, stores the results for future calls and returns the count.
HttpGet (BSTR szUrl, VARIANT *varResult)	Makes a request on the specified URL and returns the results.
HttpPost (BSTR szUrl, BSTR szBody)	Posts the specified request body to the specified URL.
InternetCheckConnection (VARIANT *varResult)	Determines if the customer machine appears to have a working internet connection.
LogMessage (BSTR szMessage)	Adds a message to the session log for the script execution.
OutlookGetPSTContents (BSTR szPSTPath, VARIANT *varResult)	Gets the contents of the specified Outlook PST file.
PromptUser (LONG Timeout, BOOL DefaultResult, BSTR Message, VARIANT *varResult)	Prompts the user with given message.
ReadLine (LONG fileno, VARIANT *varResult)	Reads a line of text from the text file. (deprecated, use FileReadLine instead).
RegCopyKey (BSTR szSourceRoot, BSTR szSourceKey, BSTR szDestRoot, BSTR szDestKey, VARIANT_BOOL bCanOverwrite, VARIANT *varResult)	Copies the entire contents of one key to another.
RegCopyValue (BSTR szSourceRoot, BSTR szSourceKey, BSTR szSourceValue, BSTR szDestRoot, BSTR szDestKey, BSTR szDestValue, VARIANT *bvarResult)	Copy the contents of one key/value to another. The user must have the ability to query keys for the root specified.
RegCreateKey (BSTR szRootPath, BSTR szKeyPath, VARIANT *bvarResult)	Creates a key entry in the user's registry.
RegDeleteKey (BSTR szRootPath, BSTR szKeyPath, VARIANT *bvarResult)	Removes a key from the registry. The user must have the ability to remove keys from the root specified.
RegDeleteValue (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, VARIANT *bvarResult)	Removes a key value from the registry. The user must have the ability to query keys for the root specified.
RegGetDWORD (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, VARIANT *dwvarResult)	Retrieves the a DWORD value from a specified key in the registry. The user must have the ability to query keys for the root specified.

RegGetString (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, VARIANT *szvarResult)	Retrieves a string value from a registry key. The user must have the ability to query keys for the root specified.
RegGetSubkeyByIndex (BSTR szRoot, BSTR szKey, LONG idxSubkey, VARIANT *varResult)	Retrieves the name of a subkey based on its index. The user must have the ability to query keys for the root specified.
RegGetSubkeysCount (BSTR szRoot, BSTR szKey, VARIANT *varResult)	Gets the number of keys underneath any given key. The user must have the ability to query keys for the root specified.
RegGetValueByIndex (BSTR szRoot, BSTR szKey, LONG idxValue, VARIANT *varResult)	Retrieves a key value given its index. The user must have the ability to query keys for the root specified.
RegGetValuesCount (BSTR szRoot, BSTR szKey, VARIANT *varResult)	Gets the number of values for a given key. The user must have the ability to query keys for the root specified.
RegGetValueType (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, VARIANT *dwvarResult)	Finds out the type of value for a given Registry key. The user must have the ability to query keys for the root specified.
RegKeyExists (BSTR szRootPath, BSTR szKeyPath, VARIANT *bvarResult)	Queries a key from the registry. The user must have the ability to query keys from the root specified.
RegMoveKey (BSTR szSourceRoot, BSTR szSourceKey, BSTR szDestRoot, BSTR szDestKey, VARIANT_BOOL bCanOverwrite, VARIANT *varResult)	Moves the entire contents of one key to another.
RegMoveValue (BSTR szSourceRoot, BSTR szSourceKey, BSTR szSourceValue, BSTR szDestRoot, BSTR szDestKey, BSTR szDestValue, VARIANT *bvarResult)	Moves the contents of one key value to another. The user must have the ability to query keys for the root specified and write to the destination.
RegRenameValue (BSTR szRootPath, BSTR szKeyPath, BSTR szOldValueName, BSTR szNewValueName, VARIANT *bvarResult)	Changes the name of a registry value. Note: The user must have the ability to query keys for the root specified.
RegRestoreKeyFromFile (BSTR szRootPath, BSTR szKeyPath, BSTR szFilePath, VARIANT *bvarResult)	Restores the entire contents of a key from a file into the registry. The user must have the ability to query and write keys for the root specified.
RegSaveKeyToFile (BSTR szRootPath, BSTR szKeyPath, BSTR szFileName, VARIANT *bvarResult)	Saves the entire contents of a key from the registry into a file. This file may then be restored using RegRestoreKeyFromFile. The user must have the ability to query keys from the root specified.
RegSetDWORD (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, LONG dwValue, VARIANT *bvarResult)	Sets a DWORD value in the registry. The user must have the ability to query keys for the root specified.
RegSetString (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, BSTR szValue, VARIANT *bvarResult)	Sets a string value for a key in the registry. The user must have the ability to query keys for the root specified.
RegValueExists (BSTR szRootPath, BSTR szKeyPath, BSTR szValueName, VARIANT *bvarResult)	Checks for the existence of a key/value pair in the registry. The user must have the ability to query keys for the root specified.

RunCommandAsImpersonatedUser (BSTR bapp, BSTR bargs, VARIANT_BOOL block, LONG timeout, VARIANT *varResult)	Runs an application with the same credentials the script has (deprecated). Returns 0 on success.
RunCommandAsUser (BSTR domain, BSTR user, BSTR password, BSTR app, BSTR args, VARIANT_BOOL block, LONG timout, VARIANT *varResult)	Runs an application as another user. Returns 0 on success.
SaveLog (BSTR fileName)	Saves the session log.
SendEmail (BSTR toAddress, BSTR emailSubject, BSTR emailBody)	Sends an email via CA Service Desk Manager mail daemon.
SetAcquiredData (BSTR data)	Save a chunk of script specific character data on the server for later use.
SetScriptSuccess (BOOL bSuccess, VARIANT *varResult)	Indicates whether the script executed successfully from the script's point of view.
ShowFileBrowseDlg (BSTR browseType, BSTR fileExt, VARIANT *varResult)	Shows the standard windows file browse dialog and returns the selected file.
ShowMessage (BSTR szMessage)	Displays the message to the user in a message box.
Sleep (LONG time)	Causes the execution thread to sleep.
TransferToQueue (BSTR queueID, BSTR queueName)	Sets the customer's current queue, this is the queue that the customer will enter if escalated to live.
UtilAttachDll (BSTR szDllPath, BSTR szHTTPLocation, VARIANT *varResult)	Loads a dll into the process space so that functions may be called from it.
UtilCloseTask (BSTR szProcName, VARIANT *bvarResult)	Closes a running task.
UtilDetachDll (LONG idDll, VARIANT *varResult)	Unloads a DLL from memory.
UtilEndProcess (BSTR szProcName, VARIANT *bvarResult)	Terminates the process with the specified name.
UtilExitWindows (LONG lAction, VARIANT_BOOL bForce, VARIANT_BOOL bRelogin)	Exits windows either by log off, restart, or shutdown.
UtilExternalMethodCall (LONG idDll, BSTR szFuncName, LONG lFuncType, BSTR szParams, VARIANT *varResult)	Executes a function from a loaded DLL.
UtilGetComputerName (VARIANT *varResult)	Gets the current computer name.
UtilGetEnvironmentVariable (BSTR szVarName, VARIANT *varResult)	Gets the value of a defined environment variable.
UtilGetOSVersion (VARIANT *varResult)	Gets the OS version.
UtilGetProcessByIndex (LONG idxProcess, VARIANT *varResult)	Retrieves process information for the specified process.
UtilGetProcesses (VARIANT *varResult)	Gets a list of all processes running on the customer machine.

UtilGetProcessesCount (VARIANT *varResult)	Gets the number of processes currently running on the customer machine.
UtilGetProcessMemory (LONG processID, VARIANT *varResult)	Gets the amount of memory used by the specified process.
UtilGetRunningTask (LONG idxWnd, VARIANT *varResult)	Gets information related to a task running on the customer machine. UtilGetRunningTasksCount should be called first to determine the number of tasks available.
UtilGetRunningTasksCount (VARIANT *varResult)	Gets a count of the tasks running on the customer machine.
UtilGetSystemDir (VARIANT *varResult)	Gets the windows system directory.
UtilGetSystemMetrics (LONG nIndex, VARIANT *varResult)	Gets the value of the specified system metric.
UtilGetUserName (VARIANT *varResult)	Gets the current user's logon name.
UtilGetWindowsDir (VARIANT *varResult)	Gets the directory for windows.
UtilGlobalMemoryStatus (VARIANT *varResult)	Gets information on global memory availability.

WScript

Many public domain script examples are available from sources such as Microsoft TechNet ScriptCenter, which are typically aimed at a system administrator audience, but are often useful for use in automated tasks. They often assume that the existence of an object called WScript, which Microsoft provides as part of their command-line script execution engine, but not part of the Windows Script Host in itself.

CA SDM implements a simple version of the WScript object providing the Echo, Sleep, GetObject, and CreateObject methods, providing compatibility for the most commonly used WScript methods. WScript.Echo(), which usually writes to the command line, is implemented in CA SDM to write to the automated task log, and thus WScript.Echo() is synonymous with Functions.LogMessage().

WScript COM Object Methods

The following WScript COM Object Methods are available for use in Support Automation automated tasks.

Object Method	**Description**
CreateObject (objDescription)	Creates an instance of the specified COM object.
Echo(msg)	Logs the specified message. Equivalent to Functions.LogMessage(msg).
GetObject (objDescription)	Used to get an instance of an object from a string reference to it.
Quit()	Ends the executing task immediately.
Sleep(time)	Pauses execution for the specified number of milliseconds. Equivalent to Functions.Sleep(time).

EBR_DICTIONARY Table

This article contains the following topic:

- **SQL Name** -- EBR_DICTIONARY
- **Object** -- EBR_DICTIONARY

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE KEY		
WORD_ID	INTEGER		
WORD	STRING 50 NOT_NULL S_KEY		
WORD_TYPE	INTEGER		
WORD_TOTAL_COUNT	INTEGER		
DF	INTEGER		
WORD_IDF	INTEGER		
last_mod_dt	LOCAL_TIME		

EBR_DICTIONARY_ADM Table

- **SQL Name** -- EBR_DICTIONARY_ADM
- **Object** -- EBR_DICTIONARY_ADM

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE KEY		
WORD_ID	INTEGER		
WORD	STRING 50 NOT_NULL S_KEY		
WORD_TYPE	INTEGER		
WORD_TOTAL_COUNT	INTEGER		
DF	INTEGER		
WORD_IDF	INTEGER		
last_mod_dt	LOCAL_TIME		

EBR_FULLTEXT Table

This topic contains the following topics:

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_FULLTEXT
- **Object** -- EBR_FULLTEXT

Field	Data Type	Reference	Remarks
DOC_TYPE	INTEGER		
ENTITY_ID	INTEGER		
FULL_WORD	STRING 50		
FULL_WORD_ REVERSE	STRING 50		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
PERMISSION_INDEX_ID	INTEGER		
PRODUCT	STRING 50		
SHORT_WORD	STRING 50		
TABLE_ID	INTEGER		
WORD_COUNT	INTEGER		
WORD_COUNT_ PROBLEM	INTEGER		
WORD_COUNT_ RESOLUTION	INTEGER		
WORD_COUNT_ SUMMARY	INTEGER		
WORD_COUNT_ TITLE	INTEGER		
WORD_IDF	INTEGER		
WORD_ORDER	INTEGER		
WORD_TYPE	INTEGER		

EBR_FULLTEXT_ADM Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_FULLTEXT_ADM
- **Object** -- EBR_FULLTEXT_ADM

Field	Data Type	Reference	Remarks
DOC_TYPE	INTEGER		
ENTITY_ID	INTEGER		
FULL_WORD	STRING 50		
FULL_WORD_ REVERSE	STRING 50		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
PERMISSION_ INDEX_ID	INTEGER		
PRODUCT	STRING 50		
SHORT_WORD	STRING 50		
TABLE_ID	INTEGER		

Field	Data Type	Reference	Remarks
WORD_COUNT	INTEGER		
WORD_COUNT_ PROBLEM	INTEGER		
WORD_COUNT_ RESOLUTION	INTEGER		
WORD_COUNT_ SUMMARY	INTEGER		
WORD_COUNT_ TITLE	INTEGER		
WORD_IDF	INTEGER		
WORD_ORDER	INTEGER		
WORD_TYPE	INTEGER		

EBR_FULLTEXT_SD Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_FULLTEXT_SD
- **Object** -- EBR_FULLTEXT_SD

Field	Data Type	Reference	Remarks
ENTITY_ID	INTEGER		
FULL_WORD	INTEGER		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
SHORT_WORD	STRING 50		
TABLE_ID	INTEGER		
WORD_COUNT	INTEGER		
WORD_COUNT_ PROBLEM	INTEGER		
WORD_COUNT_ RESOLUTION	INTEGER		
WORD_COUNT_ SUMMARY	INTEGER		
WORD_COUNT_ TITLE	INTEGER		
WORD_IDF	INTEGER		
WORD_ORDER	INTEGER		
WORD_TYPE	INTEGER		

EBR_FULLTEXT_SD_ADM Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_FULLTEXT_SD_ADM
- **Object** -- EBR_FULLTEXT_SD_ADM

Field	Data Type	Reference	Remarks
ENTITY_ID	INTEGER		
FULL_WORD	INTEGER		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
SHORT_WORD	STRING 50		
TABLE_ID	INTEGER		
WORD_COUNT	INTEGER		
WORD_COUNT_ PROBLEM	INTEGER		
WORD_COUNT_ RESOLUTION	INTEGER		
WORD_COUNT_ SUMMARY	INTEGER		
WORD_COUNT_TITLE	INTEGER		
WORD_IDF	INTEGER		
WORD_ORDER	INTEGER		
WORD_TYPE	INTEGER		

EBR_INDEX Table

This article contains the following topics:

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_INDEX
- **Object** -- EBR_INDEX

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE KEY		
ENTITY_ID	INTEGER NOT_NULL S_KEY		
WORD_ID	INTEGER NOT_NULL S_KEY		
WORD_TYPE	INTEGER NOT_NULL S_KEY		
WORD_ORDER	INTEGER		
WORD_COUNT	INTEGER		
WORD_COUNT_ TITLE	INTEGER		

WORD_COUNT_ SUMMARY	INTEGER
WORD_COUNT_ PROBLEM	INTEGER
WORD_COUNT_ RESOLUTION	INTEGER

EBR_INDEX_ADM Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_INDEX_ADM
- **Object** -- EBR_INDEX_ADM

Field	Data Type	Reference	Remarks
id	INTEGER UNIQUE KEY		
ENTITY_ID	INTEGER NOT_NULL S_KEY		
WORD_ID	INTEGER NOT_NULL S_KEY		
WORD_TYPE	INTEGER NOT_NULL S_KEY		
WORD_ORDER	INTEGER		
WORD_COUNT	INTEGER		
WORD_COUNT_ TITLE	INTEGER		
WORD_COUNT_ SUMMARY	INTEGER		
WORD_COUNT_ PROBLEM	INTEGER		
WORD_COUNT_ RESOLUTION	INTEGER		

EBR_INDEXING_QUEUE Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_INDEXING_QUEUE
- **Object** -- EBR_INDEXING_QUEUE

Field	Data Type	Reference	Remarks
ACTION	INTEGER		
ACTION_DATE	DATE		
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
INDEXED	INTEGER		
OBJ_PERSID	STRING 30		Persistent ID (SystemObjectName:id)
PRIORITY	INTEGER		
TEXT	STRING 32768		
TEXT	STRING 32768		

EBR_SYNONYMS Table

This article contains the following topics:

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_SYNONYMS
- **Object** -- EBR_SYNONYMS

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
KEYWORD1	STRING 50		
KEYWORD2	STRING 50		
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

EBR_SYNONYMS_ADM Table

Program control table used by Knowledge Management.

- **SQL Name** -- EBR_SYNONYMS_ADM
- **Object** -- EBR_SYNONYMS_ADM

Field	Data Type	Reference	Remarks
ID	INTEGER NOT_NULL KEY		Unique (to the table) Numeric ID
KEYWORD1	STRING 50		
KEYWORD2	STRING 50		
LAST_MOD_DT	LOCAL_TIME		Indicates the timestamp of when this record was last modified.

bop_sinfo--Display System Information

The bop_sinfo utility displays information about a single Majic-defined object. You can run this utility on the objects listed under Technical Reference (see page 3821).

Syntax

This command has the following format:

```
bop_sinfo [-s server] [-p] [-l] [-d] [f] [-q] [-t] [-m] [-a] object [-h]
```

- **-s server**
  Specifies the server to query.

- **-p**
  Displays the producer information.
- **-l**
  Displays the domset list.
- **-d**
  Displays database object information, including the name and type of all attributes.
- **-f**
  Displays factory information, including the rel_attr and common_name.
- **-q**
  Displays the schema name of the associated table.
- **-t**
  Displays triggers on the object.
- **-m**
  Displays methods used by the object.
- **-a**
  Displays attribute details.
- **object**
  The name of the object to query
- **-h**
  Displays help on the utility.

Example: Display System Information for the dmn object

```
bop_sinfo -d dmn
Factory dmn
 Attributes
   id            INTEGER
   producer_id    LOCAL STRING(20)
   persistent_id    STRING(30)
   sym            STRING(60) REQUIRED
   delete_flag    SREL -> actbool.enum REQUIRED
   desc        STRING(40)
   tables        BREL <- dcon.dom_id {dom_id = ?}
   last_mod       DATE
   last_mod_by    SREL -> cnt.id
   audit_userid    LOCAL SREL -> cnt.id
```

ES_CONSTANTS Object

This article contains the following topics:

The object details are as follows:

1. Associated Table: ES_CONSTANTS
2. Factories: default
3. REL_ATTR: id
4. Common Name: NAME
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Comments	COMMENTS	STRING		
id	ID	INTEGER		REQUIRED KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Name	NAME	STRING		
Property ID	PROPERTYID	INTEGER		
Property Value	PROPVALUE	INTEGER		

ES_NODES Object

The object details are as follows:

1. Associated Table: ES_NODES
2. Factories: default
3. REL_ATTR: id
4. Common Name: NODE_SHORT_DESC
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
DISPLAYED_TEXT	DISPLAYED_TEXT	STRING		
id	ID	INTEGER		REQUIRED KEY
last_mod_dt	LAST_MOD_DT	LOCAL_TIME		
LINK_ID	LINK_ID	INTEGER	ES_NODES id	
NODE_ID	NODE_ID	INTEGER		
NODE_SHORT_ DESC	NODE_SHORT_ DESC	STRING		
NODE_TYPE	NODE_TYPE	INTEGER		

Attribute	DB Field	Data Type	SREL References	Flags
PARENT_NODE_ID	PARENT_NODE_ID	INTEGER		
QUERY_RESP_ NUMBER	QUERY_RESP_ NUMBER	INTEGER		
QUERY_RESP_ TYPE	QUERY_RESP_ TYPE	STRING		
RESPLINKID1	RESPLINKID1	INTEGER		
RESPLINKID2	RESPLINKID2	INTEGER		
RESPLINKID3	RESPLINKID3	INTEGER		
RESPLINKID4	RESPLINKID4	INTEGER		
RESPLINKID5	RESPLINKID5	INTEGER		
RESPLINKID6	RESPLINKID6	INTEGER		
RESPLINKID7	RESPLINKID7	INTEGER		
RESPONSE1	RESPONSE1	STRING		
RESPONSE2	RESPONSE2	STRING		
RESPONSE3	RESPONSE3	STRING		
RESPONSE4	RESPONSE4	STRING		
RESPONSE5	RESPONSE5	STRING		
RESPONSE6	RESPONSE6	STRING		
RESPONSE7	RESPONSE7	STRING		
ROOT_ID	ROOT_ID	INTEGER	ES_NODES id	
TREE_ID	TREE_ID	INTEGER	SKELETONS id	

ES_RESPONSES Object

The object details are as follows:

1. Associated Table: ES_RESPONSES
2. Factories: default
3. REL_ATTR: id
4. Common Name: RESPONSE_LINK_TEXT
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
last_mod_dt	LAST_MOD_ DT	LOCAL_TIME		
PARENT_ NODE_ID	PARENT_ NODE_ID	INTEGER	ES_NODES id	
RESPONSE_LINK_ID	RESPONSE_ LINK_ID	INTEGER	ES_NODES id	

Attribute	DB Field	Data Type	SREL References	Flags
RESPONSE_ LINK_ORDER	RESPONSE_ LINK_ORDER	INTEGER		
RESPONSE_ LINK_TEXT	RESPONSE_ LINK_TEXT	STRING		

ES_SESSIONS Object

The object details are as follows:

1. Associated Table: ES_SESSIONS
2. Factories: default
3. REL_ATTR: id
4. Common Name: EXTERNAL_ID
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
COMMENT_TEXT	COMMENT_TEXT	STRING		
EVALUATION	EVALUATION	INTEGER		
EXTERNAL_ID	EXTERNAL_ID	STRING		
id	ID	INTEGER		REQUIRED KEY
last_mod_dt	LAST_MOD_DT	LOCAL_TIME		
PATH_IDS	PATH_IDS	STRING		
PATH_QAS	PATH_QAS	STRING		
SESSION_ID	SESSION_ID	INTEGER		
TREE_ID	TREE_ID	INTEGER	ES_NODES id	

BSVC--func_access Object

This article contains the following topics:

The object details are as follows:

1. Associated Table: usp_functional_access
2. Factories: default
3. REL_ATTR: code

4. Common Name: sym
5. Function Group: security
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
code	code	STRING 30		REQUIRED UNIQUE
type	type	SREL	func_access_type.id	REQUIRED
sym	sym	STRING 60		REQUIRED
description	description	STRING 1000		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	UUID	cnt.id	

BSVC--func_access_level Object

The object details are as follows:

1. Associated Table: usp_functional_access_level
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: security
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
access_level	access_level	INTEGER		REQUIRED
type	type	SREL	func_access_type.id	REQUIRED
sym	sym	STRING 60		REQUIRED
description	description	STRING 1000		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	UUID	cnt.id	

BSVC--func_access_role Object

The object details are as follows:

1. Associated Table: usp_functional_access_role
2. Factories: default

3. REL_ATTR: id
4. Common Name: sym
5. Function Group: security
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
access_level	access_level	SREL	func_access_level.id	
func_access	func_access	SREL	func_access.code	
role	role	SREL	role.id	
description	description	STRING 1000		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	UUID	cnt.id	

func_access_type Object

The object details are as follows:

1. Associated Table: usp_functional_access_type
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: security
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
sym	sym	STRING 60		
default_access	default_access	SREL	func_access_level.id	
description	description	STRING 1000		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	UUID	cnt.id	

Table and Object Cross-References

This article contains the following topics:

This chapter provides several tables that allow you to easily cross-reference table names, SQL names, and object names. The chapter “Data Element Dictionary” lists a complete definition of the tables in the schema. The chapter “Objects and Attributes” lists the object definitions.

Table to SQL Name and Object

This table provides a cross-reference of each table in the database schema to its corresponding SQL and object names:

Table	SQL Name (AKA)	Object
Access_Levels	acc_lvls	acc_lvls
Access_Type_v2	acctyp_v2	acctyp
Act_Log	act_log	alg
Act_Type	act_type	aty
Act_Type_Assoc	atyp_asc	act_type_assoc
Active_Boolean_Table	actbool	actbool
Active_Reverse_Boolean_Table	actrbool	actrbool
admin_tree	admin_tree	ADMIN_TREE
Am_Asset_Map	am_map	am_asset_map
Animator	anima	ANI
Archive_Purge_History	arcpur_hist	arcpur_hist
Archive_Purge_Rule	arcpur_rule	arcpur_rule
Asset_Assignment	hier	hier
Atomic_Condition	atomic_cond	atomic_cond
Attached_Events	att_evt	atev
Attached_SLA	attached_sla	attached_sla
Attachment	attmnt	attmnt
attmnt_folder	attmnt_folder	attmnt_folder
Attribute_Name	atn	
Audit_Log	audit_log	audlog
Behavior_Template	bhvtpl	bhvtpl
Boolean_Table	bool_tab	bool
Bop_Workshift	bpwshft	wrkshft
BU_TRANS	BU_TRANS	BU_TRANS
Business_Management	busmgt	bmhier
Business_Management_Class	buscls	bmcls
Business_Management_Repository	busrep	bmrep
Business_Management_Status	busstat	bms
ca_asset_type	ca_asset_type	

Table	SQL Name (AKA)	Object
ca_company	ca_company	ca_cmpny
ca_company_type	ca_company_type	vpt
ca_contact	ca_contact	cnt
ca_contact_type	ca_contact_type	ctp
ca_country	ca_country	country
ca_job_function	ca_job_function	job_func
ca_job_title	ca_job_title	position
ca_location	ca_location	loc
ca_model_def	ca_model_def	mfrmod
ca_organization	ca_organization	org
ca_owned_resource	ca_owned_resource	nr
ca_resource_class	ca_resource_class	grc
ca_resource_cost_center	ca_resource_cost_center	cost_cntr
ca_resource_department	ca_resource_department	dept
ca_resource_family	ca_resource_family	nrf
ca_resource_gl_code	ca_resource_gl_code	gl_code
ca_resource_operating_system	ca_resource_operating_system	opsys
ca_resource_status	ca_resource_status	rss
ca_schema_info	ca_schema_info	
ca_site	ca_site	site
ca_state_province	ca_state_province	state
ca_tenant	ca_tenant	tenant
ca_tenant_group	ca_tenant_group	tenant_group
ca_tenant_group_member	ca_tenant_group_member	tenant_group_member
Call_Req	call_req	cr
Call_Req_Type	crt	crt
Call_Solution	crsol	crsol
Change_Act_Log	chgalg	chgalg
Change_Category	chgcat	chgcat
Change_Request	chg	chg
Change_Status	chgstat	chgstat
Chg_Template	chg_template	chg_tpl
CI_ACTIONS	CI_ACTIONS	CI_ACTIONS
CI_ACTIONS_ALTERNATE	CI_ACTIONS_ALTERNATE	CI_ACTIONS_ALTERNATE
CI_BOOKMARKS	CI_BOOKMARKS	CI_BOOKMARKS
CI_DOC_LINKS	CI_DOC_LINKS	CI_DOC_LINKS

Table	SQL Name (AKA)	Object
CI_DOC_TEMPLATES	CI_DOC_TEMPLATES	CI_DOC_TEMPLATES
CI_DOC_TYPES	CI_DOC_TYPES	CI_DOC_TYPES

CA SDM Object List Table for Multi-Tenancy

The following table lists all CA SDM objects and indicates whether each object has a tenant attribute, and if so, if it is optional or required.

Note: The Rel_attr must be unique, regardless of tenant.

Object	Rel_Attr	Description	Tenancy
acc_lvls	enum	Access Level	No
acctyp	id	Access Type	No
acctyp_role	id	Access Type Role	No
act_type_assoc	code	Activity Type Association	Optional
actbool	enum	Active Boolean	No
actlog_prod_list	sym	actlog_prod_list	No
actrbool	enum	Active Reverse Boolean	No
ADMIN_TREE	id	Administration Tree	No
agt	id	Analyst contacts	Required
alg	persistent_id	Request Activity Log	Required
all_fmgrp	id	all_fmgrp	No
all_lr	persistent_id	all_lr	Required
am_asset_map	persistent_id	AM Asset Map	No
ANI	persistent_id	Animator	Optional

Object	Rel_Attr	Description	Tenancy
api	persistent_id	api	No
app_extx	id	app_extx	Optional
app_inhx	id	app_inhx	Optional
arcpur_hist	persistent_id	Archive Purge History	No
arcpur_rule	persistent_id	Archive Purge Rule	No
arg_history	persistent_id	arg_history	No
asset	id	asset	No
assetx_prod_list	sym	assetx_prod_list	No
atev	persistent_id	Attached Event	Required
atomic_cond	id	Atomic Condition	Optional
attached_sla	id	Attached Service Type	Required
attmnt	id	Attachment	Optional
attmnt_folder	id	Attachments Folder	Optional
attmnt_lrel	persistent_id	Attachment LREL	No
attr_alias	id	Attribute Alias	No
aty	code	Activity Type	Optional
audlog	persistent_id	Audit Log	Required
bhvtpl	id	Behavior Template	Optional
bhvtpl_wftpl	id	bhvtpl_wftpl	Optional

wsptbl	id	Web Screen Painter Table	No
cr_wf	id	Request Workflow Task	Required

CMDB Technical Reference

This article contains the following topics:

Introduction

This section is intended for implementers who perform the following configuration management database (CMDB) tasks:

- Map your data into the CMDB.
- Manage CMDB configuration items.

- Use the Advantage Data Transformer (ADT) to write a Federation Adapter.
- Use the CMDBf Web Services to interact with CMDB.

The information in this page can assist you as you plan your CMDB implementation. You can print and have the printouts handy while performing these tasks.

CI Families and Classes

Configuration item (CI) *families* categorize your business assets by type and assign meaningful attributes for each CI in the family. Families are general categories of CIs, such as hardware, software, and services CIs.

CI *classes* are specific categories within the family categories. For example, the Hardware family contains CI classes such as modem, router, repeater, and bridge.

You can organize your CIs into families and classes to make them easier to manage. For example, you can generate a list of CIs that belong to a particular family or class.

You use the following sequence to categorize your business assets:

1. Define CI families.
2. Define CI classes.
3. Define CIs.

List Configuration Item Families

You can list CMDB CI families and view their descriptions.

To list configuration item families

1. Log into CA SDM as an administrator.
   The web interface appears.
2. Click Administration.
   The Administration tree appears.
3. Navigate the folder structure by clicking CMDB, CI Families.
   The CI families and their descriptions are listed.
4. (Optional) Click a CI family name.
   CI family details appear.

Generate a Configuration Item Families Summary

You can list CMDB CI families and view their descriptions in a report format.

To list configuration item families

1. Log into CA SDM as an administrator.
   The web interface appears.

2. Click Administration.
   The Administration tree appears.

3. Navigate the folder structure by clicking CA SDM, CI Families.
   The CI families and their descriptions are listed.

4. Click Reports, Summary.
   A summary report appears in a separate window.

5. (Optional) Click Print to select a printer and print the report.
   The report prints.

MDB Extension Tables

Each CI family has a set of family-specific attributes that reside in an *extension table* in the MDB. The family-specific attributes describe the unique characteristics of each type of CI. For example, a CI in the Hardware.Server family has attributes that represent the following:

- swap_size -- The size of the disk space allocated on a hardware or network device to store the state of a process that has been swapped out.
- mem_capacity -- The total amount of memory that can be installed and made available.
- slot_total_mem -- The total amount of memory available on memory cards in a hardware or network device.

When you implement CA SDM, you can determine the types of CIs that you want to manage and the attributes that you can track for them.

Common Attributes

The following attributes are common to various families.

Object Name	Description
acquire_date	Date the resource was acquired.
alarm_id	IP address. (hardware only)
asset_count	Resource quantity.
asset_num	Alternate resource identifier, for example, an alternate ID located on sticker placed on a computer.
class	In the object, this is the name of the class. In the table, this is a foreign key to a record in the ca_resource_class table (SREL integer to grc).
company_bought_for_uuid	In the object, this is the name of the company for which the CI was bought. In the table, this is a foreign key to the ca_company table (SREL uuid to ca_cmpny).

Object Name	Description
contact_1	In the object, this is a user-defined contact field. In the table, this is a foreign key to the ca_contact table (SREL uuid to cnt).
contact_2	In the object, this is a user-defined contact field. In the table, this is a foreign key to the ca_contact table (SREL uuid to cnt).
contact_3	In the object, this is a user-defined contact field. In the table, this is a foreign key to the ca_contact table (SREL uuid to cnt).
creation_date	Timestamp (pdmtime) indicating the date and time that the CI was created.
creation_user	User ID of the contact who created the CI
delete_flag	Active|FALSE|0 (zero)|No: CI is active and displays in display lists (the default). Inactive|TRUE|1 (one)|Yes: CI is not active and does not appear in display lists.
department	In the object, this is the name of the department. In the table, this is a foreign key to the ca_resource_department table (SREL integer to dept).
description	Longer name or description of the resource.
dns_name	The name by which this device is know in the domain name server.
exclude_registration	Exclude Registration.
expense_code	In the object, this is the CI cost center. In the table, this is a foreign key to the ca_resource_cost_center table (SREL integer to cost_cntr).
expiration_date	Date the license, lease, and so on, expires.
family	In the object, this is the name of the family. In the table, this is a foreign key to a record in the ca_resource_family table (SREL integer to nrf). Used to extend at a high level, for example, hardware.server, network.router, software.database.
financial_num	Financial number.
install_date	Date resource was installed in organization or network.
is_asset	Boolean flag that can be set to categorize an Asset for filtering purposes and to control display in CA CMDB or other products such as CA Asset Portfolio Management. CA CMDB does not allow the Asset flag to be changed to NO when an asset is managed by CA Asset Portfolio Management.
is_ci	Boolean flag that can be set to categorize a CI for filtering purposes and to control display in CA CMDB or other products such as CA Asset Portfolio Management. By default, a CI created by CA CMDB is flagged as a CI but not as an Asset.
	User ID of the contact who last modified the CI

Object Name	Description
last_mod_by	
license_number	License Information.
loc_cabinet	Cabinet location.
loc_floor	Floor location.
loc_room	Room location.
loc_shelf	Shelf location.
loc_slot	Slot location.
location	In the object, this is the name of the location. In the table, this is a foreign key to a record in the location table (SREL uuid to loc).
mac_address	MAC address. (hardware only)
manufacturer	In the object, this is the name of the company who manufactured the CI. In the table, this is a foreign key to a record in the ca_company table (SREL uuid to ca_cmpny).
model	In the object, this is the model name for the CI. In the table, this is a foreign key to the ca_model_def table (SREL uuid to mfrmod).
name	The name of the resource.
name_type	Foreign key to the ca_asset_type table to represent Hardware, Software, and so on.
org_bought_for_uuid	In the object, this is the name of the organization for which the CI was bought. In the table, this is a foreign key to the ca_organization table (SREL uuid to org).
priority	Enumerated value for this entry, it specifies ordering in lists and relative values (SREL integer to pri).
product_version	Product release.
repair_org	In the object, this is the name of the organization responsible for maintenance of the CI. In the table, this is a foreign key to the ca_organization table (SREL uuid to org).
resource_alias	Resource alias.
resource_contact	In the object, this is the name of the contact responsible for the CI. In the table, this is a foreign key to the ca contact table (SREL uuid to cnt).
resource_owner_uuid	In the object, this is the name of the owner for the CI. In the table, this is a foreign key to the ca_contact table (SREL uuid to cnt).

serial_number	Serial number.
service_org	In the object, this is the name of the organization ultimately responsible for the resource. In the table, this is a foreign key to the ca_organization table (SREL uuid to org).
service_type	Noneditable enum (SREL string to no_contract_sdsc).
sla	The SLA value for this usp_owned_resource.
smag_1	User-defined string field.
smag_2	User-defined string field.
smag_3	User-defined string field.
smag_4	User-defined string field.
smag_5	User-defined string field.
smag_6	User-defined string field.
standard_ci	Standard configuration for comparison.
status	In the object, this is the status indicator for the CI. In the table, this is a foreign key to the ca_resource_status table (SREL integer to rss).
supplier	In the object, this is the name of the vendor responsible for supplying the CI. In the table, this is a foreign key to the ca_company table (SREL uuid to ca_cmpny).
system_name	Computer name. (hardware only)
tenant	Tenant assignment for the CI
vendor_repair	In the object, this is the name of the vendor providing maintenance for the CI. In the table, this is a foreign key to the ca_company table (SREL uuid to ca_cmpny).
vendor_restore	In the object, this is the name of the company ultimately responsible for the resource. In the table, this is a foreign key to the ca_company table (SREL uuid to ca_cmpny).
warranty_end	Warranty end date.
warranty_start	Warranty start date.

Relationship Types

Relationships are *directional* connections between CIs.

Provider /Dependent	Dependent /Provider	Relationship Description
administers	is administered by	A responsible entity, usually a person, performs day-to-day administration of other entities.

Provider /Dependent	Dependent /Provider	Relationship Description
approves	is approved by	A responsible entity grants approval for another entity to proceed with a planned or desired activity.
authorizes	is authorized by	A responsible entity ratifies activities of other entities.
authors	is authored by	A responsible person writes/creates document CIs.
backs up	is backed up by	For data recovery and preservation, one entity's critical information is stored upon another entity.
communicates with	communicates with	A peer-to-peer relationship where two entities which have a logical or physical connection convey data or information back and forth.
complies to	is complied to by	One entity abides by regulations (COBIT, SOX, and so on) set forth by another entity.
connects to	connects to	A peer-to-peer relationship where two entities have a logical or physical connection.
contains	is contained by	If one entity physically or logically houses another entity, then it contains that entity. The contained entity provides a service to the container.
controls	is controlled by	One entity, typically an SLA, specifies the levels of service that another entity is expected to provide.
defines	is defined by	If one entity describes another's actual or desired state, then it defines the other.
deploys	is deployed by	A responsible entity assembles and distributes other entities.
documents	is documented by	One entity, usually a document, describes the operation or other aspects of another entity. The 'documents' relationship is primarily descriptive instead of normative.
fails over	fails over	A peer-to-peer relationship between two entities where one entity can replace the other, usually in response to a disastrous interruption in service.
fronts	is fronted by	An entity is responsible for accepting and responding to requests for another physical entity. For example, a web server fronts an application.
governs	is governed by	A governing body (NIST, SOX PCAOB, SEC) typically issues regulations and rulings to which a governed entity, usually a service, must comply.
has an assignee	is assigned to	An entity, usually a person, has been designated responsible for another entity.
hosts	is hosted by	One entity hosts another entity which is continuous. The hosted entity uses services provided by the host entity.

Provider /Dependent	Dependent /Provider	Relationship Description
is business owner of	is owned by	An entity, usually a person, has been designated as the responsible business contact for another entity.
is gateway for	has for gateway	An entity, a hardware (computer) or network component, allows or controls access to another management device.
is high availability server for	has for high availability server	Uses clustering and database mirroring to provide very rapid recovery from system failures.
is location for	located at	An entity, in this case a physical location, has been designated as the place where another entity resides.
is primary contact for	has primary contact of	One entity is the primary contact for another entity.
is proxy for	is proxied by	An entity serves as a substitute pathway for connection to a network or remote storage device. For example, this gateway is a proxy for the clients on this LAN.
is recovery server of	has for recovery server	A service or application and a server that is configured to restore the specific service or application. Generally, recovery servers are an alternative to a cluster and are used when slower recovery is acceptable.
is required by	requires	An entity that cannot function properly without another entity.
is server of	is client of	A server-client relationship where the server responds to requests from the client. Alternative for "serves - is served by" relationship.
is source code for	source code is from	An entity, application code or an application library, provides the instructions that are executable in another entity.
is subscribed to by	subscribes to	An entity, either a group of users or a single user, "signs up" to have access to or use of another entity.
is the parent of	is the child of	One entity is the parent of another entity if the other entity cannot exist without the parent entity.
manages	is managed by	One entity manages another entity.
monitors	is monitored by	One entity monitors another entity if it tracks aspects of the other entity.
notifies	is notified by	An entity advises another entity that pertinent information of specific interest is now available.
provides to	is provided by	An entity is responsible for making another entity, usually a service, available to customers. For example, user, organization, or other entity provides a service.
regulates		One entity periodically adjusts some parameter of another entity. A time server which periodically regulates the time on other devices is an example.

Provider /Dependent	Dependent /Provider	Relationship Description
	is regulated by	
runs	runs on	One entity runs another transient entity.
secures	is secured by	An entity guards another entity against risks.
serves	is served by	Alternative for "is server of - is client of" relationship.
services	is serviced by	An entity, typically a maintenance organization or vendor, is responsible for responding to service calls for a physical entity.
supports	is supported by	An entity, usually an organization, is responsible for responding to incidents that emanate from another entity, usually a service.
updates	is updated by	An entity brings another entity's data up-to-date.
is used by	uses	An entity consumes data or services from another entity.

List Relationship Types

You can list CMDB relationship types to see the *directional* connections between CIs.

To list relationship types

1. Log into CA SDM as an administrator.
   The web interface appears.

2. Click Administration.
   The Administration tree appears.

3. Navigate the folder structure by clicking CMDB, CI Relationship Types.
   The relationship types are listed in columns: Provider To Dependent, Dependent to Provider, and Peer-to-Peer.

4. (Optional) Click a relationship type.
   Relationship type details appear in a separate window, and you can edit the relationship type.

Families and Classes

This section contains the following articles:

Base Families

The following CA SDM and CA APM base families do not have their own CMDB extension tables:

- Computer
- Hardware
- Other
- Projects (includes a CA Service Desk extension table)
- Software

In CMDB, CIs in these base families receive CMDB CI Detail pages with some extraneous fields and lacking an Attributes tab. You can use the Change Family and Class capability to convert these CIs to CMDB families to take advantage of CMDB advanced features such as the ability to track family-specific attributes, versioning, snapshots, and baselines.

Cluster Families

Contents

The Cluster families include the following:

- **Cluster**
  Identifies multiple servers linked together to handle variable workloads or if one or more devices fail, to provide continued operation.
- **Cluster.Resource**
  Identifies a member of a cluster resource group.

- **Cluster.Resource Group**
  Identifies a group of devices in a cluster.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Cluster	Cluster	net_clux	ci_network_cluster	Failover Cluster
Cluster.Resource	Resource	net_rsrcx	ci_network_resource	Resource Cluster
Cluster.Resource Group	Resource Group	net_rgrpx	ci_network_resource_group	Resource Group Cluster

Cluster Attributes

The Cluster family includes the following attributes that correspond to the net_clux extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
channel_address	Channel Address	The tag used to identify a channel on a port.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
		The time frame for which a maintenance contract is active.

Object Name	Label	Description
maintenance_period	Maintenance Period	
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI (for example, vendor or in-house).
network_address	Network Address	The IP address at which this CI resides (for example, 192.168.0.4)
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
os_version	OS Version	The version number of a CIs operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
quorum	Quorum	The name of the definitive repository for all configuration information relating to a cluster.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
virtual_ip	Virtual IP Address	The designation of the IP address that is shared among multiple domain names or multiple servers.

Cluster.Resource Attributes

The Cluster.Resource family includes the following attributes that correspond to the net_rsrcx extension table:

Object Name	Label	Description
resource_disk	Resource Disk	The identifier for a shared disk to which access can be requested by a server or cluster node.
resource_file	Resource File	The identifier for a file folder whose subfolders can be shared among cluster resources.

Object Name	Label	Description
resource_group_type	Resource Group Type	The type of recovery domain for a cluster (for example, data resiliency, application resiliency, or device resiliency).
resource_mount_point	Resource Mount Point	The name of the directory where the device must be mounted.
resource_type	Resource Type	The categorization of a cluster resource (for example, physical disk, print spooler, file share, network name, local quorum, and so on).

Cluster.Resource Group Attributes

The Cluster.Resource Group family include the following attribute that correspond to the net_rgrpx extension table:

Object Name	Label	Description
resource_group_type	Resource Group Type	The type of recovery domain for a cluster (for example, data resiliency, application resiliency, or device resiliency).

Contact Family

Contents

The Contact family identifies a person or role that is active in the IT infrastructure.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Contact	Executive	cntx	ci_contact	A company executive
Contact	External Contact	cntx	ci_contact	A person or role from outside
Contact	Managerial	cntx	ci_contact	A manager
Contact	Other Contact	cntx	ci_contact	Miscellaneous person or role
Contact	Technical	cntx	ci_contact	A technician

Contact Attributes

The Contact family includes the following that correspond to the cntx extension table:

- **base_contact**
  Specifies the person or group that the CI represents (SREL uuid to cnt). Represents an exclusive relationship where only one CI represents a contact in the Contact family.

Object Name	Label
access_type	Access Type
available	Available
bm_status	Operational Status
contact_num	Contact ID
domain	Data Partition
first_name	First Name
global_queue_id	Global Queue
last_name	Group Name
last_name	Last Name
middle_name	Middle Name
position	Job Title
schedule	Work Schedule
service_type	Service Type
status	Configured Status
timezone	Time Zone
type	Contact Type
userid	User ID

Contract Family

Contents

The Contract family identifies a legally binding business document signed between two parties.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Contract	License Agreement	conx	ci_contract	License Agreement Contract
Contract	Other Contract	conx	ci_contract	Miscellaneous Contract
Contract	Warranty /Maintenance Contract	conx	ci_contract	Warranty /Maintenance Contract

Contract Attributes

The Contract family includes the following attributes that correspond to the conx extension table:

Object Name	Label	Description
con_comments	Comments	Free-form text to more fully describe the particular CI.
con_num	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
con_end_date	End Date	The date on which a contract, warranty, or other legal agreement expires.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
con_ref	Contract Reference	The name or number of another document that is related to a specified contract.
con_renewal_date	Renewal Date	The date on which an existing contract, warranty, or other legal agreement is put into effect for an additional period of time.
con_start_date	Start Date	The date on which a contract, document, service, or SLA becomes active.
con_status	Status	An indication of the status of an Application, Contract, Document, Service, or SLA CI (development, review, active, retired, and so on).
con_type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.

Document Family

Contents

The Document family identifies printed or electronically stored text which is human-readable.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Document	Admin Guide	docx	ci_document	Administration Guide
Document	Application Test Plan	docx	ci_document	Application Test Plan Document
Document	Business Continuity Plan	docx	ci_document	Business Continuity Plan Document
Document	Other Document	docx	ci_document	Miscellaneous Document
Document	Policies and Standards	docx	ci_document	Policies and Standards Document
Document	Training Class Collateral	docx	ci_document	Training Class Collateral Document
Document	User Guide	docx	ci_document	User Guide Document

Document Attributes

The Document family includes the following attributes that correspond to the docx extension table:

Object Name	Label	Description
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
doc_category	Category	The high-level type designation for an application, service, SLA, or document.
doc_end_date	End Date	The date on which a document expires or is no longer valid.
doc_id	Document ID	The name or number that identifies a particular document.
doc_start_date	Start Date	The date on which a contract, document, service, or SLA becomes active.
doc_status	Status	An indication of the status of an Application, Contract, Document, Service, or SLA CI (development, review, active, retired, and so on).
doc_type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
doc_version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Enterprise Families

Contents

The Enterprise families include the following:

- **Enterprise.Service**
  Identifies a combination of people, processes, and information technology that directly or indirectly supports enterprise business processes.

- **Enterprise.Transaction**
  Identifies a single transaction in a transactional application.

- **Enterprise Transaction Context**
  Identifies an entity describing the flow of information for a specific application or the details of a complex transaction.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Enterprise.Service	Business Service	entsrvx	ci_enterprise_service
Enterprise.Service	Infrastructure Service	entsrvx	ci_enterprise_service
Enterprise.Service	Other Service	entsrvx	ci_enterprise_service
Enterprise.Transaction	Business Transactions	enttx	ci_enterprise_transaction
Enterprise Transaction Context	TransactionContext	trn_ctx	ci_transaction_ctx

Enterprise.Service Attributes

The Enterprise.Service family includes the following classes:

- Business Service
- Infrastructure Service
- Other Service

The Enterprise.Service family includes the following attributes that correspond to the entsrvx extension table:

Note: (R) indicates that the attribute can be stored as a relationship to other CIs.

Object Name	Label	Description
availability_end	Availability End	End of next anticipated service availability period for an intermittent service
availability_start	Availability Start	Start of next anticipated service availability period for an intermittent service
business_contacts (R)	Business Contacts	Business persons to contact with questions about service
business_impact	Business Impact	Magnitude of the effect on business if service is stopped or impaired
business_owner (R)	Business Owner	Person or persons who own the service
business_priority	Business Priority	Importance of the service to business
business_risk	Business Risk	Risk to business implied by the service

business_unit (R)	Business Unit	Business unit or units that receive the service
cancel_date	Cancel Date	Date service cancelled or terminated
category	Service Category	Service category
charge_code	Charge Code	Accounting code used to track service expenses
cobit_objective	Cobit Objective	Applicable COBIT control objective
description	Service Description	Service description
design_end_date	Design End Date	End date of design life cycle phase
design_start_date	Design Start Date	Start date of design life cycle phase
escalation_contacts (R)	Escalation Contacts	Persons to contact when escalating service issues
lifecycle_state	Service Lifecycle State	Conforms to ITIL v3. For example: design, transition, production, terminated.
lifecycle_status	Service Lifecycle Status	Status within lifecycle_state: Pending approval, Pending funding
operation_end_date	Operation End Date	End date of operations life cycle phase
operation_start_date	Operation Start Date	Start date of operations life cycle phase
portfolio (R)	Portfolio	Service portfolio holding service
service_alignment	Service Alignment	How well is service aligned to corporate goal? HIGH-MEDIUM-LOW
service_goal	Service Goal	Describe corporate strategy supported by the service
service_hours	Service Hours	Hours when service is normally available
service_manager (R)	Service Manager	Person or persons who manage the service
site (R)	Site	Primary location where service is maintained
SLA (R)	SLA	Brief description of applicable SLAs
transition_end_date	Transition End Date	End date of transition life cycle phase
transition_start_date	Transition Start Date	Start date of transition life cycle phase
unavailability_end	Unavailability End	End of next anticipated service blackout for an intermittent service
unavailability_start	Unavailability Start	Start of next anticipated service blackout for an intermittent service
version	Service Version	Current release of the service

Enterprise.Transaction Attributes

The Enterprise.Transaction family includes the following attributes that correspond to the enttx extension table:

Note: (R) indicates that the attribute can be stored as a relationship to other CIs.

Object Name	Label	Description
availability_end	Availability End	End of next anticipated service availability period for an intermittent service
availability_start	Availability Start	Start of next anticipated service availability period for an intermittent service
business_contacts (R)	Business Contacts	Business persons to contact with questions about service
business_impact	Business Impact	Magnitude of the effect on business if service is stopped or impaired
business_owner (R)	Business Owner	Person or persons who own the service
business_priority	Business Priority	Importance of the service to business
business_unit (R)	Business Unit	Business unit or units that receive the service
cancel_date	Cancel Date	Date service cancelled or terminated
category	Transaction Category	Service category
description	Transaction Description	Service description
design_end_date	Design End Date	End date of design life cycle phase
design_start_date	Design Start Date	Start date of design life cycle phase
escalation_contacts (R)	Escalation Contacts	Persons to contact when escalating service issues
lifecycle_state	Transaction Lifecycle State	DESIGN-TRANSITION-PRODUCTION-TERMINATED
lifecycle_status	Transaction Lifecycle Status	Status within lifecycle_state: Pending approval, Pending funding
operation_end_date	Operation End Date	End date of operations life cycle phase
operation_start_date	Operation Start Date	Start date of operations life cycle phase
site (R)	Site	Primary location where service is maintained
transaction_alignment	Transaction Alignment	Transaction Alignment
transaction_goal	Transaction Goal	Transaction Goal

Object Name	Label	Description
transaction_manager	Transaction Manager	Transaction Manager
transition_end_date	Transition End Date	End date of transition life cycle phase
transition_start_date	Transition Start Date	Start date of transition life cycle phase
unavailability_end	Unavailability End	End of next anticipated service blackout for an intermittent service
unavailability_start	Unavailability Start	Start of next anticipated service blackout for an intermittent service
version	Transaction Version	Current release of the service

Enterprise TransactionContext Attributes

The Enterprise.Transaction Context family includes the following attribute that corresponds to trn_ctx extension table:

Object Name	Label	Description
ContextType	Context Type	Type of context, whether a kind of application or a business context.

Facilities Family

Contents

The Facilities families include the following:

- **Facilities.Air Conditioning**
  Identifies air conditioning, heating, ventilation, humidity control, or general environment management systems.

- **Facilities.Fire Control**
  Identifies equipment for fire suppression.

- **Facilities.Furnishings**
  Identifies furnishings used to store important IT items.

- **Facilities.Other**
  Identifies miscellaneous facilities equipment or supplies.

- **Facilities.Uninterruptible Power Supply**
  Identifies uninterruptible power supplies, and other power conditioning and regulation systems.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Facilities.Air Conditioning	Air Conditioning	fac_acx	ci_fac_ac	Air Conditioning Facilities
Facilities.Fire Control	Fire Control	fac_firex	ci_fac_fire_control	Fire Control
Facilities.Furnishings	Equipment Rack	fac_furx	ci_fac_furnishings	Equipment Rack
Facilities.Furnishings	File Cabinet	fac_furx	ci_fac_furnishings	File Cabinet
Facilities.Other	Other Facilities	fac_othx	ci_fac_other	Miscellaneous Facilities
Facilities. Uninterruptible Power Supply	Uninterruptible Power Supply	fac_upsx	fac_upsx	Uninterruptible Power Supply

Facilities.Air Conditioning Attributes

The Facilities.Air Conditioning family includes the following attributes that correspond to the fac_acx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.

Object Name	Label	Description
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Facilities.Fire Control Attributes

The Facilities.Fire Control family includes the following attributes that correspond to the fac_firex extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.

Object Name	Label	Description
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Facilities.Furnishings Attributes

The Facilities.Furnishings family includes the following attributes that correspond to the fac_furx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.

Object Name	Label	Description
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
warehouse_loc	Warehouse Location	The physical location of a warehouse or other storage facility where a CI resides after it has been received and is in "in stock" status.

Facilities.Other Attributes

The Facilities.Other family includes the following attributes that correspond to the fac_othx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
ci_priority	CI Priority	

Object Name	Label	Description
		The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
warehouse_loc	Warehouse Location	The physical location of a warehouse or other storage facility where a CI resides after it has been received and is in "in stock" status.

Facilities.Uninterruptible Power Supply Attributes

The Facilities.Uninterruptible Power Supply family includes the following attributes that correspond to the fac_upsx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.

Object Name	Label	Description
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
warehouse_loc	Warehouse Location	The physical location of a warehouse or other storage facility where a CI resides after it has been received and is in "in stock" status.

Hardware Families

Contents

- Hardware.File Attributes (see page 4217)
- Hardware.DiskPartition Attributes (see page 4218)
- Hardware.Memory Attributes (see page 4219)
- Hardware.Processor Attributes (see page 4220)
- Hardware.StoragePool Attributes (see page 4221)
- Hardware.StorageVolume Attributes (see page 4223)
- Hardware.VMDataStore Attributes (see page 4224)

The Hardware families include the following:

- **Hardware.Logical Partition**
  Identifies Logical Partitions (LPAR) that are a mainframe architecture that segments a single system into several independent logical systems.

- **Hardware.Mainframe**
  Identifies large central computing devices, traditionally manufactured by IBM and running z/OS, OS/390, and so on.

- **Hardware.Monitor**
  Identifies computer, video, and surveillance displays. Includes CRT's, LCD's, and plasma monitors.

- **Hardware.Other**
  Identifies miscellaneous IT hardware.

- **Hardware.Printer**
  Identifies a device typically connected to a computing system which converts electronic documents to visual physical media, usually paper.

- **Hardware.Server**
  Identifies computers on a network whose main function is to respond to requests from other computers rather than provide a display and keyboard to an individual user.

- **Hardware.Storage**
  Identifies units designed to store electronic data. Tape drives, optical disks, and SANs are all included.

- **Hardware.Virtual Machine**
  Identifies servers running on a system simulated in software, for example, VMWare, MSVM.

- **Hardware.Workstation**
  Identifies computers primarily used by end-users rather than serving other computers.

- **Hardware.EnvironmentalSensor**
  Identifies environmental sensor, measures physical quantity and converts it to a numeric value.

- **Hardware.File**
  Identified a file, directory or volume/filesystem that is being watched, on an executing hardware device, or that holds relevant management data.

- **Hardware.DiskPartition**
  Identifies the logical division of a physical hard drive to treat the drive as though it were multiple, independent disks.

- **Hardware.Memory**
  Identifies the physical or paging memory in an executing hardware device.

- **Hardware.PowerSupply**
  Identifies the hardware providing the current/voltages needed to operate a device.

- **Hardware.Processor**
  Identifies a processor (such as a CPU or math processor) in an executing hardware device.

- **Hardware.StoragePool**
  Identifies the grouping of storage capacity based on various criteria, such as location, cost or hardware ownership. Pools may consist of other pools or be assembled across MediaDrives.

- **Hardware.StorageVolume**
  Identifies the storage on an array backed by a StoragePool, MediaDrive or built on other lower-level volumes. A StorageVolume is published for use outside of its hosting system/array.

- **Hardware.VMDataStore**
  Identifies storage location for virtual machine files.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Hardware.Logical Partition	Logical Partition	har_lparx	ci_hardware_lpar	Mainframe Logical Partition
Hardware. Mainframe	Cray	har_maix	ci_hardware_mainframe	Cray Mainframe

Hardware. StorageVolume	StorageVolume	har_stgvol	ci_hardware_storagevolume	Storage on an Array
Hardware. VMDataStore	NetworkFileSystem	har_vmds	ci_hardware_vmdatastore	Storage location for virtual machine files

Hardware.Logical Partition Attributes

The Hardware.Logical Partition family includes the following attributes that correspond to the har_lparx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
current_memory	Current Memory Used	An indication of how much memory is used, as opposed to the total amount available.
current_processors	Current Processors Used	An indication of how many of the processors are in use compared to the number available.
desired_memory	Desired Amount of Memory	The amount of memory to be allocated to a logical partition as long as the memory on the managed resource is not overcommitted.
desired_processors	Desired Number of Processors	The number of processors to be allocated to a logical partition as long as the processors on the managed resource are not overcommitted.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_start_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
max_memory	Maximum Memory Size	The maximum amount of memory available in an LPAR.

Object Name	Label	Description
max_processors	Maximum Number of Processors	The maximum number of processors available in an LPAR.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
min_memory	Minimum Amount of Memory	The minimum amount of memory required for an LPAR.
min_processors	Minimum Number of Processors	The minimum number of processors required for an LPAR.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
panel_display	Panel Display	The operator console used to manage logical partition configurations and booting, starting, and stopping of system or individual partitions.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.
proc_type	Processor Type	The kind of CPU in a hardware device.
profile	Profile	The configuration name for a logical partition which indicates the desired system resource allocations.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Hardware.Mainframe Attributes

The Hardware.Mainframe family includes the following attributes that correspond to the har_maix extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.

Object Name	Label	Description
proc_type	Processor Type	The kind of CPU in a hardware device.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Hardware.Monitor Attributes

The Hardware.Monitor family includes the following attributes that correspond to the har_monx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
		The number that uniquely identifies a maintenance contract.

Object Name	Label	Description
mtce_contract_number	Maintenance Contract Number	
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Hardware.Other Attributes

The Hardware.Other family includes the following attributes that correspond to the har_othx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
array_name	Storage Array Name	The identifier for an enterprise storage system that contains multiple disk drives and performs functions like RAID and virtualization.
array_serial_num	Storage Array Serial Number	The manufacturer's serial number for an enterprise storage system that contains multiple disk drives and performs functions like RAID and virtualization.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
cd_rom_type	CD ROM Type	The type of CD ROM drive that resides on a workstation or server.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
graphics_card	Graphics Card Model	The model designation for an expansion card that is installed in an available slot in a device for enhanced graphics capabilities.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.

Object Name	Label	Description
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
media_drive_num	Media Drive Capacity	The capacity of the hardware device that consolidates multiple memory cards into one unit.
media_type	Media Type	The kind of storage media on a hardware device, for example, disk, CD ROM.
mem_cache_proc	Processor Cache	The identifier of the hardware device that processes the high-speed memory storage between memory and the CPU.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
memory_shares	Number of Memory Shares	The specified memory share granted to this virtual machine.
modem_card	Modem Card	The identifier of a card in a workstation or network device that enables a faster connection to a network or the Internet.
modem_type	Modem Type	The classification/speed of a modem used by a workstation for a faster connection to a network or the Internet.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
net_card	Network Card	

Object Name	Label	Description
		The designation for an expansion card that is installed in an available slot in a computer or network device so that it can connect and communicate to another networked component.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a device.
number_net_port_conn	Number of Network Port Connections	The total number of ports on a server.
number_proc_inst	Number of Processors Installed	The total number of processors installed on a hardware or network device.
number_slot_proc	Processor Capacity	The total number of processor slots on a hardware device.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
printer	Printer	The type or model of printer attached to a hardware or network device.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.
proc_type	Processor Type	The kind of CPU in a hardware device.
processor_count	Processor Capacity	The number of CPU's or microprocessors available on a Hardware CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
security_patch_level	Security Patch Level	An indication of the current security patch version for this CI.
server_type	Server Type	The kind of server, for example, application, mail, web, proxy, FTP.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

slot_mem_used	Number of Memory Slots Used	The amount of memory in use from the available memory cards in a hardware or network device.
slot_total_mem	Number of Memory Slots	The total amount of memory available on memory cards in a hardware or network device.
swap_size	Swap Size	The size of the disk space allocated on a hardware or network device to store the state of a process that has been swapped out.
technology	Technology	The technology, TCP/IP, Ethernet, FDDI, and so on, employed by a hardware or network device.
total_capacity	Total Disk Capacity	The total amount of storage available on a hardware device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.
used_space	Total Disk Used	The amount of available disk storage space that is in use by a CI.

Hardware.Printer Attributes

The Hardware.Printer family includes the following attributes that correspond to the har_prix extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.

Object Name	Label	Description
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Hardware.Server Attributes

The Hardware.Server family includes the following attributes that correspond to the har_serx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
cd_rom_type	CD ROM Type	The type of CD ROM drive that resides on a workstation or server.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.

Object Name	Label	Description
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
net_card	Network Card	The designation for an expansion card that is installed in an available slot in a computer or network device so that it may connect and communicate to another networked component.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a device.
number_net_port_conn	Number of Network Port Connections	The total number of ports on a server.
number_proc_inst	Number of Processors Installed	The total number of processors installed on a hardware or network device.
number_slot_proc	Processor Capacity	The total number of processor slots on a hardware device.

Object Name	Label	Description
panel_display	Panel Display	The operator console used to manage logical partition configurations and booting, starting, and stopping of system or individual partitions.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
printer	Printer	The type or model of printer attached to a hardware or network device.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.
proc_type	Processor Type	The kind of CPU in a hardware device.
profile	Profile	The configuration name for a logical partition which indicates the desired system resource allocations.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
security_patch_level	Security Patch Level	An indication of the current security patch version for this CI.
server_type	Server Type	The kind of server, for example, application, mail, web, proxy, FTP.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
slot_mem_used	Number of Memory Slots Used	The amount of memory in use from the available memory cards in a hardware or network device.
slot_total_mem	Number of Memory Slots	The total amount of memory available on memory cards in a hardware or network device.
swap_size	Swap Size	The size of the disk space allocated on a hardware or network device to store the state of a process that has been swapped out.
technology	Technology	The technology, TCP/IP, Ethernet, FDDI, and so on, employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Hardware.Storage Attributes

The Hardware.Storage family includes the following attributes that correspond to the har_stox extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
array_name	Storage Array Name	The identifier for an enterprise storage system that contains multiple disk drives and performs functions like RAID and virtualization.
array_serial_num	Storage Array Serial Number	The manufacturer's serial number for an enterprise storage system that contains multiple disk drives and performs functions like RAID and virtualization.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
media_drive_num	Media Drive Capacity	The capacity of the hardware device that consolidates multiple memory cards into one unit.
media_type	Media Type	The kind of storage media on a hardware device, for example, disk, CD ROM.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.

Object Name	Label	Description
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
total_capacity	Total Disk Capacity	The total amount of storage available on a hardware device.
used_space	Total Disk Used	The amount of available disk storage space that is in use by a CI.

Hardware.Virtual Machine Attributes

The Hardware.Virtual Machine family includes the following attributes that correspond to the har_virx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
cpu_shares	Number of CPU Shares	The specified CPU shares granted to this virtual machine.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).

Object Name	Label	Description
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
media_type	Media Type	The kind of storage media on a hardware device, for example, disk, CD ROM.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
memory_shares	Number of Memory Shares	The specified memory share granted to this virtual machine.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.
proc_type	Processor Type	The kind of CPU in a hardware device.
processor_affinity	Processor Affinity	An indicator of the preferred processor on which a task should be scheduled to run.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
	Retire Date	The date on which a CI is no longer active.

Object Name	Label	Description
retire_date		
security_patch_level	Security Patch Level	An indication of the current security patch version for this CI.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
virtual_processors	Number of Virtual Processors	The number of virtual processors, the representations of physical processors to the operating system of a logical partition that uses the shared processor pool.

Hardware.Workstation Attributes

The Hardware.Workstation family includes the following attributes that correspond to the har_worx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
cd_rom_type	CD ROM Type	The type of CD ROM drive that resides on a workstation or server.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
disk_type	Disk Type	The type of disk drive that resides on a workstation or server.
graphics_card	Graphics Card Model	The model designation for an expansion card that is installed in an available slot in a device for enhanced graphics capabilities.
hard_drive_capacity	Disk Capacity	The amount of hard drive capacity that is available for use on a Hardware CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease becomes effective (also known as the lease start date).
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.

Object Name	Label	Description
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
max_memory	Maximum Memory Size	The maximum amount of memory available in an LPAR.
max_processors	Maximum Number of Processors	The maximum number of processors available in an LPAR.
media_drive_num	Media Drive Capacity	The capacity of the hardware device that consolidates multiple memory cards into one unit.
media_type	Media Type	The kind of storage media on a hardware device, for example, disk, CD ROM.
mem_cache_proc	Processor Cache	The identifier of the hardware device that processes the high-speed memory storage between memory and the CPU.
mem_capacity	Memory Capacity	The total amount of memory that can be installed and made available.
modem_card	Modem Card	The identifier of a card in a workstation or network device that enables a faster connection to a network or the Internet.
modem_type	Modem Type	The classification/speed of a modem used by a workstation for a faster connection to a network or the Internet.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
net_card	Network Card	The designation for an expansion card that is installed in an available slot in a computer or network device so that it may connect and communicate to another networked component.
number_proc_inst	Number of Processors Installed	The total number of processors installed on a hardware or network device.
number_slot_proc	Processor Capacity	The total number of processor slots on a hardware device.
phys_mem	Memory Installed	The physical amount of memory installed on a hardware device.
printer	Printer	The type or model of printer attached to a hardware or network device.

Object Name	Label	Description
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proc_speed	Processor Speed	A measurement of the rate at which a computer performs its operations.
proc_type	Processor Type	The kind of CPU in a hardware device.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retired Date	The date on which a CI is no longer active.
scsi_card	SCSI Card Model	The model identifier for a card that provides a standard interface and command set for transferring data between internal and external peripheral devices.
security_patch_level	Security Patch Level	An indication of the current security patch version for this CI.
svclvl	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for the IT component.
slot_mem_used	Number of Memory Slots Used	The amount of memory in use from the available memory cards in a hardware or network device.
slot_total_mem	Number of Memory Slots	The total amount of memory available on memory cards in a hardware or network device.

Hardware.EnvironmentalSensor Attributes

The Hardware.EnvironmentalSensor family includes the following attributes that corresponds to the har_comp extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.

Object Name	Label	Description
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
OSNumeric	OS Numeric	A numeric value either assigned by or calculated from the operating system.
ContainingIndex	Containing Index	A numeric value defining the index of the containing entity, as specified by the value of entPhysicalContainedIn in the Entity MIB.
IsPhysical	Is Physical	A boolean indicating whether the hardware is physical (if true) or logical /simulated (if false).
ContextID	Context ID	The ContextID element is used for identification.

Hardware.File Attributes

The Hardware.File family includes the following attributes that corresponds to the har_file extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.

DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
FilePathUrl	File Path URL	A fully qualified path and file name (if applicable). Wild card characters are not allowed.

Hardware.DiskPartition Attributes

The Hardware.DiskPartition family includes the following attributes that corresponds to the har_dpar extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.

Object Name	Label	Description
DeviceMac Address	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4 Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4 AddressWit hDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6 Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6 AddressWit hDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
OSNumeric	OS Numeric	A numeric value either assigned by or calculated from the operating system.
ContainingI ndex	Containing Index	A numeric value defining the index of the containing entity, as specified by the value of entPhysicalContainedIn in the Entity MIB.
IsPhysical	Is Physical	A boolean indicating whether the hardware is physical (if true) or logical /simulated (if false).
CapacityIn MB	Capacity In MB	Maximum capacity of this Partition (in binary mebi-bytes).
ContextID	Context ID	The ContextID element is used for identification.

Hardware.Memory Attributes

The Hardware.Memory family includes the following attributes that corresponds to the har_mem extension table:

Object Name	Label	Description
DeviceAsset Number	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosS ystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsN ame	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysN ame	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.

Object Name	Label	Description
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
OSNumeric	OS Numeric	A numeric value either assigned by or calculated from the operating system.
ContainingIndex	Containing Index	A numeric value defining the index of the containing entity, as specified by the value of entPhysicalContainedIn in the Entity MIB.
IsPhysical	Is Physical	A boolean indicating whether the hardware is physical (if true) or logical /simulated (if false).
ContextID	Context ID	The ContextID element is used for identification.
SizeInMB	Size In MB	Maximum size of this File (file system, directory or individual file).

Hardware.Processor Attributes

The Hardware.Processor family includes the following attributes that corresponds to the har_prcr extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.

Object Name	Label	Description
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
OSNumeric	OS Numeric	A numeric value either assigned by or calculated from the operating system.
ContainingIndex	Containing Index	A numeric value defining the index of the containing entity, as specified by the value of entPhysicalContainedIn in the Entity MIB.
IsPhysical	Is Physical	A boolean indicating whether the hardware is physical (if true) or logical /simulated (if false).
ContextID	Context ID	The ContextID element is used for identification.
SpeedInGHz	Speed In GHz	The speed (in giga-hertz) of the Processor.

Hardware.StoragePool Attributes

The Hardware.StoragePool family includes the following attributes that corresponds to the har_stgpl extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
		The identifier reported from the BIOS for the device.

Object Name	Label	Description
DeviceBiosSystemID	Device BIOS System ID	
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
IsHAEnabled	Is HA Enabled	A numeric value either assigned by or calculated from the operating system. Boolean indicating whether the group (typically a Cluster instance or a GroupType="ResourceCluster") supports high availability/failover (if true) or not (if false).
IsMonitoringMembers	Is Monitoring Members	Boolean indicating whether the group (typically a Cluster instance or a GroupType="ResourceCluster") currently is using a heartbeat or other individual monitoring technique to determine if availability is lost (if true) or whether this capability does not exist or is not currently enabled (if false).
MaxFailures	Max Failures	Number of failures that can be supported by the Group, by sparing or other load balancing means.
MemberCriteria	Member Criteria	

Object Name	Label	Description
		Defines a comma-separated list of QNames, representing the constraints on the constituency of the Group. Instances referenced as the Target element in the HasMember relationship semantic should have one of the types specified.
GroupType	Group Type	An enumerated value describing the primary type or category of the Group - such as an "authorization group", a "virtual resource pool" or a "data center".
HomePage	Home Page	The URL of the website home page.
BusinessRelevance	Business Relevance	Description of the relevance of the Entity, to the business.
CapacityInGB	Capacity In GB	The total capacity (in gibi-bytes) available for allocation to StorageVolumes or child StoragePools.
RaidLevel	Raid Level	The RAID level used for the Pool.

Hardware.StorageVolume Attributes

The Hardware.StorageVolume family includes the following attributes that corresponds to the har_stgvol extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").

DeviceIPV6 Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6 AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
OSNumeric	OS Numeric	A numeric value either assigned by or calculated from the operating system.
ContainingIndex	Containing Index	A numeric value defining the index of the containing entity, as specified by the value of entPhysicalContainedIn in the Entity MIB.
IsPhysical	Is Physical	A boolean indicating whether the hardware is physical (if true) or logical /simulated (if false).
LogicalUnit Number	Logical Unit Number	The LUN (logical unit number) used to access the Volume.
PortID	Port ID	The system/array port through which the StorageVolume is accessed.
PortWWName	Port WW Name	The World-Wide Name of the system/array port through which the StorageVolume is accessed.
CapacityIn MB	Capacity In MB	Maximum capacity of this Volume (in binary mebi-bytes).
IsThinlyProvisioned	Is Thinly Provisioned	Boolean indicating if the Volume is allocated on-demand ("thinly provisioned"), if true, or strictly allocated, if false.
IsDeDupeEnabled	Is DeDuplication Enabled	Boolean indicating if the Volume is deduplication enabled, if true, or if redundant data is persisted, if false.
IsMasked	Is Masked	When this boolean is true, the system/array validates the World-Wide Names of ports accessing the Volume, to ensure they are masked for that volume (present in the list, MaskedWWNames).
MaskedWW Names	Masked WW Names	A comma-separated list of WWNames of the allowed ports, permitted access by the StorageVolume.
RaidLevel	Raid Level	The RAID level used for the Volume. Values (both standard and non-standard) are defined by the open enumeration, RaidLevelEnum.

Hardware.VMDataStore Attributes

The Hardware.VMDataStore family includes the following attributes that corresponds to the har_vmds extension table:

Object Name	Label	Description
DeviceAsset Number	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
		The identifier reported from the BIOS for the device.

Object Name	Label	Description
DeviceBiosSystemID	Device BIOS System ID	
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
FilePathUrl	File Path URL	A fully qualified path and file name (if applicable). Wild card characters are not allowed.
CapacityInMB	Capacity In MB	Maximum capacity of this datastore (in binary mebi-bytes).
IsMultiHost	Is Multi Host	Indicates whether (or not) more than one hosting system has been configured with access to the data store.

Investment Families

Contents

The Investment families include the following:

- **Investment.Idea**
  Identifies the initial stage of creating new opportunities for investment such as projects, assets, applications, products, services, and other work. Ideas are containers for pertinent information that become the foundation for specific investments.

- **Investment.Other**
  Identifies a broad category to include investments in Application, Asset, Product, Service, and Other Work.

- **Investment.Project**
  Identifies a set of activities designed to achieve a specific objective. Labor, time, and budget constraints guide the projects.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Investment. Idea	Portfolio Idea	invidex	ci_investment_idea	Ideas are the initial stage of creating new opportunities for investment such as projects, assets, applications, products, services, and other work. Ideas lay the foundation for a specific type of investment by serving as a container for pertinent information.
Investment. Other	Portfolio Application	invothx	ci_investment_other	Captures data specific to applications running or being implemented in an organization.
Investment. Other	Portfolio Asset	invothx	ci_investment_other	Captures data specific to assets which incur costs and benefits for an organization.
Investment. Other	Portfolio Product	invothx	ci_investment_other	Captures data specific to products produced or owned by an organization.
Investment. Other	Portfolio Service	invothx	ci_investment_other	Captures data specific to services provided by an organization.
Investment. Other	Portfolio Work	invothx	ci_investment_other	Captures data specific to steady-state work performed. Other work can represent overhead tasks such as management and maintenance.
Investment. Project	Portfolio Program	invprjx	ci_investment_project	A Program is a top-level project that serves as the parent or "umbrella" project to one or more child projects.
		invprjx	ci_investment_project	A Project is a set of activities designed to achieve a specific objective. Projects are guided by labor, time and budget constraints.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Investment.Project	Portfolio Project			

Investment.Idea Attributes

The Investment.Idea family includes the following class:

- Portfolio Idea

The Investment.Idea family includes the following attributes that correspond to the invidex extension table:

Object Name	Label
business_unit	Business Unit
dependencies	Dependencies
est_finish_date	Estimated Finish Date
est_start_date	Estimated Start Date
existing_initiative_impact	Existing Initiative Impact
general_notes	General Notes
idea_priority	Idea Priority
owner	Owner
risks	Risks
subject	Subject
target_manager	Target Manager

Investment.Other Attributes

The Investment.Other family includes the following classes:

- Portfolio Application
- Portfolio Asset
- Portfolio Product
- Portfolio Service
- Portfolio Work

The Investment.Other family includes the following attributes that correspond to the invothx extension table:

Object Name	Label
active	Investment Active?
alignment	Alignment
charge_code	Charge Code
currency	Currency
finish_date	Finish Date
goal	Goal
investment_priority	Investment Priority
investment_status	Investment Status
manager	Manager
progress	Progress
risk	Risk
stage	Stage
start_date	Start Date
status_comment	Investment Status Comment
status_indicator	Investment Status Indicator
total_cost	Total Cost
total_effort	Total Effort
type	Investment Type

Investment.Project Attributes

The Investment.Project family includes the following classes:

- Portfolio Program
- Portfolio Project

The Investment.Project family includes the following attributes that correspond to the invprjx extension table:

Object Name	Label
active	Project Active?
alignment	Alignment
charge_code	Charge Code
currency	Currency
finish_date	Finish Date
goal	Goal
manager	Manager
progress	Progress
project_priority	Project Priority

project_status	Project Status
risk	Risk
stage	Stage
start_date	Start Date
status_comment	Project Status Comment
status_indicator	Project Status Indicator
total_cost	Total Cost
total_effort	Total Effort

Location Family

Contents

The Location family includes the following:

- **Location**
  Identifies a physical position or site.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Location	Building	locx	ci_location	A site contained within a single physical structure
Location	Campus	locx	ci_location	A group of buildings
Location	City	locx	ci_location	A governmental designation of a relatively large and populous area
Location	Country	locx	ci_location	An area comprised of multiple cities, regions, or states
Location	Datacenter	locx	ci_location	A site dedicated to IT operations
Location	Floor	locx	ci_location	A segment of a site on a single floor

Location Attributes

The Location family includes the following class:

- base_location
  Specifies the location that the CI represents (SREL uuid to loc). Represents an exclusive relationship where only one CI represents a location in the Location family.

The Location family includes the following attributes that correspond to the locx extension table:

Object Name	Label
address1	Address

Object Name	Label
city	City
country	Country
description	Description
site	Site
state	State/Province
zip	ZIP/Postal Code

Network Families

Contents

The Network families include the following:

- **Network.Bridge**
  Identifies an abstract device that connects multiple network segments along the data link layer.

- **Network.Controller**
  Identifies miscellaneous devices that throttle or manage bandwidth use.

- **Network.Frontend**
  Identifies a network front-end device that handles communication with host computers such as mainframes.

- **Network.Hub**
  Identifies a network device that connects together network devices by repeating the signal received at one port to others.

- **Network.Network Interface Card**
  Identifies a Network Interface Card (NIC) using any network communications protocol. Ethernet LAN and FDDI Ring network cards are NICs.

- **Network.Other**
  Identifies unclassified network components.

- **Network.Peripheral**
  Identifies network peripherals that are appliances such as printers and FAX machines that contain their own NIC cards.

- **Network.Port**
  Identifies a port on a network hub or switch that is used to connect to other hubs and switches instead of an end station.

- **Network.Router**
  Identifies any device in a network that routes messages between computers.

- **Network.Switch**
  Identifies a network device that intelligently forwards packets received at one port to other ports.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Network. Bridge	Bridge	net_brix	ci_network_bridge	Network Bridge
Network. Controller	Controller	net_conx	ci_network_controller	Controller
Network. Frontend	3270 Terminal	net_frox	ci_network_frontend	3270 Terminal
Network. Frontend	Network Terminal	net_frox	ci_network_frontend	Network Terminal
Network. Frontend	X Terminal	net_frox	ci_network_frontend	X Terminal
Network.Hub	Network Hub	net_hubx	ci_network_hub	Hub on a network
Network. Network	Interface Card	net_nicx	ci_network_nic	Network Interface Card (NIC)
Network. Other	Other Network Device	net_othx	ci_network_other	Other Network Device
Network. Peripheral	Fax Machine	net_perx	ci_network_peripheral	Fax Machine
Network.Port	Port	net_porx	ci_network_port	Network Port
Network. Router	Router	net_roux	ci_network_router	Ethernet Router
Network. Switch	Network Switch	net_gatx	ci_network_gateway	Network Switch

Network.Bridge Attributes

The Network.Bridge family includes the following attributes that correspond to the net_brix extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	

Object Name	Label	Description
		IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
		The total number of ports in use on a server.

Object Name	Label	Description
number_net_port	Number of Network Ports	
number__net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
protocol	Protocol	The communication method employed by a network device.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Controller Attributes

The Network.Controller family includes the following attributes that correspond to the net_conx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.

Object Name	Label	Description
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
		The total number of ports in use on a server.

Object Name	Label	Description
number_net_port	Number of Network Ports	
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
number_proc_inst	Number of Processors Installed	The total number of processors installed on a hardware or network device.
number_smips	Number of SMIPS	The toal number of SMIPS.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Frontend Attributes

The Network.Frontend family includes the following attributes that correspond to the net_frox extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.

Object Name	Label	Description
number_mips	MIPS	An indication of the processing speed and capacity of a hardware or network device.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
number_proc_inst	Number of Processors Installed	The total number of processors installed on a hardware or network device.
number_smips	Number of SMIPS	The total number of SMIPS.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Hub Attributes

The Network.Hub family includes the following attributes that correspond to the net_hubx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.

Object Name	Label	Description
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
net_card	Network Card	The designation for an expansion card that is installed in an available slot in a computer or network device so that it may connect and communicate to another networked component.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Network Interface Card Attributes

The Network.Network Interface Card family includes the following attributes that correspond to the net_nicx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
line_speed	Line Speed	The rate at which information is transmitted on a network connection.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
protocol	Protocol	The communication method employed by a network device.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
	Subnet Mask	

Object Name	Label	Description
subnet_mask		The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Other Attributes

The Network.Other family includes the following attributes that correspond to the net_othx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
bios_ver	BIOS Version	The version number of the BIOS - the code that is run when a personal computer starts up.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
	Maintenance Period	The time frame for which a maintenance contract is active.

Object Name	Label	Description
maintenance_period		
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.

Network.Peripheral Attributes

The Network.Peripheral family includes the following attributes that correspond to the net_perx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.

Object Name	Label	Description
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
		The total number of network port connections.

Object Name	Label	Description
number_net_port_conn	Number of Network Port Connections	
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Port Attributes

The Network.Port family includes the following attributes that correspond to the net_porx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
channel_address	Channel Address	The tag used to identify a channel on a port.

Object Name	Label	Description
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
domain	Domain	The identifier of the logical grouping (domain) to which a network or telecom device is assigned.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
line_speed	Line Speed	The rate at which information is transmitted on a network connection.
line_type	Line Type	The categorization of a network communication line, for example, ISDN.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.

Object Name	Label	Description
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
protocol	Protocol	The communication method employed by a network device.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Router Attributes

The Network.Router family includes the following attributes that correspond to the net_roux extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
flow	Flow	The amount of network traffic that can be handled by a router.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mem_cache_proc	Processor Memory Cache	The identifier of the hardware device that processes the high-speed memory storage between memory and the CPU.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
		The IP address at which this CI resides, for example, 192.168.0.4.

Object Name	Label	Description
network_address	Network Address	
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
number_proc_inst	Number of Ports Installed	The total number of processors installed on a hardware or network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
protocol	Protocol	The communication method employed by a network device.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
rout_prot	Router Protocol	The communication method employed by a network router.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
slot_mem_used	Number of Memory Slots Used	The amount of memory in use from the available memory cards in a hardware or network device.
slot_total_mem	Number of Memory Slots	The total amount of memory available on memory cards in a hardware or network device.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.

Object Name	Label	Description
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Network.Switch Attributes

The Network.Switch family includes the following attributes that correspond to the net_gatx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can possibly exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
graphics_card	Graphics Card Model	The model designation for an expansion card that is installed in an available slot in a device for enhanced graphics capabilities.
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.

Object Name	Label	Description
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of network port connections.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
	Subnet Mask	

Object Name	Label	Description
subnet_mask		The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Organization Family

Contents

The Organization family includes the following:

- **Organization**
  Identifies an entity representing a structured group of persons.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Organization	External	orgx	ci_organization	An organization not part of the company
Organization	Internal	orgx	ci_organization	An organizational segment of the company

Organization Attributes

The Organization family contains the following class:

- **base_organization**
  Specifies the organization that the CI represents (SREL uuid to org). Represents an exclusive relationship where only one CI represents an organization in the Organization family.

The Organization family includes the following attributes that correspond to the net_orgx extension table:

Object Name	Label
alt_phone	Alternate Phone Number
billing_code	Billing Code
contact	Organization Contact
description	Description
email_addr	Email Address
fax_phone	Fax Number
location	Location

Object Name	Label
org_num	Organization Code
owning_contract	Service Contract
pemail_addr	Pager Email Address
phone_number	Primary Phone Number
service_type	Service Type
status	Configured Status

Security Family

Contents

The Security family includes the following:

- **Security**
  Identifies security systems that protect data, software, and hardware against unauthorized access or manipulation. These systems include digital certificates, directory services, and biomechanical or key-based systems.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Security	Application Security	secx	ci_security	Application Security
Security	Building Security	secx	ci_security	Building Security
Security	Data Security	secx	ci_security	Data Security
Security	Other Security	secx	ci_security	Miscellaneous Security

Security Attributes

The Security family includes the following attributes that correspond to the secx extension table:

Object Name	Label	Description
appl	Applies To	The designation of the domain of this security CI.
avail	Availability	An indication of when access to a security-related CI is offered.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
confidentiality_level	Confidentiality Level	The level of confidentiality (for example, view-only, high, medium, low) for a security-related CI.

Object Name	Label	Description
integrity_level	Integrity Level	The level of integrity (for example, high, medium, low) for a particular security-related CI.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
security_id	SecurityID	Number or other identifier for a security-related CI.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Service Family

Contents

Important: The Service family has been deprecated in CA CMDB Release 12.9. Use the Enterprise Service family instead.

The Service family comprises:

- **Service**
  Identifies an entity that delivers or performs a consistent set of tasks to a consumer. Services can be high-level business services or lower level IT technical services. Support, email, accounting are often delivered as services.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
Service	Component	serx	ci_service	CA NSM Business Process View (BPV) Component
Service	Document	serx	ci_service	CA NSM BPV Document
Service	Person	serx	ci_service	CA NSM BPV Person
Service	Practice	serx	ci_service	CA NSM BPV Practice
Service	Process	serx	ci_service	CA NSM BPV Process
Service	Role	serx	ci_service	CA NSM BPV Role
Service	Service	serx	ci_service	CA NSM BPV Service

Service Attributes

The Service family includes the following attributes that correspond to the serx extension table:

Object Name	Label	Description
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
end_date	End Date	The date on which a service expires or is no longer valid.
portfolio	Service Portfolio	The name or identifier for a grouping of related services.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
service_id	Service ID	The name or other unique identifier for a Service CI.
site	Site	A designation to describe the location of a CI.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
start_date	Start Date	The date on which a contract, document, service, or SLA becomes active.
type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Service Level Agreement (SLA) Family

Contents

The Service Level Agreement family includes the following classes that identify agreements between a service provider and consumer:

- Operational Level Agreement
- Other Service Level Agreement
- Service Level Agreement
- Underpinning Contract

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Service Level Agreement	Operational Level Agreement	slax	ci_sla
		slax	ci_sla

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Service Level Agreement	Other Service Level Agreement		
Service Level Agreement	Service Level Agreement	slax	ci_sla
Service Level Agreement	Underpinning Contract	slax	ci_sla

Service Level Agreement Attributes

The Service Level Agreement family includes the following attributes that correspond to the slax extension table:

Object Name	Label	Description
sla_category	Service Level Agreement Category	The high-level type designation for an application, service, SLA, or document.
sla_date_active	Service Level Agreement Activation Date	The date on which the Configuration Item was made available to users.
sla_end_date	Service Level Agreement End Date	The date on which an SLA expires or is no longer valid.
sla_id	Service Level Agreement ID	The unique name or other identifier for a Service Level Agreement CI.
sla_start_date	Service Level Agreement Start Date	The date on which a contract, document, service, or SLA becomes active.
sla_status	Service Level Agreement Status	An indication of the status of an Application, Contract, Document, Service, or SLA CI (development, review, active, retired, and so on).
sla_type	Service Level Agreement Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
sla_version	Service Level Agreement Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Software Families

Contents

The Software families include the following:

- **Software.Application System**
  Identifies a group of related applications that perform a high-level business function, such as an SAP Financials system.

- **Software.Application Component**
  Identifies an aspect of a software program, application or application system, that is managed as part of a business transaction, and is responsible for a specific operation. Examples include a database connection or a web service.

- **Software.Application**
  Identifies programmatic components of the IT infrastructure.

- **Software.Application Server**
  Identifies a software engine that delivers client applications to client computers, typically through the Internet and using HTTP (Hypertext Transfer Protocol).

- **Software.Bespoke**
  Identifies software customized or constructed to order.

- **Software.COTS**
  Identifies software that was purchased, or leased and is manufactured outside of the owning company.

- **Software.Database**
  Identifies database management systems (DBMS) such as Oracle, DB2, and MS SQL.

- **Software.In-House**
  Identifies software applications developed by the company using the application.

- **Software.Operating System**
  Identifies system Software installed on a computer or similar device that provides basic services and enables other software to run.

- **Software.MessageServer**
  Identifies the software that processes incoming and outgoing mail message sent to/from authorized users.

- **Software.ESXHypervisor**
  Identifies the VMware software running on the OS of a VM hosting machine.

- **Software.HyperVHypervisor**
  Identifies the hyper-V software running on the OS of a VM hosting machine.

- Software.NetworkServer
  Identifies a server that is solely focused on providing protocol-specific functionality.

- Software.ResourceServer
  Identifies a system/software providing storage and query of resources - such as media - accessed via HTTP requests/responses.

- **Software.Schema**
  Identifies a named collection of data tables, stored procedures, and so on, that are managed and manipulated in a database management system (server).

- **Software.Tablespace**
  Identifies the description of the logical storage of a Database. A Tablespace bridges between the structure of the database (tables, indices, etc.) and a system's file system.

- **Software.VirtualManager**
  Identifies an application that manages a virtualization environment, the VM definitions, host machines and VMs running on the hosts.

- **Software.Website**
  Identifies a specialization of Group, representing a collection of files, designed for access using the World Wide Web, with a starting location/URI (also known as a "home page").

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Software.Application System	Application System	app_extx	ci_app_ext
Software.Application Component	SoftwareComponent	app_extx	ci_app_ext
Software.Application	Application	app_extx	ci_app_ext
Software.Application	Application Instance	app_extx	ci_app_ext
Software.Application Server	Application Server	app_extx	ci_app_ext
Software.Application Server	Application Server Instance	app_extx	ci_app_ext
Software.Bespoke	Bespoke	app_extx	ci_app_ext
Software.COTS	Batch	app_extx	ci_app_ext
Software.COTS	CICS	app_extx	ci_app_ext
Software.COTS	COTS	app_extx	ci_app_ext

Software Attributes

The following attributes correspond to the app_extx extension table and apply to the following families:

- Software.Application
- Software.Application Server
- Software.Bespoke
- Software.COTS

Object Name	Label	Description
app_id	Application ID	Application name or other unique identifier.
category	Category	The high-level type designation for an application.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on of a CI or group of CIs.
date_installed	Date Installed	The date on which the physical installation of a Configuration Item was completed.

Object Name	Label	Description
environment	Environment	The application environment (for example, development, test, production) or project environment (for example, mainframe, distributed).
highavail_appl_resources	High Availability Resource	The name of the resource that provides high availability capability for an Application CI.
highly_avail	Under High Availability?	An indication (Yes/No) that an Application CI operates in a high availability production scenario.
inhouse_or_vendor	External Vendor	The internal department responsible for development/maintenance of this software.
install_dir	Installation Directory	The directory where an application stores its program files.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific timeframe or was purchased.
main_process	Main Process	The designation of the main thread of an application process.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The timeframe for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
portfolio	Portfolio	A grouping of projects into a unit for management and tracking purposes.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.

Object Name	Label	Description
response_time	Response Time	The desired time measurement between the time a transaction is entered and the application returns a response.
server	Server	The name of the server on which an application runs.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
storage_used	Storage Used	The amount of available storage that is in use.
support_end_date	Support End Date	The date on which support for an application is no longer provided.
support_start_date	Support Start Date	The beginning date on which support for an application is provided.
support_type	Support Type	The kind of support that is provided for this CI, for example, gold/silver /bronze.
type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
uptime	Uptime	The desired "availability" that indicates the proportion of time a component is in a fully functioning condition.
version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Software.Database Attributes

The Software.Database family includes the following attributes that correspond to the dat_basx extension table:

Object Name	Label	Description
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on of a CI or group of CIs.
db_id	Database ID	A name that uniquely identifies a database.
environment	Environment	The application environment (for example, development, test, production) or project environment (for example, mainframe, distributed).
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific timeframe or was purchased.
portfolio	Portfolio	A grouping of projects into a unit for management and tracking purposes.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code		The ID or other unique identifier for the project to which a CI is assigned.

Object Name	Label	Description
	Project Code	
server	Server	The name of the server on which an application runs.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
support_end_date	Support End Date	The date on which support for an application is no longer provided.
support_start_date	Support Start Date	The beginning date on which support for an application is provided.
support_type	Support Type	The kind of support that is provided for this CI, for example, gold/silver /bronze.
type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Software.In-House Attributes

The Software.In-House family includes the following attributes that correspond to the app_inhx extension table:

Object Name	Label	Description
app_id	Application ID	Application name or other unique identifier.
category	Category	The high-level type designation for an application, service, SLA, or document.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
date_installed	Date Installed	The date on which the physical installation of a Configuration Item was completed.
environment	Environment	The application environment (for example, development, test, production) or project environment (for example, mainframe, distributed).
highavail_appl_resources	High Availability Resource	The name of the resource that provides high availability capability for an Application CI.
highly_avail	Under High Availability?	An indication (Yes/No) that an Application CI operates in a high availability production scenario.
inhouse_or_vendor	Inhouse Department	The internal department responsible for development/maintenance of this software.

Object Name	Label	Description
install_dir	Installation Directory	The directory where an application stores its program files.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific timeframe or was purchased.
main_process	Main Process	The designation of the main thread of an application process.
portfolio	Portfolio	A grouping of projects into a unit for management and tracking purposes.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost of a CI.
response_time	Response Time	The desired time measurement between the time a transaction is entered and the application returns a response.
server	Server	The name of the server on which an application runs.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
storage_used	Storage Used	The amount of available storage that is in use.
support_end_date	Support End Date	The date on which support for an application is no longer provided.
support_start_date	Support Start Date	The beginning date on which support for an application is provided.
support_type	Support Type	The kind of support that is provided for this CI, for example, gold/silver /bronze.
type	Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
uptime	Uptime	The desired "availability", indicating the proportion of time a component is in a fully functioning condition.
version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Software.Operating System Attributes

The Software.Operating System family includes the following attributes that correspond to the opsysx extension table:

Object Name	Label	Description
os_id		Operating system name or other unique identifier.

Object Name	Label	Description
	Operating System ID	
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on of a CI or group of CIs.
date_installed	Date Installed	The date on which the physical installation of a Configuration Item was completed.
environment	Environment	The application environment (for example, development, test, production) or project environment (for example, mainframe, distributed).
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_end_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_start_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific timeframe or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The timeframe for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
server	Server	The name of the server on which an application runs.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Object Name	Label	Description
support_end_date	Support End Date	The date on which support for an application is no longer provided.
support_start_date	Support Start Date	The beginning date on which support for an application is provided.
support_type	Support Type	The kind of support that is provided for this CI, for example, gold/silver /bronze.
type	OS Type	A description of the kind of Application, Contract, Document, Service, or SLA CI.
version	Version	A number or other identifier that indicates the current level (version) of an Application, Document, Service, or SLA CI.

Software.ESXHypervisor Attributes

The Software.ESXHypervisor family includes the following attributes that corresponds to the app_esx extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).

Object Name	Label	Description
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
IsMigrationEnabled	Is Migration Enabled	Boolean indicating whether (or not) migration of VM's between hosts is enabled.
ComputeResourceIndex	Compute Resource Index	Identifier for a single host, acting as a "compute resource". Either a single system or a cluster can be a "compute resource".
HostIndex	Host Index	An index generated by VMware for the host, for example, host-6746.
DatacenterPath	Datacenter Path	Although hosts are managed by vCenter and its data centers, this element is provided for query purposes. It indicates the data center to which the host belongs.
FTVersion	FT Version	The version of Fault Tolerance running on the host. Only hosts with the same version of Fault Tolerance are compatible.
NumberOfPrimaryVMs	Number Of Primary VMs	The total number of primary VMs configured to this host, supported by fault tolerance.
NumberOfSecondaryVMs	Number Of Secondary VMs	The total number of secondary VMs configured to this host, to support fault tolerance.

Software.HyperVHypervisor Attributes

The Software.HyperVHypervisor family includes the following attributes that corresponds to the app_hyp extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.

DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
IsMigrationEnabled	Is Migration Enabled	Boolean indicating whether (or not) migration of VM's between hosts is enabled.
DefaultExternalDataRoot	Default External Data Root	The fully-qualified path to the default location for the Hyper-V files.
DefaultVhdPath	Default VHD Path	The fully-qualified path to the default location for the Hyper-V Virtual Hard Disk files.
MinimumMacAddress	Minimum MAC Address	The minimum MAC address for dynamically generated MAC addresses. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
MaximumMacAddress	Maximum MAC Address	The maximum MAC address for dynamically generated MAC addresses. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.

Software.NetworkServer Attributes

The Software.NetworkServer family includes the following attributes that corresponds to the app_netsvr extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.

Object Name	Label	Description
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
ProcessID	Process ID	The PID of the running software, as defined by the operating system. This value is important to distinguish between multiple running instances of the same ProvisionedSoftware.
AccessedViaTcpPort	Accessed Via TCP Port	The TCP port number to use when communicating with the software.
ProcessDistinguishingID	Process Distinguishing ID	A string providing an additional identifier/distinguisher for RunningSoftware when the ProcessID and TCP port data are not available or are not sufficient to distinguish the instances (for example, for an Application where little information can be discovered via the current access mechanisms).
Protocol	Protocol	Defines the protocol supported by the NetworkServer - such as DHCP and DNS.
ContextID	Context ID	The ContextID element is used for identification.

Software.ResourceServer Attributes

The Software.ResourceServer family includes the following attributes that corresponds to the app_ressvr extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
ProcessID	Process ID	The PID of the running software, as defined by the operating system. This value is important to distinguish between multiple running instances of the same ProvisionedSoftware.
AccessedViaTcpPort	Accessed Via TCP Port	The TCP port number to use when communicating with the software.
ProcessDistinguishingID	Process Distinguishing ID	A string providing an additional identifier/distinguisher for RunningSoftware when the ProcessID and TCP port data are not available or are not sufficient to distinguish the instances (for example, for an Application where little information can be discovered via the current access mechanisms).

capabilities	capabilities	A comma-separated list of the capabilities of the Server.
ContextID	Context ID	The ContextID element is used for identification.

Software.VirtualManager Attributes

The Software.VirtualManager family includes the following attributes that corresponds to the app_virmgr extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
		An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").

Object Name	Label	Description
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	
ProcessID	Process ID	The PID of the running software, as defined by the operating system. This value is important to distinguish between multiple running instances of the same ProvisionedSoftware.
AccessedViaTcpPort	Accessed Via TCP Port	The TCP port number to use when communicating with the software.
ProcessDistinguishingID	Process Distinguishing ID	A string providing an additional identifier/distinguisher for RunningSoftware when the ProcessID and TCP port data are not available or are not sufficient to distinguish the instances (for example, for an Application where little information can be discovered via the current access mechanisms).
ApiVersion	API Version	The version identifier for the APIs applicable to the Manager.
ContextID	Context ID	The ContextID element is used for identification.

Software.Website Attributes

The Software.Website family includes the following attributes that corresponds to the app_website extension table:

Object Name	Label	Description
DeviceAssetNumber	Device Asset Number	Number or other designator assigned to hardware by asset management, often the finance department, that is used for tracking ownership of the resource.
DeviceBiosSystemID	Device BIOS System ID	The identifier reported from the BIOS for the device.
DeviceDnsName	Device DNS Name	The fully qualified DNS name of the device.
DeviceSysName	Device System Name	The system name of the device, as defined in the system block of SNMP's MIB-II. Other information (than the MIB-II sysName) should NOT be used for this element.
DevicePhysSerialNumber	Device Physical Serial Number	An identifying string assigned by the hardware manufacturer and printed on a tag attached to the component.

Object Name	Label	Description
DeviceMacAddress	Device MAC Address	A MAC address for the entity. The address is expressed as 6 groups of 2 hex digits (using only uppercase), separated by dashes.
DeviceIPV4Address	Device IPV4 Address	An IPv4 address for the device. The address is expressed using typical dotted decimal notation (4 groups of up to 3 decimal digits, separated by periods).
DeviceIPV4AddressWithDomain	Device IPV4 Address With Domain	An IPv4 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
DeviceIPV6Address	Device IPV6 Address	An IPv6 address for the device. The address is expressed using the formal, complete IPv6 notation (8 groups of up to 4 hex digits, using only uppercase where applicable, separated by colons).
DeviceIPV6AddressWithDomain	Device IPV6 Address With Domain	An IPv6 address for the device, prefixed by a contextual domain name, where the domain name is separated from the address by a dash ("-").
IsHAEnabled	Is HA Enabled	Boolean indicating whether the group (typically a Cluster instance or a GroupType="ResourceCluster") supports high availability/failover (if true) or not (if false).
IsMonitoringMembers	Is Monitoring Members	Boolean indicating whether the group (typically a Cluster instance or a GroupType="ResourceCluster") currently is using a heartbeat or other individual monitoring technique to determine if availability is lost (if true) or whether this capability does not exist or is not currently enabled (if false).
MaxFailures	Max Failures	Number of failures that can be supported by the Group, by sparing or other load balancing means.
MemberCriteria	Member Criteria	Defines a comma-separated list of QNames, representing the constraints on the constituency of the Group. Instances referenced as the Target element in the HasMember relationship semantic should have one of the types specified.
GroupType	Group Type	An enumerated value describing the primary type or category of the Group, such as an "authorization group", a "virtual resource pool" or a "data center".
HomePage	Home Page	The URL of the web site's home page.
BusinessRelevance	Business Relevance	Description of the relevance of the Entity, to the business.

J2EE Conventions

CA CMDB includes the following families of Software CIs:

- Software.COTS extension: ci_app_ext

- Software.Application extension: ci_app_ext
- Software.Application Server extension: ci_app_ext
- Software.Bespoke extension: ci_app_ext
- Software.In-House extension: ci_app_inhouse
- Software.Database extension: ci_database
- Software.Operating System extension: ci_operating_system

The existing CA CMDB/CA Cohesion ACM integration uses the family Software.COTS for all software CIs including both J2EE applications and J2EE application servers. Software CIs are reconciled by their system_name attribute which is composed in the following format:

HostName|AppName|Version|Qualifier

In addition, these CIs are named using a similar format:

AppName|Version|Qualifier

Families, Classes, and Reconciliation for J2EE

The following reconciliation considerations apply if you use J2EE Application or J2EE Application Server CIs:

- If you have J2EE Application and Application Server CIs, and you do *not* have CA Wily products or other MDR sources for J2EE CIs, you can use your existing reconciliation strategy. CA Cohesion ACM provides an export capability that you can customize to behave in its original mode.
- If you intend to use CA Wily products, and you already have CIs discovered by CA Cohesion ACM, you can write a script to mark your existing J2EE CIs as Inactive. Then the CIs can be rediscovered using the new CA CMDB integrations.

For future integrations with CA CMDB, use the following Families, Classes, and reconciliation key for J2EE Application CIs:

Objects	Values
Family	Software.Application
Extension	ci_app_ext
Class	Application
Attributes	Category and Type **Note:** These attributes distinguish J2EE applications from other kinds of applications.
Reconciliation attributes /key	Name: AppName|Port system_name: HostName|AppName|Port

For future integrations with CA CMDB, use the following Families, Classes, and reconciliation key for J2EE Application Server CIs:

Objects	Values
Family	Software.Application Server
Extension	ci_app_ext
Class	Application Server
Attributes	Category and Type **Note:** These attributes distinguish J2EE applications from other kinds of applications.
Reconciliation attributes /key	Name: *Host*Name|Port system_name: HostName|Port

Storage Area Network (SAN) Families

Contents

The Storage Area Network (SAN) families include the following:

- **SAN.Interface**
  Identifies a fiber channel interface, similar to a network interface card, used in a SAN fabric.
- **SAN.Switch**
  Identifies a fiber channel switch, similar to a network switch, used in a SAN fabric.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name	Description
SAN. Interface	Interface	net_nicx	ci_network_nic	Interface to a SAN
SAN.Switch	Hub	net_hubx	ci_network_hub	Hub on a SAN
SAN.Switch	Switch	net_hubx	ci_network_hub	Switch on a SAN

SAN.Interface Attributes

The SAN.Interface family includes the following attributes that correspond to the net_nicx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can exist on the network.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network

Object Name	Label	Description
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
line_speed	Line Speed	The rate at which information is transmitted on a network connection.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of ports on a server.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
protocol	Protocol	The communication method employed by a network device.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

SAN.Switch Attributes

The SAN.Switch family includes the following attributes that correspond to the net_hubx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
addr_class	Address Class	IP address values are arranged in Address Classes (A, B, and C). The Address Classes determine how many workstations can exist on the network.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and son on, of a CI or group of CIs.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
ip_mgmt_addr	Management IP Address	The IP address assigned to a station (PC or workstation) that is authorized for either manager- or operator-level access to a switch.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
leased_or_owned_status	Leased or Owned	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.

Object Name	Label	Description
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
number_net_card	Number of Network Cards	The number of expansion cards that have been installed in the available slots in a computer.
number_net_port	Number of Network Ports	The total number of ports in use on a server.
number_net_port_conn	Number of Network Port Connections	The total number of ports on a server.
number_ports	Number of Ports	The total number of ports on a network device.
number_ports_used	Number of Ports Used	The total number of ports in use on a network device.
os_version	OS Version	The version number of a CI's operating system.
priority	Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
project code	Project Code	
protocol	Protocol	The communication method employed by a network device.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
role	Role	The business function supported by a hardware or network device, for example, production, test.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address, for example, 255.128.0.0.
technology	Technology	The technology (TCP/IP, Ethernet, FDDI, and so on) employed by a hardware or network device.
type_net_conn	Type of Network Connection	An indication of the kind of network connection used by a hardware or network device.

Telecom Families

Contents

- Telecom.Wireless Attributes (see page 4283)
- Telecom.Radio Attributes (see page 4285)
- Telecom.Voice Attributes (see page 4287)

The Telecom families include the following:

- **Telecom.Circuit**
  Identifies a dedicated connection between two nodes of a telecommunications network.

- **Telecom.Other**
  Identifies miscellaneous telecom components.

- **Telecom.Radio**
  Identifies an RF receiver or transmitter.

- **Telecom.Voice**
  Identifies a multiplexed connection supporting multiple voice lines on the same circuit.

- **Telecom.Wireless**
  Identifies telecom devices that do not rely on land lines, such as mobile or cellular phones, or wireless handsets or headsets.

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Telecom.Circuit	Communication Circuit	tel_cirx	ci_telcom_circuit
Telecom.Circuit	Other Telecom Circuit	tel_cirx	ci_telcom_circuit
Telecom.Circuit	Satellite Link	tel_cirx	ci_telcom_circuit
Telecom.Other	ACD	tel_othx	ci_telcom_other
Telecom.Other	IVR	tel_othx	ci_telcom_other
Telecom.Other	Other Telecom	tel_othx	ci_telcom_other
Telecom.Other	PDA	tel_othx	ci_telcom_other
Telecom.Other	Video Conferencing Unit	tel_othx	ci_telcom_other
Telecom.Radio	Other Telecom Radio	tel_radx	ci_telcom_radio
Telecom.Radio	Radio Data Modem	tel_radx	ci_telcom_radio
Telecom.Radio	Radio Handsets	tel_radx	ci_telcom_radio
Telecom.Voice	Centrex	tel_voix	ci_telcom_voice
Telecom.Voice	Conference Bridge Line	tel_voix	ci_telcom_voice
Telecom.Voice	Desk Phone	tel_voix	ci_telcom_voice
Telecom.Voice	Other Telecom Voice	tel_voix	ci_telcom_voice
Telecom.Voice	PBX	tel_voix	ci_telcom_voice
Telecom.Voice	Phone Card	tel_voix	ci_telcom_voice
	Mobile Phone	tel_wirx	ci_telcom_wireless

Family	Class	Extension Table / Logical Name	Extension Table / Physical Name
Telecom. Wireless			
Telecom. Wireless	Other Telecom Wireless	tel_wirx	ci_telcom_wireless
Telecom. Wireless	Pager	tel_wirx	ci_telcom_wireless

Telecom.Circuit Attributes

The Telecom.Circuit family includes the following attributes that correspond to the tel_cirx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
bandwidth	Bandwidth	The amount of data that can be carried in a given time period over a wired or wireless communications link. Usually specified as bits per second, KB per second, MB per second, and so on.
carrier	Carrier	A company that provides telecommunication services, such as AT&T, Cingular, Sprint, Verizon, and so on.
circuit_number	Circuit Number	The number issued by the phone company that uniquely identifies a circuit.
circuit_type	Circuit Type	The high-level type designation for a telecommunication circuit.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
	Leased or Ownedv	An indication of whether a particular CI has been leased for a specific time frame or was purchased.

Object Name	Label	Description
leased_or_owned_status		
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
server_id	Server ID	The name or other unique identifier for a server.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

Telecom.Other Attributes

The Telecom.Other family includes the following attributes that correspond to the tel_othx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
bandwidth	Bandwidth	The amount of data that can be carried in a given time period over a wired or wireless communications link. Usually specified as bits per second, KB per second, MB per second, and so on.

Object Name	Label	Description
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
carrier	Carrier	A company that provides telecommunication services, such as AT&T, Cingular, Sprint, Verizon, and so on.
circuit_number	Circuit Number	The number issued by the phone company that uniquely identifies a circuit.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
cpu_type	CPU Type	The type (and speed) of the central processor in a telecom device.
domain	Domain	The identifier of the logical grouping (domain) to which a network or telecom device is assigned.
frequency	Frequency	The wavelength at which a telecom signal is transmitted to a wireless or radio device.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
harddrive_capacity	Hard Drive Capacity	The amount of hard drive capacity that is available for use on a Telecom CI.
harddrive_used	Hard Drive Space Used	The amount of hard drive capacity that is being used.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Ownedv	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
license_expiration_date	License Expiration Date	The date on which a hardware or software license expires.

Object Name	Label	Description
ci_license_number	CI License Number	The valid license number for a hardware or software CI.
line_id	Line ID	The designation that uniquely identifies a telecommunication line.
main_extension	Main Extension	The primary telephone number for a business.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
memory_available	Memory Available	The amount of memory that is still available for use.
memory_used	Memory Used	The amount of the available memory that is in use.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
nic_card	NIC Card	Each device (Node) on a network has a Network Interface Card (NIC). The NIC can be Ethernet, Token Ring, RF, or other. The NIC is installed inside the device and provides a real-time dedicated connection to the network.
phone_number	Phone Number	The number issued by the phone company that uniquely identifies a land line or cellular telephone connection.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.

Object Name	Label	Description
retire_date	Retire Date	The date on which a CI is no longer active.
server_id	Server ID	The name or other unique identifier for a server.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address for example, 255.128.0.0.

Telecom.Wireless Attributes

The Telecom.Wireless family includes the following attributes that correspond to the tel_wirx extension table:

Object Name	Label	Description
active_date	Activation Date	The date on which the CI was put into active status.
bandwidth	Bandwidth	The amount of data that can be carried in a given time period over a wired or wireless communications link. Usually specified as bits per second, KB per second, MB per second, and so on.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
carrier	Carrier	A company that provides telecommunication services, such as AT&T, Cingular, Sprint, Verizon, and so on.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
cpu_type	CPU Type	The type (and speed) of the central processor in a telecom device.
domain	Domain	The identifier of the logical grouping (domain) to which a network or telecom device is assigned.
frequency	Frequency	The wavelength at which a telecom signal is transmitted to a wireless or radio device.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
harddrive_capacity	Hard Drive Capacity	The amount of hard drive capacity that is available for use on a Telecom CI.
harddrive_used	Hard Drive Space Used	The amount of hard drive capacity that is being used.
		The latest date on which maintenance was performed on a CI.

Object Name	Label	Description
last_mtce_date	Last Maintenance Date	
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Ownedv	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
license_expiration_date	License Expiration Date	The date on which a hardware or software license expires.
ci_license_number	CI License Number	The valid license number for a hardware or software CI.
line_id	Line ID	The designation that uniquely identifies a telecommunication line.
main_extension	Main Extension	The primary telephone number for a business.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
memory_available	Memory Available	The amount of memory that is still available for use.
memory_used	Memory Used	The amount of the available memory that is in use.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.

Object Name	Label	Description
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
nic_card	NIC Card	Each device (Node) on a network has a Network Interface Card (NIC). The NIC can be Ethernet, Token Ring, RF, or other. The NIC is installed inside the device and provides a real-time dedicated connection to the network.
phone_number	Phone Number	The number issued by the phone company that uniquely identifies a land line or cellular telephone connection.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address for example, 255.128.0.0.

Telecom.Radio Attributes

The Telecom.Radio family includes the following attributes that correspond to the tel_radx extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
bandwidth	Bandwidth	The amount of data that can be carried in a given time period over a wired or wireless communications link. Usually specified as bits per second, KB per second, MB per second, and so on.
bios_ver	BIOS Version	The version number of the BIOS - the code that's run when a personal computer starts up.
	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.

Object Name	Label	Description
contract_number		
cpu_type	CPU Type	The type (and speed) of the central processor in a telecom device.
domain	Domain	The identifier of the logical grouping (domain) to which a network or telecom device is assigned.
frequency	Frequency	The wavelength at which a telecom signal is transmitted to a wireless or radio device.
gateway_id	Gateway ID	The unique identifier for a network point that acts as an entrance (gateway) to another network
harddrive_capacity	Hard Drive Capacity	The amount of hard drive capacity that is available for use on a Telecom CI.
harddrive_used	Hard Drive Space Used	The amount of hard drive capacity that is being used.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Ownedv	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
license_expiration_date	License Expiration Date	The date on which a hardware or software license expires.
ci_license_number	CI License Number	The valid license number for a hardware or software CI.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.

Object Name	Label	Description
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.
memory_available	Memory Available	The amount of memory that is still available for use.
memory_used	Memory Used	The amount of the available memory that is in use.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
nic_card	NIC Card	Each device (Node) on a network has a Network Interface Card (NIC). The NIC can be Ethernet, Token Ring, RF, or other. The NIC is installed inside the device and provides a real-time dedicated connection to the network.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.
subnet_mask	Subnet Mask	The identifier of the subnet into which a CI falls. Expressed in the same format as an IP address for example, 255.128.0.0.

Telecom.Voice Attributes

The Telecom.Voice family includes the following attributes that correspond to the tel_voix extension table:

Object Name	Label	Description
active_date	Active Date	The date on which the CI was put into active status.
carrier	Carrier	A company that provides telecommunication services, such as AT&T, Cingular, Sprint, Verizon, and so on.
circuit_number	Circuit Number	The number issued by the phone company that uniquely identifies a circuit.
contract_number	Contract Number	The unique identifier for a legal contract covering the purchase, lease, warranty, maintenance, and so on, of a CI or group of CIs.
cpu_type	CPU Type	The type (and speed) of the central processor in a telecom device.
harddrive_capacity	Hard Drive Capacity	The amount of hard drive capacity that is available for use on a Telecom CI.
harddrive_used	Hard Drive Space Used	The amount of hard drive capacity that is being used.
last_mtce_date	Last Maintenance Date	The latest date on which maintenance was performed on a CI.
lease_cost_per_month	Monthly Lease Cost	The dollar amount owed to the vendor each month for a lease.
lease_effective_date	Lease Effective Date	The date on which a lease begins.
lease_renewal_date	Lease Renewal Date	The date on which a lease must be renewed for the next time period, or the affected CIs must be returned to the vendor.
lease_termination_date	Lease Termination Date	The date on which a lease ends and the affected CIs must be returned to the vendor.
leased_or_owned_status	Leased or Ownedv	An indication of whether a particular CI has been leased for a specific time frame or was purchased.
main_extension	Main Extension	The primary telephone number for a business.
maintenance_fee	Maintenance Fee	The amount of money paid to cover the cost of maintenance services over a specified time period.
maintenance_period	Maintenance Period	The time frame for which a maintenance contract is active.

Object Name	Label	Description
memory_available	Memory Available	The amount of memory that is still available for use.
memory_used	Memory Used	The amount of the available memory that is in use.
monitor	Monitor Model	The type of display unit connected to a hardware, network, or telecom device.
mtce_contract_number	Maintenance Contract Number	The number that uniquely identifies a maintenance contract.
mtce_level	Maintenance Level	An indication of the current patch version for this CI.
mtce_type	Maintenance Type	The kind of maintenance that is provided for this CI, for example, vendor or in-house.
network_address	Network Address	The IP address at which this CI resides, for example, 192.168.0.4.
network_name	Network Name	The unique name or identifier for a communications system that connects two or more computers and their peripheral devices.
nic_card	NIC Card	Each device (Node) on a network has a Network Interface Card (NIC). The NIC can be Ethernet, Token Ring, RF, or other. The NIC is installed inside the device and provides a real-time dedicated connection to the network.
phone_number	Phone Number	The number issued by the phone company that uniquely identifies a land line or cellular telephone connection.
ci_priority	CI Priority	The service level designation that is assigned to indicate the priority for restoration of this CI.
proj_code	Project Code	The ID or other unique identifier for the project to which a CI is assigned.
purchase_amountc	Purchase Amount	The cost incurred to buy a CI.
retire_date	Retire Date	The date on which a CI is no longer active.
SLA	Service Level Agreement	The name or identifier of the contract between IT and the customer that governs the level of service and support options that are expected and acceptable for this IT component.

General Resource Loader - GRLoader

Contents

GRLoader Considerations

Review the following considerations before you use GRLoader:

- GRLoader Release 12.9 is compatible with earlier releases of CA CMDB, but early releases of GRLoader are incompatible with CA CMDB Release 12.9. For example, a site has an existing CA CMDB r11.2 installation and later installs CA CMDB Release 12.9, so the site has two installations. GRLoader Release 12.9 works with both installed systems, but GRLoader r11.2 only works with the r11.2 installation. You can use the - s parameter to specify which one of the multiple installations for GRLoader to use.

- We recommend that you migrate all your MDR scripts to use the latest version of GRLoader. If you want to insert new CIs, migration requires altering existing scripts to specify -n.

  

  Note: If you do not specify -n or -a, GRLoader does not insert or update CIs and relationships.

- You can specify GRLoader options in a configuration file.

- Whenever you update a CI with the -a option, Last Change Date and user displayed in the Configuration Item List are updated even if no attributes were changed. This update occurs whether a CI was edited in the user interface (and saved without changes) or updated by using GRLoader.

- If GRLoader generates a warning, the error log records the CI information, an error, or a skip. For example, when GRLoader loads CIs, but -a is not specified to allow updates, the information appears in the error log with an appropriate message.

- When you run GRLoader from a batch file, specify the *-ad attr=value* as *-ad attr{value}* to get past the Windows command parser which may remove the equal "=" symbols.

- Do *not* use curly brackets "{ }" as work area delimiter characters when you want GRLoader to insert CIs into the CMDB. TWA delimiters work properly when inserting CIs from general notes, CSV and Excel files, and JDBC/ODBC databases.

- GRLoader does not support smart quotes. Use double quote characters, or any other single character delimiter instead.

- GRLoader does not let you create NULL or empty relationships between CIs. The CA SDM web interface lets you create these relationships, but GRLoader displays the *ERROR:Relationship type is required* message in the generated error XML file.

- GRLoader does not let you create duplicate relationships between the same two CIs. Instead, GRLoader tries to update the existing relationship between the same two CIs that have the same relationship type.
  For example, the CMDB contains a relationship such as *ci_1 manages ci_2*. When you try to insert the same relationship through GRLoader, the utility tries to update the existing relationship, instead of creating a new relationship. The CA SDM web interface lets you create a duplicate relationship between the same two CIs, or update the existing relationship.

- You cannot use the *SELECT ** syntax on UNIX systems.

Use Database Queries to Verify Correct Data

We recommend that you use database queries before executing GRLoader. These queries help you debug imports to SQL Server. For example, you want to specify Server as the class in your SQL statement.

Follow these steps:

1. Create a configuration file named sqlServer.cfg with the following code:

```
grloader.jdbc.driver=com.microsoft.sqlserver.jdbc.SQLServerDriver
grloader.jdbc.url=jdbc:sqlserver://sqlserverhostname:1433;databaseName=mdb;
grloader.jdbc.user=userid
grloader.jdbc.password=password
```

2. Save the file.

3. Execute the following query in SQL Server:

```
select ca_owned_resource.resource_name as name,
       ca_resource_class.name as class
       from ca_owned_resource, ca_resource_class
       where ca_owned_resource.resource_class = ca_resource_class.id
```

   The query executes successfully because you specified the correct class name.

4. Open GRLoader.

5. Execute the following command:

```
GRLoader -cfg sqlserverdb.cfg -u userid -p password -E -s http://sdmhostname:
8080 -E -dbstmt "select ca_owned_resource.resource_name as name,
ca_resource_class.name as class from ca_owned_resource, ca_resource_class where
ca_owned_resource.resource_class = ca_resource_class.id" -a -e "c:\errorjdbc1.
xml"
```

   The data is imported.

The GRLoader Command

The General Resource Loader (GRLoader) imports CI information into CA SDM. GRLoader uses XML documents as input, which lets you import data that originates in different data sources. Run GRLoader from a command prompt or by using a .bat or .cmd file. The CA SDM installation adds the GRLoader to the path during installation, so it runs from any directory.

Results from an import show counts for all processed CIs and Relationships, including the amount of Read, Skipped, Inserts, Updates, Errors, and Warnings. GRLoader logs all processing details and errors in the *nx_root*/log/grloader.log file, where *nx_root* specifies the CA SDM installation directory.

Syntax

```
C:\WINDOWS>GRLoader -?
```

The GRLoader command uses the following parameters:

- **-u *userid***
  (Required) Specifies the user ID that runs the GRLoader process.

- **-p *password***
  (Required) Specifies the password for the user ID. If you run GRLoader without the -p parameter, the utility prompts the console for the password.

- **-s http[s]://*cmdb_servername*:*port***
  (Required) Specifies the server URL including the port number that runs the web services. For running GRLoader on the primary server or application server in a default installation, you can use the following command:

  ```
  -s http://localhost:8080
  ```

  

  Note: If you specify the optional -C parameter, GRLoader ignores the -s parameter.

- **-i *input_file***
  (Required) Specifies a full path name or a relative path name. If the filename contains a .xls or .xlsx suffix, GRLoader considers the file as a spreadsheet, otherwise it considers it as an XML file.

- **-n**
  (Optional) Allows new CI insertion into the CMDB. Without -n, CIs write to the XML error file (see the -e parameter). Relationships are only added if either -n or -a is specified. If neither is specified, no updates are performed. Updating CIs also require the -a parameter.

- **-a**
  (Optional) Allows updates to configuration items (by default, updates are not allowed if the CI exists in the CMDB). The -n flag also is required to add new CIs.

- **-D**
  (Optional) Specifies a name prefix for relations (defaults to "GRLoader"). Use the prefix for the sym field in new relationships. The sym file must be unique, so a datetime field and a number is appended to this prefix to make it unique.
  Default Prefix: GRLoader.

- **-e *XML_err_file***
  (Optional) Produces an XML error file when GRLoader detects errors or warnings. By default, the error file name uses the name of the input file, appended with _err.xml. For example, using the input file as abc.xml creates the error file as abc_err.xml. Use the -e parameter to override this default name.

- **-E**
  (Optional) Lets you overwrite the XML error file. By default, the error file is not overwritten.

- **-l**
  (Optional) Ignores case. When you use this parameter, GRLoader is not case-sensitive when comparing the input value of a lookup field with the actual value stored in the database. By default, lookups are case-sensitive.

- **-ua**
  Always updates the CMDB.

- **-lftwa [-chg *nnnn*]**
  (Optional) Loads TWA transactions into the CMDB. If used with -chg, the load selects only those transactions associated with change order *nnnn*.

  
  Note: The Change Order string is not validated when loaded into the CMDB.

- **-lftwai [-chg *nnnn*]**
  (Optional) Runs TWA transactions to update the CMDB. Transactions that run successfully are set to Inactive so that they do not appear in lists. If you use -chg, the load selects only those transactions associated with change order *nnnn*.

- **-lttwa**
  (Optional) Loads XML into the transaction work area (TWA) instead of directly into the CMDB. After data has been loaded into the TWA, it can be edited, changed and verified. After the data modification process completes, individual transactions can load into the CMDB (see - lftwa).

- **-lttwar**
  (Optional) Loads XML into the initial state in the transaction work area (TWA) instead of directly into the CMDB. Transaction data in the TWA can be edited, changed, and verified (see -simci and -simrel). After the data modification process completes, individual transactions can load into the CMDB (see - lftwai).

- **-nospinner (-spinner)**
  (Optional) Turns off the spinner that displays CI and relationship progress. Use -spinner to enable the progress display.

- **-P**
  (Optional) Specifies preload data to improve performance for large processing. For large input files, supplying the - P parameter preloads a few tables into memory so that they can be processed more quickly. For smaller inputs (< 50 entries), preload is not necessary.

- **-rs**
  (Optional) Replaces symbolic values that CA SDM includes in the XML input file. If you enable this parameter, corresponding values replace the following symbolic values:

  - *now* -- Replaced by a unique date/time string appended with a sequence number to help ensure uniqueness.
  - *userid* -- Indicates the userid specified in the -u parameter.
  - *inputfile* -- Indicates the filename specified in the -I parameter.
  - *relationcount* -- Specifies the number of relationships processed so far in this GRLoader run.
  - *lastciuuid* -- Specifies the UUID of the most recently processed CI.
  - *cicount* -- Specifies the number of CIs processed so far in this GRLoader run.

Examples: Use the -rs Parameter

With -rs enabled, the following example creates 100 CIs named ci1, ci2, …, ci100

```
<GRLoader>
<ci><name>ci*cicount*</name><class>Server</class></ci>
[...repeated 100 times...]
</GRLoader>
```

With -rs enabled, the following example updates the CI description with information about the most recent update.

```
<GRLoader>
<ci>
<name>server1</name>
<description>updated by *userid* on *now* using input file *inputfile*</description>
</ci>
</GRLoader>
```

- **-simci**
  (Optional) Simulates CI operations to predetermine whether a set of transactions creates CIs, and therefore possible ambiguities for other CIs.

- **-simrel**
  (Optional) Simulates relationship operations to predetermine whether a relationship transaction creates a relationship or updates a relationship.

- **-T *trace_level***
  (Optional) Specifies the tracing level. Known tracing levels are 0 (off, the default), 1 (low), 5 (medium) and 10 (verbose). We recommend only using this setting when necessary because much output can result.

- **-tf *filename***
  (Optional) Runs GRLoader using translation rules. *filename* specifies the name of the file that contains the translation rule set.

- **-slump**
  (Optional) Specifies the slump.jar file. This parameter can provide better performance than web services. **Important:** -slump only can be used with the -s parameter to target the following server:

  - Conventional: Primary server
  - Advanced Availability: Application server.

  

  Note: If another CA product is installed, for example, CA Coheshion ACM or CMDB service pack is installed, verify that the slump.jar file is identical to the one that is installed on the target CA SDM system.

- **-C**
  (Optional) Validates the XML input file without any additional processing. This argument only validates the XML tags, not field values.

- **-h (or -?)**
  (Optional) Displays online help.

- **-v**
  (Optional) Displays the GRLoader product version and build date.

- **-maxerror *number***
  (Optional) Specifies the maximum number of errors that can occur before remaining CIs or relationships are skipped.

- **-maxwarn *number***
  (Optional) Specifies the maximum number of warnings that can occur before remaining CIs or relationships are skipped.

- **-chg *nnnn***
  Used with - lftwa and -lftwar. Loads only those transactions associated with change order *nnnn*.

  Note: The Change Order string is not validated when loaded into the CMDB.

- **-cfg *myconfigfile*.cfg**
  (Optional) Specifies the name of the input configuration file.

- **-dt t*enant***
  (Optional) Specifies the tenant assignment for the CI/relationship. You must enable multi-tenancy to use this parameter. You can use PUBLIC to indicate that the object is public. If the tenant access of the user does not authorize creating public objects, the object is created using the default tenant.

- **-sc classname**

  Lists the attributes of CIs in the class you specify.

- **-scx classname**

  Lists the attributes of CIs in the class you specify in XML format. The XML is stored in a file named classname.xml. Any special characters are removed from the class name.

Example: Load CI and Relationship Data

The following example loads the CI and relationship data contained in the filehardware_servers.xml (in the current directory) into the CMDB that resides on the server located on the local computer on port 8080.

```
grloader -u CMDBAdmin -p password -s http://localhost:8080 -i hardware_servers.xml -n
```

Input Options

Contents

JDBC Database Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input JDBC databases.

Note: If you use SQL Server or Oracle databases, CA SDM includes the required JAR files. If you use other database types, you must use the -addjar option to add support for those databases to GRLoader dynamically. Consult your database vendor documentation for the name and location of the necessary JAR files to use JDBC. You can also consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
grloader.jdbc.driver=*name*	-dbdriver *name*	Specifies the JDBC driver name. **Note:** This driver must be available on the classpath, similar to -addjar. Consult the database vendor for specific values.
grloader.jdbc.url=*URL*	-dburl *URL*	Specifies the JDBC database URL that describes the location of the database which contains the table you want to load.
grloader.jdbc.user=*name*	-dbuser *name*	Specifies the user ID for the JDBC database.
grloader.jdbc.password=*password*	-dbpswd *password*	Specifies the password for the user ID for the JDBC database.
grloader.jdbc.statement=*statement*	-dbstmt *statement*	Specifies the JDBC statement that describes the columns and selection criteria for the data you want to import. **Note:** The column names used in the query statement must match CMDB attribute names. If these names differ, use the SQL *AS* keyword to map database column names to CMDB attributes.

Spreadsheet Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input spreadsheets. You can also usethe {} symbols as delimiters surrounding the lookup field as well as using the keyword EMPTY.

- **boolean**
  Specifies a value from one the following pairs: 1/0, YES/NO, or TRUE/FALSE.

Note: If the input file name ends in .xls or .xlsx when you use the *grloader.inputfile=name* GRLoader option or the *-i* command line argument, GRLoader assumes that it is a spreadsheet.

GRLoader Option	Command Line Option	Description
grloader.spreadsheet.filename=*name*	-ssf	Specifies the Excel spreadsheet file name when it does not contain the .XLS or .XLSX file extension.
grloader.spreadsheet.sheetname=*name*	-sss	Specifies the sheet name. **Default:** The first sheet in the spreadsheet.
grloader.spreadsheet.firstrow=*n*	-ssfr	Set this value to skip over the first *n-1* rows in the spreadsheet.
grloader.spreadsheet.lastrow=*n*	-sslr	Ignores *rows> n (greater than)* in the spreadsheet.
grloader.spreadsheet.firstcol=*x*	-ssfc	Specifies to start processing on this column. You can express this column as a letter or number, depending on your spreadsheet options.
grloader.spreadsheet.lastcol=*x*	-sslc	Ignores *columns > x (greater than)* in the spreadsheet. You can express this column as a letter or number, depending on your spreadsheet options.
grloader.spreadsheet.embeddedseparator	-sses	Specifies a character to separate multiple values contained in a single cell. This option only applies to the relationship type column in a row with multiple embedded relationships. **Default:** semi-colon ":"
grloader.attributedefault.atrname=*value*	-ad attrname=*value*	Provides a default value if you did not specify one in the input source. **Note:** These values do not undergo attribute name or data value translation. **Note:** When you run GRLoader from a batch file, specify the *-ad attr=value* as *-ad attr{value}* to get past the Windows command parser which may remove the equal "=" symbols.

GRLoader Option	Command Line Option	Description
	-dt	Deprecated. Instead, use the -ad tenant=*name* option.
grloader.maxci=*n*	-maxci	Specifies the maximum number of CIs to import before skipping further CI imports.
grloader.maxrel=*n*	-maxrel	Specifies the maximum number of relationships to import before skipping further relationship imports.
N/A	-sc *classname*	Lists the attirbutes of CIs in the class you specify.
N/A	-scx *classname*	Lists the attributes of CIs in the class you specify in XML format.
grloader.workarea.changeorderrequired=*boolean*	-cor	If set to yes, TWA transactions that do not contain a non-blank change order number are ignored.
grloader.ignoreinvalidattributes=*boolean*	-iia	Specifies if you want to ignore invalid attributes. This command suppresses all warning messages about invalid attribute names.

CSV Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input CSV files.

Note: If required, consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
-i		GRLoader assumes that a file ending in .csv is a CSV file.
grloader.csv.filename=*n* *ame*	-csvf *name*	Specifies the filename when it does not end in .csv.
grloader.csv.separator=*x*	-csvsep *x*	Specifies when the CSV file uses other than comma delimiters. You can specify a single character, such as a Tab (\t) or a semicolon.
grloader.csv.escape=*x*	-csvesc *x*	Specifies when the CSV file uses an escape character (\).
grloader.csv.comment=*x*	-csvcom *x*	Specifies when the CSV file uses the comment character (#).
grloader.csv.quote=*x*	-csvquote *x*	Specifies when the CSV file uses the quote character (").

TWA Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input from the TWA.

GRLoader Option	Command Line Option	Description
grloader.workarea.changeorderrequired=yes/no	-cor	GRLoader ignores TWA transactions that do not contain a non-blank Change Order number.

General Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input from all inputs.

Note: If necessary, consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
grloader.system.addjar=*xx;yy;zz*	-addjar *xx*	Adds JAR files to the GRLoader classpath. You can use this option with -jdbcdriver. **Note:** The grloader.system.addjar option can only appear once in the configuration file. You can add multiple jars through grloader.system.addjar by separating the filenames with a semi-colon. This option only specifies a single jar file, and you can specify it as many times as required.
grloader.attributedefault.attrname=*value*	-ad attrname=*value*	Provides a default value if you did not specify a value in the input source. **Note:** These values do not undergo attribute name or data value translation. When you run GRLoaderfrom from a batch file, specify -ad attr=value as *-ad attr{value}.* The Windows command parser can delete the equals symbol.
N/A	-ad tenant=*name*	Specifies the tenant name.
grloader.maxci=*n*	-maxci *n*	Specifies the maximum number of CIs to import before skipping further CI imports.
grloader.maxrel=*n*	-maxrel *n*	Specifies the maximum number of relationships to import before skipping further relationship imports.
N/A	-sc *xx*	Lists attributes of CIs in the class *xx*.
N/A	-scx *xx*	Lists attributes of CIs in class *xx* in XML format.
	-aer	

GRLoader Option	Command Line Option	Description
grloader.reader.allowembeddedrelationships=yes/no		Allows embedded relationships. **Default:** Yes For backward compatibility only
grloader.ignoreinvalidattributes=yes/no	-iia	Ignores invalid attributes by suppressing all warning messages about invalid attribute names.
grloader.updatealways=yes/no		

Example Display CI Class Attributes

When you create input for GRLoader, list the attributes associated with a specific class.

To list the attributes, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -sc [class name]
```

- **sc**
  Lists attributes of CIs in a class that you specify.
- **class name**
  Specifies any valid CA CMDB class name.

Example: List Attributes for Class Server

```
grloader  - u username  - p password  - s http://sdm-host:8080 -sc Server

10:33:01.997 CI and Relationship Loader for CA Service Desk Manager

List of attributes in class(Server) extension(har_serx)

ATTRIBUTE NAME                    DATA TYPE
acquire_date                      Date
active_date                       Date
alarm_id                          STRING(64)
ambiguity                         Integer
asset_count                       Integer
asset_num                         STRING(64)
audit_userid                      SREL(cnt.combo_name)
```

Example Display CI Class Attributes in XML Format

When you create input for GRLoader, list the attributes associated with a specific class in XML format. The command creates the file [class name].xml with the result.

To list the attributes in XML format, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -scx [class name]
```

- **scx**
  Lists attributes of CIs in XML format in a class that you specify.

- **class name**
  Specifies any valid CA CMDB class name.

Example: List Attributes for Class Server

```
grloader  - u username  - p password  - s http://sdm-host:8080 -scx Server

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<GRLoader>
 <ci>
    <acquire_date></acquire_date>                      <!-- Date -->
    <active_date></active_date>                        <!-- Date -->
    <alarm_id></alarm_id>                              <!-- String(64) -->
    <ambiguity></ambiguity>                            <!-- Integer -->
    <asset_count></asset_count>                        <!-- Integer -->
    <asset_num></asset_num>                            <!-- String(64) -->
    <audit_userid lookup="combo_name"></audit_userid>  <!-- SREL cnt -->
```

Note: If the class name contains special characters, they are removed.

Data Error Handling

If GRLoader finds errors, the failing CI or Relation node writes to an error file. We recommend that you edit the XML file to correct the problem, and then run GRLoader against the edited file. The -e parameter lets you name the error file. The -maxerror and -maxwarn parameters let you specify the maximum number of errors or warnings that can occur until GRLoader skips the remaining CIs or relationships.

Consider the following information about error destinations:

- If you use the TWA as the input source, the TWA also becomes the error destination.

- If you use the JDBC database as the input source, $NX_ROOT\log\grloader_err.xml becomes the error destination.

- If you use filename.xls, filename.xlsx, filename.xml, or filename.csv as the input source, filename_err.xml becomes the error destination.

Note: When you troubleshoot errors or you perform simulations, review these files and the standard CA SDM logs.

GRLoader Configuration File

Contents

You can specify GRLoader options in a configuration file. This approach provides the following advantages:

- You no longer enter passwords in the command line.
- The command prompt window (Windows) does not display the password, or in the results of the -ps command (UNIX).
- Standardized commands reduce errors.

Important! We recommend that you keep configuration files in a secure location. Avoid specifying passwords in command lines and use configuration files, especially in Linux and UNIX environments.

The following input specifies the format of the configuration file parameter:

- **-cfg *myconfigfile*.cfg**
  Specifies the name of the input configuration file. You can specify the -cfg parameter at any location in the GRLoader parameter string.

If the command line and the configuration file conflict, GRLoader uses the last value you entered.

Example: Specify a Configuration File

A configuration file command uses the following syntax:

```
GRLoader -cfg myconfigfile.cfg -i myinputfile.xml
```

Instead of specifying the more complex command:

```
GRLoader -u userid -p password -i myinputfile.xml -a -n -E -maxerror 10 -maxwarn 10 -
dt IBM -nomn
```

Example: Last Password Value is Used

The configuration file GRLoader.cfg specifies the following passwords:

```
GRLoader.password=password1
GRLoader.password=password2
```

The command line specifies the following password:

```
GRLoader -p password3 -cfg GRLoader.cfg
```

The password that is used is password2.

If the command line was changed to specify:

```
GRLoader -cfg GRLoader.cfg -p password3
```

The password that is used is password3 because it was the last one specified.

Configuration File Options

The following table lists the GRLoader options that you can use in the configuration file and the corresponding command line options.

- **boolean**
  Specifies a value from one the following pairs: 1/0, YES/NO, or TRUE/FALSE.

GRLoader Option	Command Line Option	Description
grloader.userid=*userid*	-u	Specifies the user name of the administrator.
grloader.password=*password*	-p	Specifies the administrator password.
grloader.server=*server*	-s	Specifies the URL of the CA SDM server.
grloader.inputfile=*name*	-i **Note:** If the input file name ends in .XLS or .XLSX, GRLoader assumes it is a spreadsheet.	Specifies the file you want to import with GRLoader.
grloader.errorfile=*name*	-e	
grloader.nxroot=*name*	-N	
grloader.casesensitive=boolean	-I	
grloader.loadfromtwa=yes	-lftwa [-chg *nnnn*]	
grloader.loadfromtwa.inactivatesuccessful=yes	-lftwai [-chg *nnnn*]	
	-lttwa	

GRLoader Option	Command Line Option	Description
grloader.loadtotwa=yes		
grloader.loadtotwa.ready=yes	-lttwar	
grloader.simulateloadci=boolean	-simci	
grloader.simulateloadrelation=boolean	-simrel	
grloader.emptyvalue=EMPTY		
grloader.workarea.delimiters={ }		Provides alternate lookups for the dependent CI.
grloader.workarea.ignore_transaction_dates=yes		
grloader.normalizemac=boolean	-nm/nonm	
grloader.maxerror=*number*	-maxerror	
grloader.maxwarn=*number*	-maxwarn	
grloader.defaulttenant=*tenant* | PUBLIC	-dt *tenant* | PUBLIC **Note:** The multi-tenancy option must be *setup* or *on* to use these options.	
grloader.allowupdate=boolean	-a	
grloader.allowinsert=boolean	-n	
grloader.overwriteerrorxml=boolean	-E	

GRLoader Option	Command Line Option	Description
grloader.slump=boolean	-slump (primary or application server only)	
grloader.preload=boolean	-P	
grloader.replacesymbols=boolean	-rs	
grloader.translationfile=*filename*	-tf	
grloader.tracelevel=number	-T	
grloader.spinner=boolean	-spinner/-no (equivalent to -nospinner)	
grloader.cmdbversion=11.0	(no equivalent)* *Required for CA CMDB r11.0 only. GRLoader is compatible with all later releases.	
grloader.spreadsheet.filename=*name*	-ssf	Specifies the Excel spreadsheet file name when it does not contain the .XLS or .XLSX file extension.
grloader.spreadsheet.sheetname=*name*	-sss	Specifies the sheet name. **Default:** The first sheet in the spreadsheet.
grloader.spreadsheet.firstrow=*n*	-ssfr	Set this value to skip over the first *n-1* rows in the spreadsheet.
grloader.spreadsheet.lastrow=*n*	-sslr	Ignores *rows> n (greater than)* in the spreadsheet.
grloader.spreadsheet.firstcol=*x*	-ssfc	Specifies to start processing on this column. You can express this column as a letter or number, depending on your spreadsheet options.
grloader.spreadsheet.lastcol=*x*	-sslc	Ignores *columns > x (greater than)* in the spreadsheet. You can express this column as a letter or number, depending on your spreadsheet options.
	-sses	

GRLoader Option	Command Line Option	Description
grloader.spreadsheet.embeddedseparator		Separates multiple values contained in a single cell. This option only applies to the relationship type column in a row with multiple embedded relationships. **Default:** semi-colon ":"
grloader.attributedefault.atrname=*value*	-ad attrname=*value*	Provides a default value if you did not specify one in the input source. **Note:** These values do not undergo attribute name or data value translation. **Note:** When you run GRLoader from a batch file, specify the *-ad attr=value* as *-ad attr{value}* to get past the Windows command parser which may remove the equal "=" symbols.
	-dt	Deprecated. Instead, use the -ad tenant=*name* option.
grloader.maxci=*n*	-maxci	Specifies the maximum number of CIs to import before skipping further CI imports.
grloader.maxrel=*n*	-maxrel	Specifies the maximum number of relationships to import before skipping further relationship imports.
N/A	-sc *classname*	Lists the attributes of CIs in the class you specify.
N/A	-scx *classname*	Lists the attributes of CIs in the class you specify in XML format.
grloader.workarea.changeorderrequired=*boolean*	-cor	If set to yes, TWA transactions that do not contain a non-blank change order number are ignored.
grloader.ignoreinvalidattributes=*boolean*	-iia	Specifies if you want to ignore invalid attributes. This command suppresses all warning messages about invalid attribute names.

Note: If the input file name ends in .xls or .xlsx when you use the grloader.inputfile=name GRLoader option or the -i command line argument, GRLoader assumes that it is a spreadsheet.

GRLoader XML

This article contains the following topics:

GRLoader requires XML document input that consists of a document header followed by enclosing <GRLoader> XML elements tags with one or more <ci> tags (for CI definitions) or <relation> tags (for relationships).

Specify the XML document header as follows:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
```

Update the encoding attribute as needed to handle the appropriate character encoding requirements. For example, specify “ISO-8859-1” to handle special Norwegian characters.

Example: Format a GRLoader XML File

The following template presents the format for a GRLoader XML file:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<GRLoader>

<ci>
[define a CI: common and family-specific attributes, versioning, reconciliation, MDR]
</ci>
[repeat as necessary for each CI]

<relation>
        <type>relationship_type</type>
        <delete_flag>active_state</delete_flag>
        <provider>
                <name>resource name</name>
                <serial_number>serial number</serial_number>
                <system_name>host name</system_name>
                <asset_num>resource tag</asset_num>
                <mac_address>mac address</mac_address>
                <dns_name>dns name</dns_name>
                <id>ci_uuid</id>
        </provider>
        <dependent>
                <name>resource name</name>
                <serial_number>serial number</serial_number>
                <system_name>host name</system_name>
```

```
                <asset_num>resource tag</asset_num>
                <mac_address>mac address</mac_address>
                <dns_name>dns name</dns_name>
                <id>ci_uuid</id>
        </dependent>
</relation>
[repeat as necessary for each relationship]
</GRLoader>
```

XML Content The CI Tag

GRLoader uses the CI XML definition to load a CIs attribute values and relationships. The CI definition must include a minimum set of required attributes to be created or updated by using *<ci>* XML element tags.

You define the XML for a CI by specifying values for the following attributes:

- Class identification (required)
- Reconciliation attributes (required)
- Common attributes
- Family-specific attributes
- MDR identification attributes
- Versioning attributes

The CI Tag Family and Class Identification

Class identification must be specified for each CI to associate the proper family and class with the CI.

Specify the family and class attributes using the following XML tags:

- **<family>**
  (Optional) Specifies a collection of CIs that have similar attributes.
- **<class>**
  (Required) Specifies a subset of CIs within a family.

> **Note:** If GRLoader cannot find family or class, the CI is not created or updated.

Example: Identify a CI by Family and Class

The following example shows a CI named ServerCI that is identified by the family Hardware.Server and class Windows.

```
<ci>
        <name>ServerCI</name>
```

```
        <family>Hardware.Server</family>
        <class>Windows</class>
...
</ci>
```

The CI Tag Reconciliation Attributes (Required)

One or more reconciliation attributes are required when creating, updating, or referencing a CI. GRLoader uses these attributes to uniquely identify the CI to be created or updated. Reconciliation attributes are also used to identify a provider/dependent relationship between two CIs.

Specify the reconciliation attributes using the following XML element tags:

- <name> -- The name of the CI or resource (required when creating the CI for first time)
- <serial_number> -- The manufacture unique identifier
- <asset_num> -- Alternate resource identifier, for example, an alternate ID located on sticker placed on computer
- <system_name> -- Computer name (hardware only)
- <dns_name> -- The name by which this device is known in the domain name server
- <mac_address> -- MAC address. (hardware only)
- <id> -- UUID of the CI, used for direct updates when ID is known

The name attribute is required when creating a CI for the first time. If GRLoader cannot resolve the specified reconciliation attributes, an existing CI is not updated. Reconciliation attributes are special purpose Common Attributes that are used for identification purposes.

Example: Identify a CI When Creating or Updating It

In the following example, the CI definition uses name, serial_number, dns_name, mac_address and system_name to uniquely identify the CI when creating or updating it.

```
<ci>
    <name>ServerCI</name>
    <serial_number>HMVV081</serial_number>
    <dns_name>serverci.myco.com</dns_name>
    <mac_address>00:12:3F:48:F0:95</mac_address>
    <system_name>ServerCI</system_name>
...
</ci>
```

The CI Tag Common Attributes

In general, common attributes are attributes that can be used in any CMDB family or class. The XML element tag used for the attribute is the same as the attribute object name. The attribute value depends on its type, which can be a constant or an SREL value that indicates a foreign key reference to another table.

Example: Specify Common Attributes

In the following example, the CI definition named ServerCI specifies the following common attributes: manufacturer, model, and alarm_id (IP Address). The ServerCI name is also a common attribute.

```
<ci>
    <name>ServerCI</name>
...
    <manufacturer>Dell Inc.</manufacturer>
    <model>OptiPlex GX280</model>
    <alarm_id>130.200.19.220</alarm_id>
...
</ci>
```

The CI Tag Family-Specific Attributes

Class attributes are unique to a specific CI family or class. The XML element tag used for the class attribute is the same as the attribute object name found in the family/class specific tables.

Example: Specify Family-Specific Attributes

In the following example, the CI definition named ServerCI specifies the attributes specific to the Hardware.Server family that include bios_ver, cd_rom_type, hard_drive_capacity, and so on.

```
<ci>
    <name>ServerCI</name>
...
    <bios_ver>A04</bios_ver>
    <cd_rom_type>DVD+-RW DVD8701</cd_rom_type>
    <hard_drive_capacity>90 MB</hard_drive_capacity>
    <number_net_card>3</number_net_card>
    <number_proc_inst>1</number_proc_inst>
    <phys_mem>2048 MB</phys_mem>
    <proc_speed>2793 MHz</proc_speed>
   <swap_size>4959 MB</swap_size>
...
</ci>
```

The CI Tag MDR Identification

A management data repository (MDR) identifies the data provider for a CI and how the CIs maps back to the corresponding MDR.

CA SDM uses MDR information to perform the following tasks:

- Launch in context from the CI log directly to the MDR data provider.
- Tracks CI attribute changes back to the source MDR.
- Detects when more than one MDR updates a CI attribute. This situation occurs when multiple MDRs contribute data independently to a CI definition.
- Identifies which MDR acts as the authoritative source.

Note: For more information about MDRs, see this (see page 2538) topic.

Use the following XML element tags to specify MDR attributes:

- **<mdr_class>**
  Specifies the MDR class to group MDRs that CA SDM processed similarly.

- **<mdr_name>**
  Specifies the MDR name that an MDR uses to reference itself. Verify that the mdr_name and mdr_class value combination is unique within your enterprise.

- **<federated_asset_id>**
  Specifies the Federated asset ID that indicates the unique identifier of an MDR for a CI.

If GRLoader cannot resolve the specified mdr_class and mdr_name to an existing MDR, GRLoader does not import the CI. A CI with no associated federated_asset_id mapping is not federated.

Example: Identify a CI in the MDR

In the following example, the CI definition named ServerCI specifies mdr_class and mdr_name to uniquely identify the MDR and federated asset id, and thus identify the CI in the MDR.

Note: CA SDM uses the mdr_class string value *Cohesion* when federating data from the [assign the value for acm in your book] product.

```
<ci>
    <name>ServerCI</name>
...
    <federated_asset_id>1001118</federated_asset_id>
    <mdr_class>Cohesion</mdr_class>
    <mdr_name>CohesionServer</mdr_name>
...
</ci>
```

The CI Tag Versioning Attributes

You can use GRLoader to set versioning attributes for a CI.

Note: For more information about versioning, see the Versioning section.

Specify the Versioning attributes using the following XML element tags:

- **<milestone>**
  Specifies the label associated with that milestone that displays in the Versioning tab.

- **<standard_ci>**
  Specifies the name of the standard CI to use for baseline comparisons in the Versioning tab.

The CI that you specified for the standard_ci attribute must already exist in the CMDB or be specified before you specify the CI definition in the XML file. The milestone generated records the state of the CI at the time that GRLoader executes.

Example: Specify Baseline Comparisons

In the following example, the CI definition named ServerCI specifies the standard CI named standard server config for baseline comparisons with ServerCI (the focal CI). This example assumes that the standard CI already exists in CA SDM. In addition, a milestone named Fiscal year end 2008 is also created to preserve the state of the CI at the time that GRLoader imports the XML.

```
<ci>
     <name>ServerCI</name>
     <class>Server</class>
     <standard_ci>standard server config</standard_ci>
     <milestone>Fiscal year end 2008</milestone>
...
</ci>
```

XML Content The Relation Tag

GRLoader can create or update relationships between configuration items by using the <relation> XML element tag. Relationships are many-to-many, and the relationship type specifies how two provider/dependent configuration items relate to one another in CMDB.

Specify the relation attributes using the following XML element tags:

- **<type>**
  (Optional) Specifies the name of the relationship type.

- **<delete_flag>**
  Designates a relationship as inactive or active. Specify 1 (one), yes, or true to make the relationship inactive. Specify 0 (zero), no or false to make the relationship active again. Setting the delete_flag to true leaves the existing relationship intact but marks it as inactive.

- **<provider>**
  (Required) Identifies the provider CI for the relationship, which contains one or more of the CI reconciliation attributes.

- **<dependent>**
  (Required) Identifies the dependent CI for the relationship, which contains one or more of the CI reconciliation attributes.

Note: If GRLoader cannot find a specified type, provider CI, or dependent CI, the relationship is created or updated.

Example: Define a Relationship Between CIs

The following example defines a relationship between the CIs named ServerCI (provider) and ServerCI|NetworkAdaptor-0 (dependent). The relationship type is contains. The example assumes that both CIs have already been defined in the CMDB or are specified preceding the relationship definition in an XML file. In addition, both the provider and dependent CIs must match all reconciliation attributes for the relationship to be created.

```
<relation>
    <type>contains</type>

    <provider>
        <name>ServerCI</name>
        <serial_number>HMVV081</serial_number>
        <dns_name>serverci.myco.com</dns_name>
        <mac_address>00:12:3F:48:F0:95</mac_address>
        <system_name>ServerCi</system_name>
    </provider>
    <dependent>
        <name>ServerCI|NetworkAdaptor-0</name>
    </dependent>
</relation>
```

XML Content Special Values

Special-purpose XML attributes can modify how a CI value is set or updated when imported by GRLoader. You can use these attributes to perform special processing or formatting when setting the value; for example, to format a date value or use the result of a lookup.

Examples of special XML values include the following ones:

- **lookup**
  Specifies a CI by an attribute other than combo_name (lastname, firstname, middle). Examples include: userid,

- **update_if_null**
  Specifies the update_if_null option for GRLoader to use to distinguish between values that are blank and those which are not supplied in the XML. By default, update_if_null is set to "", which means that blank or missing values are ignored by GRLoader.
  The following attribute descriptions for serial number are equivalent:

  ```
  <serial_number></serial_number>

  <serial_number/>

  <serial_number update_if_null="">
  ```

  If you want to remove the serial number from a CI that has one, the previous XML does *not* work, because GRLoader ignores blank or missing values. Instead, code xml for the serial number as follows:

  ```
  <serial_number update_if_null="true"></serial_number>
  ```

  This syntax always updates the attribute, even if the value is blank or missing.

- **dateformat=[utc | localtime]**
  Sets the *dateformat* attribute for the date field to be either “utc” or “localtime”. Required when the format of the date is in UNIX Time Code (UTC) format. If dateformat is not set, the default is “localtime".

Date Formats

CMDB supports the following localtime date formats:

- yyyy.mm.dd
- yyyy.mm.dd hh:mm:ss

If the value does not match either of these formats, the parser tries to resolve the date as a UTC time. If the date format is not UTC, CMDB uses the system locale setting: for US English, the 12-hour format of “mm/dd/yyyy” or “mm/dd/yyyy hh:mm:ss *a*” where *a* specifies either AM or PM).

Contact and Other Lookup Fields

The Contact object combines first name, middle initial, and last name. The object has the following format:

```
<resource_contact>Lastname, Firstname MiddleInitial</resource_contact>
```

If you want to use a different field for a lookup field, you can supply a lookup attribute. For example, if you wanted to look up John Q. Doe by userid, use the following entry:

```
<resource_contact lookup="userid">doejo04</resource_contact>
```

Fields Validated Against Data in Existing Tables (SREL)

Common attributes accept only a specific set of values that must be defined in related tables in CMDB. These attributes can also have additional restrictions and exceptions that must be met for the assignment to occur. For example, a class attribute specified in XML must match one of the existing class names (CMDB default or user-defined). Otherwise, the CI is not created or updated. In addition, the value cannot be set to null, and the class must be Active for the assignment to occur.

The following fields validate data against data in existing tables:

- audit_userid
- bm_rep
- bm_status
- class
- company_bought_for_uuid
- contact_1
- contact_2

- contact_3
- delete_flag
- department
- expense_code
- family
- location
- manufacturer
- model
- operating_system
- org_bought_for_uuid
- priority
- repair_org
- resource_contact
- resource_owner_uuid
- service_org
- service_type
- status
- supplier
- vendor_repair
- vendor_restore

XML Input

When importing CI data, format the data in a supported format, such as XML or a spreadsheet (XLS or XLSX).

Consider the following XML format example:

XML Document	Notes
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?> <GRLoader>	These headers are required.

<ci>	Include zero or more <ci> nodes to define the CIs.
<name>value</name> <mac_address>value </mac_address> <dns_name>value </dns_name> <asset_num>value </asset_num> <serial_number>value </serial_number> <system_name>value </system_name>	These six characteristics uniquely identify a CI in a CI or Relations definition. At least one must be specified.
<class>value</class> <family>value</family> <manufacturer>value </manufacturer> <model>value</model>	These four values determine the class and family of a CI. You specify either (class) or (manufacturer/model).
<mem_capacity>value </mem_capacity> <number_net_card>value </number_net_card> <phys_mem>value </phys_mem_update> <proc_speed>value </proc_speed> <proc_type>value </proc_type> <server_type>value </server_type> </ci>	Family-specific values. Zero or more family-specific values can be provided when defining a CI.
<relation> <type>relation_type </type>	Include zero or more <relation> nodes to define relationships. Specify the relationship type.
<provider> <name>value</name> <mac_address>value </mac_address> <dns_name>value </dns_name> <asset_num>value </asset_num> <serial_number>value </serial_number> </provider>	Identify the provider CI with at least one attribute.
<dependent>	Identify the dependent CI with at least one attribute.

```
<name>value</name>
<mac_address>value<
/mac_address>
<dns_name>value<
/dns_name>
<asset_num>value<
/asset_num>
<serial_number>value<
/serial_number>
</dependent>
</relation>

</GRLoader>
```

Example: XML Input

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<GRLoader>
    <ci>
        <name>Host1</name>
        <class>Server</class>
    </ci>
    <ci>
        <name>Host2</name>
        <class>Server</class>
    </ci>
    <relation>
        <type>connects to</type>
        <provider>
            <name>host1</name>
        </provider>
        <dependent>
            <name>host2</name>
        </dependent>
    </relation>
</GRLoader>
```

MAC Address Normalization

Previous releases of GRLoader normalized the MAC address of CIs by removing the ":" and "-" delimiters from the MAC address. This normalization resulted in a MAC address of: aa:bb:cc:dd:ee storing as aabbccddee.

Consider the following MAC address behavior:

- The default is no MAC address normalization.
- CIs created with no normalization in CMDB reconcile with CIs that were created without normalization in CMDB r11.x.
- Invalid MAC addresses are treated as simple strings and are stored unmodified.

The following GRLoader parameters let you enable or disable MAC normalization:

- **-mn**
  Removes the ":" and "-" delimiters from MAC addresses (MAC normalization).

- **-nomn**
  Does not remove the ":" and "-" delimiters from MAC addresses.

  Important! Installing an earlier version if CMDB enables MAC address normalization automatically. You can override normalization by using the *-nomn* parameter

Because options are processed sequentially on the command line, the order of the options is important in the syntax.

How to Prepare for Loading JDBC Data

Contents

Complete the following steps when preparing to load data from a JDBC database table into CA SDM:

1. Identify the database, database type, userid, password and the JDBC drivers used to access the database.
2. Identify the table and columns that you want to load.
3. If necessary, map column names using the SQL *AS* keyword to CMDB attribute names.
4. If necessary, map data values using a translation file or a SQL join.
5. Identify portions of the table that you want GRLoader to ignore or skip.

Example JDBC Attribute Mapping

The following example shows how to use the SQL AS clause for JDBC attribute mapping:

```
GRLoader  - dbdriver sun.jdbc.odbc.JdbcOdbcDriver
-dburl "jdbc:odbc:Driver={Microsoft Access Driver (*.mdb, *.accdb)};DBQ=filename"
-dbuser administrator
-dbpswd adminpassword
-s http://hostname:8080
-n  - a -E
```

```
 - dbstmt "SELECT 'ci'    AS objecttype, resource_name AS name , ip_address AS
alarm_id     FROM   my_table"
```

Consider the following information about the previous example:

- The objecttype column is required when you import CIs without specifying a class column in the SELECT statement.
  Note: Use the SQL “AS” keyword when you use input from database tables to create views.

- You use the *ci* value in the obecttype column as a constant value that does not require a physical presence in the database.

Example Load Data from a Microsoft Access Database Using ODBC

CA SDM includes the generic JDBC-ODBC driver named sun.jdbc.odbc.JdbcOdbcDriver in the rt.jar file. If you want to use a database-specific driver, specify additional JDBC JAR files, as required by your database vendor. Use the -addjar facility to add any necessary JARs to the classpath dynamically. In this example, you load data from a Microsoft Access database.

Follow these steps:

1. Open GRLoader.

2. Execute the following command:

```
GRLoader
 - dbdriver sun.jdbc.odbc.JdbcOdbcDriver
-dburl "jdbc:odbc:Driver={Microsoft Access Driver (*.mdb, *.accdb)};
DBQ=filename"
-dbuser administrator
-dbpswd adminpassword
-s http://hostname:8080
-n  - a -E
-u userid -p password
-dbstmt "SELECT ciname AS name, ciclass AS class,
 FROM table1"
-e jdbc_err.xml
```

> **Important!** When you use values that contain spaces, enclose the values in double quotations, such as with dbdriver and dbstmt.

Example Load Data from a Microsoft Access Database Using ODBC and a Configuration File

In this example, you include the database connection information in a separate configuration file. Using this file reduces the command line length in GRLoader.

Note: You do not have to include quotes in the configuration file. Input statements on single lines and do not continue the input across multiple lines.

Follow these steps:

1. Create a file named table1.cfg and add the following code:

```
grloader.jdbc.driver=sun.jdbc.odbc.JdbcOdbcDriver
grloader.jdbc.url=jdbc:odbc:Driver={Microsoft Access Driver (*.mdb, *.accdb)};
DBQ=filename
grloader.jdbc.user=administrator
grloader.jdbc.password=adminpassword
```

   Note: In this example file, the grloader.jdbc.url appears on one line, as each option in the configuration file also appear.

2. Save the file.

3. Open GRLoader.

4. Execute the following command:

```
GRLoader
 - cfg table1.cfg
-s http://hostname:8080
-n  - a -E
-u userid -p password
-dbstmt "SELECT ciname AS name, ciclass AS class FROM table1"
```

Example Load Data from a SQL Server Database Table

In this example, you load data from a SQL Server database using drivers supplied by the database vendor.

Follow these steps:

1. Open GRLoader.

2. Execute the following command:

```
GRLoader
-dbdriver com.microsoft.sqlserver.jdbc.SQLServerDriver
-dburl jdbc:sqlserver://localhost:1433;databaseName=mdb;
-dbuser servicedesk -dbpswd password
-s http://hostname:8080  -a -n -E
-u userid -p password
-dbstmt "SELECT name, 'Server' AS class
         FROM ca_owned_resource"
-e jdbc_err.xml
```

Example Load Data from an Unsupported MySQL Database

In this example, you load data from an unsupported MySQL Server database to the TWA using drivers supplied by the database vendor. You specify the database user and password in the dburl option.

Follow these steps:

1. Open GRLoader.
2. Execute the following command:

```
GRLoader
-dbdriver com,mysql.jdbc.Driver
-dburl jdbc:mysql://hostname/test?user=abed&password=pwd
-s http://hostname:8080  -a -n -E
-lttwa
-u userid -p password
-dbstmt "SELECT name, class from mytable3"
-e jdbc_err.xml
```

Example Import Relationships from a Database Table

In this example, you load relationships from a database table. The provider and dependent attribute names are prefixed with *provider_* and *dependent_*, as in the TWA.

Follow these steps:

1. Open GRLoader.
2. Execute the following command:

```
GRLoader
-dbdriver com.microsoft.sqlserver.jdbc.SQLServerDriver
-dburl jdbc:sqlserver://localhost:1433;databaseName=mdb;
-dbuser servicedesk -dbpswd password
-s http://hostname:8080  -a -n -E
-u userid -p password
-dbstmt "SELECT provider_name, type, dependent_name,
 FROM mytable4"
```

Example Display the WHERE Clause in the SELECT Statement

In this example, you display the WHERE clause in the SELECT statement to filter input data by location.

Follow these steps:

1. Open GRLoader.
2. Execute the following command:

```
GRLoader
-dbdriver com.microsoft.sqlserver.jdbc.SQLServerDriver
-dburl jdbc:sqlserver://localhost:1433;databaseName=mdb;
-dbuser servicedesk -dbpswd password
-s http://hostname:8080  -a -n -E
-u userid -p password
-dbstmt "SELECT name, class,
 FROM mytable5 WHERE location='Brooklyn' "
```

Example Set Default Values for Attributes that Do Not Appear in the Input Table

In this example, you can specify any attribute with the -ad option. You can apply this example to spreadsheets and XML files.

Important! We recommend that you do not specify the tenant with the -ad option. Instead, GRLoader should inherit the tenant from the user ID that runs GRLoader. The Service Provider assigns each tenant a tenant-specific user ID, and then each tenant uses that user ID when creating objects that belong to that tenant.

Follow these steps:

1. Open GRLoader.
2. Execute the following command to set a default IP address:

   ```
   grloader  - i myspreadsheet.xlsx  - ad alarm_id="Unknown"
   ```

   Note: If a row in the spreadsheet contains a value for alarm_id, then GRLoader does not use the default value.
3. Use the -iia option to ignore an invalid attribute name to hide the warning message.
   For example, the spreadsheet contains both CIs and relationships, and the relationships would receive a warming message because alarm_id is not a valid relationship attribute.

How to Prepare for Loading CSV File Data

Contents

GRLoader can read CSV files to load CIs and relationships, similar to how it processes JDBC database tables and spreadsheets. GRLoader treats any rows that begin with # as comments.

Note: The first row in the CSV file must contain column headings so that GRLoader translates the CI and relationship attribute names correctly.

Complete the following steps when preparing to load data from a CSV file:

1. Identify the CSV file that you want to load.
2. If necessary, add a header row.
3. If necessary, map attribute names and data values using a translation (see page 4326) file.
4. Identify parts of the CSV file that GRLoader *must* ignore or skip. If necessary, write corresponding translation rules.

Example Load Data from a CSV File

In this example, you load data from a file named sample.csv and the example.rul translation file.

Follow these steps:

1. Open the CSV file that contains the following information:

```
"name","class","alarm_id","disk space","carrier","phys_mem"
"server 1","Server","1","5","","7"
"server2","Server","2","6","",""
"acd1","ACD","3","","Vendor1",""
"server3","Discovered Hardware","4","","","",""
```

2. Open the translation file that contains the following information:

```
<ruleset>
<rule><attribute>attributename</attribute>
      <from>disk space</from><to>hard_drive_capacity</to>
      <rulename>rule12</rulename></rule>
</ruleset>
```

3. Execute the following GRLoader command:

```
grloader  - u username -p password  - s  http://sdmhost:8080  - i example13.
csv  - tf example13.rul -lttwa.
```

GRLoader loads 4 CIs to the TWA.

How to Prepare for Loading Spreadsheet Data

This article contains the following topics:

- Example Load a CI with Multiple Embedded Relationships (see page 4333)
- Example Create a CI and a Relationship by Specifying the UUID (see page 4334)
- Example Load a Spreadsheet that Contains Change Specifications (see page 4334)

If the spreadsheet includes instructions, comments, and data that you do *not* want load into CA SDM, specify the exact area you want to import into GRLoader. To specify the area of the spreadsheet to use as input, use GRLoader to provide the spreadsheet file name, the spreadsheet sheet name, the first and last rows, and the first and last columns, as set by the - i (or -ssf), -sss, -ssfr, -sslr, -ssfc, and -sslc options.

Perform the following tasks before loading CI data from a spreadsheet with GRLoader.

1. Identify the general area of the spreadsheet to use as an input to GRLoader.
2. If necessary, map attribute names and data values using a translation file (see page 4326).
3. Identify parts of the spreadsheet that GRLoader *must* ignore or skip.

The input examples in the following sections use a fictitious spreadsheet named *grloader_spreadsheet_example.xls*. This spreadsheet contains nine subsheets, named Sheet1, Sheet2, Sheet3, and so on.

Spreadsheet Data Loading Support

GRLoader supports loading CI and CI relationship (see page 4332) data from spreadsheets (see page 4323) in Microsoft® Excel XLS and XLSX format, but it does *not* support XLSB files. By default, GRLoader attempts to process the first sheet of the spreadsheet file. In general, GRLoader attempts to match the column names in the spreadsheet to attribute names in the CI or relationship. GRLoader uses rules similar to when importing data from the TWA.

For example, a spreadsheet contains the following cells:

name	class	phys_mem
server1	Server	1gb
server2	Server	2gb

The following XML matches the spreadsheet cells exactly:

```
<GRLoader>
<ci><name>server1</server><class>Server</class>
    <phys_mem>1gb</phys_mem></ci>
<ci><name>server2</server><class>Server</class>
    <phys_mem>2gb</phys_mem></ci>
</GRLoader>
```

Note: Like when loading data to the TWA, if the GRLoader import results in an error, a file ending in **_err.XML* appears in the input file directory with information about the error. For example, if your spreadsheet file name is cidata.xlsx, the error file is named cidata_err.xml. As usual, logging information is also directed to the GRLoader.log file in the nxroot\log directory.

Spreadsheet Column Rules

A single spreadsheet can contain both CIs and relationships. When you load spreadsheet data, the presence of specific columns implies the target object type, as described by the following rules:

- If a column *class* is present with a nonblank value, the object type is assumed as *CI*.
- If any column prefixed with *provider_* is present with a nonblank value, the object type is assumed as *relation*.
- If data exists in both the *class* and *provider_* columns in the spreadsheet, you can specify *objecttype*. Use *ci* or *relation* as the value of the objecttype.
- A default class specified on the command line with *-ad class=class name*.
- A default provider attribute is specified on the command line with *-ad provider_xxxx*=nonblank.

By applying these rules, you cannot determine if the following example input data represents a CI or a relationship, which can represent an update to a CI:

name	hard_drive_capacity
Server1	10 GB

If you did not specify class, set the *objecttype* on the command line, or set it explicitly in the spreadsheet table as shown in the following example:

objecttype	name	hard_drive_capacity
ci	Server1	10 GB

The objecttype attribute takes precedence over the existence of class or provider_ attribute names when GRLoader determines if the row represents a CI or a relationship.

When you load relationship data from spreadsheets or databases, prefix the CI-identifying attribute with either *provider_* or *dependent_*, to match how they were specified in the TWA. For example, specify the name of a relationship provider by naming a column as *provider_name* in the database table.

Spreadsheet Rows with Embedded Relationships

For convenience of entering data, a single row in a spreadsheet can contain embedded relationships. A row with an embedded relationship contains both a CI and its associated relationships. The following example shows a CI with an embedded relationship.

objecttype	name	hard_drive_capacity	is used by
ci	Server1	10 GB	Server2; Server3

How GRLoader Converts Spreadsheet Data Types

When you use spreadsheets to load data, GRLoader performs data type conversions automatically:

1. Converts *DATES* to standard CA SDM dates in the *yyyy.mm.dd hh:mm:ss* format.
   Note: Excel stores these dates as milliseconds past the epoch.

2. Converts *NUMERIC* values to strings.
3. Converts *BOOLEAN* values to 0 or 1.
4. *STRINGS* are not altered.
5. GRLoader ignores *BLANK* values.
6. Evaluates *FORMULAS* first and then applies the previously specified rules to the cell.

Translation Rule Spreadsheet Attribute Mapping

Column names typically define the same CI or CI relationship attribute names. If the names differ, use a translation file to convert a column heading to an attribute name.

Important! The first row of the selected input area is significant because it contains column headings.

You map attribute names by including a rule which specifies a rule for the new keyword attribute name named *attributename*. GRLoader processes rules for *attributename* before applying value maps. A rule which specifies *<attribute>attributename</attribute>* is an attribute map, not a value map, so it changes the attribute name of an attribute, not the value of the attribute data.

For example, CA SDM requires that you load the IP address of a CI into a field named *alarm_id*. If the spreadsheet column name is *ip address*, use a translation rule to map *ip address* to *alarm_id* by using the following translation rule:

```
<rule>
   <attribute>attributename</attribute>
   <from>ip address</from>
   <to>alarm_id</to>
</rule>
```

Mapping an attribute name to “” (blank) is equivalent to ignoring that attribute. In the following example, GRLoader ignores all *owner* data:

```
<rule>
   <attribute>attributename</attribute>
   <from>owner</from>
   <to></to>
</rule>
```

Setting Default Attribute Values

In a typical business environment, you use an existing spreadsheet as an input to GRLoader. We recommend that you do not change the content in the spreadsheet. If that spreadsheet is incomplete and does *not* contain information necessary to import the data, you *must* specify the - ad (attribute default) option on the command line, as shown in the following example:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i myspreadsheet.
xlsx  - ad tenant=tenanta -ad mdr_class=spreadsheet -ad mdr_name=mdr1 -n
```

You can specify any attribute with the - *ad* option. For example, set a default IP address with the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i myspreadsheet.
xlsx  - ad alarm_id="Unknown" -n
```

If a row in the spreadsheet contains a value for alarm_id, then the default value is not used.

You can also specify attribute defaults for relationships. If myspreadsheet.xlsx contains both CIs and relationships, the relationships receive a warning message because alarm_id is not a valid relationship attribute. In this case, use the *-iia* parameter in GRLoader to ignore the invalid attribute name because this option suppresses the warning message.

Spreadsheet Considerations

The spreadsheet input area contains two areas, column headings and data. The GRLoader options bind the square input area for the start row, end row, start column, and end column. If you do not supply these options, then the bounds define the natural limits of the spreadsheet.

If you want to import CI data and CI relationships from spreadsheets (see page 4323), consider the following information:

- GRLoader considers the first populated row in the input area as column headings, and *must* contain CI attribute names or relationship attribute names, as XML attribute names appear for XML-based input.
- GRLoader does *not* process comments from Excel spreadsheets.
  Note: A red triangle in the upper right corner of the cell indicates a comment in Excel.
- GRLoader ignores the entire column when the heading row value is prefixed with the comment character (#).
- If a heading line consists entirely of comment, GRLoader considers it as a blank line and skips it.
- GRLoader can view hidden rows and columns in spreadsheets.
- GRLoader ignores embedded objects within spreadsheets.
- GRLoader identifies embedded relationships by an attribute name when it is an actual relationship type.
- GRLoader supports embedded relationships (see page 4332) with the following limitations:
  - The CI identified by name, serial number, mac address, and so on, represents the provider CI.
  - In the relationship column, specify the CI as the dependent, when you use a provider /dependent relationship type.
  - Using a dependent/provider relationship type reverses the roles of the two CIs.

- Multiple embedded relationships can occur in a single relationship cell. You separate each partner name from other partners by the *grloader.spreadsheet.embeddedseparator* character specified in the config file.

- If you *must* specify more than one identifying attributes for a dependent or provider in a relationship, then you *must* fall back to the fully qualified style of creating relationships. In this case, you specify provider_name, provider_mac_address, type, dependent_name, dependent_mac_address, and so on. If you want to specify more than one identifying attribute, you cannot use embedded relationships.

- GRLoader can evaluate most functions in a spreadsheet, but not all functions. The following functions are known to be incompatible with GRLoader:

  - edate()

  - text()

Important! Any cell that directly or indirectly references an incompatible function generates an error message and GRLoader ignores the cell.

Error Handling

When loading data into integer fields (such as hardware_server.purchase_amount) previous versions of GRLoader would attempt to load the data resulting in partial and incorrect data. The current GRLoader generates a warning message indicating the data is invalid. The only valid characters in an integer field are [0-9].

Because using the - *ad* option often results in an attribute warning message when both CI and relationships are imported in the same run, referring to an invalid attribute in a CI or Relationship definition results in a warning instead of an error. The Ignore Invalid Attribute - *iia* option can be used to suppress these warnings.

Example Load CI Data from a Simple Spreadsheet

Use GRLoader to load a simple spreadsheet with CI data. The column headings match CI attribute names in the following example in *Sheet1* of *grloader_sample_spreadsheet.xls*:

name	class
server1	Server
server2	Server
acd1	ACD

To load the data with GRLoader, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -i
grloader_sample_spreadsheet. -n
```

GRLoader loads three CIs with no errors.

Example Load CI Data from the Extension Table

Use GRLoader to load a spreadsheet with CI data, including data from the extension table. The column headings match CI attribute names in the following example in *Sheet2* of *grloader_sample_spreadsheet*.xls:

name	class	alarm_id	hard_drive_capacity	carrier	phys_mem
server1	Server	1	5		7
server2	Server	2	6		
acd1	ACD	3		carrier1	
server3	Discovered Hardware	4			

To load the data with GRLoader, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -i
grloader_sample_spreadsheet.xls -sss Sheet2 -n
```

GRLoader loads four CIs with no errors, including family-specific attributes.

If the data is offset from the A1 cell in *Sheet3* in the spreadsheet, and the data has blank rows and columns, load the data by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -i
grloader_sample_spreadsheet.xls -sss Sheet3 -n
```

GRLoader ignores blank rows, columns, and cells, and loads four CIs with no errors.

If the data in *Sheet4* contains missing (or blank) column headings, such as E5, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -i
grloader_sample_spreadsheet.xls -sss Sheet4 -n
```

GRLoader ignores the empty Column E (E5) and loads four CIs with no errors.

If the data in *Sheet5* contains four rows that you want to ignore, and the CI data begins on the C5, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -i
grloader_sample_spreadsheet.xls -sss Sheet5 -ssfr 5 -n
```

GRLoader ignores the first four rows and loads four CIs with no errors.

Example Load a Spreadsheet with Column Names that Contain Invalid CI Attribute Names

Use GRLoader and translation file to load a spreadsheet with column names that contain invalid CI attribute names. The name column begins on row C5. The column headings match CI attribute names in the following example in *Sheet7* of *grloader_sample_spreadsheet.xls*:

name	class		hard_drive_capacity	carrier	phys_mem
server1	Server	ignore	ok		ok
server2	Server	ignore	ok		ok
acd1	ACD	ignore		ok	ok
server3	Discovered Hardware	ignore			ok

Before you run GRLoader, create a translation file named *Sheet7.rul* that contains the following XML:

```
<ruleset>
<rule>
   <attribute>attributename</attribute>
   <from>ip address</from>
   <to>alarm_id</to>
</rule>
</ruleset>
```

After you create this XML file, load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls  - sss Sheet7  - ssfr 5  - tf Sheet7.rul -n
```

GRLoader ignores the first four rows and column E because E5 is empty, and loads four CIs with no errors.

Load a Spreadsheet that Does Not Contain mdr_name or tenant

Use GRLoader to load a spreadsheet that does not contain mdr_name or tenant. You can set attributes from the command line. The name column begins on C5. The column headings match CI attribute names in the following example in *Sheet8* of *grloader_sample_spreadsheet.xls*:

name	class	tenant	federated_asset_id
server1	Server		f1
server2	Server		f2
acd1	ACD	tenantb	f3
server3	Discovered Hardware	tenantb	f4

To load the data with GRLoader, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls  - sss Sheet8  - ssfr 5  - ad tenant=tenanta  - ad
mdr_name=ACMserver1  - ad mdr_class=ACM12 -n
```

GRLoader assigns server1 and server2 to tenanta, assigns all CIs with the mdr_name as ACMserver1, assigns all CIs with the mdr_class as ACM12, and loads the four CIs with no errors.

Example Load a Spreadsheet that Rejects Bad Data

Use GRLoader to load a spreadsheet that rejects bad data by using a translation rule. In the following example, the name column begins on row C5 in *Sheet9* of *grloader_sample_spreadsheet.xls*:

name	class	skip	ip address
server1	Server		
server2	Server	yes	
server3	ACD	1	
server4	ACD		bad
server5	ACD		bad
server6	ACD		

Before you run GRLoader, create a translation file named *Sheet9.rul* that contains the following XML:

```
<ruleset>
<rule><attribute>skip</attribute><from>1</from>
      <reject>yes</reject><rulename>rule1</rulename></rule>
<rule><attribute>skip</attribute><from>yes</from>
      <reject>yes</reject><rulename>rule2</rulename></rule>
<rule><attribute>alarm_id</attribute><from>bad</from>
      <reject>yes</reject><rulename>rule3</rulename></rule>
<rule><attribute>attributename</attribute>
      <from>ip address</from><to>alarm_id</to>
      <rulename>rule4</rulename></rule>
</ruleset>
```

After you create this XML file, load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls  - sss Sheet9  - ssfr 6  - tf Sheet9.rul -n
```

Based on the translation rule, GRLoader completes the following actions:

1. GRLoader loads two CIs: server1 and server6.
2. GRLoader rejects server2 because the skip column is set to yes (rulename rule2).
3. GRLoader rejects server3 because the skip column is set to 1 (rulename rule1).
4. GRLoader rejects server4 and server5 because of bad IP addresses for these CIs (rulename rule3).

Note: The attribute name translation (rule4) occurs before value translation, so the value translation rules *must* specify the translated attribute name. Even though the spreadsheet contained a column heading of *ip address*, the rule to reject the *bad* ip addresses (rule 3) *must* specify alarm_id.

Example Load a Spreadsheet Using Embedded Relationships

Use GRLoader to load a spreadsheet that contains CIs and relationships using embedded relationships. If you want to specify more than one identifying attribute, you cannot use embedded relationships.

In the following example, the name column begins on row A1 in *Sheet10* of *grloader_sample_spreadsheet.xls*:

name	class	connects to	hosts
accounting	Service		
server1	Server		accounting
server2	AIX	server1	accounting
server3	UNIX		GIS

Load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls -sss Sheet10 -aer yes -n
```

GRLoader creates the following CIs:

- accounting
- server1
- server2
- server3

GRLoader creates the following relationships:

- server1 hosts accounting
- server2 connects to server1
- server2 hosts accounting
- server3 hosts GIS

Loading Relationship Data from Spreadsheets

When you load relationship data from spreadsheets, specify the attributes for the provider and dependent CIs in the same way as they were in the TWA. As a result, you prefix the CI-identifying attribute with either *provider_* or *dependent_*.

For example, to specify the name of a relationship provider, specify *provider_name* in the spreadsheet column heading.

Example Load CI Relationships

Use GRLoader to load a spreadsheet that contains CI relationships. In the following example, the dependent_name column begins on row A5 in *Sheet6* of *grloader_sample_spreadsheet.xls*:

dependent_name	type	provider_name
service1	uses	server2
service1	uses	server3

To load the spreadsheet with CI relationships, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls  - sss Sheet6  - ssfr 5 -n
```

After you execute the command, GRLoader ignores the first four rows and loads two relationships with no errors.

Example Load a CI with Multiple Embedded Relationships

Use GRLoader to load a spreadsheet that contains CIs and relationships using embedded relationships. If you want to specify more than one identifying attribute, you cannot use embedded relationships.

In the following example, the name column begins on row A1 in *Sheet11* of *grloader_sample_spreadsheet.xls*:

name	class	manages	is managed by
chief	manager		
agent99	agent		
agent86	agent		
chief	manager	agent86;agent99	CEO

Load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls -sss Sheet11 -aer yes -n
```

GRLoader creates the following CIs and relationships:

- The first three rows create three CIs.
- Row 4, processed after rows 1-3, creates the following CI relationships:
  - chief *manages* agent86
  - chief *manages* agent99
  - chief *is managed by* CEO

- As with XML input, the direction of the relationship is significant. In the *manages* column labeled, GRLoader creates two relationships, because chief is the *provider* for both dependents, agent86 and agent99.

- Because the *is managed by* attribute is a dependent/provider relationship type, the provider and dependents are switched in the *is managed by* column, because chief is a dependent and CEO is the provider.

Example Create a CI and a Relationship by Specifying the UUID

Use GRLoader to load a spreadsheet that contains CIs and relationships by specifying the UUID.

In the following example, the *# transaction* column begins on row A1 in *Sheet12* of *grloader_sample_spreadsheet.xls*:

# transaction	objecttype	name	class	provider_id	type	dependent_name
1	ci	server1	Server			
2	relation			12345678901234567890123456789012	uses	server2

Load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls -sss Sheet12 -n
```

GRLoader creates the following CIs and relationships:

- The transaction creates the server1 CI.

- The transaction creates a relationship between server1 and server2.

Example Load a Spreadsheet that Contains Change Specifications

Use GRLoader to load a Change Order with multiple change specifications.

In the following example, the *# transaction* column begins on row A1 in *Sheet13* of *grloader_sample_spreadsheet.xls*:

objecttype	chg	ci	attribute_name	attribute_value_planned
change specification	12345	server1	ip address	1.2.3.4
change specification	12345	server2	ip address	1.2.3.5
change specification	12345	server3	ip address	1.2.3.6
change specification	12345	server4	ip address	1.2.3.7

Load the data with GRLoader by executing the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080  - i
grloader_sample_spreadsheet.xls  - sss Sheet13
```

GRLoader creates four CIs and inserts the CIs into Change Order 12345.

Data Translation

This article contains the following topics:

Data values provided by an MDR may not meet the requirements of CMDB because of the following reasons:

- The country or language for an MDR can differ from the country or language selected for CMDB server installation. For example: A CA Cohesion MDR that uses American English transfers data to a CMDB in France. When CA Cohesion creates server CIs, it specifies the CI family as "Server". However, in France the CI family must be specified as "Serveur". An inbound "Server" value must be translated to the required "Serveur" value whenever the American-based MDR communicates with the French CMDB installation.

- Data inconsistencies can occur in lookup (SREL) fields. For example: An MDR contains CIs with a manufacturer of "Dell Inc", "Dell Corporation", or simply "Dell". If the CMDB manufacturer table requires "Dell Inc", other values are rejected with warning messages. The invalid inbound "Dell Corporation" and "Dell" values must be translated to the standard "Dell Inc" value for the manufacturer attribute.

- Data inconsistencies in non-SREL fields. For example, some MDRs report data in units, while others report data in bytes or gigabytes. You can standardize the format of the data stored in the CMDB.

To satisfy these requirements, GRLoader can translate any incoming value to another value, by using an XML-based lookup file when GRLoader is run.

Important: The pre-edit translation and validation step occurs when CI and relationship XML is read, before normal GRLoader processing occurs (for example, update_if_null, lookup, dateformat) and before data is transmitted to the CMDB server.

Because each MDR can have specific translation requirements, the data translation file is specified for each GRLoader invocation. For standardization purposes, we recommend that this file is located on a common file system and shared among the CMDB data providers.

Create Translation Rules

To use the GRLoader data translation and validation feature, create a set of rules to specify the data to be translated. Rules are required for each attribute and value being translated. Data translation rules are applied to the GRLoader input XML using the - tf *filename* parameter. The rules in *filename* are applied to all input submitted to GRLoader using the -i parameter. You can also use translation rules when importing CI data from spreadsheets.

Note: For information about creating translation rules for importing spreadsheet data, see this (see page 4323)topic.

To create translation rules, use a text editor to create and save rules in the GRLoader input XML like the following:

1. <ruleset>
2. <rule>
3. <attribute>class</attribute>
4. <from>Server</from>
5. <to>Serveur</to>
6. </rule>
7. <rule>
8. <attribute>manufacturer</attribute>
9. <from>Dell Corporation</from>
10. <to>Dell Inc</to>
11. </rule>
12. <rule>
13. <attribute>manufacturer</attribute>
14. <from>Dell</from>
15. <to>Dell Inc</to>

16. </rule>
17. </ruleset>

The translation rules are created.

Notes:

Lines 2-6 specify that whenever GRLoader encounters a line specifying <class>Server</class>: replace Server with Serveur (French) before sending the data to CMDB.

Lines 7-11 specify that a manufacturer of Dell Corporation should be replaced by Dell Inc. A single set of XML rules can be used to redefine several different attributes.

Lines 12-16 translate any input specifying Dell to the standard Dell Inc. The single set of XML contains multiple rules. When taken together, the rules specify multiple from/to values.

Data Transformation Example

This example shows a sample subset of the required rules for sharing data between MDRs using different languages. The GRLoader input XML example translates three classes from English to their French equivalents.

1. <?XML version="1.0" encoding="UTF-8"?>
2. <ruleset>
3. <rule>
4. <attribute>class</attribute>
5. <from>Server</from>
6. <to>Serveur</to>
7. </rule>
8. <rule>
9. <attribute>class</attribute>
10. <from>Printer</from>
11. <to>Imprimante</to>
12. </rule>
13. <rule>
14. <attribute>class</attribute>
15. <from>Contract</from>
16. <to>Contrat</to>

17. </rule>
18. </ruleset>

Data Validation

Often the values that are accepted into an attribute must be validated against a list of acceptable values before the CI is stored. The relationship between an attribute and its set of acceptable values (stored in a separate table) is named a *single relationship* (SREL).

When you want to validate data even when an SREL is not created for it, data translation rules can enforce standardization of data values.

Example: Convert Units of Data Storage

In the following GRLoader input XML, the MDR provides data in gigabytes (GB), but we want to store the total number of bytes in the CMDB.

1. <ruleset>
2. <rule>
3. <attribute>phys_mem</attribute>
4. <from>1 GB</from>
5. <to>1,073,741,824</to>
6. </rule>
7. <rule>
8. <attribute>phys_mem</attribute>
9. <from>2 GB</from>
10. <to>2,147,483,648</to>
11. </rule>
12. ...
13. </ruleset>

Unmatched or Non-Standard Input Values

When validating data, you can reject unacceptable values and replace them with new values. When input data does not match a rule, it proceeds unchanged to the next GRLoader phase.

Example: Validate Primary Colors

In the following example, if the GRLoader input specifies <color>hot pink</color>, the color data is unaffected by any translation.

```
1. <ruleset>
2. <rule>
3. <attribute>color</attribute>
4. <from>red</from>
5. <to>red</to>
6. </rule>
7. <rule>
8. <attribute>color</attribute>
9. <from>blue</from>
10. <to>blue</to>
11. </rule>
12. <rule>
13. <attribute>color</attribute>
14. <from>yellow</from>
15. <to>yellow</to>
16. </rule>
17. </ruleset>
```

In the previous example, the "from" and "to" values are the same. The following example shows a shortened form of the rule definition that does not include the "to" value:

```
1. <ruleset>
2. <rule>
3. <attribute>color</attribute>
4. <from>red</from>
5. </rule>
6. <rule>
```

7. <attribute>color</attribute>
8. <from>blue</from>
9. </rule>
10. <rule>
11. <attribute>color</attribute>
12. <from>yellow</from>
13. </rule>
14. </ruleset>

Using the shortened form of the rule definition, line 16 is more apparent. Line 16 specifies that if there is no matching "from" value for an attribute, that whatever value is specified, it is replaced by the "to" value.

1. <ruleset>
2. <rule>
3. <attribute>color</attribute>
4. <from>red</from>
5. </rule>
6. <rule>
7. <attribute>color</attribute>
8. <from>blue</from>
9. </rule>
10. <rule>
11. <attribute>color</attribute>
12. <from>yellow</from>
13. </rule>
14. <rule>
15. <attribute>color</attribute>
16. <to>unknown color</to>
17. <unmatched>yes</unmatched>

18. </rule>
19. </ruleset>

The GRLoader input includes a rule that matches "hot pink" (the "unmatched" rule on line 16). If color specifies an attribute other than red, blue or yellow (as indicated on lines 4, 8 and 12 respectively), that color is changed to the "to" value. For example, <color>hot pink</color> is recoded to <color>unknown color</color>.

If only lines 14-18 appear in the rule set (that is, no matches are possible), all colors in the GRLoader input XML file are set to "unknown color". This technique forces all values of a specific attribute to a single value.

Important!: The editing process cannot create new XML when none exists. If the input XML does not include information about <widgets>, all rules about <widgets> are ignored.

Example: Change All Unmatched "owner" Attributes to "Pete"

The following GRLoader input XML sets the value Pete for unmatched owners.

1. <ruleset>
2. <rule>
3. <attribute>owner</attribute>
4. <unmatched>yes</unmatched>
5. <to>Pete</to>
6. </rule>
7. </ruleset>

Consider how the following GRLoader input XML uses the previous ruleset:

1. <GRLoader>
2. <ci>
3. <name>server1</name>
4. <owner>John</owner>
5. </ci>
6. </GRLoader>

If the attribute "owner" has a rule, the rule attempts to match the value "John". Because no rule for the value "John" exists, GRLoader looks for an unmatched rule for the attribute "owner". If one exists, the translated input results in the following:

1. <GRLoader>
2. <ci>
3. <name>server1</name>
4. <owner>Pete</owner>
5. </ci>
6. </GRLoader>

Now consider the following GRLoader input XML file:

1. <GRLoader>
2. <ci>
3. <name>server2</name>
4. </ci>
5. </GRLoader>

The ruleset results in the following:

1. <GRLoader>
2. <ci>
3. <name>server2</name>
4. </ci>
5. </GRLoader>

The CI "server2" does not set the owner to Pete because no owner tag exists in the original XML.

Specify an Empty String

When an empty string must be specified as either the "from" value or the "to" value, always include the <from> or <to> value in the rule set.

Important!: Specifying <to></to> or not specifying <to> in the XML have very different XML meanings!

1. <ruleset>
2. <rule>
3. <attribute>size</attribute>
4. <from>XXL</from>
5. </rule>
6. <rule>
7. <attribute>manufacturer</attribute>
8. <from>General Motors</from>
9. <to></to>
10. </rule>
11. </ruleset>

Lines 2-5 specify that a size of XXL is possible. Because <to> is not specified, no recoding is performed on a size=XXL. This kind of rule is only useful when an unmatched rule appears later in the rule set for the same attribute.

Lines 6-10 examine all input data for a manufacturer="General Motors". Whenever this rule is found, because "<to></to>" is specified in the rule on line 9, the value of "General Motors" is replaced by "".

If you want to blank out the manufacturer, specify the update_if_null="YES" keyword in the GRLoader input XML.

Note: For more information about the use of the "update_if_null" option to blank out values in the database, see this (see page 4306) topic.

Alternative Comparison Methods

The default method uses "equals" for comparison. That is, when the <from> value is compared with the value in the GRLoader input, the two are considered to match when they are equal. The <comparetype> tag specifies alternative forms of comparison.

The comparetype tag accepts one of the following values:

- startswith
- endswith
- contains

- equals
- equalsignorecase

Example: Standardize a Company Name

In the following example, all manufacturer names beginning with "Dell" (such as "Dell Corp", "Dell Inc", "Dell Corporation") are reset to "Dell".

1. <ruleset>
2. <rule>
3. <attribute>manufacturer</attribute>
4. <from>Dell Corp</from>
5. <to>Dell</to>
6. </rule>
7. <rule>
8. <attribute>manufacturer</attribute>
9. <from>Dell Inc</from>
10. <to>Dell</to>
11. </rule>
12. <rule>
13. <attribute>manufacturer</attribute>
14. <from>Dell Corporation</from>
15. <to>Dell</to>
16. </rule>
17. </ruleset>

Alternatively, the following rule produces the same result:

1. <ruleset>
2. <rule>
3. <attribute>manufacturer</attribute>
4. <from>Dell</from>

5. <comparetype>startswith</comparetype>
6. <to>Dell</to>
7. </rule>
8. </ruleset>

Input Rejection

To reject input from an MDR before loading data into the CMDB, use the <reject> tag.

Example: Rejecting Input Data

The<reject tag> can be used with the <comparetype> tag, as shown in following example.

1. <ruleset>
2. <rule>
3. <attribute>name</attribute>
4. <from>test</from>
5. <comparetype>startswith</comparetype>
6. <reject>yes</reject>
7. </rule>
8. </ruleset>

When a reject rule is matched, the corresponding CI or relationship is rejected and the CMDB is not updated or created for that entire object. The transaction is skipped, and the XML is written to the _err file with an error message indicating that it was rejected.

Rule Syntax

The following table describes the XML tags that are used in a data translation rule set.

Tag	Description
<?XML version="1.0" encoding="codepage"?>	Enables different code pages for GRLoader.
<ruleset>	Begins a rule set. A ruleset can contain many rules.
<rule>	Begins a rule
<attribute>*attr_name*< /attribute>	Specifies an attribute that the rest of the rule applies to. *attribute* mus t be a valid CMDB attribute name.
<from>*value*</from>	Specifies a value to be changed. The <from> tag is modified by the <comparetype> tag.
<to>*value*</to>	Specifies the replacement value

<comparetype>*value*</comparetype>	(Optional) Specifies one of the following values: equals startswith endswith contains equalsignorecase If not specified, "equals" is the default.
<reject>yes</reject>	Specifies that GRLoader reject the CI or relationship. Yes can be specified as "yes" or one (1). No can be specified as "no" or zero (0). If not specified in a rule, the default is "no" (reject).
<rulename>*rule_name*</rulename>	(Optional) *name* assigned to identify this rule. This name appears in debugging messages.
</rule>	Ends a rule
</ruleset>	Ends a rule set

Running GRLoader with Translation Enabled

To run GRLoader using translation/transformation, run GRLoader with the **- tf** *filename* option. *filename* specifies the file which that contains the translation rule set.

Note: Alternatively, you can specify grloader.translationfile=*filename* in the configuration file.

Logging

Input modifications are logged in the stdlog.n and the GRLoader log messages, which reflect the data values after translation rules have run.

You can run GRLoader with the - T option set to five (5) or greater to display additional debugging information.

Localized CMDB Considerations

When implementing a localized CMDB, you can translate the class and family names from one language to another. Translation rules are provided in the $nxroot/java/lib/GRLoader directory. These rules are named xlate_*xx*_to_*yy*.RUL. *xx* and *yy* represent the language codes (en, fr, es, dm, and so on).

You can expand these rules to accommodate any additional SREL fields.

The XML Header

Following XML coding standards, if the XML content in the rule set contains non-UTF-8 characters, you may require a line at the beginning of the XML translation file that is similar to the following:

<?XML version="1.0" encoding="*codepage*"?>

codepage defines the code page.

Note: For more information about GRLoader XML, see the CMDB Technical Reference (see page 4168) .

Test the Rules

Before running the XML input file through GRLoader, test the rules and view the translation results.

To test the translation rules, run GRLoader without the " - a" or " - n" options.

Running without inserts and updates effectively writes the translated and validated XML to the _err. XML file, where the results of the rule translation can be reviewed.

Run GRLoader from a Remote MDR

You can use GRLoader to copy data from a remote MDR to the CMDB in either of two ways:

- Copy the XML data from the remote system that runs the MDR to the system running CMDB, and then execute GRLoader on the CMDB system.
- Execute GRLoader on the remote MDR system itself.

To prepare to execute GRLoader from a remote system that does not have CMDB installed

1. Verify that the Java Runtime Environment (JRE) version 6.0 or higher is installed and available.
2. Copy the contents of the %NX_ROOT%\java\lib directory from the CMDB system to a directory on the remote system where you want to run it. This remote directory is called % ROOT%.
3. Create a file called NX.ENV in the %ROOT% directory:
   @NX_LOG=path_which_will_contain log files
4. Create directory %ROOT%\site\cfg
5. Create directory %ROOT%\log

To run GRLoader from the remote system, execute the following command:

```
java -Xmx512M -cp %ROOT% -jar %ROOT%/GRLoader.jar -N %ROOT% -u [userid]  - s [server]
-i [other GRLoader options]
```

where %ROOT% is the fully qualified path containing the files that were copied in Step 2.

GRLoader and Multi-Tenancy

Multi-tenancy allows multiple independent tenants to share hardware and application support resources in a single implementation of CMDB. You can use the tenant attribute (<tenant>) in XML so that GRLoader assigns tenants for multi-tenancy use in CMDB. All changes that you make to the tenant attribute are reflected in the CMDB Versioning tab.

The tenant attribute is as follows:

- **<tenant>**
  Specifies the tenant assignment for the CI/Relationship. You can use PUBLIC to specify that the object is public. The Tenant may or may not be set in the object, depending on your default roles tenant access.

Consider the following tenant assignment behavior *before* you implement multi-tenancy using GRLoader:

- Tenants can only be assigned during the creation of a CI or relationship.
- All CIs that GRLoader loads are assigned either a default tenant or a specific one from the XML file.
- GRLoader XML lets you specify the <tenant> attribute or a default tenant for a CI or a relationship.
- If you do not specify <tenant> or a default tenant, the tenant is assumed to be blank and the tenant assignment is based on the logged on users default role. This default role assignment is used primarily for CA Cohesion and other MDRs that do not specify a tenant when creating CIs.
- GRLoader sets the tenant of a CI or relationship based on input from the following sources. When the default role lets you select the choice of tenant in the objects created, you can specifically set the tenant for an object. The multi-tenancy option must be set to setup or on to use <tenant>.
  - Including <tenant> in the xml.
  - Use of the - dt command line option when invoking GRLoader.
  - Use of the grloader.defaulttenant option in the configuration file.
  - The default tenant associated with the contact.

Example: Set the Tenant for an Object

Your default access allows you to create CIs for a specific tenant and for public use. You want to create several public CIs.

Run grloader with a default tenant of PUBLIC to indicate the tenant of the new objects specifically.

Bulk Loading Change Specifications with GRLoader

Contents

- Change Specification Example Spreadsheet (see page 4350)

After a user creates a Change Order, you can use GRLoader to bulk load change specifications, instead of using the web interface. Use the *object* node with the *objecttype* attribute.

You can use the following attributes with GRLoader:

- **objecttype**
  (Required) Identifies the Change Specification.
- **chg**
  (Required) Specifies the Change Order ticket number.
- **ci**
  Specifies the CI name.
- **attribute_name**
  (Required) Specifies the CI attribute that you want to change.
- **attribute_value_planned**
  Specifies the new value of the attribute_name you entered.
- **status**
  Specifies the initial verify status. By default, GRLoader uses the managed attribute initial verify status.
- **description**
  Specifies descriptive text of the change.

Note: Change specifications are not reconciled. If you run GRLoader multiple times with identical input, CACF creates duplicate change specifications. Use the web interface to edit and remove duplicates that CACF creates accidentally. Duplicates are independent of each other.

Change Specification Example XML

The following example XML adds change specifications for a Change Order numbered 24. The changeorder24.xml file specifies that alarm_id becomes server1, and location becomes 2.4.6.8.

```
<GRLoader>
     <object>
        <objecttype>ci_planned_change</objecttype>
        <description>created by grloader *now* </description>
        <attribute_name>alarm_id</attribute_name>
        <chg>24</chg>
        <ci>server1</ci>
        <attribute_value_planned>2.4.6.8</attribute_value_planned>
    </object>
    <object>
        <objecttype>ci_planned_change</objecttype>
     <description>created by grloader *now* </description>
        <attribute_name>location</attribute_name>
        <chg>24</chg>
        <ci>server1</ci>
```

```
        <attribute_value_planned>NY</attribute_value_planned>
    </object>
</GRLoader>
```

Execute the following command:

```
grloader -u ServiceDesk -p password -s http://hostname:8080 -i changeorder24.xml
```

Change Specification Example Spreadsheet

The following example spreadsheet adds Change Specification for a Change Order numbered 24, which assigns new IP addresses and locations to three CIs:

objecttype	chg	CI	attribute_name	attribute_value_planned	description
ci_planned_change	24	server 1	alarm_id	1.1.1.1	loaded by grloader at *now*
ci_planned_change	24	server 2	alarm_id	1.1.1.2	loaded by grloader at *now*
ci_planned_change	24	server 3	alarm_id	1.1.1.3	loaded by grloader at *now*
ci_planned_change	24	server 1	location	NY	loaded by grloader at *now*
ci_planned_change	24	server 2	location	NY	loaded by grloader at *now*
ci_planned_change	24	server 3	location	NY	loaded by grloader at *now*

The GRLoader Command

This article contains the following topics:

The General Resource Loader (GRLoader) imports CI information into CA SDM. GRLoader uses XML documents as input, which lets you import data that originates in different data sources. Run GRLoader from a command prompt or by using a .bat or .cmd file. The CA SDM installation adds the GRLoader to the path during installation, so it runs from any directory.

Results from an import show counts for all processed CIs and Relationships, including the amount of Read, Skipped, Inserts, Updates, Errors, and Warnings. GRLoader logs all processing details and errors in the *nx_root*/log/grloader.log file, where *nx_root* specifies the CA SDM installation directory.

Syntax

```
C:\WINDOWS>GRLoader -?
```

The GRLoader command uses the following parameters:

- **-u *userid***
  (Required) Specifies the user ID that runs the GRLoader process.

- **-p *password***
  (Required) Specifies the password for the user ID. If you run GRLoader without the -p parameter, the utility prompts the console for the password.

- **-s http[s]://*cmdb_servername*:*port***
  (Required) Specifies the server URL including the port number that runs the web services. For running GRLoader on the primary server or application server in a default installation, you can use the following command:

  ```
  -s http://localhost:8080
  ```

  

  Note: If you specify the optional -C parameter, GRLoader ignores the -s parameter.

- **-i *input_file***
  (Required) Specifies a full path name or a relative path name. If the filename contains a .xls or . xlsx suffix, GRLoader considers the file as a spreadsheet, otherwise it considers it as an XML file.

- **-n**
  (Optional) Allows new CI insertion into the CMDB. Without -n, CIs write to the XML error file (see the -e parameter). Relationships are only added if either -n or -a is specified. If neither is specified, no updates are performed. Updating CIs also require the -a parameter.

- **-a**
  (Optional) Allows updates to configuration items (by default, updates are not allowed if the CI exists in the CMDB). The -n flag also is required to add new CIs.

- **-D**
  (Optional) Specifies a name prefix for relations (defaults to "GRLoader"). Use the prefix for the sym field in new relationships. The sym file must be unique, so a datetime field and a number is appended to this prefix to make it unique.
  Default Prefix: GRLoader.

- **-e *XML_err_file***
  (Optional) Produces an XML error file when GRLoader detects errors or warnings. By default, the error file name uses the name of the input file, appended with _err.xml. For example, using the input file as abc.xml creates the error file as abc_err.xml. Use the -e parameter to override this default name.

- **-E**
  (Optional) Lets you overwrite the XML error file. By default, the error file is not overwritten.

- **-I**
  (Optional) Ignores case. When you use this parameter, GRLoader is not case-sensitive when comparing the input value of a lookup field with the actual value stored in the database. By default, lookups are case-sensitive.

- **-ua**
  Always updates the CMDB.

- **-lftwa [-chg *nnnn*]**
  (Optional) Loads TWA transactions into the CMDB. If used with -chg, the load selects only those transactions associated with change order *nnnn*.

  
  Note: The Change Order string is not validated when loaded into the CMDB.

- **-lftwai [-chg *nnnn*]**
  (Optional) Runs TWA transactions to update the CMDB. Transactions that run successfully are set to Inactive so that they do not appear in lists. If you use -chg, the load selects only those transactions associated with change order *nnnn*.

- **-lttwa**
  (Optional) Loads XML into the transaction work area (TWA) instead of directly into the CMDB. After data has been loaded into the TWA, it can be edited, changed and verified. After the data modification process completes, individual transactions can load into the CMDB (see - lftwa).

- **-lttwar**
  (Optional) Loads XML into the initial state in the transaction work area (TWA) instead of directly into the CMDB. Transaction data in the TWA can be edited, changed, and verified (see -simci and -simrel). After the data modification process completes, individual transactions can load into the CMDB (see - lftwai).

- **-nospinner (-spinner)**
  (Optional) Turns off the spinner that displays CI and relationship progress. Use -spinner to enable the progress display.

- **-P**
  (Optional) Specifies preload data to improve performance for large processing. For large input files, supplying the - P parameter preloads a few tables into memory so that they can be processed more quickly. For smaller inputs (< 50 entries), preload is not necessary.

- **-rs**
  (Optional) Replaces symbolic values that CA SDM includes in the XML input file. If you enable this parameter, corresponding values replace the following symbolic values:

  - *now* -- Replaced by a unique date/time string appended with a sequence number to help ensure uniqueness.
  - *userid* -- Indicates the userid specified in the -u parameter.
  - *inputfile* -- Indicates the filename specified in the -I parameter.

- *relationcount* -- Specifies the number of relationships processed so far in this GRLoader run.
- *lastciuuid* -- Specifies the UUID of the most recently processed CI.
- *cicount* -- Specifies the number of CIs processed so far in this GRLoader run.

Examples: Use the -rs Parameter

With -rs enabled, the following example creates 100 CIs named ci1, ci2, …, ci100

```
<GRLoader>
<ci><name>ci*cicount*</name><class>Server</class></ci>
[...repeated 100 times...]
</GRLoader>
```

With -rs enabled, the following example updates the CI description with information about the most recent update.

```
<GRLoader>
<ci>
<name>server1</name>
<description>updated by *userid* on *now* using input file *inputfile*</description>
</ci>
</GRLoader>
```

- **-simci**
  (Optional) Simulates CI operations to predetermine whether a set of transactions creates CIs, and therefore possible ambiguities for other CIs.
- **-simrel**
  (Optional) Simulates relationship operations to predetermine whether a relationship transaction creates a relationship or updates a relationship.
- **-T *trace_level***
  (Optional) Specifies the tracing level. Known tracing levels are 0 (off, the default), 1 (low), 5 (medium) and 10 (verbose). We recommend only using this setting when necessary because much output can result.
- **-tf *filename***
  (Optional) Runs GRLoader using translation rules. *filename* specifies the name of the file that contains the translation rule set.
- **-slump**
  (Optional) Specifies the slump.jar file. This parameter can provide better performance than web services. **Important:** -slump only can be used with the -s parameter to target the following server:
  - Conventional: Primary server
  - Advanced Availability: Application server.

Note: If another CA product is installed, for example, CA Coheshion ACM or CMDB service pack is installed, verify that the slump.jar file is identical to the one that is installed on the target CA SDM system.

- **-C**
  (Optional) Validates the XML input file without any additional processing. This argument only validates the XML tags, not field values.

- **-h (or -?)**
  (Optional) Displays online help.

- **-v**
  (Optional) Displays the GRLoader product version and build date.

- **-maxerror *number***
  (Optional) Specifies the maximum number of errors that can occur before remaining CIs or relationships are skipped.

- **-maxwarn *number***
  (Optional) Specifies the maximum number of warnings that can occur before remaining CIs or relationships are skipped.

- **-chg *nnnn***
  Used with - lftwa and -lftwar. Loads only those transactions associated with change order *nnnn*.

  Note: The Change Order string is not validated when loaded into the CMDB.

- **-cfg *myconfigfile*.cfg**
  (Optional) Specifies the name of the input configuration file.

- **-dt t*enant***
  (Optional) Specifies the tenant assignment for the CI/relationship. You must enable multi-tenancy to use this parameter. You can use PUBLIC to indicate that the object is public. If the tenant access of the user does not authorize creating public objects, the object is created using the default tenant.

- **-sc classname**

  Lists the attributes of CIs in the class you specify.

- **-scx classname**

  Lists the attributes of CIs in the class you specify in XML format. The XML is stored in a file named classname.xml. Any special characters are removed from the class name.

Example: Load CI and Relationship Data

The following example loads the CI and relationship data contained in the filehardware_servers.xml (in the current directory) into the CMDB that resides on the server located on the local computer on port 8080.

```
grloader -u CMDBAdmin -p password -s http://localhost:8080 -i hardware_servers.xml -n
```

JDBC Database Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input JDBC databases.

Note: If you use SQL Server or Oracle databases, CA SDM includes the required JAR files. If you use other database types, you must use the -addjar option to add support for those databases to GRLoader dynamically. Consult your database vendor documentation for the name and location of the necessary JAR files to use JDBC. You can also consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
grloader.jdbc.driver=*name*	-dbdriver *name*	Specifies the JDBC driver name. **Note:** This driver must be available on the classpath, similar to -addjar. Consult the database vendor for specific values.
grloader.jdbc.url=*URL*	-dburl *URL*	Specifies the JDBC database URL that describes the location of the database which contains the table you want to load.
grloader.jdbc.user=*name*	-dbuser *name*	Specifies the user ID for the JDBC database.
grloader.jdbc.password=*password*	-dbpswd *password*	Specifies the password for the user ID for the JDBC database.
grloader.jdbc.statement=*statement*	-dbstmt *statement*	Specifies the JDBC statement that describes the columns and selection criteria for the data you want to import. **Note:** The column names used in the query statement must match CMDB attribute names. If these names differ, use the SQL *AS* keyword to map database column names to CMDB attributes.

Spreadsheet Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input spreadsheets. You can also usethe {} symbols as delimiters surrounding the lookup field as well as using the keyword EMPTY.

- **boolean**
  Specifies a value from one the following pairs: 1/0, YES/NO, or TRUE/FALSE.

Note: If the input file name ends in .xls or .xlsx when you use the *grloader.inputfile=name* GRLoader option or the *-i* command line argument, GRLoader assumes that it is a spreadsheet.

GRLoader Option	Command Line Option	Description
grloader.spreadsheet.filename=*name*	-ssf	Specifies the Excel spreadsheet file name when it does not contain the .XLS or .XLSX file extension.
grloader.spreadsheet.sheetname=*name*	-sss	Specifies the sheet name. **Default:** The first sheet in the spreadsheet.
grloader.spreadsheet.firstrow=*n*	-ssfr	Set this value to skip over the first *n-1* rows in the spreadsheet.
grloader.spreadsheet.lastrow=*n*	-sslr	Ignores *rows> n (greater than)* in the spreadsheet.
grloader.spreadsheet.firstcol=*x*	-ssfc	Specifies to start processing on this column. You can express this column as a letter or number, depending on your spreadsheet options.
grloader.spreadsheet.lastcol=*x*	-sslc	Ignores *columns > x (greater than)* in the spreadsheet. You can express this column as a letter or number, depending on your spreadsheet options.
grloader.spreadsheet.embeddedseparator	-sses	Specifies a character to separate multiple values contained in a single cell. This option only applies to the relationship type column in a row with multiple embedded relationships. **Default:** semi-colon ":"
grloader.attributedefault.atrname=*value*	-ad attrname=*value*	Provides a default value if you did not specify one in the input source. **Note:** These values do not undergo attribute name or data value translation. **Note:** When you run GRLoader from a batch file, specify the *-ad attr=value* as *-ad attr{value}* to get past the Windows command parser which may remove the equal "=" symbols.
	-dt	Deprecated. Instead, use the -ad tenant=*name* option.
grloader.maxci=*n*	-maxci	Specifies the maximum number of CIs to import before skipping further CI imports.
grloader.maxrel=*n*	-maxrel	Specifies the maximum number of relationships to import before skipping further relationship imports.
N/A	-sc *classname*	Lists the attirbutes of CIs in the class you specify.

GRLoader Option	Command Line Option	Description
N/A	-scx *classname*	Lists the attributes of CIs in the class you specify in XML format.
grloader.workarea.changeorderrequired=*boolean*	-cor	If set to yes, TWA transactions that do not contain a non-blank change order number are ignored.
grloader.ignoreinvalidattributes=*boolean*	-iia	Specifies if you want to ignore invalid attributes. This command suppresses all warning messages about invalid attribute names.

CSV Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input CSV files.

Note: If required, consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
-i		GRLoader assumes that a file ending in .csv is a CSV file.
grloader.csv.filename=*name*	-csvf *name*	Specifies the filename when it does not end in .csv.
grloader.csv.separator=*x*	-csvsep *x*	Specifies when the CSV file uses other than comma delimiters. You can specify a single character, such as a Tab (\t) or a semicolon.
grloader.csv.escape=*x*	-csvesc *x*	Specifies when the CSV file uses an escape character (\).
grloader.csv.comment=*x*	-csvcom *x*	Specifies when the CSV file uses the comment character (#).
grloader.csv.quote=*x*	-csvquote *x*	Specifies when the CSV file uses the quote character (").

TWA Input Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input from the TWA.

GRLoader Option	Command Line Option	Description
grloader.workarea.changeorderrequired=yes/no	-cor	GRLoader ignores TWA transactions that do not contain a non-blank Change Order number.

GRLoader Option	Command Line Option	Description

General Options

The following table lists the options that you use in the configuration file and the corresponding command line options when you input from all inputs.

Note: If necessary, consult your database vendor or database administrator for specific values and credentials.

GRLoader Option	Command Line Option	Description
grloader.system.addjar=*xx;yy;zz*	-addjar *xx*	Adds JAR files to the GRLoader classpath. You can use this option with -jdbcdriver. **Note:** The grloader.system.addjar option can only appear once in the configuration file. You can add multiple jars through grloader.system.addjar by separating the filenames with a semi-colon. This option only specifies a single jar file, and you can specify it as many times as required.
grloader.attributedefault.attrname=*value*	-ad attrname=*value*	Provides a default value if you did not specify a value in the input source. **Note:** These values do not undergo attribute name or data value translation. When you run GRLoaderfrom from a batch file, specify -ad attr=value as *-ad attr{value}.* The Windows command parser can delete the equals symbol.
N/A	-ad tenant=*name*	Specifies the tenant name.
grloader.maxci=*n*	-maxci *n*	Specifies the maximum number of CIs to import before skipping further CI imports.
grloader.maxrel=*n*	-maxrel *n*	Specifies the maximum number of relationships to import before skipping further relationship imports.
N/A	-sc *xx*	Lists attributes of CIs in the class *xx*.
N/A	-scx *xx*	Lists attributes of CIs in class *xx* in XML format.
grloader.reader.allowembeddedrelationships=yes/no	-aer	Allows embedded relationships. **Default:** Yes For backward compatibility only
grloader.ignoreinvalidattributes=yes/no	-iia	Ignores invalid attributes by suppressing all warning messages about invalid attribute names.

GRLoader Option	Command Line Option	Description
grloader.updatealways=yes/no		

Example Display CI Class Attributes

When you create input for GRLoader, list the attributes associated with a specific class.

To list the attributes, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -sc [class name]
```

- **sc**
  Lists attributes of CIs in a class that you specify.

- **class name**
  Specifies any valid CA CMDB class name.

Example: List Attributes for Class Server

```
grloader  - u username  - p password  - s http://sdm-host:8080 -sc Server

10:33:01.997 CI and Relationship Loader for CA Service Desk Manager

List of attributes in class(Server) extension(har_serx)

ATTRIBUTE NAME                    DATA TYPE
acquire_date                      Date
active_date                       Date
alarm_id                          STRING(64)
ambiguity                         Integer
asset_count                       Integer
asset_num                         STRING(64)
audit_userid                      SREL(cnt.combo_name)
```

Example Display CI Class Attributes in XML Format

When you create input for GRLoader, list the attributes associated with a specific class in XML format. The command creates the file [class name].xml with the result.

To list the attributes in XML format, execute the following command:

```
grloader  - u username  - p password  - s http://sdm-host:8080 -scx [class name]
```

- **scx**
  Lists attributes of CIs in XML format in a class that you specify.

- **class name**
  Specifies any valid CA CMDB class name.

Example: List Attributes for Class Server

```
grloader  - u username  - p password  - s http://sdm-host:8080 -scx Server

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<GRLoader>
 <ci>
    <acquire_date></acquire_date>                       <!-- Date -->
    <active_date></active_date>                         <!-- Date -->
    <alarm_id></alarm_id>                               <!-- String(64) -->
    <ambiguity></ambiguity>                             <!-- Integer -->
    <asset_count></asset_count>                         <!-- Integer -->
    <asset_num></asset_num>                             <!-- String(64) -->
    <audit_userid lookup="combo_name"></audit_userid>   <!-- SREL cnt -->
```

Note: If the class name contains special characters, they are removed.

CI Reconciliation

CI Reconciliation Attributes

Reconciliation associates imported CI data with CIs in the CMDB.

Reconciliation uses the following CI identifying attributes:

- Name
- Serial Number
- Asset Number
- System Name
- DNS Name
- MAC Address

You must specify at least one of these values when you create or reference an existing CI.

The following table shows the results of the reconciliation process:

Name	Serial Number	Asset Number	System Name	DNS Name	MAC Address	Result
Unique	Null	Null	Null	Null	Null	CI Created
Null	Unique	Null	Null	Null	Null	CI Created
Null	Null	Unique	Null	Null	Null	CI Created

Name	Serial Number	Asset Number	System Name	DNS Name	MAC Address	Result
Null	Null	Null	Unique	Null	Null	CI Created
Null	Null	Null	Null	Unique	Null	CI Created
Null	Null	Null	Null	Null	Unique	CI Created
Duplicate	Duplicate	Duplicate	Unique	Duplicate	Duplicate	CI Created
Unique	Duplicate	Duplicate	Duplicate	Duplicate	Duplicate	Recognized as Duplicate CI
Null	Null	Null	Null	Unique	Unique	CI Created
Null	Null	Null	Null	Duplicate	Unique	Recognized as Duplicate CI
Null	Null	Null	Null	Unique	Duplicate	Recognized as Duplicate CI
Duplicate	Duplicate	Unique	Duplicate	Duplicate	Duplicate	CI Created
Duplicate	Unique	Duplicate	Duplicate	Duplicate	Duplicate	CI Created
Duplicate	Duplicate	Duplicate	Duplicate	Duplicate	Unique	Recognized as Duplicate CI
Duplicate	Duplicate	Duplicate	Duplicate	Unique	Duplicate	Recognized as Duplicate CI
Duplicate	Duplicate	Duplicate	Duplicate	Unique	Unique	Recognized as Duplicate CI

Transaction Work Area Attributes

Contents

The Transaction Work Area (twa) tables are:

- **ci_twa_ci**
  A single table that includes all attributes across all CA CMDB families. Table data is stored in denormalized form to enable customers and services to understand and manipulate the content more easily.

- **ci_twa_relation**
  Complements the ci_twa_ci table. Contains relationship information.

- **ci_twa_statusnames**
  Descriptive labels for row status.

External processes update these tables and GRLoader reads them during transaction processing. When processing is complete, GRLoader updates the row_status and tran_message columns to indicate whether the transaction has completed successfully.

Note: If multiple errors or warnings occur, the messages are concatenated.

ci_twa_ci Attributes

The ci_twa_ci table contains attributes for CI transactions.

Column Name	Notes
id	Transaction identifier
last_mod_dt	Sets the current date every time the row is added or updated.
tran_dt	Sets the current date and time if no value is supplied when row is added.
creation_date	Sets the current date and time when row is added.
delete_flag	Sets to zero (0) if no other value is supplied when row is added.
tran_status	Sets to zero (0) if no other value is supplied when row is added.

ci_twa_relation Attributes

The ci_twa_relation table contains attributes for relationship transactions.

Column Name	Notes
id	Transaction identifier
last_mod_dt	Sets the current date every time the row is added or updated.
tran_dt	Sets the current date and time if no value is supplied when row is added.
creation_date	Sets the current date and time when row is added.
delete_flag	Sets to zero (0) if no other value is supplied when row is added.
tran_status	Set to zero (0) if no other value is supplied when row is added.

CMDB Web Services

CA CMDB provides a set of high-level web services that supports CMDBf Web Services Standard version 1.0. These services allow external CMDBf-aligned applications and also registered Management Data Repositories (MDRs) to interact with CA CMDB, including federated MDRs in accordance with the CMDBf/DMTF standard.

You can find the CMDBf specification in the following document:

`http://cmdbf.org/schema/1-0-0/CMDBf%20v1.0.pdf`

Web Services Deployment

CMDB installation automatically deploys CMDB web services. If you want, you can redeploy the web services.

To redeploy CMDB Web Services

1. Execute the following command:
   : install-dir \sdk\websvc\cmdbf

2. Deploy the following files:

   - deploy.wsdd

   - cmdbf.jar

3. Execute the following file:
   deploy_cmdbws.bat
   The CMDB web services are deployed.

Web Service Components

Contents

CA CMDB Web Services consists of two defined services:

- **Registration Service**
  Allows clients to create\update CIs and Relationships. The endpoint can be located at the following address:

  ```
  http://<servername>:< port >/axis/services/RegistrationPort
  ```

- **Query Service**
  Allows clients to query for CIs and Relationships. The endpoint can be located at the following address:

  ```
  http://<servername>:< port >/axis/services/QueryPort
  ```

Registration Service

The Registration service uses push mode federation. The fundamentals of push mode federation are as follows:

- The client invokes the Register operation for configuration items or relationships that it wants to register. Each item or relationship must be associated with at least one record type supported by the Registration service.

  Note: The CMDBf Register web service either creates a new CI or, if that CI already exists, updates it. If the CI already exists and is Inactive, the CI is set to Active and all attributes passed to it are updated. To prevent updates to Inactive CIs, send Inactive as one of the attributes.

- The Registration service responds with the registration status for each item or relationship named in the Register operation. The status is either accepted or declined.

The management data repository (MDR) also uses the Register operation to update registered data. An update can consist of any combination of the following:

- Changes to existing data, such as a property value change
- Deregistering a previously registered record type for this configuration item or relationship

MDR Registration

You must do the following to register an MDR:

1. Create a valid MDR manually before using CMDBf web services to register a CI.
2. Set the MdrName to your MDR Name.
3. Set the MdrClass to “cmdbf” (a static value).

Query Service

The Query service contains a GraphQuery operation that can be used for anything from a simple instance query to a much more complex topological query. A GraphQuery request describes items and relationships of interest in the form of a graph. Constraints can be applied to the nodes (items) and edges (relationships) in that graph to further refine them.

The GraphQuery response contains the items and relationships that, in combination, compose a graph that satisfies the constraints of the graph in the query. A graph query is only one level deep.

Login

You log in by passing credential information either through Java or a SOAP message. The following examples show you how you can log in.

Example: Java

```
QueryBindingStub binding;

binding = (QueryBindingStub) new QueryServiceLocator().getQueryPort(new URL
(Endpoint));

SOAPHeaderElement Header = new SOAPHeaderElement("http://schemas.xmlsoap.org/soap
/envelope/", "securityHeader");

Header.setPrefix("sec");

javax.xml.soap.SOAPElement Element = null;

Element = Header.addChildElement("username");
Element.addTextNode("CMDBAdmin");
Element = Header.addChildElement("password");
Element.addTextNode("password");
```

```
binding.setHeader(Header);
```

Example: SOAP Message

```
<soapenv:Header>
        <sec:securityHeader  xmlns:sec="http://schemas.xmlsoap.org/soap/enveloe/">
        <sec:username>CMDBAdmin</sec:username>
        <sec:password>password</sec:password>
        </sec:securityHeader>
        </soapenv:Header>
```

CA CMDB Web Services Access

Contents

You can access CMDB web services by using one of the following methods:

- Create your own message for the SOAP interface to call your endpoint.
- Write your own Java program to access the CMDB endpoint.

Code to Return All CIs From Every Family in CMDB

You can use the following code to return all CIs from every Family in CMDB:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:
dat="http://cmdbf.org/schema/1-0-0/datamodel">
   <soapenv:Header>
        <sec:securityHeader xmlns:sec="http://schemas.xmlsoap.org/soap/envelope/">
                <sec:username>cmdbadmin</sec:username>
                <sec:password>miramar</sec:password>
        </sec:securityHeader>
   </soapenv:Header>
   <soapenv:Body>
      <dat:query>
        <itemTemplate suppressFromResult="false" id="All">
[constraints go here]
         </itemTemplate>
      </dat:query>
   </soapenv:Body>
</soapenv:Envelope>
//*********************************************//
```

Sample Java Program

To assist you with web services client application development, CMDB provides the following sample Java programs:

- RegistrationServiceTestCase.java shows you how to create two CIs and a Relationship.
- QueryServiceTestCase.java shows you how to query your CMDB for all CIs.

You can find sample programs at the following location:

```
%NX_ROOT%\sdk\websvc\cmdbf\
```

WSDL Document

The location of the Web Services Description Language (WSDL) document that you need depends on the function of CMDB you intend to use. The following locations are available:

- The default location of the WSDL for the CMDBf Web Services for Registration is the following URL:

  ```
  http://<servername>:<port>/axis /services/RegistrationPort?wsdl
  ```

- The default location of the WSDL for the CMDBf Web Services for graphQuery is the following URL:

  ```
  http://<servername>:<port>/axis/services/QueryPort?wsdl
  ```

Note: Many servlet containers use a port number different from 80. For example, Tomcat defaults to port 8080, which is established during installation.

Security Considerations

There are important security considerations when deploying web services. The default configuration when using HTTP is insecure, as it is for all information in web service calls sent between the client and the server in plain text over the network using the HTTP protocol. This configuration includes application data and login methods, and it can include passwords. Administrators who deploy web services are encouraged to consider security carefully and to take additional configuration steps at the application and network levels to secure your web service environment.

Important! The default web service configuration used with HTTP is insecure and vulnerable to security threats that can include password discovery, session fixation, and data spying, and so on.

CMDBf Implementation CA CMDB Limitations

Contents

CMDB has limitations in its CMDBf implementation. The following CMDBf pseudo-schema highlights some limitation areas:

```
<query>
        <itemTemplate id="xs:ID" suppressFromResult="xs:boolean">
                (<contentSelector ...>...</contentSelector> ?
                <instanceIdConstraint>...</instanceIdConstraint> ?
                <recordConstraint>
                        <recordType ... /> *
                        <propertyValue ...>...</propertyValue> *
                </recordConstraint> *)
                |
                (<xpathExpression...>...</xpathExpression> *)
                xs:any
        </itemTemplate> *
        <relationshipTemplate id="xs:ID" suppressFromResult="xs:boolean">
                (<contentSelector ...>...</contentSelector> ?
                <instanceIdConstraint>...</instanceIdConstraint> ?
                <recordConstraint>
                        <recordType>...</recordType> *
                        <propertyValue>...</propertyValue> *
                </recordConstraint> *)
                |
                (<xpathExpression ...>...</xpathExpression> *)
                <sourceTemplate ref="xs:IDREF" minimum="xs:int"?
                 maximum="xs:int"?/>
                <targetTemplate ref="xs:IDREF" minimum="xs:int"?
                 maximum="xs:int"?/>
                <depthLimit ... /> ?
                xs:any
        </relationshipTemplate> *
</query>
```

Item Template Limitations

The CMDB implementation uses the CMDBf specification with the following item template limitations:

- Multiple RecordConstraints under one ItemTemplate are handled as Logical OR, not Logical AND.
- suppressFromResult="xs:boolean" is not supported.
  CMDB always displays the results.
- <contentSelector matchedRecords="xs:*boolean*">:matchedRecords="true" is supported, but matchedRecords="false" is not.
  CMDB only supports one selectedRecordType per contentSelector.
- <recordConstraint> only supports one <recordType ... /> expression; for example <recordType namespace="http://cmdb.ca.com/Hardware" localName="Hardware.Server"/>
  The localName expression must identify a valid CMDB family.
  Replace each space in a family name that includes spaces with a dash (-). For example, replace Software.Application Server with Software.Application-Server.

- <propertyValue namespace="xs:anyURI" localName="xs:NCName" recordMetadata="xs:boolean" matchAny="xs:boolean">
  recordMetadata is not supported.
  matchAny is set to the default value of false; this value allows "Logical AND" and "Logical OR" CMDBf queries on all the property values. "Logical AND" queries are not supported.
  “like” operators are not supported.
  “equals” does not support caseSensitive, or negate.

- <xpathExpression...>...</xpathExpression>: is not implemented.

Registration Limitations

Registration has the following limitations:

- Multiple record elements under one Item element or Relationship element
- Additional RecordType

Relationship Template Support and Limitations

CMDB supports the following relationshipTemplate features:

- contentSelector
- relationshipTemplate ID
- recordConstraint -- can use propertySelectors
- sourceTemplate
- targetTemplate

CMDB *does not* support the following relationshipTemplate features:

- Source/Target Template @minimum
- Source/Target Template @maximum
- Depth Limit with @MaxIntermediateItems
- Depth Limit with @intermediateItem Template
- instanceIdConstraint
- xpathExpression
- suppressFromResult in relationship Template

Example: Register Request relationshipTemplate Using a contentSelector and propertySelectors Under the recordConstraint

```
<relationshipTemplate  id="rels">
            <contentSelector>
```

```
                    <selectedRecordType namespace=" http://cmdb.ca.com/r1"
localName="is-deployed-by">
                              <selectedProperty namespace=" http://cmdb.ca.com/r1"
localName="last_mod_by"/>
                              <selectedProperty namespace=" http://cmdb.ca.com/r1"
localName="last_mod_dt"/>
                              <selectedProperty namespace=" http://cmdb.ca.com/r1"
localName="child"/>
                              <selectedProperty namespace=" http://cmdb.ca.com/r1"
localName="parent"/>
                    </selectedRecordType>
               </contentSelector>
                               <sourceTemplate ref="Linux1" />
                               <targetTemplate ref="Linux2" />
                               <recordConstraint>
                                    <recordType namespace=" http://cmdb.ca.com/r1"
localName="is-deployed-by"/>
                                         <propertyValue namespace=" http://cmdb.ca.com
/r1" localName="parent" matchAny="true">
                                         <equal>test</equal>
                                         </propertyValue>
                                </recordConstraint>
</relationshipTemplate>
```

Example: Response (edges portion)

```
<edges templateId="rels">
         <relationship xsi:type="ns3:RelationshipType" xmlns:ns3="http://cmdbf.org
/schema/1-0-0/datamodel">
               <source>
                    <mdrId xsi:type="xsd:string">http://cmdb.ca.com/r1</mdrId>
                    <localId xsi:type="xsd:string">nr:
C2B975A96C03934BA61080C0F79C8BD2</localId>
               </source>
               <target>
                    <mdrId xsi:type="xsd:string">http://cmdb.ca.com/r1</mdrId>
                    <localId xsi:type="xsd:string">nr:
B985B5297C46224283D0E5F2632A2A44</localId>
               </target>
               <record xsi:type="ns3:RecordType">
                    <recordMetadata>
                        <recordId xsi:type="xsd:string">bmhier:400004</recordId>
                    </recordMetadata>
                  <is-deployed-by xmlns="http://cmdb.ca.com/r1/is-deployed-by">
                     <child>ali5</child>
                     <last_mod_dt>6 Oct 2008 16:34:48 GMT</last_mod_dt>
                     <parent>ali</parent>
                     <last_mod_by>ServiceDesk</last_mod_by>
                  </is-deployed-by>
               </record>
               <instanceId xsi:type="ns3:MdrScopedIdType">
                  <mdrId xsi:type="xsd:string">http://cmdb.ca.com/r1</mdrId>
                  <localId xsi:type="xsd:string">bmhier:400004</localId>
```

```
                </instanceId>
            </relationship>
</edges>
```

Generic Limitations

The following generic limitations apply:

- <recordMetadata>
  <recordId>...</recordId>
  <lastModified>...</lastModified> ?
  <baselineId>...</baselineId> ?
  <snapshotId>...</snapshotId> ?
  xs:any </recordMetadata>:

  Note: recordMetadata only returns recordId, and the xs:any.

  Other values have no meaning to CMDB.

- CMDB does not support case-sensitivity for the equal, contains, and like operators.
- CMDB does not support escape sequences as unique wild card characters.
- CMDBf supports XSD date and XSD dateTime formats:
  "YYYY-MM-DD" -XSD date
  "YYYY-MM-DDThh:mm:ss" -XSD dateTime

Date Data Type

The Date Data type is specified in the following form:

YYYY-MM-DD

where:

- **YYYY**
  Specifies the year.
- **MM**
  Specifies the month.
- **DD**
  Specifies the day of the month.

Note: All components are required.

DateTime Data Type

The DateTime data type is used to specify both a date and a time on that date.

dateTime is specified in the following form:

YYYY-MM-DDThh:mm:ss

where:

- **YYYY**
  Specifies the year.
- **MM**
  Specifies the month.
- **DD**
  Specifies the day.
- **T**
  Specifies the start of the required time section.
- **hh**
  Specifies the hour.
- **mm**
  Specifies the minute.
- **ss**
  Specifies the second.

Note: All components are required.

Multi-Tenancy and CIs

How Multi-Tenancy Affects CIs

The following CA CMDB objects are *tenanted*:

- CIs and their associated extension tables
- CI relationships
- Management Data Repository (MDR) providers
- MDR mappings

To create, edit, and list CIs effectively, you must understand how multi-tenancy affects CIs. When you create, list, or update CIs, consider the following:

- When multi-tenancy is installed, the Role Detail form includes Tenant Access and Tenant Write Access drop-down lists on its Authorization tab that contains the following options:
  - Contact's Tenant
  - Single Tenant
  - Tenant Group
  - All Tenants

  The specified Tenant Access affects how you can work with CIs in the CA CMDB-related applications.
- If the Tenant Access or Tenant Write Access type is not specified for the contact, the default role is used.
- On the Role Detail form, the Update Public check box controls whether a user in the role is authorized to create or update public data. This check box is effective only for users associated with the service provider, as tenant users are restricted to read-only access to data not belonging to their tenant.

Important! Users associated with a tenant other than the service provider can only create or update objects associated with their own tenant unless authorized by their role. Users associated with the service provider are permitted to create or update objects belonging to tenants other than their own.

CI Lists and Multi-Tenancy Relationships

The following table shows the results of listing CIs in CA CMDB-related applications with multi-tenancy enabled.

This table is a partial listing of the many possible combinations of role access options, and how they affect the various applications.

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
Contact's Tenant	Lists CIs in the same tenant and public	Lists all CIs	Lists CIs in the same tenant and public	Lists CIs in the same tenant and public	Lists CIs in the same tenant and public
Single Tenant	Lists CIs in the same tenant and public	Lists all CIs	Lists CIs in the same tenant and public	Lists CIs in the same tenant and public	Lists CIs in the same tenant and public
Tenant Group					

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
	Lists CIs in the all tenants in a tenant group and public	Lists all CIs	Lists CIs in the all tenants in a tenant group and public	Lists CIs in the all tenants in a tenant group and public	Lists CIs in the all tenants in a tenant group and public
All Tenants	Lists all CIs	Lists all CIs	Lists all CIs	Lists all CIs	Lists all CIs

CI Creation and Multi-Tenancy Relationships

The following table shows the results of creating CIs in CA CMDB-related applications with multi-tenancy enabled.

This table is a partial listing of the many possible combinations of role access options, and how they affect the various applications.

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
Contact's Tenant	CI tenant is the one assigned to the signed-on user	CI tenant is created as public	Uses the Web UI to create CIs	CI tenant is the default tenant associated with the signed-on user **Note:** We recommend that you set up a distinct contact for every data source. The contact definition should specify a role that is Contact's Tenant.	CI tenant is the one assigned to the signed-on user
Single Tenant	CI tenant is the one assigned to the signed-on user's proxy	CI tenant is created as public	Uses the Web UI to create CIs	CI tenant is the default tenant associated with the signed-on user **Note:** We recommend that you set up a distinct contact for every data source. The contact definition should specify a role which is contact-tenant.	CI tenant is the one assigned to the signed-on user's proxy
Tenant Group	CI tenant can be selected from list in the UI that includes only those tenants in the group **Note:** The default tenant can be overridden by using the GRLoader -dt option.	CI tenant is created as public	Uses the Web UI to create CIs	Can use the <tenant> option to assign a tenant. **Note:** We recommend that you set up a distinct contact for every data source. The contact definition should specify a role which is contact-tenant.	CI is created as public unless -dt is specified
All Tenants	CI tenant can be selected from a list in the UI	CI tenant is		Can use the <tenant> option to assign a tenant. If a tenant is not specified, the default is public.	

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
		created as public	Uses the Web UI to create CIs	**Note:** We recommend that you set up a distinct contact for every data source. The contact definition should specify a role that is Contact's Tenant.	CI is created as public unless -dt is specified

CI Update and Multi-Tenancy Relationships

The following table shows the results of updating CIs in CA CMDB-related applications with multi-tenancy enabled. Consider the following when you update CIs:

- Only CIs that can be listed can be updated.
- The tenant attribute can only be changed by using the command line.
- CA Cohesion ACM does not populate the <tenant> attribute.

This table is a partial listing of the many possible combinations of role access options, and how they affect the various applications.

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
Contact's Tenant	Can update a CI in same tenant Role and service provider determine the public read /write access	Can update any CI	Uses the Web UI to update CIs	Can update a CI in same tenant Role and service provider determine the public read/write access	Can update a CI in same tenant Role and service provider determine the public read/write access
Single Tenant	Can update a CI in same tenant Role and service provider determine the public read /write access	Can update any CI	Uses the Web UI to update CIs	Can update a CI in same tenant Role and service provider determine the public read/write access	Can update a CI in same tenant Role and service provider determine the public read/write access
Tenant Group	Can update a CI in same tenant Cannot update CIs in the tenant group Role and service provider determine the public read /write access CI relationship updates across tenants requires that the contact must be a service provider tenant	Can update any CI	Uses the Web UI to update CIs	Can update a CI in same tenant Cannot update CIs in the tenant group Role and service provider determine the public read/write access CI relationship updates across tenants requires that the contact must be a service provider tenant	Can update a CI in same tenant Cannot update CIs in the tenant group Role and service provider determine the public read/write access CI relationship updates across tenants requires that the contact must be a service provider tenant

Role Tenant Access Option	Web UI	CA APM	Visualizer	GRLoader	CA Cohesion ACM
All Tenants	Can update any CI	Can update any CI	Uses the Web UI to update CIs	Can update any CI	Can update any CI

Generate API Documentation for RESTful Services

You can use jax-doclets-0.9.0.jar file (Third-party product) to generate the API documentation for all the CA Service Desk Manager RESTful services. This library file also dynamically generates the API documentation during the product customizations.

Complete the following steps in CA SDM to deploy the jax-doclets-0.9.0.jar library file:

Note: The Third-party product (jax-doclets-.0.9.0.jar) is available as a separate media and is not included with the CA Service Desk Manager DVD1 media.

Follow these steps:

1. Log in to the CA SDM server where RESTful web services are deployed.
2. Copy the jax-doclets-0.9.0.jar file to the NX_ROOT/java/lib directory.
3. Undeploy the RESTful Web Services by executing the following command from the NX_ROOT /bin directory:

   ```
   (Windows) pdm_rest_util.cmd –undeploy
   (UNIX) ./pdm_rest_util.sh –undeploy
   ```

4. Deploy the RESTful Web Services by executing the following command from the NX_ROOT/bin directory:

   ```
   (Windows) pdm_rest_util.cmd –deploy
   (UNIX) ./pdm_rest_util.sh –deploy
   ```

   After the RESTful Web Services are deployed successfully, the REST docs will be available in the NX_ROOT/Doc folder.

5. Repeat steps 1-4 on all the CA SDM servers where RESTful web services are deployed.

Objects and Attributes

This page lists the objects and attributes that define CA SDM. The system uses objects and attributes to build notification text, scoreboard queries, and data partition constraints. The *FACTORY Optional* statement that accompanies each object, defines access to the object, including its relation attribute, a common name, the security group that can access it, the type of lists produced, and how those lists can be sorted. If omitted, the object is treated according to default specifications.

Note: When an object is documented as a containing a LOCAL *DB Field*, the attribute maps to a local variable instead of a database column. Objects that are documented as a BREL *Data Type*, refer to a backward single relationship (SREL). For more information about default specifications and detailed lists of the attributes of each object, see the chapter "Object Definition Syntax."

This article contains the following topics:

attached_sla Object

The object details are as follows:

1. Associated Table: Attached_SLA
2. Factories: default, ttv_slas
3. REL_ATTR: id
4. Common Name: ticket_type
5. Function Group:

6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
_mapped_chg	_mapped_chg	INTEGER	chg id	
_mapped_cr	_mapped_cr	STRING	call_req persid	
_mapped_iss	_mapped_iss	STRING	issue persistent_id	
_mapped_iss_wf	_mapped_iss_wf	INTEGER	isswf id	
_mapped_wf	_mapped_wf	INTEGER	wf id	
delete_flag	del	INTEGER	actbool enum	REQUIRED
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		
last_ttv_upd	last_ttv_upd	LOCAL_TIME		
map_sdsc	map_sdsc	STRING	srv_desc code	REQUIRED
persistent_id	persid	STRING		
sla_viol_status	sla_viol_status	INTEGER		
ticket_id	ticket_id	INTEGER		REQUIRED S_KEY
ticket_type	ticket_type	STRING		REQUIRED
time_to_violation	time_to_violation	LOCAL_TIME		
ttv_event	ttv_event	STRING	att_evt persid	

attr_control Object

The object details are as follows:

1. Associated Tables: dependent_control and usp_attr_control
2. Factories: default
3. REL_ATTR: id
4. Common Name: attrname

Function Group: admin

REST Operations: CREATE READ UPDATE

Attribute	Data Type	SREL References	Flags
control		SREL dependent_control	Dependent control
attrname	STRING		Name of controlled attribute
locked	INTEGER		1 = attribute is read-only
required	INTEGER		1= attribute is required
delete_flag	INTEGER	SREL actbool	Required; on new default: 0

Attribute	Data Type	SREL References	Flags
last_mod_by		SREL cnt	On new default user; on CI set user
last_mod_dt	DATE		On CI set now

auto_close Object

The object details are as follows:

1. Associated Table: usp_auto_close
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: admin
6. Tenant: optional
7. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
sys	symbol	STRING		Required
cr_ach	request	INTEGER		Required On new default: 0
in_ach	incident	INTEGER		Required On new default: 0
pr_ach	problem	INTEGER		Required On new default: 0
chg_ach	change order	INTEGER		Required On new default: 0
iss_ach	issue	INTEGER		Required On new default: 0
delete_flag		INTEGER	actbool	On CI set now
description	description	STRING		
last_mod_dt		DATE		On CI set now
last_mod_by		DATE	cnt	On CI set user On new default user

aty Object

The object details are as follows:

1. Associated Table: Act_Type
2. Factories: default, chgaty, craty, issaty, mgsaty

3. REL_ATTR: code
4. Common Name: sym
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
chg_default_ survey	chg_default_survey	INTEGER	survey_tpl id	
chg_notify_info	chg_notify_info	STRING	splmac persid	
chg_send_ survey	chg_send_survey	INTEGER		
chg_survey_ method	chg_survey_ method	INTEGER	ct_mth id	
chg_survey_ msgbody	chg_survey_ msgbody	STRING		
chg_survey_ msgtitle	chg_survey_msgtitl	STRING		
code	code	STRING		UNIQUE REQUIRED S_KEY
cr_default_ survey	cr_default_survey	INTEGER	survey_tpl id	
cr_notify_info	cr_notify_info	STRING	splmac persid	
cr_send_survey	cr_send_survey	INTEGER		
cr_survey_method	cr_survey_method	INTEGER	ct_mth id	
cr_survey_msgbody	cr_survey_msgbody	STRING		
cr_survey_msgtitle	cr_survey_msgtitle	STRING		
delete_flag	del	INTEGER	actbool enum	REQUIRED
description	description	STRING		
cr_flag	flag1	INTEGER	bool_tab enum	
chg_flag	flag2	INTEGER	bool_tab enum	
iss_flag	flag3	INTEGER	bool_tab enum	
mgs_flag	flag4	INTEGER	bool_tab enum	
kd_flag	flag5	INTEGER	bool_tab enum	
id	id	INTEGER		UNIQUE REQUIRED KEY
internal	internal	INTEGER		
iss_default_survey	iss_default_survey	INTEGER	survey_tpl id	
iss_notify_info	iss_notify_info	STRING	splmac persid	
iss_send_ survey	iss_send_survey	INTEGER		
iss_survey_ method	iss_survey_method	INTEGER	ct_mth id	
iss_survey_ msgbody	iss_survey_ msgbody	STRING		
iss_survey_ msgtitle	iss_survey_msgtitl	STRING		
kd_notify_info	kd_notify_info	STRING	splmac persid	

Attribute	DB Field	Data Type	SREL References	Flags
last_mod_dt	last_mod_dt	LOCAL_TIME		
mgs_notify_info	mgs_notify_info	STRING	splmac persid	
notify_msg_ack	notify_ack	STRING		
persistent_id	persid	STRING		
sym	sym	STRING		REQUIRED S_KEY

audlog Object

The object details are as follows:

1. Associated Table: Audit_Log
2. Factories: default
3. REL_ATTR: code
4. Common Name: audobj_persid
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
analyst	analyst	UUID	ca_contact uuid	
attr_after_val	attr_after_val	STRING		
attr_before_val	attr_before_val	STRING		
attr_name	attr_name	STRING		
aud_opr	aud_opr	INTEGER		
audobj_name	audobj_name	STRING		
audobj_persid	audobj_persid	STRING		
audobj_trkid	audobj_trkid	STRING		
audobj_uniqueid	audobj_uniqueid	STRING		
change_date	change_date	LOCAL_TIME		
id	id	INTEGER		UNIQUE REQUIRED KEY
int1_rsrved	int1_rsrved	INTEGER		
int2_rsrved	int2_rsrved	INTEGER		
persistent_id	persid	STRING		
str1_rsrved	str1_rsrved	STRING		

bhvtpl Object

The object details are as follows:

1. Associated Table: Behavior_Template
2. Factories: default
3. REL_ATTR: id
4. Common Name: description
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
context_attrname	context_attrname	STRING		
context_attrval	context_attrval	INTEGER		
context_type	context_type	STRING		REQUIRED
delete_flag	del	INTEGER	actbool enum	REQUIRED
description	description	STRING		
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
modified_date	last_mod_dt	LOCAL_TIME		
macro_condition	macro_condition	STRING	splmac persid	
object_id	object_id	INTEGER		REQUIRED
object_type	object_type	STRING		REQUIRED
persistent_id	persid	STRING		
transition_errmsg	transition_errmsg	STRING		
transition_test	transition_test	STRING	splmac persid	

BU_TRANS Object

The object details are as follows:

1. Associated Table: BU_TRANS
2. Factories: default
3. REL_ATTR: id
4. Common Name:
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Document Hit Date	BU_DATE	LOCAL_TIME		
Processed by Bubble Up Flag	BU_PROCESSED	INTEGER		
Document Rating	BU_RATING	REAL		
Document ID	DOC_ID	INTEGER	SKELETONS id	
No Rating Flag	HIT_NO_VOTE	INTEGER		
Hit Origin	HIT_ORIGIN	INTEGER		
id	ID	INTEGER		REQUIRED KEY
Category Id	INDEX_ID	INTEGER	O_INDEXES id	
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Contact ID	USER_ID	UUID	ca_contact uuid	

ADMIN_TREE Object

The object details are as follows:

1. Associated Table: admin_tree
2. Factories: default
3. REL_ATTR: id
4. Common Name: CAPTION
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
CAPTION	CAPTION	STRING		
DESCRIPTION	DESCRIPTION	STRING		
HAS_CHILDREN	HAS_CHILDREN	INTEGER		
id	ID	INTEGER		KEY
KT_ADMIN	KT_ADMIN	INTEGER		
KT_KS_CAPTION	KT_KS_CAPTION	STRING		
KT_KS_FLAG	KT_KS_FLAG	INTEGER		
KT_MANAGER	KT_MANAGER	INTEGER		
last_mod_dt	last_mod_dt	LOCAL_TIME		
PARENT_ID	PARENT_ID	SREL		
RESOURCE	RESOURCE	STRING		
SD_ADMIN	SD_ADMIN	INTEGER		

alg Object

The object details are as follows:

1. Associated Table: Act_Log
2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: description
5. Function Group: call_mgr
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
action_desc	action_desc	STRING		
analyst	analyst	UUID	ca_contact uuid	
call_req_id	call_req_id	STRING	call_req persid	
description	description	STRING		
id	id	INTEGER		UNIQUE REQUIRED KEY
internal	internal	INTEGER		
session	knowledge_ session	STRING		
k_tool	knowledge_ tool	STRING		
last_mod_dt	last_mod_dt	LOCAL_TIME		
persistent_id	persid	STRING		
system_time	system_time	LOCAL_TIME		
time_spent	time_spent	DURATION		
time_stamp	time_stamp	LOCAL_TIME		
type	type	STRING	act_type code	

am_asset_map Object

The object details are as follows:

1. Associated Table: Am_Asset_Map
2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: dmuuid
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
dmuuid	am_dmuuid	STRING		
domain_id	am_domain_id	INTEGER		
server	am_server	STRING		
type	am_type	INTEGER		
unit_domain_id	am_unit_domain_id	INTEGER		
unit_id	am_unit_id	INTEGER		
id	id	INTEGER		UNIQUE REQUIRED KEY
int1_rsrved	int1_rsrved	INTEGER		
int2_rsrved	int2_rsrved	INTEGER		
ob_persid	ob_persid	STRING		
ob_type	ob_type	STRING		
persistent_id	persid	STRING		
str1_rsrved	str1_rsrved	STRING		
str2_rsrved	str2_rsrved	STRING		
schema_ver	version	INTEGER		REQUIRED

arcpur_rule Object

The object details are as follows:

1. Associated Table: Archive_Purge_Rule
2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: name
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
add_query	add_query	STRING		
arc_file_name	arc_file_name	STRING		
conf_obj_name	conf_obj_name	STRING		
days_inactive	days_inactive	INTEGER		REQUIRED
delete_flag	del	INTEGER	actbool enum	REQUIRED
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		

Attribute	DB Field	Data Type	SREL References	Flags
name	name	STRING		REQUIRED UNIQUE REQUIRED S_KEY
oper_type	oper_type	INTEGER		REQUIRED
persistent_id	persid	STRING		
reoccur_interv	reoccur_interv	DURATION		
sched	sched	STRING	bpwshft persid	

atev Object

The object details are as follows:

1. Associated Table: Attached_Events
2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: user_smag
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
cancel_time	cancel_time	LOCAL_TIME		
event_tmpl	event_tmpl	STRING	evt persid	REQUIRED S_KEY
fire_time	fire_time	LOCAL_TIME		
first_fire_time	first_fire_time	LOCAL_TIME		
group_name	group_name	STRING		
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_dt	last_mod_dt	LOCAL_TIME		
num_fire	num_fire	INTEGER		
obj_id	obj_id	STRING		REQUIRED
owning_ast	owning_ast	INTEGER	attached_sla id	
persistent_id	persid	STRING		
start_time	start_time	LOCAL_TIME		
status_flag	status_flag	INTEGER		
user_smag	user_smag	STRING		
wait_time	wait_time	DURATION		

atomic_cond Object

The object details are as follows:

1. Associated Table: Atomic_Condition
2. Factories: default
3. REL_ATTR: id
4. Common Name: description
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
cond_code	cond_code	STRING		
connecter	connecter	INTEGER		REQUIRED
delete_flag	del	INTEGER	actbool enum	REQUIRED
description	description	STRING		
id	id	INTEGER		UNIQUE REQUIRED KEY
l_paran	l_paran	INTEGER		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		
lval	lval	STRING	atyp_asc code	REQUIRED
operator	operator	INTEGER		REQUIRED
owning_macro	owning_macro	STRING	splmac persid	
persistent_id	persid	STRING		
r_paran	r_paran	INTEGER		REQUIRED
rval	rval	STRING		
rval_assoc	rval_assoc	STRING	atyp_asc code	
sequence	sequence	INTEGER		REQUIRED

act_type_assoc Object

The object details are as follows:

1. Associated Table: Act_Type_Assoc
2. Factories: default
3. REL_ATTR: code
4. Common Name: sym
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
act_type	act_type	STRING	act_type code	
code	code	STRING		UNIQUE REQUIRED S_KEY
description	description	STRING		
id	id	INTEGER		UNIQUE REQUIRED KEY
internal	int1_rsrved	INTEGER		
int2_rsrved	int2_rsrved	INTEGER		
int3_rsrved	int3_rsrved	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		
log_me_f	log_me_f	INTEGER		
ob_type	ob_type	STRING		
ob_type_attr	ob_type_attr	STRING		
persistent_id	persid	STRING		
str1_rsrved	str1_rsrved	STRING		
str2_rsrved	str2_rsrved	STRING		
str3_rsrved	str3_rsrved	STRING		
sym	sym	STRING		REQUIRED

ca_cmpny Object

The object details are as follows:

1. Associated Table: ca_company
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
alias	alias	STRING		
authentication_password	authentication_password	STRING		
authentication_user_name	authentication_user_name	STRING		
bbs	bbs	STRING		

Attribute	DB Field	Data Type	SREL References	Flags
Company Name	company_name	STRING

id	company_uuid	UUID		UNIQUE REQUIRED KEY
creation_date	creation_date	LOCAL_TIME		
creation_user	creation_user	STRING		
delete_time	delete_time	LOCAL_TIME		
description	description	STRING		
exclude_registration	exclude_registration	integer		
delete_flag	inactive	integer	actbool enum	
last_update_date	last_update_date	LOCAL_TIME		
last_update_user	last_update_user	STRING		
location_uuid	location_uuid	UUID	ca_location location_uuid	
month_fiscal_year_ends	month_fiscal_year_ends	integer		
parent_company_uuid	parent_company_uuid	UUID	ca_company company_uuid	
primary_contact_uuid	primary_contact_uuid	UUID	ca_contact uuid	
version_number	version_number	integer		
web_address	web_address	STRING		

ca_tou Object

The object details are as follows:

1. Associated Table: ca_tou
2. Factories: default
3. REL_ATTR: id
4. Common Name: name
5. Function Group: security
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
name	name	STRING		REQUIRED

Attribute	DB Field	Data Type	SREL References	Flags
description	description	STRING		
terms_of_usage_text		STRING		
version_number	version_number	INTEGER		DEFAULT 0
creation_user	creation_user		cnt	DEFAULT USER
creation_date	creation_date	DATE		
last_mod_dt	last_mod_dt	DATE		
last_update_date	last_update_date	DATE	cnt	
delete_flag	del	INTEGER	actbool enum	REQUIRED

caextwf_inst Object

The object details are as follows:

1. Associated Table: usp_caextwf_instances
2. Factories: default
3. REL_ATTR: id
4. Common Name: procname
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
delete_flag		actbool.enum		REQUIRED
instance_id	instance_id	STRING(255)		
object_persid	object_persid	STRING(60)		
procname	procname	STRING(32768)		
starttime	starttime	DATE		
endtime	endtime	DATE		

caextwf_sfrm Object

The object details are as follows:

1. Associated Table: usp_caextwf_start_forms
2. Factories: default
3. REL_ATTR: id
4. Common Name: procname

5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
object_persid	object_persid	STRING(60)		
caextwf_form	caextwf_form	STRING(255)		
caextwf_path	caextwf_path	STRING(32768)		
procname		STRING(0)		

closure_code Object

The object contains the following:

1. Associated Table: usp_closure_code
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	Data Type	SREL References	Flags
id	Integer		Unique
producer_id	String 20		
persistent_id	String 60		
delete_flag	SREL	actbool.enum	Standard active indicator Required
sym	String 40		Required
code	String 40		Required
last_mod_by	SREL	cnt.id (http://cnt.id)	
last_mod_date	DATE		
description	String 40		
tenant	SREL		

cmth Object

The object details are as follows:

1. Associated Table: Contact_Method

2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: notification_reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
cm_template	cm_template	STRING		
delete_flag	del	INTEGER	actbool enum	REQUIRED
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		DATE ON_CI {NOW}
description	nx_desc	STRING (40)		
producer_id		LOCAL STRING (20)		
persistent_id	persid	STRING (30)		
supports_smtp	supports_smtp	SREL	bool.enum	
sym	sym	STRING		UNIQUE REQUIRED S_KEY
write_file	write_file	INTEGER		

cnote Object

The object details are as follows:

1. Associated Table: Note_Board
2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: text
5. Function Group: announcement
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
active	active_flag	INTEGER	bool_tab enum	REQUIRED

pr_trans Object

The object details are as follows:

1. Associated Tables: pr_trans
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
status	status	STRING	crs	Specifies the current ticket status.
new_status	new status	STRING	crs	Specifies the new ticket status.
is default		INTEGER		Default transition that appears when the Status field is empty. On new default: 0
must_comment		INTEGER		Comment required when using a transition. On new default: 0
delete_flag	del		actbool	Required. On new default: 0
condition			macro	Site condition macro to approve transition.
condition_error		STRING		Error message for site condition.
description		STRING		Description of this transition.
last_mod_by			cnt	On new default user; on CI set user
last_mod_dt		DATE		On CI set user now

prod Object

The object details are as follows:

1. Associated Table: Product
2. Factories: default

3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
delete_flag	del	INTEGER	actbool enum	REQUIRED
id	id	INTEGER		UNIQUE REQUIRED KEY

persistent_id	persid	STRING		
sym	sym	STRING		UNIQUE REQUIRED S_KEY

resocode Object

This object is a reference object to denote the resolution code of the request or incident.

The object details are as follows:

1. Associated Table: usp_resolution_code
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	Data Type	Reference	Flags
delete_flag	SREL	actbool.enum	ON_NEW
description	STRING		
id	INTEGER		UNIQUE
persistent_id	STRING		
last_mod_by	SREL	cnt	ON_NEW {USER} ON_CI {USER}
last_mod_dt	DATE		ON_CI {NOW}
sym	STRING		REQUIRED

resomethod Object

This object is a reference object to denote the resolution method of the request or incident.

The object details are as follows:

1. Associated Table: usp_resolution_method
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	Data Type	Reference	Flags
delete_flag	SREL	actbool.enum	ON_NEW
description	STRING		
id	INTEGER		UNIQUE
persistent_id	STRING		
last_mod_by	SREL	cnt	ON_NEW {USER} ON_CI {USER}
last_mod_dt	DATE		ON_CI {NOW}
sym	STRING		REQUIRED

response Object

The object details are as follows:

1. Associated Table: Response
2. Factories: default
3. REL_ATTR: id
4. Common Name: sym
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
chg_flag	chg_flag	INTEGER		S_KEY
cr_flag	cr_flag	INTEGER		S_KEY

Attribute	DB Field	Data Type	SREL References	Flags
delete_flag	del	INTEGER	actbool enum	REQUIRED

chgcnf chg Object

The object details are as follows:

1. Associated Table: usp_conflict_chg
2. Factories: default
3. REL_ATTR: code
4. Common Name: last_mod_dt
5. Function Group: chg_mgr
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE KEY
last_mod_by	last_mod_by	UUID	ca_contact	User who last updated this.
last_mod_dt	last_mod_dt	LOCAL_TIME		timestamp of last update to this record.
change	change	INTEGER	chg	Pointer to change order involved in conflict.
conflict_change	conflict_change	INTEGER	chg	Pointer to change order involved in conflict.
is_cause	is_cause	INTEGER		Change in change column caused conflict.

chgcnf Object

The object details are as follows:

1. Associated Table: usp_conflict, usp_conflict_status, usp_conflict_type, usp_conflict_chg
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. Function Group: change_mgr
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
delete_flag	delete_flag	INTEGER	actbool enum	**0** -- Active **1** -- Inactive
comments	comments	STRING		Reference to comment information.
conflict_begin	conflict_begin	LOCAL_TIME		Start of time period of the conflict.
source_change	source_change	INTEGER	chg	Pointer to change order involved in conflict.
conflict_change	conflict_change	INTEGER	chg	Pointer to change order involved in conflict.
		UUID		Pointer to Configuration Item involved in conflict.

Attribute	DB Field	Data Type	SREL References	Flags
conflict_ci	conflict_ci		ca_owned_resource	
conflict_end	conflict_end	LOCAL_TIME		End of time period of the conflict.
conflict_status	conflict_status	STRING	chgcnf_status	Pointer to usp_conflict_status that indicates the status of this conflict. For example: Resolved, Unresolved, Researching.
conflict_type	conflict_type	STRING	chgcnf_type	Pointer to usp_conflict_type that classifies the type of conflict represented by this record. For example: Schedule Collision.
creation_dt	creation_dt	LOCAL_TIME		Date conflict was last detected.
id	id	INTEGER		UNIQUE KEY
is_resolved	is_resolved	INTEGER		Flag that indicates whether this conflict should be considered resolved. The entry in usp_conflict_status pointed to by conflict_status has an is_resolved flag that is reflected in this column.
last_mod_dt	last_mod_dt	LOCAL_TIME		Last modified timestamp
last_mod_by	last_mod_by	UUID	ca_contact	Last modified by
persistent_id	persid	STRING		Persistent ID.
suppress_log		INTEGER		LOCAL
tenant	tenant	UUID	ca_contact	Reference to Tenant information.

chgcnf status Object

The object details are as follows:

1. Associated Table: usp_conflict_status
2. Factories: default
3. REL_ATTR: code
4. Common Name: sym
5. Function Group: reference

6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
code	code	STRING		
delete_flag	delete_flag	INTEGER		Logical database delete status.
description	description	STRING		Textual description of the meaning of the status.
id	id	INTEGER		UNIQUE KEY
is_resolved	is_resolved	INTEGER		Used in stored queries to distinguish Resolved and Unresolved conflicts.
last_mod_by	last_mod_by	UUID	ca_contact	User who last updated this
last_mod_dt	last_mod_dt	LOCAL_TIME		Indicates the timestamp of last update to this record.
sym	sym	STRING		Text value displayed to the user.

chgcnf type Object

The object details are as follows:

1. Associated Table: usp_conflict_type
2. Factories: default
3. REL_ATTR: code
4. Common Name: sym
5. Function Group: change_mgr
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
code	code	STRING	actbool	
delete_flag	delete_flag	INTEGER		Logical database delete status.
description	description	STRING		Textual description of the meaning of the status.
icon	icon	STRING		
id	id	INTEGER		UNIQUE KEY
last_mod_by	last_mod_by	UUID	ca_contact	User who last updated this

Attribute	DB Field	Data Type	SREL References	Flags
last_mod_dt	last_mod_dt	LOCAL_TIME		Indicates the timestamp of last update to this record.
sym	sym	STRING		Text value displayed to the user.

chgstat Object

The object details are as follows:

1. Associated Table: Change_Status
2. Factories: default
3. REL_ATTR: code
4. Common Name: sym
5. Function Group: change_reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
description	description	STRING		
active	active	INTEGER		
code	code	STRING		UNIQUE REQUIRED S_KEY
delete_flag	del	INTEGER	actbool enum	REQUIRED
hold	hold	INTEGER		
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
modified_date	last_mod_dt	LOCAL_TIME		
persistent_id	persid	STRING		
resolved	resolved	INTEGER		
sym	sym	STRING		REQUIRED

BSVC--chgtype Object

The object details are as follows:

1. Associated Table: usp_change_type
2. REL_ATTR: id
3. Common Name: sym
4. Function Group: change_reference

5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE REQUIRED KEY
producer_id		LOCAL_STRING 20		
persistent_id	persid	STRING 30		
delete_flag	del	SREL	actbool.enum	REQUIRED
sym	sym	STRING 60		REQUIRED
description	description	STRING 240		
modified_date	last_mod_dt	DATE		
last_mod_by	last_mod_by	SREL	cnt.id (http://cnt.id)	

Configuration Item

This article contains the following topics:

CI_ACTIONS Object

The object details are as follows:

1. Associated Table: CI_ACTIONS
2. Factories: default
3. REL_ATTR: id
4. Common Name: ACTION_TITLE
5. Function Group: reference

6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Task Order	ACTION_ORDER	INTEGER		
Task Title	ACTION_TITLE	STRING		
Contact ID	ANALYST_ID	UUID	ca_contact uuid	
Group ID	GROUP_ID	UUID	ca_contact uuid	
id	ID	INTEGER		REQUIRED KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Predefined	PREDEFINED	INTEGER		
Current Status ID	STATUS_CURRENT_ID	INTEGER	CI_STATUSES id	
Unpublish Task	UNPUBLISH	INTEGER		
Unretire Task	UNRETIRE	INTEGER		
Workflow Template ID	WF_TEMPLATE_ID	INTEGER	CI_WF_TEMPLATES id	

CI_ACTIONS_ALTERNATE Object

The object details are as follows:

1. Associated Table: CI_ACTIONS_ALTERNATE
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Task ID	ACTION_ID	INTEGER	CI_ACTIONS id	
Contact ID	CONTACT_ID	UUID	ca_contact uuid	
Contact Type	CONTACT_TYPE	INTEGER		
id	ID	INTEGER		REQUIRED KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		

CI_BOOKMARKS Object

The object details are as follows:

1. Associated Table: CI_BOOKMARKS
2. Factories: default

3. REL_ATTR: id
4. Common Name: BOOKMARK_TITLE
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Bookmark Title	BOOKMARK_TITLE	STRING		
Document ID	DOCUMENT_ID	INTEGER	SKELETONS id	
id	ID	INTEGER		REQUIRED KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Contact ID	USER_ID	UUID	ca_contact uuid	

CI_DOC_LINKS Object

The object details are as follows:

1. Associated Table: CI_DOC_LINKS
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
DOC_ID1	DOC_ID1	INTEGER	SKELETONS id	
DOC_ID2	DOC_ID2	INTEGER	SKELETONS id	
SUPPRESS_OEVENTS	SUPPRESS_OEVENTS	INTEGER		
parent_child	parent_child	INTEGER		
id	ID	INTEGER		REQUIRED KEY
last_mod_dt	last_mod_dt	LOCAL_TIME		Indicates the timestamp of when this record was last modified.
last_mod_by	last_mod_by	UUID	ca_contact	Specifies the UUID of the contact who last modified this record.
tenant	tenant	UUID	ca_tenant	Specifies the UUID of the tenant.

CI_DOC_TEMPLATES Object

The object details are as follows:

1. Associated Table: CI_DOC_TEMPLATES
2. Factories: default
3. REL_ATTR: id
4. Common Name: TEMPLATE_NAME
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Default Template Flag	IS_DEFAULT	INTEGER		
Predefined Flag	IS_PREDEFINED	INTEGER		
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Template HTML	PAGE_HTML	STRING		
Template Name	TEMPLATE_NAME	STRING		

CI_DOC_TYPES Object

The object details are as follows:

1. Associated Table: CI_DOC_TYPES
2. Factories: default
3. REL_ATTR: id
4. Common Name: DOC_TYPE_TXT
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Document Type	DOC_TYPE_TXT	STRING		
id	ID	INTEGER		KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		

ci_managed_attribute Object

The object details are as follows:

1. Associated Table: ci_managed_attribute
2. Factories: default
3. REL_ATTR: id
4. Common Name: attribute_label
5. Function Group: ci
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		KEY
producer_id		LOCAL STRING 20

PRIORITY	PRIORITY	INTEGER		
TEXT	TEXT	STRING		

EBR_KEYWORDS Object

The object details are as follows:

1. Associated Table: EBR_KEYWORDS
2. Factories: default
3. REL_ATTR: id

4. Common Name: FULL_WORD
5. Function Group:

Attribute	DB Field	Data Type	SREL References	Flags
ENTITY_ID	ENTITY_ID	INTEGER		
EXT_TABLE_ID	EXT_TABLE_ID	INTEGER		
FULL_WORD	FULL_WORD	STRING		
id	ID	INTEGER		REQUIRED KEY

EBR_LOG Object

The object details are as follows:

1. Associated Table: EBR_LOG
2. Factories: default
3. REL_ATTR: id
4. Common Name: SEARCH_TEXT
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
ASKED_DATE	ASKED_DATE	LOCAL_TIME		
BEST_IDS	BEST_IDS	STRING		
EXTERNAL_ID	EXTERNAL_ID	STRING		
FILTER_DATA	FILTER_DATA	STRING		
FUZZINESS	FUZZINESS	INTEGER		
id	ID	INTEGER		KEY
KEYWORDS	KEYWORDS	STRING		
MATCH_TYPE	MATCH_TYPE	INTEGER		
METHOD_ PERFORMANCE	METHOD_ PERFORMANCE	INTEGER		
METHOD_TYPE	METHOD_TYPE	INTEGER		
NUM_MATCHES	NUM_MATCHES	INTEGER		
ORDER_DIRECTION	ORDER_DIRECTION	INTEGER		
PRIMARY_ORDER	PRIMARY_ORDER	STRING		
ROWS_FOUND	ROWS_FOUND	INTEGER		
ROWS_TO_FETCH	ROWS_TO_FETCH	INTEGER		

Attribute	DB Field	Data Type	SREL References	Flags
SEARCH_IN	SEARCH_IN	INTEGER		
SEARCH_QUALITY	SEARCH_QUALITY	INTEGER		
SEARCH_TEXT	SEARCH_TEXT	STRING		
SEARCH_TYPE	SEARCH_TYPE	INTEGER		
SECONDARY_ORDER	SECONDARY_ORDER	INTEGER		
SESSION_ID	SESSION_ID	INTEGER		
SQL_TEXT	SQL_TEXT	STRING		
TOP_MATCH_ID	TOP_MATCH_ID	INTEGER		
UNIQUE_WORD_ COUNT	UNIQUE_WORD_ COUNT	INTEGER		
USER_ID	USER_ID	STRING		
WORD_COUNT	WORD_COUNT	INTEGER		

EBR_METRICS Object

The object details are as follows:

1. Associated Table: EBR_METRICS
2. Factories: default
3. REL_ATTR: id
4. Common Name: METRIC
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
Comments	COMMENTS	STRING		
id	ID	INTEGER		REQUIRED KEY
Metric	METRIC	STRING		
Weight	WEIGHT	REAL		

EBR_NOISE_WORDS Object

The object details are as follows:

1. Associated Table: EBR_NOISE_WORDS
2. Factories: default
3. REL_ATTR: id

4. Common Name: NOISE_WORD
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		
Noise Word	NOISE_WORD	STRING		

EBR_PATTERNS Object

The object details are as follows:

1. Associated Table: EBR_PATTERNS
2. Factories: default
3. REL_ATTR: id
4. Common Name: PATTERN_NAME
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
PATTERN_DEFAULT	PATTERN_DEFAULT	STRING		
PATTERN_NAME	PATTERN_NAME	STRING		
PATTERN_VALUE	PATTERN_VALUE	STRING		
PATTERN_VALUE_ADM	PATTERN_VALUE_ADM	STRING		

EBR_PREFIXES Object

The object details are as follows:

1. Associated Table: EBR_PREFIXES
2. Factories: default
3. REL_ATTR: id
4. Common Name: PREFIX

5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Prefix	PREFIX	STRING		

EBR_PROPERTIES Object

The object details are as follows:

1. Associated Table: EBR_PROPERTIES
2. Factories: default
3. REL_ATTR: id
4. Common Name: PROPERTY_NAME
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
PROPERTY_ADMIN	PROPERTY_ADMIN	INTEGER		
PROPERTY_DEFAULT	PROPERTY_DEFAULT	STRING		
PROPERTY_NAME	PROPERTY_NAME	STRING		S_KEY
PROPERTY_TYPE	PROPERTY_TYPE	STRING		
PROPERTY_VALUE	PROPERTY_VALUE	STRING		
PROPERTY_VALUE_ADM	PROPERTY_VALUE_ADM	STRING		

EBR_SUBSTITS Object

The object details are as follows:

1. Associated Table: EBR_SUBSTITS
2. Factories: default
3. REL_ATTR: id
4. Common Name: SYMBOL1
5. Function Group: reference

6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
SYMBOL1	SYMBOL1	STRING		
SYMBOL2	SYMBOL2	STRING		

EBR_SUFFIXES Object

The object details are as follows:

1. Associated Table: EBR_SUFFIXES
2. Factories: default
3. REL_ATTR: id
4. Common Name: SUFFIX
5. Function Group: reference
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Suffix	SUFFIX	STRING		

EBR_SYNONYMS Object

The object details are as follows:

1. Associated Table: EBR_SYNONYMS
2. Factories: default
3. REL_ATTR: id
4. Common Name: KEYWORD1
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Keyword 1	KEYWORD1	STRING		
Keyword 2	KEYWORD2	STRING		

Attribute	DB Field	Data Type	SREL References	Flags
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		

EBR_SYNONYMS_ADM Object

The object details are as follows:

1. Associated Table: EBR_SYNONYMS_ADM
2. Factories: default
3. REL_ATTR: id
4. Common Name: KEYWORD1
5. Function Group:
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	ID	INTEGER		REQUIRED KEY
Keyword 1	KEYWORD1	STRING		
Keyword 2	KEYWORD2	STRING		
Last Modified Date	LAST_MOD_DT	LOCAL_TIME		

Event Objects

This topic contains the following information:

event_log Object

The object details are as follows:

1. Associated Table: event_log
2. Factories: default
3. REL_ATTR: id
4. Common Name: sd_obj_type
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
event	event	INTEGER	event_type id	
id	id	INTEGER		UNIQUE REQUIRED KEY
kd	kd_id	INTEGER	SKELETONS id	
log_time	log_time	LOCAL_TIME		
millitime	millitime	INTEGER		
numdata1	numdata1	INTEGER		
numdata2	numdata2	INTEGER		
sd_obj_id	sd_obj_id	INTEGER		
sd_obj_type	sd_obj_type	STRING		
session	session	INTEGER	session_log id	
textdata1	textdata1	STRING		
textdata2	textdata2	STRING		

event_type Object

The object details are as follows:

1. Associated Table: event_type
2. Factories: default
3. REL_ATTR: id
4. Common Name: description
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
description	description	STRING		
code	code	STRING		UNIQUE REQUIRED S_KEY
id	id	INTEGER		UNIQUE REQUIRED KEY
last_mod_by	last_mod_by	UUID	ca_contact uuid	
last_mod_dt	last_mod_dt	LOCAL_TIME		
persistent_id	persid	STRING		

evt Object

The object details are as follows:

1. Associated Table: Events

2. Factories: default
3. REL_ATTR: persistent_id
4. Common Name: sym
5. Function Group: admin
6. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
description	description	STRING

tech_desc	tech_desc	STRING		
validate_script	validate_script	STRING		

pdmMacroControlType Object

This object contains design view control types. The object details are as follows:

1. Associated Table: usp_pdmMacroControlType
2. Factories: default
3. REL_ATTR: enum
4. Common Name: name
5. UI_INFO: NOLOOKUP
6. Function Group: admin

Attribute	DB Field	Data Type	SREL References	Flags
enum	enum	INTEGER		
sym	sym	STRING		
description	description	STRING		
delete_flag	del	INTEGER		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	SREL	cnt	

pdmMacroParam Object

This object describes an argument of a web macro. The object details are as follows:

1. Associated Table: usp_pdmMacroParam
2. Factories: default
3. REL_ATTR: id
4. Common Name: name
5. UI_INFO: NOLOOKUP
6. Function Group: admin

Attribute	DB Field	Data Type	SREL References	Flags
macro	macro	SREL	pdmMacro	
name	name	STRING		REQUIRED
caption	caption	STRING		REQUIRED
description	description	STRING		
tooltip	tooltip	STRING		
help_form	help_form	STRING		

Attribute	DB Field	Data Type	SREL References	Flags
is_required	is_required	INTEGER		
is_advanced	is_advanced	INTEGER		
default_value	default_value	STRING		
type	type	SREL	pdmMacroParamType	REQUIRED
size_textbox	size_textbox	INTEGER		
value_list	value_list	STRING		
delete_flag	del	SREL	actbool	REQUIRED
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	SREL	cnt	

pdmMacroParamType Object

This object contains design view control types. The object details are as follows:

1. Associated Table: usp_pdmMacroParamType
2. Factories: default
3. REL_ATTR: enum
4. Common Name: name
5. UI_INFO: NOLOOKUP
6. Function Group: admin

Attribute	DB Field	Data Type	SREL References	Flags
enum	enum	INTEGER		
sym	sym	STRING		
description	description	STRING		
delete_flag	del	INTEGER		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	SREL	cnt	

pdmMacroType Object

This object contains macro form types (detail or list). The object details are as follows:

1. Associated Table: usp_pdmMacroType
2. Factories: default
3. REL_ATTR: enum
4. Common Name: name

5. UI_INFO: NOLOOKUP
6. Function Group: admin

Attribute	DB Field	Data Type	SREL References	Flags
enum	enum	INTEGER		
sym	sym	STRING		
description	description	STRING		
delete_flag	del	INTEGER		
last_mod_dt	last_mod_dt	DATE		
last_mod_by	last_mod_by	SREL	cnt	

Layout

This article contains the following topics:

menu_bar Object

The object details are as follows:

1. Associated Table: usp_menu_bar
2. Factories: default
3. REL_ATTR: id
4. Common Name: name
5. Function Group: Security
6. REST Operations: CREATE READ UPDATE

tenant	tenant	UUID	ca_tenant	

sa_patch_history Object

The object details are as follows:

1. Associated Table: sa_patch_history
2. Factories: default
3. REL_ATTR: id
4. Common Name: patch_name
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
patch_name	patch_name	STRING 100		REQUIRED
release_base	release_base	STRING 50		REQUIRED
build_version	build_version	STRING 50		
epoch	epoch	LOCAL_TIME		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_portal_component Object

The object details are as follows:

1. Associated Table: sa_portal_component
2. Factories: default
3. REL_ATTR: id
4. Common Name: name
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
name	name	STRING 50		REQUIRED
URL	URL	STRING 255		REQUIRED
beforeLogin	beforeLogin	INTEGER		
afterLogin	afterLogin	INTEGER		
beforeProbDef	beforeProbDef	INTEGER		
afterProbDef	afterProbDef	INTEGER		
displayColumn	displayColumn	INTEGER		
displayIndex	displayIndex	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_property Object

The object details are as follows:

1. Associated Table: sa_property
2. Factories: default
3. REL_ATTR: id
4. Common Name: propertyName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
propertyName	propertyName	STRING 30		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_sd_user_map Object

The object details are as follows:

1. Associated Table: sa_sd_user_map
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
SDUUID	SDUUID	UUID		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_sdconfig Object

The object details are as follows:

1. Associated Table: sa_sdconfig
2. Factories: default
3. REL_ATTR: id
4. Common Name: propertyKey
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
propertyKey	propertyKey	STRING 50		REQUIRED
propertyValue	propertyValue	STRING 512		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_sdgroup_map Object

The object details are as follows:

1. Associated Table: sa_sdgroup_map
2. Factories: default
3. REL_ATTR: id
4. Common Name: SDTicketID
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupID	groupID	SREL	sa_group	REQUIRED
SDTicketID	SDTicketIT	STRING 50		REQUIRED

SDRefNum	SDRefNum	STRING 50		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME

roleID	roleID	SREL	sa_role	REQUIRED
sessionID	sessionID	SREL	sa_login_ session	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_division_tool_join Object

The object details are as follows:

1. Associated Table: sa_division_tool_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
toolID	toolID	SREL	sa_tool	REQUIRED
enabled	enabled	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Direct Session

This topic contains the following information:

sa_direct_session Object

The object details are as follows:

1. Associated Table: sa_direct_session
2. Factories: default
3. REL_ATTR: id
4. Common Name: code
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
code	code	STRING 100		REQUIRED
groupID	groupID	SREL	sa_group	
expired	expired	LOCAL_TIME		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

Attribute	DB Field	Data Type	SREL References	Flags
tenant	tenant	UUID	ca_tenant	

sa_direct_session_page Object

The object details are as follows:

1. Associated Table: sa_direct_session_page
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
stage	stage	INTEGER		REQUIRED
epoch	epoch	LOCAL_TIME		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_direct_session_preset Object

The object details are as follows:

1. Associated Table: sa_direct_session_preset
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
responseID	responseID	SREL	sa_chat_preset	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Events

This topic contains the following information:

sa_event_history Object

The object details are as follows:

1. Associated Table: sa_event_history
2. Factories: default
3. REL_ATTR: id
4. Common Name: sd_obj_type
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
eventEpoch	eventEpoch	LOCAL_TIME		REQUIRED
eventType	eventType	SREL	sa_event_type	REQUIRED
sd_obj_type	sd_obj_type	STRING 10		
sd_obj_id	sd_obj_id	INTEGER		
cr_rel	cr_rel	SREL	Call_Req	
iss_rel	iss_rel	SREL	Issue	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_event_history_param Object

The object details are as follows:

1. Associated Table: sa_event_history_param
2. Factories: default
3. REL_ATTR: id
4. Common Name: paramValue
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
eventID	eventID	SREL	sa_event_ history	REQUIRED
paramID	paramID	SREL	sa_event_type_param	REQUIRED
paramValue	paramValu	STRING 4000		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_event_type Object

The object details are as follows:

1. Associated Table: sa_event_type
2. Factories: default
3. REL_ATTR: id
4. Common Name: displayTemplate
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
displayTemplate	displayTemplate	STRING 255		
eventDescription	eventDescription	STRING 50		
localizationID	localizationID	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

Support Automation Group

This topic contains the following information:

sa_group Object

The object details are as follows:

1. Associated Table: sa_group
2. Factories: default
3. REL_ATTR: id
4. Common Name: groupName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupName	groupName	STRING 100		
startEpoch	startEpoch	LOCAL_TIME		
endEpoch	endEpoch	LOCAL_TIME		
isCurrent	isCurrent	INTEGER		
owner SessionID	owner SessionID	SREL	sa_login_session	
status	status	INTEGER		
escalation Date	escalation Date	LOCAL_TIME		
creatorUser ID	creatorUser ID	SREL	cnt	
originalGroup ID	originalGroup ID	SREL	sa_group	
categoryID	categoryID	SREL	sa_custom_ category	
groupType	groupType	INTEGER		
sd_obj_type	sd_obj_type	STRING 10		
sd_obj_id	sd_obj_id	INTEGER		
cr_rel	cr_rel	SREL	cr.persistent_id	
iss_rel	iss_rel	SREL	iss.persistent_id	
user_route_ rel	user_route_ rel	SREL	sa_user_route.id (http://sa_user_route.id/)	
isscat_rel	isscat_rel	SREL	isscat.code	
pcat_rel	pcat_rel	SREL	pcat.persistent_id	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_group_current_user Object

The object details are as follows:

1. Associated Table: sa_group_current_user
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupID	groupID	SREL	sa_group	REQUIRED
sessionID	sessionID	SREL	sa_login_ session	REQUIRED
directedURL	directedURL	STRING 500		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_group_event_join Object

The object details are as follows:

1. Associated Table: sa_group_event_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupID	groupID	SREL	sa_group	REQUIRED
eventID	eventID	SREL	sa_event_history	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_group_history Object

The object details are as follows:

1. Associated Table: sa_group_history
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupID	groupID	SREL	sa_group	REQUIRED
startEpoch	startEpoch	LOCAL_TIME		REQUIRED
endEpoch	endEpoch	LOCAL_TIME		REQUIRED
sessionID	sessionID	SREL	sa_login_session	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_group_tool_invocation Object

The object details are as follows:

1. Associated Table: sa_group_tool_invocation
2. Factories: default
3. REL_ATTR: id
4. Common Name: toolStartTime
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
groupID	groupID	SREL	sa_group	REQUIRED
toolID	toolID	SREL	sa_tool	REQUIRED
toolInstanceID	toolInstanceID	SREL	sa_tool_ instance	REQUIRED
toolStartEpoch	toolStartEpoch	LOCAL_TIME		REQUIRED
toolStartTime	toolStartTime	STRING 50		

Attribute	DB Field	Data Type	SREL References	Flags
toolInstance LogID	toolInstance LogID	SREL	sa_tool_ instance_log	
extraData	extraData	STRING 100		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Guest

This topic contains the following information:

sa_guest_agent_code Object

The object details are as follows:

1. Associated Table: sa_guest_agent_code
2. Factories: default
3. REL_ATTR: id
4. Common Name: agentCode
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
agentCode	agentCode	STRING 5		REQUIRED
groupID	groupID	SREL	sa_group	
createdEpoch	createdEpoch	LOCAL_TIME		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_guest_profile Object

The object details are as follows:

1. Associated Table: sa_guest_profile
2. Factories: default
3. REL_ATTR: id

4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
sessionID	sessionID	SREL	sa_login_session	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_guest_user_field Object

The object details are as follows:

1. Associated Table: sa_guest_user_field
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
fieldID	fieldID	SREL	sa_field	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Milepost

This topic contains the following information:

sa_milepost Object

The object details are as follows:

1. Associated Table: sa_milepost
2. Factories: default

3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
sessionID	sessionID	SREL	sa_login_session	REQUIRED
milepost	milepost	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_milepost_history Object

The object details are as follows:

1. Associated Table: sa_milepost_history
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
sessionID	sessionID	SREL	sa_login_session	REQUIRED
milepost	milepost	INTEGER		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Queue

This topic contains the following information:

- sa_queue_summary_field Object (see page 4680)
- sa_queue_tool_join Object (see page 4681)

sa_queue_transfer_target Object

The object details are as follows:

1. Associated Table: sa_queue_transfer_target
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
roleID	roleID	SREl	sa_role	REQUIRED
queueID	queueID	SREL	sa_queue	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_queued_group Object

The object details are as follows:

1. Associated Table: sa_queued_group
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueID	queueID	SREL	sa_queue	REQUIRED
groupID	groupID	SREL	sa_group	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_queued_user

The object details are as follows:

1. Associated Table: sa_queued_user
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueID	queueID	SREL	sa_queue	REQUIRED
sessionID	sessionID	SREL	sa_login_session	REQUIRED
entryEpoch	entryEpoch	LOCAL_TIME		
status	status	INTEGER		
user_route_rel	user_route_rel	SREL	sa_user_route	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_queue Object

The object details are as follows:

1. Associated Table: sa_queue
2. Factories: default
3. REL_ATTR: id
4. Common Name: queueName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueName	queueName	STRING 100		REQUIRED
isDefault	isDefault	SREL	bool.enum	
isActive	isActive	SREL	actrbool.enum	
enableAuto Matching	enableAuto Matching	INTEGER		

enableAuto Escalation	enableAuto Escalation	INTEGER		
escalation Timeout	escalation Timeout	INTEGER		
escalation TargetQueue	escalation TargetQueue	SREL	sa_queue	
customer DisplayName	customer DisplayName	STRING 100		REQUIRED
onDeck Priority	onDeck Priority	INTEGER		
categoryID	categoryID	SREL	sa_custom_ category	
responseID	responseID	SREL	sa_chat_preset	
isscat_rel	isscat_rel	SREL	isscat.code	
pcat_rel	pcat_rel	SREL	pcat.persistent_id	
cr_template	cr_template	SREL	cr.persistent_id	
iss_template	iss_template	SREL	iss.persistent_id	
workshift	workshift	SREL	wrkshft.persistent_ id	
is_special	is_special	SREL	bool.enum	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIM E		

sa_queue_hour_setting Object

The object details are as follows:

1. Associated Table: sa_queue_hour_setting
2. Factories: default
3. REL_ATTR: id
4. Common Name: url
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueID	queueID	SREL	sa_queue	REQUIRED
url	url	STRING 2048		
isExternal	isExternal	INTEGER		
useHours	useHours	SREL	sa_hour_ operation_mode	
last_mod_by	last_mod_by	UUID	ca_contact	

last_mod_dt	last_mod_dt	LOCAL_TIME	
tenant	tenant	UUID	ca_tenant

sa_queue_localized Object

The object details are as follows:

1. Associated Table: sa_queue_localized
2. Factories: default
3. REL_ATTR: id
4. Common Name: customerDisplayName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueID	queueID	SREL	sa_queue	REQUIRED
localizationID	localizationID	SREL	sa_localization	REQUIRED
customer DisplayName	customer DisplayName	STRING 100		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_queue_summary_field Object

The object details are as follows:

1. Associated Table: sa_queue_summary_field
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
fieldID	fieldID	SREL	sa_field	REQUIRED

Attribute	DB Field	Data Type	SREL References	Flags
fieldOrder	fieldOrder	INTEGER		REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_queue_tool_join Object

The object details are as follows:

1. Associated Table: sa_queue_tool_join
2. Factories: default
3. REL_ATTR: id

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
queueID	queueID	SREL	sa_queue	REQUIRED
toolID	toolID	SREL	sa_tool	
displayOrder	displayOrder	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

Support Automation Role

This topic contains the following information:

sa_role Object

The object details are as follows:

1. Associated Table: sa_role
2. Factories: default
3. REL_ATTR: id
4. Common Name: roleName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
roleName	roleName	STRING 100		
isAgent	isAgent	INTEGER		
default SecurityGroup	default SecurityGroup	SREL	sa_security_ group	
joinSession	joinSession	INTEGER		
allowSecLevel Change	allowSecLevel Change	INTEGER		
isActive	isActive	SREL	actrbool.enum	
onDeck	onDeck	INTEGER		
allow_script_ide	allow_script_ide	INTEGER		
sa_client_ launch_node	sa_client_ launch_node	INTEGER		
description	description	STRING 1024		
queues	queues	BREL	sa_role_ queue_join	
target_queues	target_queues	BREL	sa_queue_transfer _target	
security_grps	security_grps	BREL	sa_security_grp_ role_join

assigned_ scripts	assigned_ scripts	BREL	sa_script_role_join	
last_mod_dt	last_mod_dt	LOCAL_TIME		
last_mod_by	last_mod_by	UUID	ca_contact	

sa_role_queue_join Object

The object details are as follows:

1. Associated Table: sa_role_queue_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
roleID	roleID	SREL	sa_role	REQUIRED
queueID	queueID	SREL	sa_queue	REQUIRED

Attribute	DB Field	Data Type	SREL References	Flags
isDefault	isDefault	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_role_tool_join Object

The object details are as follows:

1. Associated Table: sa_role_tool_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
roleID	roleID	SREL	sa_role	REQUIRED
toolID	toolID	SREL	sa_tool	
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_role_tool_non_art_join Object

The object details are as follows:

1. Associated Table: sa_role_tool_non_art_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
roleID	roleID	SREL	sa_role	REQUIRED
toolID	toolID	SREL	sa_tool_non_art	REQUIRED

Attribute	DB Field	Data Type	SREL References	Flags
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

Support Automation Script

This topic contains the following information:

sa_script Object

The object details are as follows:

1. Associated Table: sa_script
2. Factories: default
3. REL_ATTR: id
4. Common Name: scriptName
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
scriptText	scriptText	INTEGER		
scriptName	scriptName	STRING 128		
script Description	script Description	STRING 2000		
isLocked	isLocked	INTEGER		
version	version	INTEGER		
GUID	GUID	STRING 255		
credLogin	credLogin	STRING 50		

Attribute	DB Field	Data Type	SREL References	Flags
credPswd	credPswd	STRING 255		
credPswdPlain	credPswdPlain	LOCAL STRING		
credDomain	credDomain	STRING 50		
impersonate	impersonate	INTEGER		
credentials Type	credentials Type	INTEGER		
disclaimer	disclaimer	SREl	sa_disclaimer	
surveyID	surveyID	SREL	sa_survey	
percentShown	percentShown	INTEGER		
loginRequired	loginRequired	INTEGER		
restrict Functions	restrict Functions	iNTEGER		
scriptTimeout	scriptTimeout	INTEGER		
wsEnabled	wsEnabled	INTEGER		
groupID	groupID	SREL	sa_script_group	REQUIRED
securityFunctions	securityFunctions	BREL	sa_script_ security_join	
assigned_roles	BREL	BREL	sa_script_role_ join	
last_mod_dt	last_mod_dt	LOCAL_TIME		
last_mod_by	last_mod_by	UUID	ca_contact	
tenant	tenant	UUID	ca_tenant	

sa_script_acquired_data Object

The object details are as follows:

1. Associated Table: sa_script_acquired_data
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
sessionID	sessionID	SREL	sa_login_session	REQUIRED
scriptID	scriptID	SREL	sa_script	REQUIRED
scriptInstance ID	scriptInstance ID	SREL	sa_script_ execution_log	REQUIRED
epoch	epoch	LOCAL_TIME		REQUIRED
acquiredData	acquiredData	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	

Attribute	DB Field	Data Type	SREL References	Flags
last_mod_dt	last_mod_dt	LOCAL_TIME		

sa_script_exec_log_join Object

The object details are as follows:

1. Associated Table: sa_role_tool_join
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
scriptInstanceID	scriptInstanceID	SREL	sa_script_ execution	REQUIRED
eventID	eventID	SREL	sa_event_ history	REQUIRED
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		
tenant	tenant	UUID	ca_tenant	

sa_script_exec_status Object

The object details are as follows:

1. Associated Table: sa_script_exec_status
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
eventID	eventID	SREL	sa_event_history	REQUIRED
scriptID	scriptID	SREL	sa_script	REQUIRED
executedStatus	executedStatus	INTEGER		
last_mod_by	last_mod_by	UUID	ca_contact	
last_mod_dt	last_mod_dt	LOCAL_TIME		

Attribute	DB Field	Data Type	SREL References	Flags
tenant	tenant	UUID	ca_tenant	

sa_script_execution_log Object

The object details are as follows:

1. Associated Table: sa_script_execution_log
2. Factories: default
3. REL_ATTR: id
4. Common Name: id
5. REST Operations: CREATE READ UPDATE

Attribute	DB Field	Data Type	SREL References	Flags
id	id	INTEGER		UNIQUE NOT_NULL KEY
scriptID	scriptID	SREL	sa_script	REQUIRED
selfServe SessionID	selfServe SessionID	SREl	sa_self_serve_ session	REQUIRED

CA Service Catalog Glossary

accounts

Accounts are part of a business unit. Accounts are used to subscribe and request services. Charges are applied at the account level in Service Accounting Component.

action

An *action* is the smallest unit of work in the Rule Management Engine. This task is executed when a rule gets notified. Examples include sending an email, running a script, and running Java code.

Activity Based Costing (ABC)

Activity Based Costing is a costing methodology that is used to trace overhead costs directly to cost objects. The cost objects can be products, processes, services, or customers. This costing methodology helps managers to make the right decisions regarding product mix and competitive strategies.

Activity Based Management (ABM)

Activity Based Management uses Activity Based Cost information to allocate resources more effectively during budgeting and planning processes.

adjustments

Adjustments are credits or debits applied to services, individual charges of a Service Option Group, and SLA violations. These adjustments are either a fixed dollar amount or a percentage. Several types of general and SLA violation adjustments are available.

batch print job

A *batch print job* is a collection of invoices that have been grouped according to the specified credentials. After the collection has been created, it remains unchanged. The invoices can then be printed as a whole or individually at any time.

business unit

The *business unit* is a branch in the organizational structure. This organizational unit has some characteristics of the service provider and all characteristics of a sub-department.

CA Embedded Entitlements Manager (CA EEM)

CA Embedded Entitlements Manager provides enterprises with the ability to manage the identities of their employees, partners, and customers. CA EEM can also provision web services, and applications to the users, and define authentication and authorization policies.

cost allocation

Cost allocation is a method to determine the cost of services that are provided to users of that service. This method does not determine the price of the service, but rather it determines the cost of providing the service.

cost element

A *cost element* is a resource that is used to subdivide costs corresponding to the consumption of a particular service. Cost Element is the amount that is paid for a resource that an activity consumes and included in the activity cost pool. Such information helps validating that the overhead calculated at the beginning of the process is the same as the overhead that is assigned to each individual product using ABC.

cost pool

A *cost pool* is a grouping of all cost elements that are associated with an activity.

Dashboard Library

A *Dashboard Library* is a hierarchical tree structure of name spaces facilitating the sharing of information. The Dashboard Library does not hold actual data. Instead, it stores information about how the data can be accessed.

data collector (DC)

A *data collector* collects data for particular metrics.

data mediation profile

The *data mediation profile* is a definition of the data feed and structure of the external data. Data Mediation Profile also provides features to manipulate and normalize usage event data.

data object

A *data object* defines the data for a chart or table. The data object source can be a SQL database, comma-separated file, or any data source that a Java plug-in can access. Data objects are managed in folders to help categorize them by purpose.

data view

A *data view* formats the data that a data object produces. Data can be presented in tabular or chart format or both. Data views are managed in folders to help categorize them by purpose.

direct costs

Direct costs are those costs that can be easily traced and assigned to activities.

dynamic invoice group

Dynamic invoice groups are invoice groups that contain account lists that are generated dynamically. The invoice groups are generated based on the specified criteria that are stored as a data object.

event filter

An *event filter* can be specified as part of a rule and is used to refine the event. The event filter allows actions that are associated with a rule to be invoked only if certain event conditions are met.

failover

Failover is the process of maintaining an up-to-date copy of a database on an alternate system for backup. The traditional failover architecture is comprised of one system running the application and the other is idle in standby mode. The standby system is ready to take over if the primary system fails. An alternative architecture includes clustering.

invoice group

An *invoice group* is comprised of a set of accounts that can be run together in one instance.

IT Infrastructure Library (ITIL)

ITIL is a set of practices that is used to aid the implementation of a framework for IT Service Management. This customizable framework defines how service management is applied within an organization. ITIL is used across the world as the de-facto standard for best practice in the provision of IT Service.

Although ITIL covers a number of areas, its main focus is on IT Service Management.

Java Runtime Environment (JRE)

Java Runtime Environment or Java Runtime provides the minimum requirements for executing a Java application. JRE consists of the Java Virtual Machine (JVM), core classes, and supporting files. JRE is part of the Java Development Kit (JDK), a set of programming tools for developing Java applications.

Management Database (MDB)

The *Management Database (MDB)* is the CA Management Database schema. The MDB is a common enterprise data repository that integrates CA product suites. The MDB provides a unified database schema for the management data that all CA products store. The CA products can be distributed or

mainframe. Use of the MDB with CA products enables full integration for managing your IT infrastructure. The MDB integrates management data from all IT disciplines and CA products. Customers can extend the MDB Schema to include other IT management data from non-CA software products and tools.

pool worksheets

Pool worksheets are used to trace cost elements to activities to obtain dollar values for each related activity cost pool. Formulas can be used to adjust costs spanning across fiscal periods and sets.

process definition

A *process definition* is a representation of one of your business processes. A process definition is comprised of nodes, events, roles, actors, work, and the criteria for process logic. Running a process definition creates a process instance. You can create multiple process instances of the same process definition.

process instance

A *process instance* represents what is actually happening. By running a process definition, you create a process instance. You can create multiple process instances of the same process definition. Process instances are sometimes called a process definition instance.

proration

Proration is the process of dividing the cost of a subscription over the billing cycle period of an account.

report layout

A *report layout* is used to present multiple report elements as one report. With report layouts, you can design customized reports by using objects such as text, URLs, and multiple data view objects. You can choose sizes, colors, borders/styles, set up snap to grid, and other tools to obtain the desired result. Layouts are managed in folders to help categorize them by purpose.

routing nodes

Routing nodes define the branching of control flow in a Workflow process definition. Choice routing nodes allow one route for the next activity. Parallel routing nodes allow more than one route to be taken.

rule

A *rule* is associated with an event. A rule can have a set of filter conditions that define when the rule is applied. When the filter conditions are satisfied and the rule is enabled, the rule actions are launched.

service

A *service* is a product or an application that your clients can access through a request or a subscription. A service is defined by associating service option groups to the service before it can be subscribed to or requested.

service catalog

A *service catalog* consists of services that a business unit or an entire enterprise publishes. Services are built of one or more service option groups that describe IT services and how to charge for them. The service catalog enables an organization to model its business units and manage the users accounts contained within those units. The service catalog also defines the inclusion, inheritance, dependencies, and associative relationships between each of the published items in the catalog. The published items can be services, service option groups, and service option group definitions. Accounts and users subscribe to or request catalog services. Services in the service catalog can be organized into folders. Each service contains detailed information about the price of the service. Services can represent one or more metrics and include service level agreements.

A *service catalog* is also known as a *catalog*.

Service Level Agreement (SLA)

A *Service Level Agreement* is a contract. This contract specifies the level of service to be provided while the agreement is in effect.

Service Level Objective (SLO)

A *Service Level Objective* is the building block for an SLA. The SLO provides the business objectives or business rules that set the warning and violation threshold levels. The SLO thus determines the success or failure of the overall SLA.

service option element

A *service option element* is the smallest unit of the catalog. This unit defines a piece of text, fee, or an application in a service. Service option elements are grouped or classified in service option groups.

service option group

A *service option group* contains the cost that is associated with subscribing to a service. The cost can be based on transaction, usage-based billing, or rate. Service Option Group can be composed of many types of chargeable and non-chargeable items. For example, rates, applications and agreements.

service worksheets

Service worksheets contain services, service option groups, and service option elements. Service worksheets are used to apply applicable costs to associated services. These costs can be direct or derived from associated activity cost pools. Formulas can be used to adjust costs spanning across fiscal periods and sets.

Simple Object Access Protocol (SOAP)

SOAP is a lightweight, XML-based protocol for exchanging information in a decentralized, distributed environment. SOAP uses HTTP as the transport protocol and XML as the payload encoding scheme. Developers can use any programming language to call the exposed methods of CA Service Catalog, using standard SOAP call syntax.

worksheets

Worksheets enable you to define costs that are related to business activities. Service Worksheet and Pool Worksheet are the two types of worksheets.

WSDL

WSDL (Web Services Description Language) is an XML format that is published for describing web services.

CA Service Management Common Data Object Field Level Mapping Details

This section describes the Common Data Object reference field level mapping details for implementers who are using Web Services with CA ITAM, CA SDM, and/or CA Service Catalog. As a CA Service Management solution implementer, you might need field level mapping details between point products like CA SDM, CA ITAM, CA Service Catalog in order to leverage the mapping information.

This section contains the following topics:

Field Level Reference Mapping for ca_company

Contents

The ca_company table describes the CA ITAM and CA Service Desk Manager reference mapping details.

CA ITAM Department	CA SDM Department	Database Column Name	Data Type
companyid	id	company_uuid	UUID
value	Company Name	company_name	string
companytypekey	company_type	company_type	Number
alias	alias	alias	String
bbs	bbs	bbs	String
inactiveflag	delete_flag	inactive	boolean
description	description	description	string
creationdate	creatioin_date	creation_date	date
creationuser	creation_user	creation_user	string
lastupdatedate	last_mod	last_update_date	date
lastupdateuser	last_update_user	last_update_user	String
description	description	description	String
defaultlocationid	location_uuid	location_uuid	UUID
fiscalmonthkey	month_fiscal_year_ends	month_fiscal_year_ends	Number
parentcompanyid	parent_company_uuid	parent_company_uuid	UUID
primarycontactid	primary_contact_uuid	primary_contact_uuid	UUID
website	web_address	web_address	String
Assetcount	(Not Applicable)	Asset_count	Number
Divisionid	(Not Applicable)	Division_id	Number
Domainuuid	(Not Applicable)	Domain_uuid	UUID
Duplicateid	(Not Applicable)	Duplicate_with_uuid	UUID
Employeecount	(Not Applicable)	Employee_count	Number
Fastflag	(Not Applicable)	Fast_flag	Number
siiaflag	(Not Applicable)	siia_flag	Number

CA ITAM Department	CA SDM Department	Database Column Name	Data Type
Sourcetypeid	(Not Applicable)	Source_type_id	Number
Userpriorityflag	(Not Applicable)	User_priority_flag	Number
(Not Applicable)	authentication_password	authentication_password	String
(Not Applicable)	authentication_user_name	authentication_user_name	number
(Not Applicable)	delete_time	delete_time	number
(Not Applicable)	exclude_registration	exclude_registration	Integer

Field Level Reference Mapping for ca_location

The ca_location table describes the field level reference mapping details for CA ITAM, CA Service Desk Manager, and CA Service Catalog.

CA ITAM Location	CA SDM Location	CA Service Catalog Location	DB Column Name	Data Type
Locationid	Id	(Not Applicable)	Location_uuid	UUID
Location Name	name	Name	Location_name	String
address1	address1	Address	address_1	String
address2	address2	Address	address_2	String
address3	address3	Address	address_3	String
address4	address4	Address	address_4	String
address5	address5	Address	address_5	String
address6	address6	Address	address_6	String
city	city	City	city	String
stateprovincekey	state	State/Province	state	Number
zip	zip	ZIP/Postal Code	zip	String
telephone	pri_phone_number	Primary Phone	pri_phone_number	String
fax	fax_number	Fax Number	fax_number	String
inactiveflag	delete_flag	(Not Applicable)	inactive	Boolean (1 or 0)
creationuser	(Not Applicable)	(Not Applicable)	Creation_user	String
creationdate	(Not Applicable)	(Not Applicable)	Creation_date	Long Number
lastupdateuser	last_update_user	(Not Applicable)	Last_update_user	String
lastupdatedate	last_mod	(Not Applicable)	Last_update_date	Long Number
locationtypekey	(Not Applicable)	(Not Applicable)	location_type_id	Number
countrykey	Country	Country	country	Number
regionid	(Not Applicable)	(Not Applicable)	region_id	Number
mailaddress1	mail_address1	(Not Applicable)	mail_address_1	String
mailaddress2	mail_address2	(Not Applicable)	mail_address_2	String

CA ITAM Location	CA SDM Location	CA Service Catalog Location	DB Column Name	Data Type
mailaddress3	mail_address3	(Not Applicable)	mail_address_3	String
mailaddress4	mail_address4	(Not Applicable)	mail_address_4	String
mailaddress5	mail_address5	(Not Applicable)	mail_address_5	String
mailaddress6	mail_address6	(Not Applicable)	mail_address_6	String
county	county	(Not Applicable)	county	String
siteid	Site	(Not Applicable)	site_id	Number
comments	description	Description	comments	String
organizationid	(Not Applicable)	(Not Applicable)	organization_uuid	UUID
individualid	primary_contact_uuid	(Not Applicable)	primary_contact_uuid	UUID
parentlocationid	(Not Applicable)	(Not Applicable)	parent_location_uuid	UUID

Field Level Reference Mapping for ca_site

The ca_site table describes the CA ITAM and CA SDM field level reference mapping details.

CA ITAM Site	CA SDM Site	Database Column Name	Data Type
siteid	id	Site_id	Number
sitename	name	name	String
inactiveflag	delete_flag	inactive	Boolean (1 or 0)
contactid	contact	contact_uuid	UUID
alias	alias	alias	String
description	description	description	String
lastupdatedate	last_mod	last_update_date	Number
lastupdateuser	last_update_user	last_update_user	String
creationdate	creation_date	creation_date	Number
creationuser	creation_user	creation_user	String

Field Level Reference Mapping for ca_organization

The ca_organization table describes the field reference mapping details CA ITAM and CA Service Desk Manager.

CA ITAM Organization	CA SDM Organization	Column Name	DataType
Organizationid	id	Organization_uuid	UUID

CA ITAM Organization	CA SDM Organization	Column Name	DataType
Name	name	name	String
abbreviation	org_num	abbreviation	String
inactiveflag	delete_flag	inactive	Boolean
primaryphonenumber	phone_number	pri_phone_number	String
altphonenumber	alt_phone	alt_phone_number	String
faxnumber	fax_phone	fax_number	String
contactid	contact	contact_uuid	UUID
emailaddress	email_addr	email_address	String
pageremailaddress	pemail_addr	pager_email_address	String
costcenterkey	billing_code	cost_center	Number
locationid	location	location_uuid	UUID
description	Description	description	String
lastupdatedate	last_mod	last_update_date	Number
lastupdateuser	Last Modified By	last_update_user	String
parentorganizationid	(Not Applicable)	parent_org_uuid	UUID
creationdate	(Not Applicable)	creation_date	Number
creationuser	(Not Applicable)	creation_user	String
(Not Applicable)	iorg_service_type	Table: usp_organization column: iorg_service_type	String
(Not Applicable)	owning_contract	Table: usp_organization column: owning_contract	Number

Field Level Reference Mapping for ca_owned_resource

The ca_owned_resource table describes the CA ITAM and CA Service Desk Manager reference mapping details.

CA ITAM Asset	CA SDM Configuration Item	Data Type	Ca_owned_resource Column	Reference Database Table
assetid	id	UUID	Own_resource_uuid	(Not Applicable)
assetname	name	String	Resource_name	(Not Applicable)
serialnumber	serial_number	String	Serial_number	(Not Applicable)
altassetid	alt ci id	String	resource_tag	(Not Applicable)
hostname	system_name	String	host_name	(Not Applicable)
dnsname	dns_name	String	dns_name	(Not Applicable)
macaddress	Mac_address	String	mac_address	(Not Applicable)

CA ITAM Asset	CA SDM Configuration Item	Data Type	Ca_owned_resource Column	Reference Database Table
costcenterkey	cost center	Number	cost_center	Ca_resource_cost_center
ci	ci	Boolean	is_ci	(Not Applicable)

creationdate	(Not Applicable)	Date	creation_date	(Not Applicable)
creationuser	(Not Applicable)	String	creation_user	(Not Applicable)

Field Level Reference Mapping for ca_contact

The ca_contact table describes the field level reference mapping details for CA ITAM, CA Service Desk Manager, and CA Service Catalog.

CA ITAM Contact	CA SDM Contact	CA Service Catalog User	Database Column Name	Data Type
lastname	last_name	last name	last_name	string
firstname	first_name	first name	first_name	string
middlename	middle_name	middle name	middle_name	string
companyid	company	(Not Applicable)	company_uuid	uuid
inactiveflag	delete_flag	(Not Applicable)	inactive	boolean (1 or 0)
altcontactid	contact_num	(Not Applicable)	alternate_identifier	string
userid	userid	user id	userid	string
contacttypekey	type	(Not Applicable)	contact_type	number
jobtitlekey	position	job title	job_title	number referring to id column of ca_job_title table
alias	alias	alias	alias	string

CA ITAM Contact	CA SDM Contact	CA Service Catalog User	Database Column Name	Data Type
lastupdatedate	Last_mod	(Not Applicable)	last_update_date	long number
lastupdateuser	last_mod_by	(Not Applicable)	last_update_user	string
telephone	phone_number	primary phone	pri_phone_number	string
fax	fax_phone	fax number	fax_number	string
pagertelephone	beeper_phone	pager number	pager_number	string
alttelephone	alt_phone	Secondary Phone	alttelephone	String
emailid	email_address	Email	email_address	String
pageremailaddress	pemail_address	(Not Applicable)	pager_email_address	String
locationid	location	Location	location_uuid	UUID
organizationid	organization	(Not Applicable)	organization_uuid	UUID
adminorganizationid	admin_org	(Not Applicable)	adminorganizationid	UUID
supervisorid	supervisor_contact_uuid	Manager	supervisor_contact_uuid	UUID
departmentkey	dept	(Not Applicable)	department	Number
costcenterkey	billing_code	(Not Applicable)	cost_center	Number
comments	notes	Description	comments	String
creationdate	(Not Applicable)	(Not Applicable)	Creation_date	Long number
creationuser	(Not Applicable)	(Not Applicable)	Creation_user	String

Field Level Reference Mapping for ca_resource_cost_center

The ca_resource_cost_center table describes the CA ITAM and CA SDM field level reference mapping details.

CA ITAM Cost Center	CA SDM Cost Center	Database Column Name	Data Type
id	id	id	number
value	name	name	string
inactiveflag	delete_flag	inactive	boolean

CA ITAM Cost Center	CA SDM Cost Center	Database Column Name	Data Type
description	description	description	string
creationdate	creation_date	creation_date	date
creationuser	creation_user	creation_user	string
lastupdatedate	last_mod	last_update_date	date
lastupdateuser	last_update_user	last_update_user	string
(Not Applicable)	delete_time	delete_time	number
(Not Applicable)	exclude_registration	exclude_registration	integer

Field Level Reference Mapping for ca_resource_family

The ca_resource_family table describes the CA APM and CA SDM field level reference mapping details.

CA APM Asset Family	CA SDM Family	Database Column Name	Data Type
id	**id**	**id**	**Number**
Value	sym	name	String
inactiveflag	delete_flag	inactive	Boolean
description	description	description	String
lastupdatedate	last_update_date	last_update_date	Number
lastupdateuser	last_update_user	last_update_user	String
extensiontablename	extension_name	table_extension_name	String
physicaltablename	physical_table_name	physical_table_name	String
includereconciliationkey	include_reconciliation	include_reconciliation	Boolean
Is ITAM	(Not Applicable)	is_itam	Boolean
creationdate	(Not Applicable)	creation_date	Number
creationuser	(Not Applicable)	creation_user	String
(Not Applicable)	exclude_registration	exclude_registration	Number

Field Level Reference Mapping for ca_resource_class

The ca_resource_class table describes the CA ITAM and CA Service Desk Manager field level reference mapping details.

CA ITAM Asset Class	CA SDM Class	Database Column Name	Data Type
Value	type	name	String
inactiveflag	delete_flag	inactive	Boolean
description	description	description	String

CA ITAM Asset Class	CA SDM Class	Database Column Name	Data Type
lastupdatedate	last_mod	last_update_date	Number
lastupdateuser	last_update_user	last_update_user	String
creationuser	creation_user	creation_user	String
creationdate	creation_date	creation_date	Number
familyid	family	id	Number
(Not Applicable)	exclude_ registration	exclude_ registration	(Not Applicable)

Field Level Reference Mapping for ca_resource_department

The ca_resource_department table describes the CA ITAM and CA Service Desk Manager field level reference mapping details.

CA ITAM Department	CA SDM Department	Database Column Name	Data Type
name	id	name	string
value	name	name	string
inactiveflag	delete_flag	inactive	boolean
description	description	description	string
creationdate	creation_date	creation_date	date
creationuser	creation_user	creation_user	string
lastupdatedate	last_mod	last_update_date	date
lastupdateuser	last_update_user	last_update_user	string
(Not Applicable)	delete_time	delete_time	number
(Not Applicable)	exclude_registration	exclude_registration	integer

USM Data Mapping for CA Service Desk Manager Connector

When connectors import services and CIs from domain managers, they normalize the classes, properties, relationships, and severities in the domain manager to adhere to the USM schema. This section lists the CA SDM classes, severities, and relationships and their USM mapping after the import.

Note: For more information about CI property mapping, see the CA SDM Connector policy file located at the policy registry location.

More Information:

Device Properties Calculation

Certain CIs, such as ProvisionedSoftware and NIC Card, are mapped to USM CI types that require device properties defined by USM import standards in Catalyst. When device properties are not defined for the CI, the connector uses this property to obtain the information from the system on which the CI is hosted. One or more of the following CI device properties may be required:

- DeviceAssetNumber
- DeviceBiosSystemID
- DeviceDnsName
- DeviceSysName
- DevicePhysSerialNumber
- DeviceMacAddress
- DeviceIPV4Address
- DeviceIPV4AddressWithDomain
- DeviceIPV6Address
- DeviceIPV6AddressWithDomain

CA SDM Connector queries CMDB for the device properties of the CI as follows:

1. Based on the system name, the connector queries CMDB for the CI device properties, and the CI is populated when found. For application discovered CIs in CMDB, the System Name field appears in the following format:

   ```
   SNMP_CI_name| CI_name | file_path
   ```

2. If the SNMP_CI_name does not exist in CMDB and the query fails, the connector uses the DeviceSysName attribute to query CMDB for the device properties of the CI.

3. If the queries described in step 1 and 2 are unsuccessful, the connector uses the DeviceXXXFromRelationship attribute to query CMDB for the CI device properties based on the relationship type.

Device Properties

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Device (USM)	CA SDM Attributes	User Interface
DeviceAssetNumber	Calculated by the connector.	N/A
DeviceBiosSystemID	Calculated by the connector.	N/A
DeviceDnsName	Calculated by the connector.	N/A
DeviceSysName	Calculated by the connector.	System Name
DevicePhysSerialNumber	Calculated by the connector.	N/A
DeviceMacAddress	Calculated by the connector.	N/A
DeviceIPV4Address	Calculated by the connector.	N/A
DeviceIPV4AddressWithDomain	N/A	N/A
DeviceIPV6Address	Calculated by the connector.	N/A
DeviceIPV6AddressWithDomain	N/A	N/A

Mandatory Attributes for CI Mapping in CA Catalyst

The following table shows the mandatory attributes in CA SDM required to populate CIs in CA Catalyst:

USM Family	CMDB Family	Attribute	Format	Comments
Cluster	**Cluster**			
		Serial_num/ asset_num/ DNS name		
Database Instance	**Software. Database**			
		Asset_num		
		Server /System_name	System_name should contain the pipe (|) separated value	System_name example: "SDMServer|SQL|C:\Program Files\SQL\".
Provisioned Software	**Software. COTS**			
		System_name	System_name should contain the pipe (|) separated value	System_name example:

USM Family	CMDB Family	Attribute	Format	Comments
				"SDM Server|Cohesion Agent (Windows)|5.0-SP1|C:\Program Files\CA\Cohesion\Agent".
Media Drive	**Hardware. Storage**			
		System_name	System_name should contain the pipe (|) separated value	System_name example: SDMServer|HardDisk0
Operating System	**Software. Operating System**			
		Server /System_name	System_name should contain the pipe (|) separated value	System_name example: SDMServer|Windows 2008SP2
Virtual System	**Hardware. Virtual Machine**			
		Serial_num/ asset_num/ DNS name		
		system_name		
Computer System	**Hardware. Server**			
		Serial_num/ asset_num/ DNS name		
		system_name		
Port	**Network.Port**			
		Serial_num/ asset_num		
		system_name	System_name should contain the pipe (|) separated value	System_name Example: SDMServer|Apachetomcat
Application Server	**Software. Application Server**			
		asset_num		
		server /system_name		

USM Family	CMDB Family	Attribute	Format	Comments
Application	**Software. Application**			
		server /system_name		
GenericIPDevice	**Network. Hub**			
		Serial_num/ asset_num/ DNS name		
InterfaceCard	**Network. Network Interface Card**			
		Serial_num		
Printer (Network)	**Hardware. Printer**			
		Serial_num/ asset_num/ DNS name		
Router	**Network. Router**			
		Serial_num/ asset_num/ DNS name		
Running Hardware	**Hardware**			
		System_name	System_name should contain the pipe (|) separated value	System_name Example: SDMServer|Disk1
Switch	**Network. Switch**			
		Serial_num/ asset_num/ DNS name		
		system_name		

Relationship Mapping

This topic contains the following information:

Relationship Mapping

The CA SDM classes are transformed into USM types as shown in the following table:

BinaryRelationship	CA SDM Attributes	User Interface / CMDB Relationship Details
SourceMdrProduct	CA:00020	n/a
SourceMdrProdInstance	<primary server host name>	n/a
SourceMdrElementID	nr.persid/chg.persid/cr.persid	<bop_dump>
SourceCorrelatedKey	n/a	n/a
TargetMdrProduct	CA:00020	n/a
TargetMdrProdInstance	<primary server host name>	n/a
TargetMdrElementID	nr.persid/chg.persid/cr.persid	<bop_dump>
ScopeMdrProduct	CA:00020	n/a
ScopeMdrProdInstance	<primary server host name>	n/a
ScopeMdrElementID	Configured by the connector	<bop_dump>
Significance	n/a	n/a
Semantic	Bmhier:ci_rel_type	CMDB Relationships tab; Relationship

Relationship Semantic Mapping

The relationship semantic mapping is shown in the following table:

CA SDM <Property>	USM Type
Change, Problem, Incident, Request	IsImpactedBy
IsRequiredBy	HasRequirementFor
Connects To	IsConnectedTo
Contains	IsPartOf
Is Source Code For	IsInstanceOf
Hosts	IsHostedBy
Manages	IsManagedBy
IsUsedBy	HasAccessTo
Monitors	IsDiscoveredBy
Supports	IsAffectedBy

CA SDM <Property>	USM Type
Runs	HasMember
Is The Child Of	HasDetail
Is Location For	IsResidentOf
Administers	HasContact
Is Primary Contact For	HasContact
Is Business Owner Of	HasContact
Approves	HasContact
Has As Assignee	HasContact
Financially Belongs To	IsComposedOf
Is Bound To	IsBoundTo
Is Clone Of	IsCloneOf
Is Composed Of	IsComposedOf
Is Evolution Of	IsEvolutionOf
Is Result Of	IsResultOf
Is Successor Of	IsSuccessorOf
Is Triggered By	IsTriggeredBy
Is Affected By	IsAffectedBy
Has Member	HasMember
Is Discovered By	IsDiscoveredBy
Manages	IsManagedBy
Has Access To	HasAccessTo
Is Required By	HasRequirementFor
Is Triggered By	Is Triggered By
Has Detail	HasDetail
Is Successor Of	IsSuccessorOf
Is Source Code For	IsInstanceOf
Is Result Of	IsResultOf
Is Primary Contact For	HasContact
Is Location For	IsResidentOf
Is Evolution Of	IsEvolutionOf
Is Composed Of	IsComposedOf
Is Clone Of	IsCloneOf
Is Business Owner Of	HasContact
Is Bound To	IsBoundTo
Hosts	IsHostedBy
Has As Assignee	HasContact

Severity Mapping

The following table shows how the CA SDM Connector maps alert severities to USM severities:

CA SDM Connector Alerts	USM Severity
Too Many Open Incidents	Critical
SLA to Expire	Major
SLA Violated	Critical
Upcoming Maintenance Window	Critical
Upcoming Blackout Window	Critical

Note: In CA SDM, blackout windows are not configured with CIs, therefore, they do not appear in the Service Console. You can, however, view blackout windows for CIs in the REST interface by disabling the useAlertFilter through the Connector Controls panel.

Type Mapping

When connectors import services and CIs from domain managers, they normalize the classes in the domain manager to the standard USM types. This section lists the CA SDM classes and their mapping after the import.

The CMDB classes are transformed into USM types for CIs as shown in the following table:

USM Type (entitytype = CI)	User interface CI detail where CMDB family = ...
Application	Software.Application
ApplicationServer	Software.Application Server
Cluster	Cluster
ComputerSystem	Hardware.Server
DatabaseInstance	Software.Database
GenericIPDevice	Network.Hub
InterfaceCard	Network.Network Interface Card
MediaDrive	Hardware.Storage
OperatingSystem	Software.Operating System
Port	Network.Port
ProvisionedSoftware	Software.COTS
Printer (Network)	Hardware.Printer
Router	Network.Router

USM Type (entitytype = CI)	User interface CI detail where CMDB family = ...
RunningHardware	Hardware
Service	Enterprise.Service/Service
Switch	Network.Switch
VirtualSystem	Hardware.VirtualMachine

The CA SDM classes are transformed into USM types for other elements as shown in the following table:

USM type (entitytype = other elements)	CA SDM CMDB Definition	User Interface
Change Order	SDM: chg	Change Order
Incident	SDM: cr WHERE cr.type='I'	Incident
Location	SDM:loc CMDB: ci_location	Location
OrganizationEntity	SDM: org CMDB: ci_organization	Organization
Person	SDM: cnt WHERE cnt.type!=2308 CMDB: ci_contact	Contact
Problem	SDM: cr WHERE cr.type='P'	Problem
Request	SDM: cr WHERE cr.type='R'	Request

Application

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

Application (USM)	CA Service Management Attribute	User Interface (CI detail form)
Description	nr.description	
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)

Application (USM)	CA Service Management Attribute	User Interface (CI detail form)
ProductName	nr.name (http://nr.name)	Name
Version	app_extx.version	Attributes tab version
MajorVersion	n/a	n/a
BuildNumber	n/a	n/a
ServiceLevel	n/a	n/a
Device properties required (see page 4738)	n/a	n/a
ProcessID	n/a	n/a
AccessedViaTcpPort	n/a	n/a
ProcessDistinguishingID	app_extx. app_id	Attributes tab; Application ID

ApplicationServer

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

ApplicationServer (USM)	CA SDM Attribute	User Interface (CI detail form)
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
ProductName	nr.name (http://nr.name)	Name
Version	app_extx.version	Attributes tab version
MajorVersion	n/a	n/a
BuildNumber	n/a	n/a
ServiceLevel	n/a	n/a
Device properties required (see page 4739)	n/a	n/a
ProcessID	n/a	n/a
AccessedViaTcpPort	n/a	n/a
ProcessDistinguishingID	app_extx. app_id	Attributes tab; Application ID
AppServerType	app_extx.type	Attributes tab; Type

Change Order

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

ChangeOrder (USM Type)	CA SDM Attributes	User Interface
AssignedID	chg.chg_reg_num	Text on button bar (left side)
IsTemplate	n/a	n/a
TemplateUsed	n/a	n/a
Severity	n/a	n/a
IsActive	issue 157	n/a
Urgency	n/a	n/a
Impact	chg.mpact; imp.sym	Impact
Priority	chg.priority; pri.sym	Priority
Open Timestamp	chg.target_start_last	Open Date (above tabs)
CallbackTimestamp	chg.call_back_date	Call Back Date/Time
Resolution Timestamp	chg.resolve_date	Resolve Date (above tabs)
Closure Timestamp	chg.close_date	Close Date (above tabs)
ChargebackID	n/a	n/a
RootCause	chg.rc	Root Cause
SolutionUrls	n/a	n/a
NeedByDate	chg.need_by	Need By Date
COType [COTypeEnum]	chg.chgtype; chgtype.sym	Type
RequiresCabApproval	chg.cab_approval	CAB Approval
COStatus [COStatusEnum]	chg.chgtype; chgtype.sym	Status
CompletionCode	chg.closure_code; closure_code.sym	Closure Code
FulfillmentData	n/a	config.items

ChangeOrder (USM Type)	CA SDM Attributes	User Interface
ChangeBackedOut [ChageReversonEnum]	n/a	n/a
COCategory [CoCategoryEnum]	chg.category; chgcat.code	Category
EstimatedCost	chg.est_cost	Costs/Plans tab; Est Cost
ActualCost	chg.cost	Costs/Plans tab; Actual Cost
Currency [CurrencyEnum]	n/a	n/a
EstimatedStartDate	chg.sched_start_date	Schedule Start Date
Estimated TotalTime	chg.sched_duration	Schedule Duration
ActualStartDate	chg.actual_start_date	Costs/Plans tab; Actual Implementation Start Date
ActualTotalTime	chg.actual_total_time	Costs/Plans tab; Actual Duration
ProjectID	chg.project; nr.family.extension_name; projex.clarity_id (if null, then use the chg.project.name (http://chg.project.name))	n/a
BusinessCase	chg.business_case	Costs/Plans tab; Business Case
Effort	chg.effort	Costs/Plans tab; Implementation Plan

Cluster

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Cluster (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
PrimaryIPV4Address	nr.alarm_id if IPV4 is formatted	Inventory tab; IP Address (V4)
PrimaryIPV6AddressWithDomain	n/a	n/a
PrimaryIPV6Address	nr.alarm_id if IPV6 is formatted	

Cluster (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
		Inventory tab; IP Address (V6)
PrimaryIPV4AddressWithDomain	n/a	n/a
GroupName	nr.name (http://nr.name)	Attributes Network Name
PrimaryIPV4AddressWithDomain	n/a	n/a
MemberCriteria	net_clux.quorum	Attributes; Quorum
PrimaryDnsName	nr.dns name	DNS Name
LoadBalancingType	n/a	n/a
usm-core2: MemberStatus	n/a	
InstanceName	<<AUTO-GENERATED BY GLOBAL Policy>>	
NamedAliases	<<AUTO-GENERATED BY GLOBAL Policy>>	
Label	<<AUTO-GENERATED BY GLOBAL Policy>>	
Tags	<<AUTO-GENERATED BY GLOBAL Policy>>	
Description	nr.description	
CreationTimestamp	nr.creation_user	
CreationUserName	nr.creation_date	
LastModTimestamp	nr.last_mod	
UrlParams	"nr"	

Common CI Properties

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
MdrProduct	ConnectorConfigMdrProduct	n/a
MdrProdInstance	ConnectorConfigMdrProdInstance	n/a
MdrElementID	nr.persid (Outbound)	<bop_dump>
UrlParams	nr	n/a
NamedAliases	nr.name (http://nr.name), nr.system_name, nr.dns_name	Name, Host Name, Dns Name
Label		n/a

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
	Auto generated by GLOBAL policy	
Description	nr.description	Notes
TenantID	nr.tenant	Tenant ID
Tags	Auto generated by GLOBAL policy	n/a
CreationTimestamp	nr.creation_date	<bop_dump>
CreationUserName	nr.creation.user	<bop_dump>
LastModTimestamp	nr.last_mod	<bop_dump>
LastModActivity	Generated by connector.	n/a
LastModUserName	nr.last_mod_by	<bop_dump>
Deletion Timestamp	This is the timestamp when the CI became inactive in SDM.	<bop_dump>
DeletionUserName	nr.last_mod_by (When it is deleted)	n/a
InstanceName	Auto generated by GLOBAL policy	n/a
TypeName	n/a	n/a
AdministrativeStatus	nr.status.sym [rss]	Inventory tab; Service Status (Ensure that AdministrativeStatus corresponds with AdministrativeStatusEnum in the connector policy)
Retirement Timestamp	nr.retire_date	Attributes tab; Retire Date
IsInMaintenance	nr.status.sym [rss]	Inventory tab; Service Status
MaintStartTimestamp	n/a	n/a
MainExpectedDuration	n/a	n/a
Vendor	nr.manufacturer	
Model	nr.model	
GroupName	nr.name	Name
WebSite	nr.class	Class
Software.WebSite	nr.family	Family
usm-core2: HomePage|usm-core2: DeviceBiosSystemID	nr.system_name	Hostname
usm-core2: DeviceAssetNumber	app_website. DeviceAssetNumber	Device Asset Number
usm-core2: DeviceBiosSystemID	app_website. DeviceBiosSystemID	Device Bios System ID

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2: DeviceDnsName	app_website. DeviceDnsName	Device DNS Name
usm-core2: DevicePhysSerialNumber	app_website. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2: DeviceMacAddress	app_website. DeviceMacAddress	Device MAC Address
usm-core2: DeviceIPV4Address	app_website. DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_website. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2: DeviceIPV6Address	app_website. DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	app_website. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
usm-core2:IsHAEnabled	app_website.IsHAEnabled	Is HA Enabled
usm-core2: IsMonitoringMembers	app_website. IsMonitoringMembers	Is Monitoring Members
usm-core2:MaxFailures	app_website.MaxFailures	Max Failures
usm-core2: MemberCriteria	app_website. MemberCriteria	Member Criteria
usm-core2:GroupType	app_website.GroupType	Group Type
usm-core2:HomePage	app_website.HomePage	Home Page
usm-core2: BusinessRelevance	app_website. BusinessRelevance	Business Relevance

DiskPartition

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
PartitionType|usm-core2:OSDriveName	nr.name	Name
FAT32	nr.class	Class
Hardware.DiskPartition	nr.family	Family
PartitionType|OSNumeric|usm-core2: OSDriveName|DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_dpar. DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_dpar. DeviceBiosSystemID	Device Bios System ID

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2:DeviceDnsName	har_dpar.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_dpar.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	har_dpar. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_dpar. DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_dpar. DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	har_dpar. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_dpar. DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	har_dpar. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
OSNumeric	har_dpar.OSNumeric	OS Numeric
ContainingIndex	har_dpar.ContainingIndex	Containing Index
IsPhysical	har_dpar.IsPhysical	Is Physical
usm-core2:OSDriveName	har_dpar.OSDriveName	OS Drive Name
IsBootable	har_dpar.IsBootable	Is Bootable
IsPrimary	har_dpar.IsPrimary	Is Primary
usm-core2:CapacityInMB	har_dpar.CapacityInMB	Capacity In MB
ContextID	har_dpar.ContextID	Context ID

EnvironmentalSensor

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
SensorType|OS Numeric |Containing Index|DeviceDnsName	nr.name (http://nr.name)	Name
Vibration	nr.class	Class
Hardware.EnvironmentalSensor	nr.family	Family
SensorType|OS Numeric |Containing Index|DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_compr. DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_compr. DeviceBiosSystemID	Device Bios System ID

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2:DeviceDnsName	har_compr.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_compr.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	har_compr. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_compr.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_compr.DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	har_compr. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_compr.DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	har_compr. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
OSNumeric	har_compr.OSNumeric	OS Numeric
ContainingIndex	har_compr.ContainingIndex	Containing Index
IsPhysical	har_compr.IsPhysical	Is Physical
ContextID	har_compr.ContextID	Context ID

ESXHypervisor

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	**CA SDM Attributes**	**User Interface / CI Detail Form**
ProductName	nr.name	Name
ESXHypervisor	nr.class	Class
Software.ESXHypervisor	nr.family	Family
ProductName|ProcessID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_esx.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_esx.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_esx.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	app_esx.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	app_esx.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_esx.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_esx.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_esx. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_esx.DeviceIPV6Address	Device IPv6 Address

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2: DeviceIPV6AddressWithDomain	app_esx. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
IsMigrationEnabled	app_esx.IsMigrationEnabled	Migration Enabled
usm-core2:ComputeResourceIndex	app_esx.ComputeResourceIndex	Compute Resource Index
usm-core2:HostIndex	app_esx.HostIndex	Host Index
usm-core2:DatacenterPath	app_esx.DatacenterPath	Datacenter Path
usm-core2:FTVersion	app_esx.FTVersion	FT Version
usm-core2:NumberOfPrimaryVMs	app_esx.NumberOfPrimaryVMs	Number Of Primary VMs
usm-core2: NumberOfSecondaryVMs	app_esx.NumberOfSecondaryVMs	Number Of Secondary VMs
ProcessID	app_esx.ProcessID	Process ID
AccessedViaTcpPort	app_esx.AccessedViaTcpPort	Accessed Via Tcp Port
ProcessDistinguishingID	app_esx.ProcessDistinguishingID	Process Distinguishing ID

File

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
FilePathUrl|FileType |DeviceDnsName	nr.name	Name
File	nr.class	Class
Hardware.File	nr.family	Family
FilePathUrl|FileType |DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_file.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_file.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_file.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_file.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	har_file.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_file.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_file.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	har_file. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_file.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	har_file. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
FilePathUrl	har_file.FilePathUrl	File Path Url

HyperVHypervisorManager

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	**CA SDM Attributes**	**User Interface / CI Detail Form**
ProductName	nr.name	Name
HyperVHypervisor	nr.class	Class
Software.HyperVHypervisor	nr.family	Family
ProductName|ProcessID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_hyp.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_hyp.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_hyp.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	app_hyp.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	app_hyp.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_hyp.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_hyp.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_hyp. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_hyp.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	app_hyp. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
IsMigrationEnabled	app_hyp.IsMigrationEnabled	Migration Enabled
AccessedViaTcpPort	app_hyp.DefaultExternalDataRoot	Accessed Via Tcp Port
usm-core2:DefaultExternalDataRoot	app_hyp.DefaultVhdPath	Default External Data Root
usm-core2:DefaultVhdPath	app_hyp.MinimumMacAddress	Default Vhd Path
usm-core2:MinimumMacAddress	app_hyp.MaximumMacAddress	Minimum Mac Address
usm-core2:MaximumMacAddress	app_hyp.ProcessID	Maximum Mac Address
ProcessDistinguishingID	app_hyp.AccessedViaTcpPort	Process Distinguishing ID
ProcessID	app_hyp.ProcessDistinguishingID	Process ID

Memory

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
MemoryType|SizeInMB |ContainingIndex|DeviceDnsName	nr.name	Name
Physical	nr.class	Class
Hardware.Memory	nr.family	Family
ClassName|MemoryType|SizeInMB |ContainingIndex|DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_mem. DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_mem. DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_mem.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_mem.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	har_mem. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_mem. DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_mem. DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	har_mem. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_mem. DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	har_mem. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
OSNumeric	har_mem.OSNumeric	OS Numeric
ContainingIndex	har_mem.ContainingIndex	Containing Index
IsPhysical	har_mem.IsPhysical	Is Physical
SizeInMB	har_mem.SizeInMB	Size In MB
ContextID	har_mem.ContextID	Context ID

NetworkServer

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProductName	nr.name	Name
NetworkServer	nr.class	Class

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
Software.NetworkServer	nr.family	Family
Protocol|ProcessDistinguishingID|DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_netsvr.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_netsvr.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_netsvr.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	app_netsvr.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	app_netsvr. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_netsvr.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_netsvr.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_netsvr. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_netsvr.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	app_netsvr. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
ProcessID	app_netsvr.ProcessID	Process ID
AccessedViaTcpPort	app_netsvr.AccessedViaTcpPort	Accessed Via Tcp Port
ProcessDistinguishingID	app_netsvr. ProcessDistinguishingID	Process Distinguishing ID
Protocol	app_netsvr.Protocol	Protocol
ContextID	app_netsvr.ContextID	Context ID

Processor

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProcessorType|SpeedInGHz|DeviceDnsName	nr.name	Name
x86	nr.class	Class
Hardware.Processor	nr.family	Family
ProcessorType|OSNumeric|ContainingIndex| DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_prcr.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_prcr.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_prcr.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_prcr.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber		

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
	har_prcr.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_prcr.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_prcr.DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	har_prcr.DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_prcr.DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	har_prcr.DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
OSNumeric	har_prcr.OSNumeric	OS Numeric
ContainingIndex	har_prcr.ContainingIndex	Containing Index
IsPhysical	har_prcr.IsPhysical	Is Physical
Speed In GHz	har_prcr.SpeedInGHz	Speed In GHz
ContextID	har_prcr.ContextID	Context ID

ResourceServer

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProductName	nr.name	Name
ResourceServer	nr.class	Class
Software.ResourceServer	nr.family	Family
ProductName|ProcessID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_ressvr.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_ressvr.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_ressvr.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	app_ressvr.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	app_ressvr.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_ressvr.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_ressvr.DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	app_ressvr.DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_ressvr.DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	app_ressvr.DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProcessID	app_ressvr.ProcessID	Process ID
AccessedViaTcpPort	app_ressvr.AccessedViaTcpPort	Accessed Via Tcp Port
ProcessDistinguishingID	app_ressvr.ProcessDistinguishingID	Process Distinguishing ID
Resources	app_ressvr.capabilities	Capabilities
ContextID	app_ressvr.ContextID	Context ID

StoragePool

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	**CA SDM Attributes**	**User Interface / CI Detail Form**
GroupName	nr.name (http://nr.name)	Name
StoragePool	nr.class	Class
Hardware.StoragePool	nr.family	Family
GroupName|GroupType|usm-core2: DeviceDnsName	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_stgpl.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_stgpl.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_stgpl.DeviceDnsName	Device Dns Name
usm-core2:DeviceSysName	har_stgpl.DeviceSysName	Device Sys Name
usm-core2:DevicePhysSerialNumber	har_stgpl. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_stgpl.DeviceMacAddress	Device Mac Address
usm-core2:DeviceIPV4Address	har_stgpl.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	har_stgpl. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_stgpl.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	har_stgpl. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
usm-core2:IsHAEnabled	har_stgpl.IsHAEnabled	Is HA Enabled
usm-core2:IsMonitoringMembers	har_stgpl. IsMonitoringMembers	Is Monitoring Members
usm-core2:MaxFailures	har_stgpl.MaxFailures	Max Failures
usm-core2:MemberCriteria	har_stgpl.MemberCriteria	Member Criteria
usm-core2:GroupType	har_stgpl.GroupType	Group Type
usm-core2:BusinessRelevance	har_stgpl.BusinessRelevance	Business Relevance
usm-core2:CapacityInGB	har_stgpl.CapacityInGB	Capacity In GB
usm-core2:RaidLevel	har_stgpl.RaidLevel	Raid Level

StorageVolume

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2:StorageID	nr.name	Name
StorageVolume	nr.class	Class
Hardware.StorageVolume	nr.family	Family
usm-core2:StorageID|usm-core2:PortWWName|usm-core2:PortID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_stgvol.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_stgvol.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_stgvol.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_stgvol.DeviceSysName	Device System Name
usm-core2:DevicePhysSerialNumber	har_stgvol.DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_stgvol.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_stgvol.DeviceIPV4Address	Device IPv4 Address
usm-core2:DeviceIPV4AddressWithDomain	har_stgvol.DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_stgvol.DeviceIPV6Address	Device IPv6 Address
usm-core2:DeviceIPV6AddressWithDomain	har_stgvol.DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
usm-core2:OSNumeric	har_stgvol.OSNumeric	OS Numeric
usm-core2:ContainingIndex	har_stgvol.ContainingIndex	Containing Index
IsPhysical	har_stgvol.IsPhysical	Is Physical
usm-core2:LogicalUnitNumber	har_stgvol.LogicalUnitNumber	Logical Unit Number
usm-core2:PortID	har_stgvol.PortID	Port ID
usm-core2:PortWWName	har_stgvol.PortWWName	Port WW Name
usm-core2:CapacityInMB	har_stgvol.CapacityInMB	Capacity In MB
usm-core2:IsThinlyProvisioned	har_stgvol.IsThinlyProvisioned	Is Thinly Provisioned
usm-core2:IsDeDupeEnabled	har_stgvol.IsDeDupeEnabled	Is DeDupe Eanbled

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
usm-core2:IsMasked	har_stgvol.IsMasked	Is Masked
usm-core2:MaskedWWNames	har_stgvol. MaskedWWNames	Masked WW Names
usm-core2:RaidLevel	har_stgvol.RaidLevel	Raid Level

TransactionContext

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ContextName	nr.name (http://nr.name)	Name
TransactionContext	nr.class	Class
Enterprise TransactionContext	nr.family	Family
ContextName|ContextType	nr.system_name	Hostname
ContextType	trn_ctx.ContextType	ContextType

VirtualManager

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProductName	nr.name (http://nr.name)	Name
VirtualManager	nr.class	Class
Software.VirtualManager	nr.family	Family
ProductName|ProcessID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_virmgr.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_virmgr.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_virmgr.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	app_virmgr.DeviceSysName	Device System Name
usm-core2: DevicePhysSerialNumber	app_virmgr. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_virmgr.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_virmgr.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_virmgr. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_virmgr.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	app_virmgr. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
ProcessID	app_virmgr.ProcessID	Process ID
AccessedViaTcpPort	app_virmgr.AccessedViaTcpPort	Accessed Via Tcp Port
ProcessDistinguishingID	app_virmgr.ProcessDistinguishingID	Process Distinguishing ID
ApiVersion	app_virmgr.ApiVersion	Api Version
ContextID	app_virmgr.ContextID	Context ID

VMDataStore

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
StoreName	nr.name	Name
NetworkFileSystem	nr.class	Class
Hardware.VMDataStore	nr.family	Family
StoreName|FilePathUrl	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	har_vmds.DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	har_vmds.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	har_vmds.DeviceDnsName	Device DNS Name
usm-core2:DeviceSysName	har_vmds.DeviceSysName	Device System Name
usm-core2: DevicePhysSerialNumber	har_vmds. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	har_vmds.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	har_vmds.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	har_vmds. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	har_vmds.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	har_vmds. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
FilePathUrl	har_vmds.FilePathUrl	File Path Url
CapacityInMB	har_vmds.CapacityInMB	Capacity In MB
IsMultiHost	har_vmds.IsMultiHost	Is Multi Host

Website

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
GroupName	nr.name (http://nr.name)	Name

Common CI Properties (USM)	CA SDM Attributes	User Interface / CI Detail Form
WebSite	nr.class	Class
Software.WebSite	nr.family	Family
usm-core2:HomePage|usm-core2: DeviceBiosSystemID	nr.system_name	Hostname
usm-core2:DeviceAssetNumber	app_website. DeviceAssetNumber	Device Asset Number
usm-core2:DeviceBiosSystemID	app_website.DeviceBiosSystemID	Device Bios System ID
usm-core2:DeviceDnsName	app_website.DeviceDnsName	Device DNS Name
usm-core2:DevicePhysSerialNumber	app_website. DevicePhysSerialNumber	Device Physical Serial Number
usm-core2:DeviceMacAddress	app_website.DeviceMacAddress	Device MAC Address
usm-core2:DeviceIPV4Address	app_website.DeviceIPV4Address	Device IPv4 Address
usm-core2: DeviceIPV4AddressWithDomain	app_website. DeviceIPV4AddressWithDomain	Device IPv4 Address With Domain
usm-core2:DeviceIPV6Address	app_website.DeviceIPV6Address	Device IPv6 Address
usm-core2: DeviceIPV6AddressWithDomain	app_website. DeviceIPV6AddressWithDomain	Device IPv6 Address With Domain
usm-core2:IsHAEnabled	app_website.IsHAEnabled	Is HA Enabled
usm-core2:IsMonitoringMembers	app_website. IsMonitoringMembers	Is Monitoring Members
usm-core2:MaxFailures	app_website.MaxFailures	Max Failures
usm-core2:MemberCriteria	app_website.MemberCriteria	Member Criteria
usm-core2:GroupType	app_website.GroupType	Group Type
usm-core2:HomePage	app_website.HomePage	Home Page
usm-core2:BusinessRelevance	app_website.BusinessRelevance	Business Relevance
usm-core2:DeviceSysName	app_website.DeviceSysName	Device System Name

ComputerSystem

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

ComputerSystem (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr.manufacturer	Inventory tab; Manufacturer

ComputerSystem (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
		(Configure this property in the connector policy to the requirement of your site)
Model	nr.model	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)

usm-core2: NumberOfMemorySlots	har_serx. slot_total_mem	

DatabaseInstance

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

DatabaseInstance (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
DBInstanceName	dat_basx.db_id If db_id is found, then set to nr. system_name	Attributes tab; Database ID or System Name
ProductName	nr.name (http://nr.name)	Name
DBServerType	nr.class	Class

DatabaseInstance (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
ProcessDistinguishingID	dat_basx.db_id	Attributes tab; Database ID
Device properties required (see page 4758)	n/a	n/a

GenericIPDevice

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

GenericIPDevice (USM)	CA SDM Attribute	User Interface (CI detail form)
PrimaryDnsName	nr.dns_name	DNS Name
OtherDnsNames	n/a	n/a
SysName	n/a	n/a
PrimaryMacAddress	nr.mac_address	MAC Address
OtherMacAddresses	n/a	n/a
PrimaryIPV4Address	nr.alarm_id	Inventory tab; IP Address
PrimaryIPV4AddressWithDomain	n/a	n/a
PrimaryIPV6Address	nr.alarm_id (if IPv6 is formatted)	Inventory tab; IP Address (if IPv6 is formatted)
PrimaryIPV6AddressWithDomain	n/a	n/a
OtherIPAddresses	n/a	n/a
OtherIPAddressesWithDomains	n/a	n/a

Idea

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Idea (USM)	CA SDM Attributes	User Interface
usm-udm:IdeaName	nr.name (http://nr.name/)	Name
usm-udm:IsActive	nr.delete_flag	Active?
usm-udm:Manager	invidex.target_manager	Target Manager
usm-udm:GeneralNotes	invidex.general_notes	General Notes
usm-core2:URI	nr.zinvestment_uri	n/a
usm-udm:Priority	invidex.zudm_idea_priority	SPM Idea Priority
usm-udm:IdeaStatus	invidex.zudm_idea_lifecycle_status	SPM Idea Lifecycle Status
usm-udm:OriginatingRequestor	invidex.zoriginating_requestor	Originating Requestor
usm-udm:RequestID	invidex.zrequest_id	Request ID
usm-core2:CompleteUrl	invidex.zcomplete_url	n/a

Incident

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Incident (USM Type)	CA SDM Attributes	User Interface
AssignedID	cr.ref_num	Text on button bar (left side)
Urgency	n/a	Urgency
Impact	cr.impact; imp.sym	Impact
CalculatedPriority	cr.priority; pri.sym	Priority
Open Timestamp	cr.target_start	<bop_dump>
CallbackTimestamp	cr.call_back_date	Call Back Date/Time
Resolution Timestamp	cr.resolve_date	Resolve Date (above tabs)
Closure Timestamp	cr.close_date	Close Date (above tabs)
ChargebackID	n/a	n/a
RootCause	cr.rc	n/a
SolutionUrls	soln_log	n/a
IncidentCategory	cr.category	Incident Area
IsMajor	cr.major_incident	Major Incident
IncidentStatus	cr.status; cr.sym	Status
CreationDocUrl	n/a	n/a
OutageStartTimestamp	cr.outage_start_time	Outage tab; Start Time
OutageEndTimestamp	cr.outage_end_time	Outage tab; End Time
OutageType	cr.outage_type	Outage tab; Type
IsReturnedToService	cr.return_to_service	Outage tab; Return to Service
SymptomCodes	cr.symptom code	Symptom

InterfaceCard

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

InterfaceCard (USM)	CA SDM Attributes	User Interface
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)

InterfaceCard (USM)	CA SDM Attributes	User Interface
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
PhysSerialNumber	nr.serial_number	Serial Number
AssetNumber	nr.asset_num	Alternate CI ID
Device properties required (see page 4760)	n/a	n/a
OSNumeric	n/a	n/a
ContainingIndex	n/a	n/a
IsPhysical	n/a	n/a

Location

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Location (USM)	CA SDM Attributes	User Interface
LocationName	loc.name (http://loc.name)	Name
Uri	n/a	n/a
CountryCode	loc.country	Address tab; Country
CountryName	loc.country	Address tab; Country
PostalCode	loc.zip	Addresss tab; ZIP/Postal Code
StateOrProvince	loc.state	Address tab; State/Province
City	loc.city	Address tab; City
County	loc.county	n/a
AddressLine1	loc.address1	Address; Address (1)
AddressLine2	loc.address2	Address; Address (2)
AddressLine3	loc.address3	Address; Address (3)
Building	n/a	n/a
Floor	n/a	n/a
Room	n/a	n/a
Description	nr.description, loc.description	
PostalCode	loc.zip	
StateOrProvince	loc.state	
City	loc.city	
County	loc.county	
AddressLine1	loc.address1	
AddressLine2	loc.address2	

Location (USM)	CA SDM Attributes	User Interface
AddressLine3	loc.address3	
Floor	nr.loc_floor	
Room	nr.loc_room	

MediaDrive

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

MediaDrive (USM)	CA SDM Attributes	User Interface
Vendor	nr.manufacturer. xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
PhysSerialNumber	nr.serial_number	Serial Number
AssetNumber	nr.asset_num	Alternate CI ID
Device properties required (see page 4762)	n/a	n/a
OSNumeric	n/a	n/a
ContainingIndex	n/a	n/a
IsPhysical	n/a	n/a
DriveType	nr.class	Class
CapacityInMB	har_stox. media_drive_num	Attributes Tab memory capacity
SupportsRemovableMedia	n/a	n/a
SupportsWrite	n/a	n/a
Description	nr.description	
usm-core2: DriveInterfaceType	har_stox. Disk_type	

OperatingSystem

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

OperatingSystem (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr. manufacturer	Inventory tab; Manufacturer (Configure this property within the connector policy to the requirement of your site)
ProductName	nr.name (http://nr.name)	Name
Version	nr.version	Attributes tab; Version
MajorVersion	nr. product_version	n/a
MinorVersion	nr. product_version	n/a
BuildNumber	n/a	n/a
Device properties required (see page 4763)	n/a	n/a
NamedAliases	nr.name (http://nr.name)	
Description	nr.description	
OSType	nr.class	

OrganizationEntity

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

OrganizationEntity (USM Type)	CA SDM Attributes	User Interface
GroupName	n/a	Name
MemberCriteria	n/a	n/a
Category	n/a	n/a
OrgType	n/a	n/a

PrimaryPhoneNumber	org.phone_number	Primary Phone Number
OtherPhoneNumbers	org.phone	Alternate Phone Number
EmailAddresses	org.email_addr	Email Address
WebSites	n/a	n/a

Person

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Person (USM)	CA SDM Attributes	User Interface
FirstName	cnt.first_name	First Name
MiddleNames	cnt.middle_name	Middle Name
FamilyName	cnt.last_name	Last Name
FullName	cnt.combo_name	n/a
EmployeeID	cnt.userid	Contact ID
UserName	cnt.userid	User ID
JobTitle	cnt.position	Job Title
CompanyName	n/a	n/a
IsActive	cnt.available	n/a
PrimaryPhoneNumber	cnt.phone_number	Notification tab; Telephone Number
OtherPhoneNumbers	n/a	n/a
EmailAddresses	cnt.email_address	Notification tab; Email Address

Port

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

Port (USM)	CA SDM Attributes	User Interface
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)

Port (USM)	CA SDM Attributes	User Interface
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
PhysSerialNumber	nr.serial_number	Serial Number
AssetNumber	nr.asset_num	Alternate CI ID
Device properties required (see page 4764)	n/a	n/a
OSNumeric	n/a	n/a
ContainingIndex	n/a	n/a
IsPhysical	n/a	n/a
PortID	n/a	n/a
CardOSNumeric	n/a	n/a
CardContainingIndex	n/a	n/a
ifindex	n/a	n/a
IfType	net_porx. technology	Attributes tab Technology
IfTypeExtension	n/a	n/a
NomSpeedInBitsPerSec	n/a	n/a
PrimaryMacAddress	nr.mac_address	MAC Address
OtherMacAddresses	n/a	n/a
PrimaryIPV4Address	nr.alarm_id	Inventory tab; IP Address
PrimaryIPV6Address	nr.alarm_id (if IPV6 is formatted)	Inventory tab; IP Address
OtherIPAddresses	n/a	n/a
OtherIPAddressesWithDomains	n/a	n/a
Description	nr.description	
PrimaryIPV4Address, PrimaryIPV6Address or OtherIPAddresses	nr.alarm_id	
PrimaryMacAddress or OtherMacAddresses	nr.mac_address	
usm-core2:IsFullDuplex	n/a	
usm-core2:DuplexIsNegotiated	n/a	

PortfolioApplication

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

PortfolioApplication (USM)	CA SDM Attributes	User Interface
usm-udm:PortfolioAppName	nr.name (http://nr.name/)	Name
usm-udm:IsActive	nr.delete_flag	Active?
usm-udm:AvailabilityStart	invothx.start_date	Start Date
usm-udm:AvailabilityEnd	invothx.finish_date	Finish Date
usm-udm:Manager	invothx.manager	Manager
usm-core2:URI	nr.zinvestment_uri	n/a
usm-udm:OpenForTimeEntry	invothx.zopen_for_time_entry	Open for Time Entry?
usm-udm:Stage	invothx.zudm_stage	SPM Stage

Printer

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

Network Printer (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr.manuafacturer	Inventory tab; Manufacturer (Configure this property within the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property within the IE Policy file to the requirement of your site)
RetirementTimestamp	nr.retire_date	Attributes tab; Retire Date
SerialNumber	nr.serial_number	Serial Number
VendorSerialNumber	n/a	n/a
AssetNumber	nr.asset_num	Alt CI ID
PrimaryDnsName	nr.dns_name	DNS Name
OtherDnsNames	n/a	n/a
LocalPrintername	nr.system_name	n/a
PrimaryMacAddress	nr.mac_address	MAC Address

Network Printer (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
OtherMacAddresses	n/a	n/a
PrimaryIPV4Address	nr.alarm_id (if IPV4 format)	Inventory tab; IP Address (V4)
PrimaryIPV6Address	nr.alarm_id (if IPV6 format)	Inventory tab; IP Address (V6)
OtherIPAddresses	n/a	n/a
SupportsColor	n/a	n/a
IsPhotoPrinter	n/a	n/a
SupportsDoubleSided	n/a	n/a
SupportsStapling	n/a	n/a
IsScanner	n/a	n/a
IsCopier	n/a	n/a
IsFax	n/a	n/a
FaxNumber	n/a	n/a

Problem

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Problem (USM Type)	CA SDM Attributes	User Interface
AssignedID	cr.ref_num	Text on button bar (left side)
IsActive [transform to "true" or "false"]	n/a	n/a
Urgency [IssueUrgencyEnum]	n/a	n/a
Impact	cr.impact; imp.sym	Impact
CalculatedPriority [IssuePriorityEnum]	cr.priority; pri.sym	Priority
Open Timestamp	cr.target_start_last	<bop_dump>
CallbackTimestamp	cr.call_back_date	Call Back Date/Time

Problem (USM Type)	CA SDM Attributes	User Interface
Resolution Timestamp	cr. resolve_date	Resolve Date (above tabs)
Closure Timestamp	cr.close_date	Close Date (above tabs)
ChargebackID	n/a	n/a
RootCause [Issue Root Cause Enum]	cr.rc	Root Cause (Configure this property in the connector policy to the requirement of your site)
SolutionUrls	n/a	No Knowledge on Problem
ProblemCategory	cr.category	Problem Area
IsMajor	n/a	n/a
Status [Incident Status Enum]	cr.status; cr. sym	Status
CreationDocUrl	n/a	n/a

ProvisionedSoftware

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

ProvisionedSoftware (USM)	CA SDM Attribute	User Interface (CI detail form)
Vendor	nr.manufacturer. xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
ProductName	nr.name (http://nr. name)	Name
Version	app_extx.version	Attributes tab version
MajorVersion	n/a	n/a
BuildNumber	n/a	n/a
ServiceLevel	n/a	n/a
Locales	n/a	n/a
ProcessorEnvironments	n/a	n/a
OSEnvironments	n/a	n/a
VirtualizationEnvironments	n/a	n/a

ProvisionedSoftware (USM)	CA SDM Attribute	User Interface (CI detail form)
ReleaseType	n/a	n/a
SoftwareCategories	app_extx.category	Attributes tab category
IsLocal		
Device properties required (see page 4768)	n/a	n/a
DeviceIPV6AddressWithDomain	n/a	n/a
ProvisionedForItem	n/a	n/a
SoftwarePathUrl	app_extx. install_dir	Attributes tab Install Directory
ProvisioningMethod	n/a	n/a
MdrElementID	nr.persid (Outbound)	
SoftwarePathUrl	app_extx. install_dir	
CreationTimestamp	nr.creation_date	
AdministrativeStatus = "Missing-InSubseqDiscover"	nr.status.sym [rss]	
usm-core2: BlueprintName	nr.family.sym + nr. class.sym	
SoftwareCategories	app_extx.category	

Request (USM Type)

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Request (USM Type)	CA SDM Attributes	User Interface
DeletionUserName	n/a	n/a
InstanceName	n/a	n/a
TypeName	n/a	n/a
AssignedID	cr.ref_num	Text on button bar (left side)
IsTemplate	n/a	n/a
TemplateUsed	n/a	n/a
Severity	n/a	Severity
Urgency [RequestUrgencyEnum]	n/a	Urgency
Priority	cr.priority; pri.sym	Priority
OpenTimestamp	cr.target_start	<bop_dump>
CallbackTimestamp	cr.call_back_date	Call Back Date/Time

Request (USM Type)	CA SDM Attributes	User Interface
ResolutionTimestamp	cr.resolve_date	Resolve Date (above tabs)
ClosureTimestamp	cr.close_date	Close Date (above tabs)
ChargebackID	n/a	n/a
RootCause	cr.rc	Root Cause
SolutionUrls	soln_log	n/a
RequestStatus	cr.status; cr.sym	Status
RequestCategory	cr.category	Request Area
UserAspect	n/a	n/a
CreationDocUrl	n/a	n/a
IsReturnedToService	cr.return_to_service	Outage tab; Return to Service

Router

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

Router (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr.manuafacturer	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
SerialNumber	nr.serial_number	Serial Number
VendorSerialNumber	n/a	n/a
AssetNumber	nr.asset_num	Alternate CI ID
PrimaryDnsName	nr.dns_name	DNS name
OtherDnsNames	n/a	n/a
SysName	n/a	n/a
PrimaryMacAddress	nr.mac_address	MAC Address
	n/a	n/a

Router (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
OtherMacAddresses		
PrimaryIPV4Address	nr.alarm_id	Inventory tab; IP Address (V4)
PrimaryIPV6Address	nr.alarm_id	IP Inventory tab; IP Address (V6)
OtherIPAddresses	n/a	n/a
FirmwareVersion	net_roux.rout_prot	Attributes tab; Router Protocol
Redundancy Type	n/a	n/a
FirmwareVersion	net_roux.os_version	
RoutingProtocolTypes	net_roux.rout_prot	
RoutingRedundancyType	n/a	

RunningHardware

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

RunningHardware (USM)	CA SDM Attributes	User Interface
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
PhysSerialNumber	nr.serial_number	Serial Number
AssetNumber	nr.asset_num	Alternate CI ID
Device properties required (see page 4771)	n/a	n/a
OSNumeric	n/a	n/a

RunningHardware (USM)	CA SDM Attributes	User Interface
ContainingIndex	n/a	n/a
IsPhysical	n/a	n/a
Description	nr.description	

Service (USM Type)

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Service (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
ServiceName	nr.name (http://nr.name)	Name
ServiceVersion	serx.version or entservx	Attributes tab; Version
AccessedViaTCPPort	n/a	n/a
BusinessRisk	entservx.business_risk or servx.business_risk	Attributes tab; Business Risk
BusinessImpact	n/a	Attributes tab; Business Impact
ImpactDescription	entservx.business_impact or serx. business_impact	n/a
AvailabilityStart	entservx.availability_start or serx. availability_start	Attributes tab; Availability Start
AvailabilityEnd	entservx.availability_end or serx. lifecycle_state	Attributes tab; Availability End
MdrElementID	nr.persid (OutBound)	
Description	nr.description	
CreationUserName	nr.creation_user (SREL --> cnt.user_name)	
CreationTimestamp	nr.creation_date	
LastModTimestamp	nr.last_mod	
UrlParams	"nr"	
ServiceCapabilities	nr.class	
usm-udm:IsActive	nr.delete_flag	Active?
usm-udm: ServiceManager	entservx.service_manager	Service Manager
usm-core2:URI	nr.zinvestment_uri	n/a
usm-udm: OpenForTimeEntry	entservx.zopen_for_time_entry	Open for Time Entry?
ServiceLifecycleState	entservx.zudm_lifecycle_state	SPM Service Lifecycle State

entservx.availability_start or serx.availability start

Switch

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

> **Note**: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

Switch (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr.manuafacturer	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
SerialNumber	nr.serial_number	Serial Number
VendorSerialNumber	n/a	n/a
AssetNumber	nr.asset_num	Alt CI ID
PrimaryDnsName	nr.dns_name	DNS Name
OtherDnsNames	n/a	n/a
PrimaryMacAddress	n/a	n/a
PrimaryIPV4Address	nr.alarm_id	Inventory tab; IP Address
PrimaryIPV6Address	nr.alarm_id (if IPV6 format)	Inventory tab; IP Address
OtherIPAddresses	n/a	n/a
FirmwareVersion	net_nubx.os_version	Attributes tab; OS version

TimeReporting

The CA SDM Connector maps to the USM types based on the values of the following CA SDM properties.

usm-core2:TimeReporting (USM)	CA SDM Attributes	User Interface
usm-core2:ReportingID	alg.persistent_id or chgalg.persistent_id	n/a
usm-core2:IssueType	cr.type or chg.type	n/a
usm-core2: TimeSpentInHours	alg.time_spent or chgalg.time_spent	Time Spent
usm-core2:StartingDate	alg.time_stamp or chgalg.time_stamp	Date of Activity
Description	alg.description or chgalg.description	User Description
usm-core2:IssueID	alg.call_req_id or chg.persistent_id	n/a
usm-udm:InvestmentURI	nr.zinvesement_uri or chg.zproject_id	n/a
usm-udm:InvestmentType	based on the selection from nr.zinvestment_uri or chg. zproject_id	n/a
usm-core2:ProjectTaskID	chg.zproject_task_id	n/a
usm-udm:OriginatingURL	n/a	n/a
usm-core2:UserID	cnt.userid	Analyst

VirtualSystem

The CA SDM Connector maps to USM types based on the values of the following CA SDM properties.

Note: You can define the Vendor and Model properties through the CA SDM connector policy to manage your configuration items. For more information about these properties, see Post-Installation: Manufacturers and Models.

VirtualSystem (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
Vendor	nr.manufacturer.xym [ca_cmpny]	Inventory tab; Manufacturer (Configure this property in the connector policy to the requirement of your site)
Model	nr.model.sym [mfrmod]	Inventory tab; Model (Configure this property in the connector policy to the requirement of your site)
PhysSerialNumber	nr.serial_number	Serial Number
AssetNumber	nr.asset_num	Alternate CI ID
PrimaryDnsName	dns_name	Virtual Host Name
OtherDnsNames	n/a	n/a

VirtualSystem (USM Type)	CA SDM Attributes	User Interface / CI Detail Form
SysName	n/a	n/a
PrimaryMacAddress	nr.mac_address	MAC Address
OtherMacAddresses	n/a	n/a
PrimaryIPV4Address	nr.alarm_id	Inventory tab; IP Address
PrimaryIPV6Address	nr.alarm_id (if IPV6 format)	Inventory tab; IP Address (if IPV6 format)
OtherIPAddresses	n/a	n/a
ComputerName	nr.name (http://nr.name)	Name
BiosSystemID	har_virx.bios_ver	Attributes tab; Bios Version
Type	n/a	n/a
MemoryInGB	har_virx.phys_mem (SDM no float type)	Attributes tab; Memory Installed
StorageInGB	har_virx.hard_drive_capacity (SDM no float type)	Attributes tab; Disk Capacity
ProcessorType	har_virx.proc_type	Attributes tab; Processor Type
NumberOfCores	har_virx.virtual_processors	Attributes tab; No of Process Installed
ProcessorSpeedInGHz	har_virx.proc_speed	Attributes tab; Processor Speed
PrimaryOSType	nr.class	Class
PrimaryOSVersion	n/a	n/a
OtherOSDetails	n/a	n/a
usm-core2: VirtualizationEnvironment	nr.class	
usm-core2: IsAutomaticallyStarted	n/a	

Attributes tab; No of Processs Installed

Default Port Numbers and Connectivity

The following list shows all of the default port numbers available for each of the components in the CA SDM-CA SOI integration:

Note: The list describes only the default ports. Some of the ports may or may not be applicable for this integration.

CA Catalyst

- Server Container: 7000
- Connector Container: 8080
- Search Server: 7443 (HTTPS)
- Persistence Store (Microsoft SQL database): 1433
- ActiveMQ Server: 61616
- Registry shutdown: 8005
- Registry AJP: 8009
- Registry: 8081, 8443
- Persistence Store (Oracle Database Server): 1521
- Administration UI: 8082
- Administration UI AJP: 8010
- Administration UI shutdown: 8006

CA SDM Server

- Server Tomcat Port: 8080
- SA Tomcat Port: 8070
- SA Tomcat Shutdown Port: 8075
- Shutdown Port: 8085
- CA CMDB Visualizer: 9080
- CA CMDB Visualizer Shutdown Port: 9085

CA SOI

- Shutdown Port: 7095 (Manager)
- Shutdown Port: 7005 (UI Server)
- Tomcat Server Port: 7090 (Manager)
- Tomcat Server Port: 7070 (UI Server)
- SSL Port: 7493 (Manager)
- SSL Port: 7403 (UI Server)

- JDBC Port: 1433
- CMS Server Port: 6400

Relationship and Service Mapping

This topic includes the following information about Relationship and Service Mapping for CA CMDB and CA Configuration Automation integration:

Supported CIs and Relationships

The ServiceDeskManagerConnector_policy.xml and ServiceDeskManager_policySB.xml files contain complete mapping information of the CI and CI relationship data for the integration.

The following table lists the Relationship mapping for the integration:

Parent	Relationship Type	Child Type	CMDB Support?
Service			Yes
	IsHostedBy	ComputerSystem	Yes
	HasDetail	ComplianceStatus	No
	HasContact	Person	Yes
ComputerSystem			Yes
	IsHostFor	ProvisionedSoftware	Yes
	IsHostFor	ComputerSystem	Yes
	IsManagerFor	ComputerSystem	Yes
	HasDetail	ComplianceStatus	No
	HasContact	Person	Yes
	HasDetail	IPConfig	No
	IsComposedOf	Port	Yes
	IsComposedOf	OperatingSystem	Yes
	IsComposedOf	RunningHardware	Yes
	IsComposedOf	Memory	No
	IsComposedOf	MediaDrive	Yes
	IsComposedOf	Processor	No
ProvisionedSoftware			Yes
	HasAccessTo	ComputerSystem	Yes
	HasRequirementFor	ComputerSystem	Yes
Compliance Status			No

Parent	Relationship Type	Child Type	CMDB Support?
Location			Yes
	IsLocationFor	ComputerSystem	Yes
	IsLocationFor	Router	Yes
	IsLocationFor	Service	Yes
VirtualSystem			Yes
Router			Yes
Port			Yes
	HasDetail	IPConfig	No
Cluster			Yes
	HasMember	ComputerSystem	Yes
MediaDrive			Yes
	IsHostFor	File	Yes
Application			Yes
	HasRequirementFor	Port	Yes
	IsConnectedTo	Port	Yes
	IsConnectedTo	Application	Yes
BackgroundProcess			No
	HasRequirementFor	Port	No
	IsConnectedTo	BackgroundProcess	No
RunningHardware			Yes
Memory			No
OperatingSystem			Yes
Processor			No
DiskPartition			No
File			Yes
IPConfig			No
BinaryRelationship			Yes
ApplicationServer			Yes
DatabaseInstance			Yes
GenericIPDevice			Yes
InterfaceCard			Yes
Printer			Yes
Switch			Yes
Person			Yes
OrganizationEntity			Yes
Incident			Supported (Only Outbound)

Parent	Relationship Type	Child Type	CMDB Support?
	IsImpactedBy	(Any Supported CMDB CI)	Supported (Only Outbound)
Problem			Supported (Only Outbound)
	IsImpactedBy	(Any Supported CMDB CI)	Supported (Only Outbound)
Request			Supported (Only Outbound)
	IsImpactedBy	(Any Supported CMDB CI)	Supported (Only Outbound)
ChangeOrder			Supported (Only Outbound)
	IsImpactedBy	(Any Supported CMDB CI)	Supported (Only Outbound)

Service Mapping

The following table lists the mapping for the Services:

Services (CA Configuration Automation)	CA Configuration Automation Schema [acm_svc]	USM:Service	CA SDM Business Service
service uuid	svc_uuid	MdrElementID	nr.persid (Outbound)
service name	svc_name	ServiceName	nr.name (http://nr.name/)
description	descr	Description	nr.description
created by	created_by	CreationUserName	nr.creation_user (SREL cnt.user_name)
creation time	creation_tm	CreationTimestamp	nr.creation_date
business process	business_process	usm-core2: BusinessRelevance **Note:** All CIs contain this field, not only for USM:Service	nr.service_goal
modification time	modification_tm	LastModTimestamp	nr.last_mod
Launch-in-context URL	[acm_svc].svc_name	UrlParams	nr **Note:** This integration only uses the CA SDM object factory for backward compatibility with SSA/Catalyst 2.5.
N/A	N/A	ServiceVersion	serx.version or entservx.version
N/A	N/A	AccessedViaTCPPort	N/A
N/A	N/A	BusinessRisk	entservx.business_risk or servx.business_risk
N/A	N/A	ImpactDescription	entservx.business_impact or serx.business_impact

Services (CA Configuration Automation)	CA Configuration Automation Schema [acm_svc]	USM:Service	CA SDM Business Service
N/A	N/A	AvailabilityStart	entservx.availability_start or serx.availability start
N/A	N/A	AvailabilityEnd	entservx.availability_start or serx.availability start
N/A	N/A	usm-core2: CommonlyKnownNames	nr.asset_num
N/A	N/A	ServiceCapabilities	nr.class Note: For Services, you can also use Alt CI Id
N/A	N/A	ServiceLifecycleState	entservx.lifecycle_state

Post Installation Steps for CA Unified Self-Service

Perform the following optional post-installation steps for USS 14.1.02:

- Customize CA SDM Data Source Property (see page 4780)
- Enable or Disable the Community (see page 4781)
- Enable Clickjacking Filter (see page 4781)

Prerequisites

Create a backup of the *US4SM\OSOP\portal-ext.properties* file.

Note: *US4SM* is the default Unified Self-Service installation directory.

Customize CA SDM Data Source Property

Perform the following steps to customize the CA SDM Data Source Property:

1. Open the *US4SM\OSOP\portal-ext.properties* file and copy the following content at the end of the file:

```
# SDM Datasource Config Fields
# Maximum number of the SDM Fields that can be shown in SDM Datasource config
Fields sections
# If no value/invalid value/ value less than 4 is specified, it will default to
10
sdm.configFields.maxFieldsToShowInConfigOptionsPage = 10
# If you want this property to be tenant specific, prefix the Web ID of the
tenant to the property. It is case-sensitive
# (Web Id can be obtained from the http(s)://server-name:<port-no>/group
/control panel > Portal Instances)
# Example Format:
# someCompany.com (http://someCompany.com).sdm.configFields.
maxFieldsToShowInConfigOptionsPage = 10
```

2. Save the file and restart (see page 1704) the services.

Enable or Disable the Community

Perform the following steps to enable or disable the community:

1. Open *US4SM\OSOP\portal-ext.properties* and copy the following content at the end of the file:

```
# Community On/Off
# Community/Message board feature can be disabled by the setting property
disable.uss.community to true (case sensitive)
# Example - with Multi tenancy
# For a specific tenant, prefix the property with the tenant webID
# For tenants, if the value is not defined or the property is missing,Community
is enabled, by default.

# someCompany.com (http://someCompany.com).disable.uss.community = true

# Example - All other tenant Community will be disabled if the value for the
property is true (case sensitive).
# If the value is not defined or the property is missing, Community is enabled,
by default.

# disable.uss.community = true
```

2. Save the file and restart (see page 1704) the services.

Enable Clickjacking Filter

Follow these steps:

1. Open the *US4SM\OSOP\tomcat-7.0.40\conf\web.xml* file.

2. Search for the text: *Built In Filter Definitions*
   The Built In Filter section appears as follows:
   <!-- ================== Built In Filter Definitions ==================== -->

<filter>
.
.
.
</filter>

3. Add the following filter at the end of the *Built In Filter Definitions* section:

```
<!-- Filter :Restricts framing of USS application in all domains expect the
current domain in which USS is hosted -->
<filter>
<filter-name>ClickjackFilterSameOrigin</filter-name>
<filter-class>org.owasp.esapi.filters.ClickjackFilter</filter-class>
<init-param>
<param-name>mode</param-name>
<param-value>SAMEORIGIN</param-value>
</init-param>
</filter>
<filter-mapping>
<filter-name> ClickjackFilterSameOrigin </filter-name>
<url-pattern>/*</url-pattern>
</filter-mapping>
```

4. Save and close the file and restart (see page 1704) the services.

USS Announcements are Formatted Incorrectly for Windows

1. Navigate to the *US4SM\OSOP\tomcat-7.0.40\bin* folder and edit the file *wrapper.conf:*

   a. Modify the variable *wrapper.java.additional.20* value from *-Duser.timezone=GMT* to *-Duser.timezone=sdm-time-zone*
   For Example: '-Duser.timezone=America/Denver'. (Mountain Time)

   b. Save and close the file.

2. Navigate to *US4SM\OSOP* folder and *a*ppend the following content at the end of the *portal-ext.properties* file.

```
#set this to show the announcement date format in 24/12 hr
#format:
# dd-MMM-yy hh.mm (http://hh.mm).ss aa for 12 hr format
# dd-MMM-yy HH.mm (http://HH.mm).ss for 24 hr format
announcement.date.format=dd-MMM-yy hh.mm (http://hh.mm).ss aa
```

3. Save the file and restart (see page 1704) the services.

USS Announcements are Formatted Incorrectly for Linux

1. Navigate to the *US4SM\OSOP\tomcat-7.0.40\bin* folder and edit the file *setupenv.sh*

   a. Modify the variable *Duser.timezone* value from *-Duser.timezone=GMT* to *-Duser.timezone=sdm-time-zone*
   For Example: '-Duser.timezone=America/Denver'. (Mountain Time)

b. Save and close the file.

2. Navigate to *US4SM\OSOP* folder and *a*ppend the following content at the end of the *portal-ext.properties* file.

```
#set this to show the announcement date format in 24/12 hr
#format:
# dd-MMM-yy hh.mm (http://hh.mm).ss aa for 12 hr format
# dd-MMM-yy HH.mm (http://HH.mm).ss for 24 hr format
announcement.date.format=dd-MMM-yy hh.mm (http://hh.mm).ss aa
```

3. Save the file and restart (see page 1704) the services.

For more information about USS enhancements, see CA Service Management Release 14.1.02 Enhancements (see page 69).

Additional Resources

This section contains additional resources that you help you with using CA Service Management.

Content Pack for ITIL CA Service Desk Manager

The Information Technology Infrastructure Library (ITIL®) is a set of books developed by the United Kingdom's Office of Government Commerce (OGC). The books describe an integrated, process based, best practice framework for managing IT services. The current version of ITIL is 2011.

The Content Pack for ITIL for the current release of CA Service Desk Manager provides additional content for CA Service Desk Manager (CA SDM) to fully support the following 15 IT Service Management ITIL 2011 edition processes:

- Availability Management
- Capacity Management
- Change Management
- Event Management
- Financial Management
- Incident Management
- IT Service Continuity Management
- Knowledge Management
- Problem Management
- Release & Deployment Management
- Request Fulfillment
- Service Asset & Configuration Management
- Service Catalog Management

- Service Level Management
- Service Portfolio Management

This document records the content and modifications that are included in the Content Pack. This package includes:

- Schema and object modifications
- New and updated analyst web forms (htmpl files)
- Updated help files (html)
- New CA Process Automation Manager workflows
- New BOXI CA Service Desk universe
- New WebI and Crystal reports

Important! Review the list of schema and data updates included in this package to ensure that your CA SDM environment does not have any conflicts.

For example, if you have already created a “z” table or “z” field with the same name that the installer will configure, it is not recommended to run the installer. See the Schema Updates for information on the schema delivered with this package. Although CA SDM will ignore any schema conflicts deployed with the package, the forms delivered with the package will reference them. See New and Updated HTMPL Forms and Updated Help Files sections for a list of modified forms.
If you already have data in your system as specified in the ITIL Content Data section, the installer may create duplicates. See the ITIL Content Data section for information on what data will be loaded into the server to identify any possible duplication.

Schema Updates

The MDB will be modified to support additional data capturing for ITIL process support. Several fields were added to existing tables and new tables were added to the MDB. The installer will put the updated schema in place for you automatically. When the installer script is run, a schema_done file will be created. The schema_done file is used to identify whether the ITIL schema was added to the server. Flag files will be created under the $NX_ROOT\samples\ITIL_Content_14_1 folder.
A vanilla or out of the box installation or upgrade of CA SDM will not have any schema conflicts. If you have modified your environment, ensure that there are not conflicts with what you have created and what the content pack delivers.
The installer will automatically create schema modifications to the MDB. If matching schema is found in the form of a table or field name, the installer will ignore the attempted update by the content installer and will not modify the site defined field, table or schema definition.
The following updates to the MDB database schema were made. Note that the ‘TABLE’ name column represents the table name as defined in $NX_ROOT/site/ddict.sch. For more information on TABLE name, SQL Name, and Object Name, see the Data Element Dictionary (see page 3496).

TABLE	FIELD	TYPE	Summary of Modification
Change_Request	zcategory_init	STRING 12 REF Change_Category	Initial change category
	zchg_bus_cls	INTEGER REF zchg_bus_cls	Business Classification

New and Updated HTMPL Forms

Several HTMPL forms were modified to support the ITIL Content. The installer will automatically take a backup of your existing site defined htmpl files before doing a copy and replace of the files noted in the table below. Any matching site defined htmpl files located in $NX_ROOT\site\mods\www\htmpl\web\analyst will be copied to $NX_ROOT\samples\ITIL_Content_14_1\<platform>\backups\<date-time>, where <platform> is either nt or unix. If you do not want to use the updated htmpl files that the installer will provide, you will need to delete the ITIL Content version from $NX_ROOT\site\mods\www\htmpl\web\analyst and replace the it with your original file located in the backups folder. Alternately, you can use the Web Screen Painter to update the ITIL Content version to include your previous updates. The original out of the box htmpl files will not be altered.
The following HTMPL forms were modified as part of the extended ITIL content support.

Form Name	Modification Made
cmdb_detail.htmpl	Field added: Business Criticality (Zbusiness_impact)
	Contacts tab renamed to “Contacts, Subscribers”

Form Name	Modification Made
cmdbNotebook.htmpl	
detail_chg.htmpl	New function on form to copy category to zcategory_init Fields added: ▪ Business Classification (zchg_bus_cls), ▪ Urgency (zurgency) ▪ Authorized for Release (zisRelease)
detail_cr.htmpl	New function on form to copy category to zcategory_init
detail_in.htmpl	Exposed Created Via (created_via.sym) ootb field New function on form to copy category to zcategory_init
detail_org.htmpl	Field added: Cost Center (zcost_center)
detail_pr.htmpl	Exposed Symptom (symptom_code), Major Problem (major_incident) and Created Via (created_via) ootb fields on form New function on form to copy category to zcategory_init
detail_sdsc.htmpl	Fields added: ▪ Record Type (ztype) ▪ Agreement Start Date (zfield_date) ▪ Agreement End Date (zfield_date2) Tab added with three sub tabs: ▪ Related Contacts (displays all contacts with this ST) ▪ Related Configuration Items (displays all CIs with the ST) ▪ Additional Content: link to zsdsc_tab.htmpl
detail_zbusiness_impact.htmpl	New form with fields: Symbol, Description fields
detail_zchg_bus_cls.htmpl	New form with fields: Symbol, Description fields, last modified by/date
in_relreq_tab.htmpl	New button: Link Incidents, Updated list to show cr and not in
list_chg.htmpl	Search Fields added: ▪ Business Classification (zchg_bus_cls), ▪ Urgency (zurgency) ▪ Authorized for Release (zisRelease)

Form Name	Modification Made
	List updated to include Authorized for Release
list_nr.htmpl	Search Fields added: ▪ Business Criticality (zbusiness_impact) ▪ SPM Lifecycle Stage List updated to include Business Criticality
list_sdsc.htmpl	Search Field added: ▪ Record Type (ztype) List updated to include Type
list_zbusiness_impact.htmpl	New form: Symbol, Description fields
list_zchg_bus_cls.htmpl	New form: Symbol, Description fields
menubar_sd.htmpl	Added to File menu item: New Knowledge Document
nr_cmdb_invothx_tab.htmpl	Fields added: ▪ SPM Lifecycle Stage (zSPMLifecycleStage)
nr_contact_tab.htmpl	Fields added: ▪ Business Owner Group (zbusiness_owners) ▪ Business Users Group (zbusiness_users)
nr_financials_tab.htmpl	New form with fields: zcharges_service, zrevenue_service, zcost_service, zprice_service, zcost_hw_purchases, zcost_hw_maintenance, zcost_sw_licenses, zcost_sw_maintenance, zcost_utility, zcost_personnel, zest_budget, zactual_budget, zpre_program_ROI, zpost_program_ROI, zcurrent_monthly_service_cost, zci_cost_category, zcost_biz_units
nr_inv_tab.htmpl	Field added: ▪ Release Package Number (zrelease_package_num)
nr_loc_tab.htmpl	Field added: ▪ Definitive Media Library Path (zDML_path)
nr_serv_tab.htmpl	Fields added: ▪ Previous Availability (zprevAvailability) ▪ Previous Capacity (prevCapacity) ▪ Previous Performance (prevPerformance) ▪ Current Availability (zcurrentAvailability) ▪ Current Capacity (zcurrentCapacity)

Form Name	Modification Made
	▪ Current Performance (zcurrentPerformance) ▪ Service Description (zservice_description) ▪ Service Value Proposition (zvalue_prop) ▪ Business Processes Supported (zbiz_proc_supported)
xx_prop_tab.htmpl	Field added: ▪ zscope
zsdsc_tab.htmpl	Fields added: ▪ Location included (zquestion1) ▪ Definitions (zquestion2) ▪ Responsibilities and Dependencies (zquestion3) ▪ Scope (zfield_long) ▪ KPI (zKPI1) ▪ KPI (zKPI2) ▪ KPI (zKPI3)

ITIL Content Data

Content Data

When the installer script is run, a dataLoad_done file will be created. The dataLoad_done file identifies if the ITIL content was loaded on the server. This will ensure that if the script is re-executed that duplicate data will not be loaded into the system. It also allows CA Support to track if the content exists or not. Flag files will be created under the $NX_ROOT\samples\ITIL_Content_14_1 folder.

The following table shows what tables will have data loaded into them and what the values of that data will be. Before running the install script, ensure that the values listed below do not already exist in your environment. For example, if you already have a Change Category titled “Service. Improvement Plan” you may not want to create a duplicate value in your database when the install script is run. You can manually modify the data that gets loaded into the application by editing the data files located in the ITIL_Content_14_1\files\data folder.

Description: Table	Data File(s)	Values
Activity Type Association : Act_Type_Assoc	Act_Type_Assoc.dat	RFC Authorized for Release

Additional Content Data

Templates

The following data is not supplied automatically by the ITIL Content installer, however it is recommended that you manually add the following templates to your CA SDM application to further support the incident, request, problem, change, and release and deployment ITIL processes

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
Incident Template	Incident Model for <insert type of Incident> For example: Incident Model for Printer Repair	Incident Area = <any>	Contains the pre-defined steps that should be taken for dealing with a particular type of Incident. Further supported through incident status transitions.	CA SDM online help, Section on 'Create an Incident Template'
Incident Template	User Compliment	Incident Area = User. Compliment	Used to record user compliments received from interaction with analyst.	CA SDM online help, Section on 'Create an Incident Template'
Incident Template	User Complaint	Incident Area = User. Complaint	Used to record user complaints received from interaction with analyst.	CA SDM online help, Section on 'Create an Incident Template'

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
Request Template	Knowledge Document Update	Request Area = Knowledge. BrokenLink	Request to update knowledge documents that have been flagged with a broken link.	CA SDM online help, Section on 'Create a Request Template'
Request Template	New Service Request	Request Area = <any>	Contains the pre-defined steps that should be taken for dealing with a service request. Further supported through request status transitions.	CA SDM online help, Section on 'Create a Request Template'
Problem Template	Problem Model for <insert type of Problem> For example: Problem Model for Known Error	Problem Area = <any>	Use for the resolution of dormant and underlying problems. Further supported through problem status transitions.	CA SDM online help, Section on 'Create a Problem Template'
Problem Template	Major Problem Review	Problem Area = Problem Review	Major Problem Review Required	CA SDM online help, Section on 'Create a Problem Template'
Change Order Template	Change Model for <insert type of change> For example: Change Model for New Hires	Category = <any> Change Type = Normal	Defines specific pre-defined steps that will be followed to manage a Change. Further supported through change status transitions.	CA SDM online help, Section on 'Create a Change Order Template'
Change Order Template	Release and Deployment Model	Category = Release and Deployment Model	Defines specific pre-defined steps that will be followed to manage a Release. Further supported through the CA Process Automation Workflow, Change and Release Management, when that workflow is linked to the Release and Deployment Model Change Category.	CA SDM online help, Section on 'Create a Change Order Template'
Change Category	Release and Deployment Model	Properties: ▪ Is this a known or scheduled disaster recovery test? ▪ Does the count towards the	Properties added to support the gathering of data.	CA SDM online help, Section on 'Define Change Order Categories'

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
		yearly failover test requirements? ▪ Was the failover plan followed? ▪ How long did the failover test occur for? ▪ Was the failover successful? ▪ Was failback implemented?		

Administrative Data

The following data is not supplied automatically by the ITIL Content installer, however it is recommended that you manually add the following Administrative Data to your CA SDM application to further support the incident, request, problem, change, and release and deployment ITIL processes

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
Change Category	Release and Deployment Model	Properties: ▪ Is this a known or scheduled disaster recovery test?	Properties added to support the gathering of data.	CA SDM online help, Section on 'Define Change Order Categories'

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
		▪ Does the count towards the yearly failover test requirements? ▪ Was the failover plan followed? ▪ How long did the failover test occur for? ▪ Was the failover successful? ▪ Was failback implemented?		
Knowledge Document	Test Checklist	Knowledge Category = Disaster Recovery Plans	Test checklists should be created and stored under relevant knowledge categories.	CA SDM online help, Section on 'Create Knowledge Documents'
Knowledge Document	Technical and Service Information	Knowledge Category = Service Quality Plan	Record technical and service related information under relevant knowledge categories.	CA SDM online help, Section on 'Create Knowledge Documents'
Knowledge Document	Plans	Knowledge Categories = Availability Plans, Capacity Plans, Disaster Recovery Plans	Record plans under relevant knowledge categories.	CA SDM online help, Section on 'Create Knowledge Documents'
Knowledge Document	Procedures	Knowledge Categories = Compliance	Record procedures under relevant knowledge categories.	CA SDM online help, 'Section on 'Create Knowledge Documents'
CI Class	Design Package	Family = Service	Service Design Package	CA SDM online help, Section on 'Configuration Item Classes'
Menu Tree Resource	Business Impact	Sample Business Impacts are provided with the Content Pack for ITIL for CA SDM.	If you would like to add to the content we provided, we recommend doing so via a menu tree resource for 'Business Impact', under the Administration Tab->Service Desk->Application Data -> Codes	'Menu Trees', as well as the CA SDM online help, section on 'Create a Menu Tree Resource'

Object	Suggested Name /Title	Suggested Default Data	Description	How-to Documentation
Menu Tree Resource	Business Classification	Sample Business Classifications are provided with the Content Pack for ITIL for CA SDM.	If you would like to add to the content we provided, we recommend doing so via a menu tree resource for 'Business Classification, under the Administration Tab->Service Desk->Application Data -> Codes	'Menu Trees', as well as the CA SDM online help, section on 'Create a Menu Tree Resource'

Updated Help Files

Several help files were updated to support the extended ITIL content. Help data is in standard HTML files, not HTMPL templates, so the web engine cannot dynamically change file references. Since there is no /CAisd/site/mods/help subdirectory, all modified help files will be copied to /CAisd/help. For example: $NX_ROOT\bopcfg\www\wwwroot\help\web. The installer will back up the original html files to $NX_ROOT\samples\ ITIL_Content_14_1\files\help.
If you have modified any of the following help files you will want to review the Summary of Modifications column below to understand what was modified and decide whether to use the out of the box version or the supplied modified file. The original files will be backed up under the $NX_ROOT\samples\ITIL_Content_14_1\Backups folder and the modified version will be to /CAisd /help by the installer.
Due to the structure of help files, any patch or future version of CA SDM that delivers any of the same help files included in the content pack will be over ridden with the version included in the patch or new release.

HTML HELP FILE	Summary of Modifications
add_act_to_co.html	Updated summary text
add_act_to_inc.html	Updated summary text
add_act_to_prob.html	Updated summary text
add_act_to_req.html	Updated summary text
chg_order_fields.html	Added Authorized for Release
CI_inv_flds.html	Added Release Package Number
CI-svc_flds.html	Also added Service Description and Business Processes Supported
ci_tabs.html	Update tab name to Contacts, Subscribers Added Financials Tab
CI-flds.html	Field documented: Business Criticality
	Field documented: DML Path

HTML HELP FILE	Summary of Modifications
CI-loc_info.html	
CI-srch_flds.html	Field documented: Business Criticality, SPM Lifecycle Stage
CI-svc_flds.html	Field documented: SPM Lifecycle Stage, Service Value Proposition field, Previous Availability, Previous Capacity, Previous Performance, Current Availability, Current Capacity, Current Performance
CO-use_temp.html	Description updated
CO-srch_flds.html	Added Authorized for Release
co_tabs.html	Properties updated, Cost/Plans updated
create_act_not.html	Added created_via
create_quick_close_ticket.html	Note sample quick close templates for complaint and compliment.
create_svc_type.html	Add instructions for how to Edit a Service Type
def_CO_cat.html	Document categories: Service.Improvement Plan, Service.Quality Plan
define_knowfiles_fields.html	Field documented: Doc ID
define_status_transitions.html	Added pending major problem review note
from_inc.html	Documented the Create Incident button
Inc_def_areas.html	Document categories: Service.Improvement Plan, Service.Quality Plan
INC-use-temp.html	Documented template: Create Incident Model Template Note that templates can be used to log events from monitoring tools.
incident_fields.html	Field documented: created_via, open date/time fields added
manage_CI_classes.html	Document new CI Classes: Design Package, Portfolio Service
manage_co_chg_win.html	

HTML HELP FILE	Summary of Modifications
manage_know_cat.html	Data documented: knowledge categories of Availability Plans, Capacity Plans, Known Errors, business cases, Compliance, CSI Register, Service Improvement and Quality Plans, Release & Deployment, Workaround
organization_fields.html	Help page added for organization fields
prob_fields.html	Fields documented: symptom, created via, Major Problem
PROB-use_temp.html	Documented templates
REQ-flds.html	Field documented: RFC open date/time field, Service Development listed as a request area example.
req-inc-prob-area_flds.html	Field documented: symbol
role_list.html	Removed reference to “ITIL v3” and just used “ITIL”
search_for_documents.html	Added summary sentence
survey_templates.html	Note 2 OOTB surveys: Service Desk Quality Survey and Request Fulfillment Survey
svc_type_flds.html	Fields documented: Record Type, Agreement Start Date, Agreement End Date, and Scope tab
service_type_tabs.html	Document the new Scope tab
view_req.html	Button documented: ‘Create Incident’ button

New Reports

Find the following additional reports under Folder Name (Public Folders-> CA Reports -> CA Service Desk).

Report Name	Report Description	Report Type
Business Impact	Ticket list per service CI showing business impact.	Web Intelligence Report

Report Name	Report Description	Report Type
Incident Closure Category Summary Report	Incident report showing the initial categorization and the closing categorization. This report shows the total count of Incidents with pie charts showing categories with the highest number of re-classifications.	Web Intelligence Report
Problem Closure Category Summary Report	Problem report showing the initial categorization and the closing categorization. This report shows the total count of problems with pie charts showing categories with the highest number of re-classifications.	Web Intelligence Report
Service Request Closing Category Summary Report	Service Request report showing the initial categorization and the closing categorization. This report shows the total count of problems with pie charts showing categories with the highest number of re-classifications.	Web Intelligence Report
RFC Closure Category Summary Report	Request for Change report showing the initial categorization and the closing categorization. This report shows the total count of RFCs with pie charts showing categories with the highest number of re-classifications.	Web Intelligence Report
SLA Management Report	Service level management report showing different trends based on ticket type and service.	Web Intelligence Report
SLA Management Report Previous 12 months	Service level management report showing different trends based on ticket type and service for the last 12 months.	Web Intelligence Report
SLA Management Report Previous 3 Months	Service level management report showing different trends based on ticket type and service for the last 3 months.	Web Intelligence Report
SLA Management Report Previous 7 Days	Service level management report showing different trends based on ticket type and service for the last 7 days.	Web Intelligence Report
SLAs To be validated Today	Service levels that will be violated today.	Web Intelligence Report
SLAs Violating Today Summary Report	Summary report showing SLAs with a validation date of today.	Web Intelligence Report
Violations Report	Service type violations report. Filter available for selecting OLA, SLA, or UC.	Crystal Report
SLA Monitoring Chart	Service Level Agreement Monitoring chart to show service level performance history.	Crystal Report
Change Order Closure Category	Detailed report to track the initial and closing categorization on change requests.	Crystal Report

Incident Closure Category Report	Detailed report to track the initial and closing categorization on incidents.	Crystal Report
Incidents Closure Category Count Report	High level summary to view the total count of categorization differences between initial and closing categorization on incidents.	Crystal Report
Problems Closure Category Report	Detailed report to track the initial and closing categorization on problems.	Crystal Report
Request Closure Category Report	Detailed report to track the initial and closing categorization on requests.	Crystal Report
Service Requests by Requests Area	Graph showing the number of requests over a period of time grouped by request area.	Crystal Report
Trend: RFCs and Affected CIs	Report to show Change Orders with associated Configuration Items. Sort filters are by earliest Open Date, Latest Open Date, CI, CI Class Type or CI Family.	Crystal Report
Service Availability and Performance Violation Report	Service type violations report for service availability and performance tickets. Filter available for created via, category, and affected end user.	Crystal Report

For the out of the box reports, see CA Service Desk Manager Reports (see page 4784)

Options Manager

Options Manager settings can be found under the Administrative tab in the Options Manager folder. It is recommended to install the following Options Manager Options when using the ITIL Content Pack for CA SDM:

- employee_intf_incident_support
- catalog_server

CA Process Automation Workflows

When the installer script is run, a subdirectory is created called ‘workflows’. It contains two files.
1.) An XML file with all of the Processes, SRF’s, IRF’s, and Custom Operators required for implementation of the process.
2.) A PDF file with setup, configuration, integration, and Best Practices information. It also contains a screenshot demo of all Process Definitions ‘In Action’. Note that this content builds upon the existing ‘CA Process Automation Sample Process Definitions for CA SDM’. The chart below outlines those process definitions that are new with the Content Pack for ITIL for CA SDM, the ones that are updated for the Content Pack for ITIL for CA SDM, and those that existed previously in an OOB install of CA SDM.

Process Name	New /Updated	What it does
Request Fulfillment	New	The goal of this process is to provide a foundation for Request Fulfillment which aligns to ITIL 2011.
Change and Release Management	Updated	This process definition adds Release and Deployment Management to the existing Change Management process included in the 'CA Process Automation Sample Process Definitions for CA SDM'. The goal of this process is to provide a foundation for Change and Release and Deployment Management which aligns to ITIL 2011. Provides the ability to manage a Change Management process for all Standard, Normal or Emergency Changes from the initial Request for Change through to its deployment and Post Implementation Review. It analyzes the 'Type' of Change Order and associated 'Risk' Level to determine what level of approvals are necessary for Change implementation. Should be called from a Change Category.
Change Management	Existing, no updates	Replaced with Change and Release Management Process Definition
Order PC	Existing, no updates	Sample building block which walks you through approval steps for and end user to raise the request and fulfill a PC Order.
Problem Analysis	Existing, no updates	The goal of this process definition is to make a decision regarding if an RFC /Change should be created for a given problem. Once the problem assignee has finished researching the problem and has a suggested solution, they will fill out this problem survey and provide a recommendation. The survey should give the approver a good idea of the impact of the problem and if it is necessary to resolve it through Change Management. The idea of a Problem Pain/Value Analysis comes from ITIL v3 and should help CA better align to ITIL.

Install the ITIL Content for CA Service Desk Manager

Run the installer for one of the following instances:

- Fresh installation of CA SDM ITIL content
- When you upgrade to CA SDM 14.1, the ITIL content is also migrated, but some schema files may be missing. To rectify this issue, you need to run the installer.

Follow these instructions to run the installer.

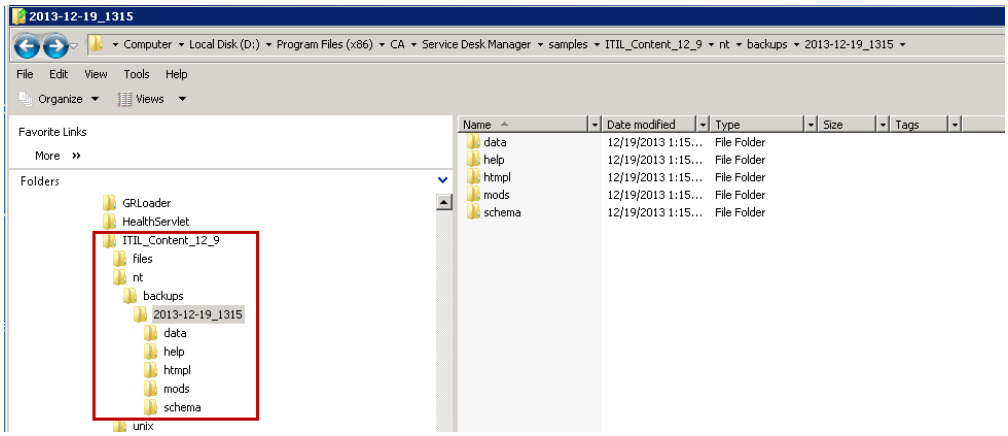
Verify the Prerequisites

Perform the following pre-requisite steps before running the installer:

1. Ensure you have a functional version of CA SDM running in a test or development environment. It is not recommended to run the installer on a production instance of CA SDM without strict change control and validation testing first.

2. Unzip ITIL_Content_14_1.zip to the $NX_ROOT\samples folder on your CA SDM primary server and all CA SDM standby servers if using Advanced Availability.

3. Backups will be made under $NX_ROOT \samples\ITIL_Content_14_1\<platform>\backups\<date-time> folder



4. Review the content included with the installer as defined throughout this document.

5. Log files will be created under the $NX_ROOT\logs folder.

Run the Installer

Install the Content on Windows

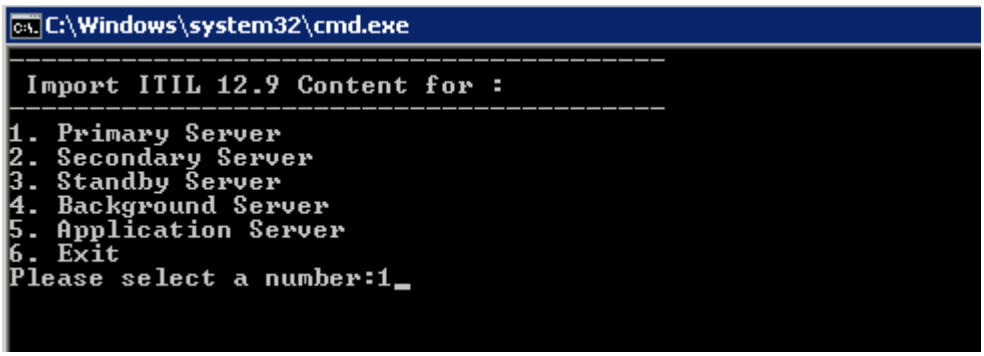
For Conventional Environment – Primary Server Install

1. Login to the Primary CA SDM Server.

2. Navigate to $NX_ROOT\Samples\ITIL_Content_14_1\nt and execute setup.bat

3. Select Run

4. Select the appropriate option based on your server environment. For example, select 1 if you are installing onto your Primary Server:



5. The install will initiate and start CA SDM if necessary.

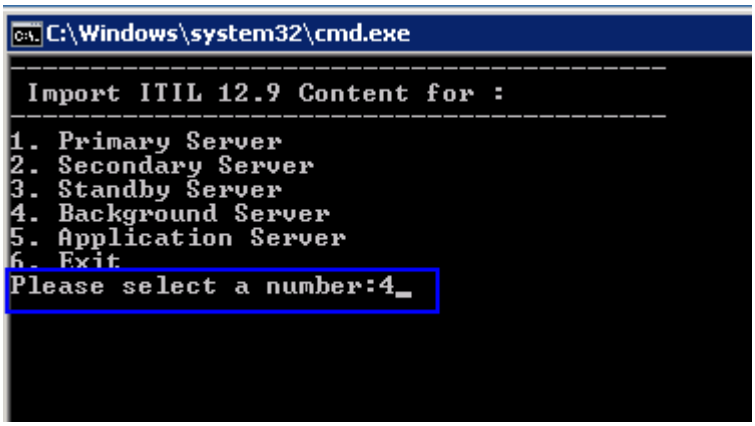
For Advanced Availability Environment

ITIL Data will be loaded only if the Primary or Background options are selected, and is executed only one time.
Complete the following steps on the original Standby Server:

1. Login to the Standby Server. After the deployment of the ITIL Content pack on this machine, a failover will be performed and this server will become the new Background server.

2. Navigate to $NX_ROOT/samples/ITIL_Content_14_1/nt and execute setup.bat

3. When prompted, select option 4, for Background Server



4. Click "Y" to do fail-over during pdm_publish.

5. On the original Background Server, now Standby Server

    a. Login to the “new” Standby Server (Former Background)

    b. Navigate to $NX_ROOT/samples/ITIL_Content_14_1/nt and execute setup.bat

    c. When prompted, select option 3 for Standby Server.

6. On the Application Servers,

    a. Login to the Application Server

b. Navigate to $NX_ROOT/samples/ITIL_Content_14_1/nt and execute setup.bat

c. When prompted, select option 5 for Application Server

Install the Content on UNIX

Note: CA SDM services will restarted during the deployment process, ensure that the environment variables (PATH - Oracle executables, ORACLE variables) are set in the terminal /console before executing the setup.sh file

For Conventional Setup:

1. Login to the Primary Server
2. Navigate to /opt/CAisd/samples/ITIL_Content_14_1/unix and execute ./setup.sh
3. Select appropriate option based on server.

For Advanced Availability Setup:

1. Login to Standby Server and select Option as Background server, as during pdm_publish we do failover and make this server as Background.
2. Navigate to /opt/CAisd/samples/ITIL_Content_14_1/unix and execute ./setup.sh
3. Click "Y" to do fail-over during pdm_publish
4. Login to Standby Server (Former Background, Now standby after fail-over) or Application Server
5. Select appropriate option based on server.

Note:

- Ensure that the ITIL Content pack is deployed on the new background server. If not, perform a manual failover, using the command: pdm_server_control -b
- ITIL Data will be loaded only in Primary and Background option. So it has to execute only once.
- Data Extract and Load will happen only on Background and Primary Server only. Choose option carefully.

Install CA Process Automation Workflows

CA Process Automation workflows are located under $NX_ROOT\Samples\ITIL_Content_14_1\files\workflows\

Follow these steps:

1. Import CA SDM CA Process Automation Process Definitions (see page 4824)
2. Configure SDM Dataset for Sample Process Definitions (see page 4828)
3. Increase 'Maximum Number of Log Messages' in CA Process Automation (see page 4832)
4. Verify CA SDM Options Manager Options (see page 4833)
5. Troubleshooting Note (see page 4834)

Install ITIL Reports

Find the BIAR report is under <NX_ROOT>\Samples\ITIL_Content_14_1\files\reports\. CA Business Intelligence also includes BIConfig, a utility that can be used to add, modify, delete, and otherwise affect various BusinessObjects objects. BIConfig is generally used during a CA product's installation or maintenance process and is run in a batch mode.

Important! If you have migrated from CA SDM 12.9, ensure that you have installed CA Business Intelligence 4.1 SP3 for the ITIL content reports.

The BiConfig utility takes inputs from the command line and an XML file that describes the configuration updates to be performed on the Business Objects environment.

Follow these steps:

1. Create the directory c:\BIConfig on your local machine where BOXI is installed.
2. Copy and Unzip the contents of the BIConfig folder from the Business Intelligence Embedding Kit [<ServiceDeskManager_Installation_CD>\ca_tps.nt\CABO\biconfig.zip] to C:\BIConfig.
3. Copy "xml_biar_import.xml" file from <NX_ROOT>\Samples\ITIL_Content_14_1\files\reports\ folder to BIConfig folder.
4. Edit "xml_biar_import.xml" file and specify necessary values for path of the biar file located, DB Username, DB password, System DSN (data source name) specified under Windows Administrative Tools -> Data Sources (ODBC drivers). Find the xml_biar_import.xml file under <NX_ROOT>\Samples\ITIL_Content_14_1\files\reports\ folder.

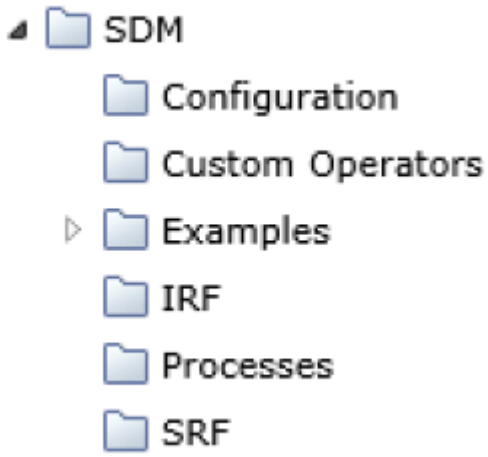
   The BIConfig utility is run from the command line, can be invoked silently, and requires the JRE. Invoke BIConfig by executing the BIConfig.bat file using the syntax and example shown below. Log messages are written to the BIConfig.log file.

Syntax:
biconfig.bat -h "<BOXI-hostname>" –u "<BOXI username>" –p "<BOXI pwd>" -f "xml_biar_import.xml"

Example:
C:\biconfig>biconfig.bat -h "itcse-r121" –u "Administrator" –p "BOXI1" -f "xml_biar_import.xml"

Import CA SDM CA Process Automation Process Definitions

Note: These process definitions are imported to the CA SDM directory off of the root directory in PAM, as shown in the screenshot below. This is the same place that the CA SDM CA Process Automation Sample Process Definitions available in $NX_ROOT/samples /CA_PAM_Workflows, are imported to. The Process Definitions that are provided with the Content Pack for ITIL for CA SDM build upon and enhance those previously provided in the directory below, if you have already imported the CA SDM CA Process Automation Sample Process Definitions. Be sure to take a backup prior to importing the process definitions provided with the Content Pack for ITIL for CA SDM.



Before we begin: The XML File we will be importing into PAM in the instructions to follow includes the following components to ensure that these flows will function properly. This XML file can be found at: $NX_ROOT/samples/ITIL_Content_14_1/files/workflows /ContentPackITILCASDM141PAMWF.XML

CA Process Automation Object	What it Does
Custom Operators	Pre-configure parameters for repeated use in many different processes
Global Datasets	

CA Process Automation Object	What it Does
	Define and group variables used as parameters for module and job invocations. Datasets can define common parameters-such as application locations, passwords, and profile names-required by modules and applications on a network. These variables can be easily configured so that Processes and scheduling can be efficiently updated to reflect changes in an application environment.
Interaction Request Forms (IRF's)	Provides field and other UI elements with which users can enter information required to execute an Operator or continue a process.
Processes	Graphically describe the ordering and dependencies for Operations Performed by modules. Operators are represented in a Process graphically and by Operators with links and dependencies that define the order and logic for performing tasks in a Process. These processes are samples with which you can use as-is, or modify to meet your business needs.
Start Request Forms (SRF's)	Define shortcuts to allow an operator to invoke processes manually using the Management Console. Start Request Form objects define custom dialogs that prompt operators for the values of parameters required by the associated project. These are also used by CA SDM to launch CA Process Automation Process definitions by attaching a definition to a Request/Incident/Problem Area, or Change Order/Issue Category.

Follow these steps:

1. To manually import the sample process definitions do the following. Login to CA Process Automation by either navigating to Start, Programs, CA, <*CA Process Automation*>, Start CA Process Automation locally on the CA Process Automation Server, or via the direct URL if you are launching it from a server remote from CA SDM:

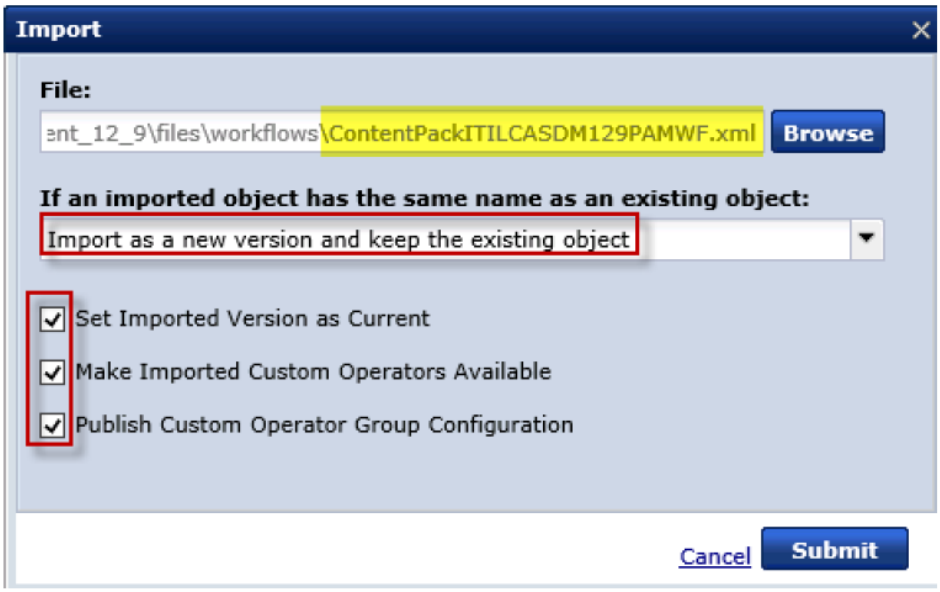
    a. Login as 'itpamadmin' on an upgraded instance of CA Process Automation, or 'pamadmin' on a fresh install of CA Process Automation 4.1 SP01 or above.

2. Import the Process Definitions into CA Process Automation:

    a. Click on the 'Library' Tab

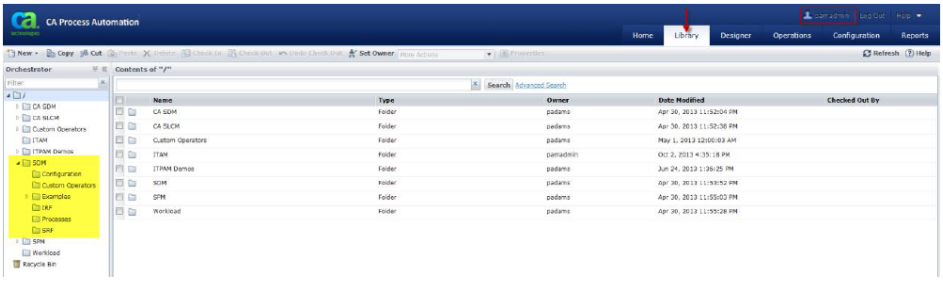
    b. RMC on the root directory, and select 'Import:

    c. Browse to the XML File which contains the CA Process Automation Process Definitions, select it, then select all remaining checkboxes, then hi 'submit'. In my example I have logged into CA Process Automation via url from the CA SDM Server. I have browsed to the ContentPackITILCASDM141PAMWF.XML file under $NX_ROOT/samples /ITIL_Content_14_1/files/workflows/



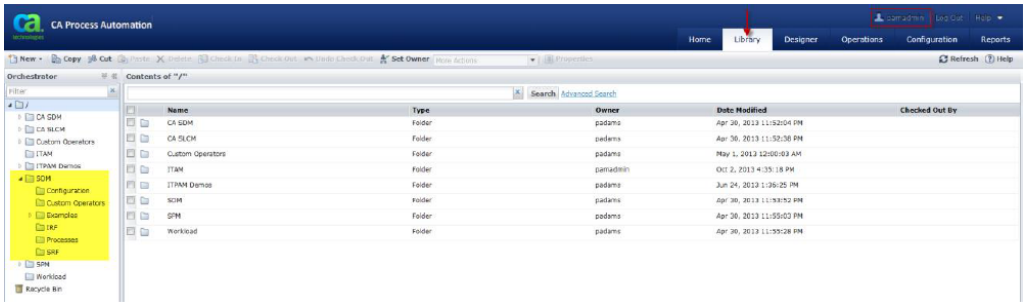
d. You will now see a new folder, SDM, as shown in the screenshot below.

Note: If you have already imported the process definitions available in $NX_ROOT/samples/CA_PAM_Workflows then this will overwrite the content already in the 'SDM' directory, however, depending on the flag you specified above during the import, it will also create a new 'version'.

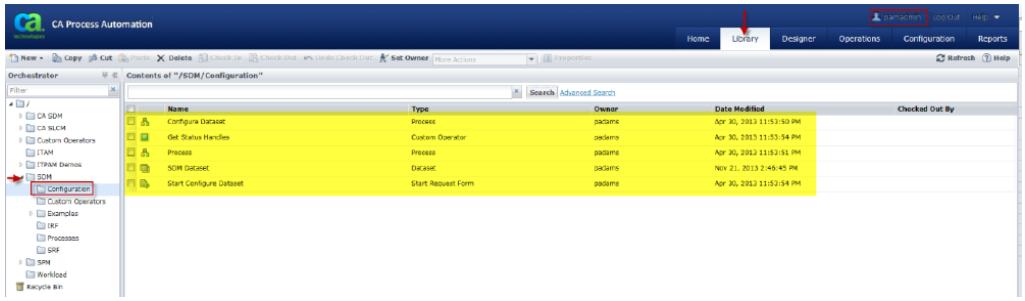


View Imported Process Definitions

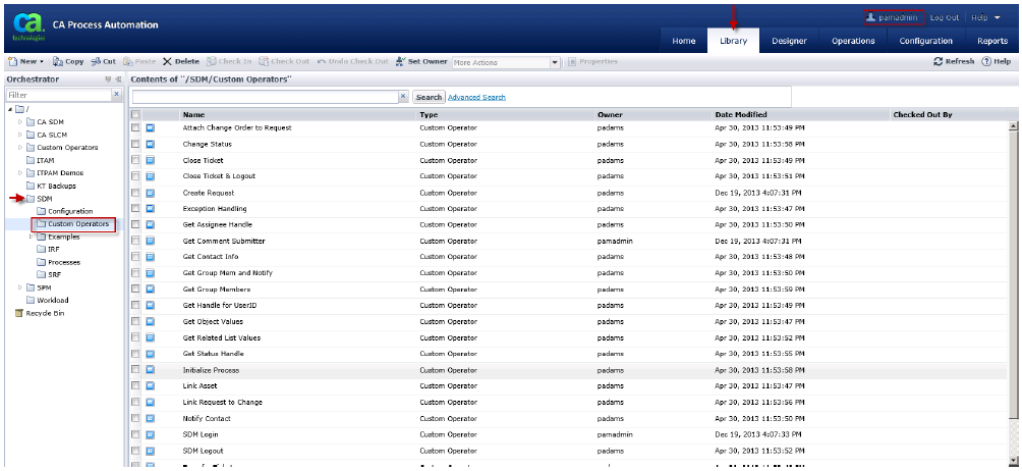
1. Once you have imported the Process Definitions, a new folder called 'SDM' appears, which includes Configuration, Custom Operators, Examples, IRF's, Processes, and SRF's:



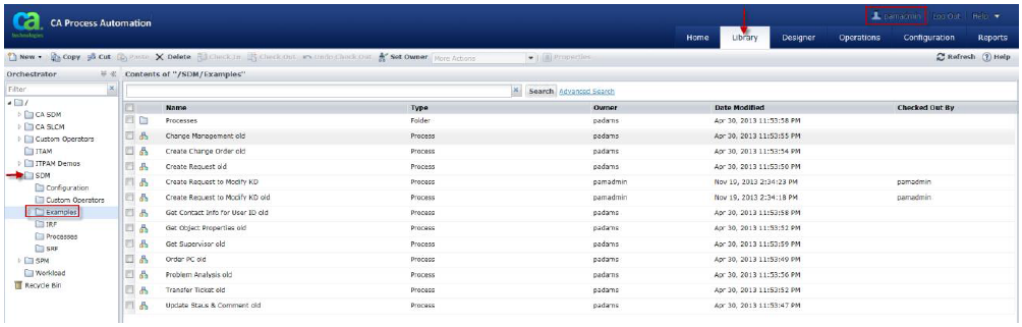
2. Configuration:



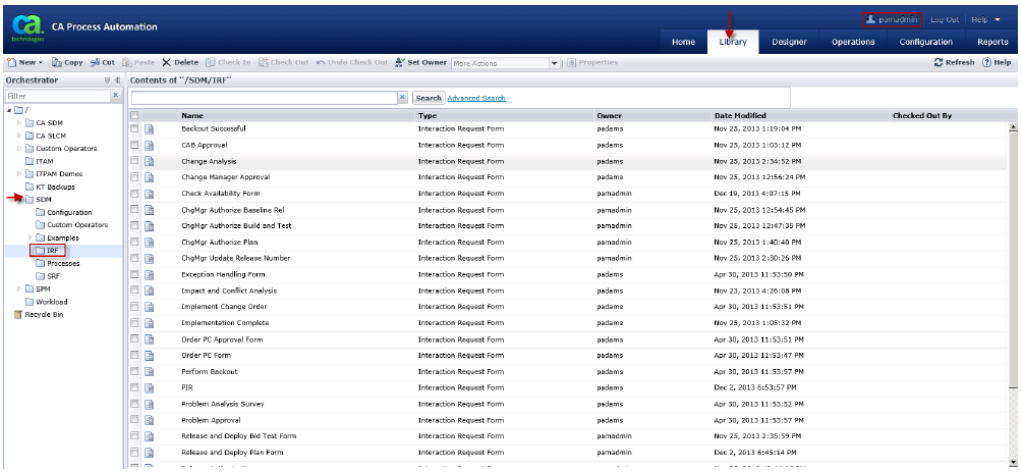
3. Custom Operators:



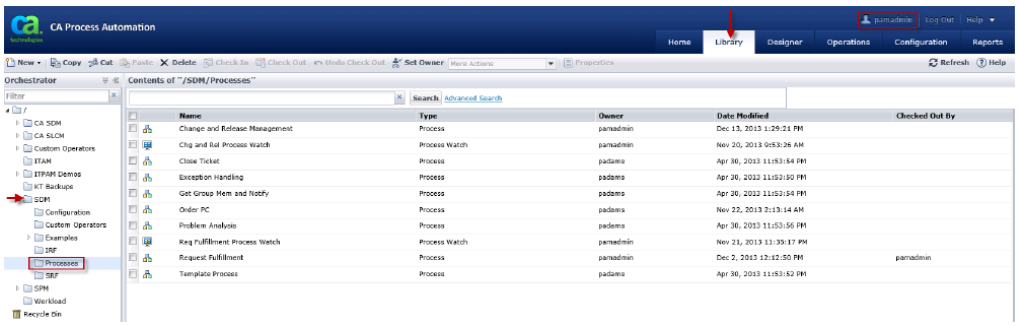
4. Examples:



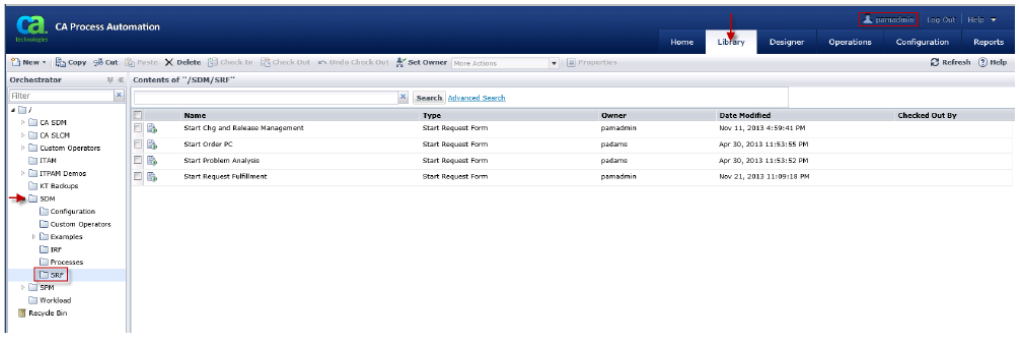
5. IRF's:



6. Processes:

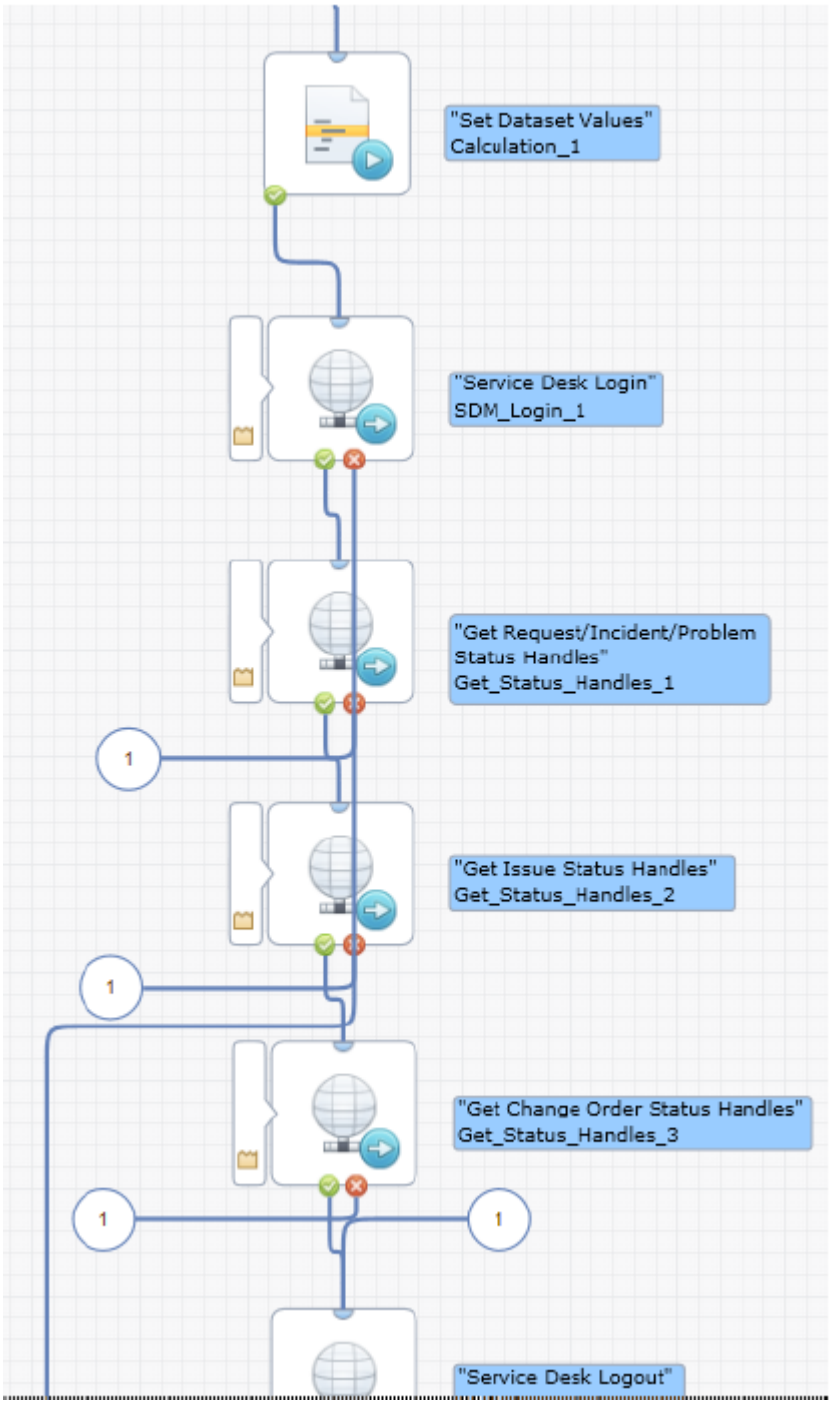


7. SRF's:

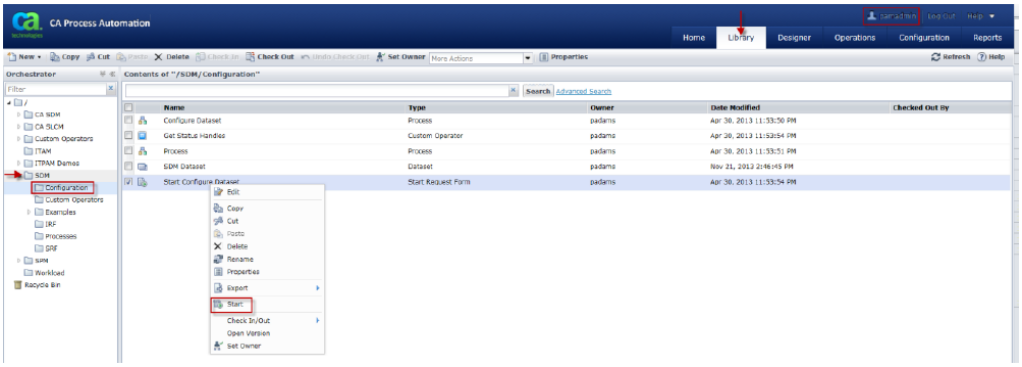


Configure SDM Dataset for Sample Process Definitions

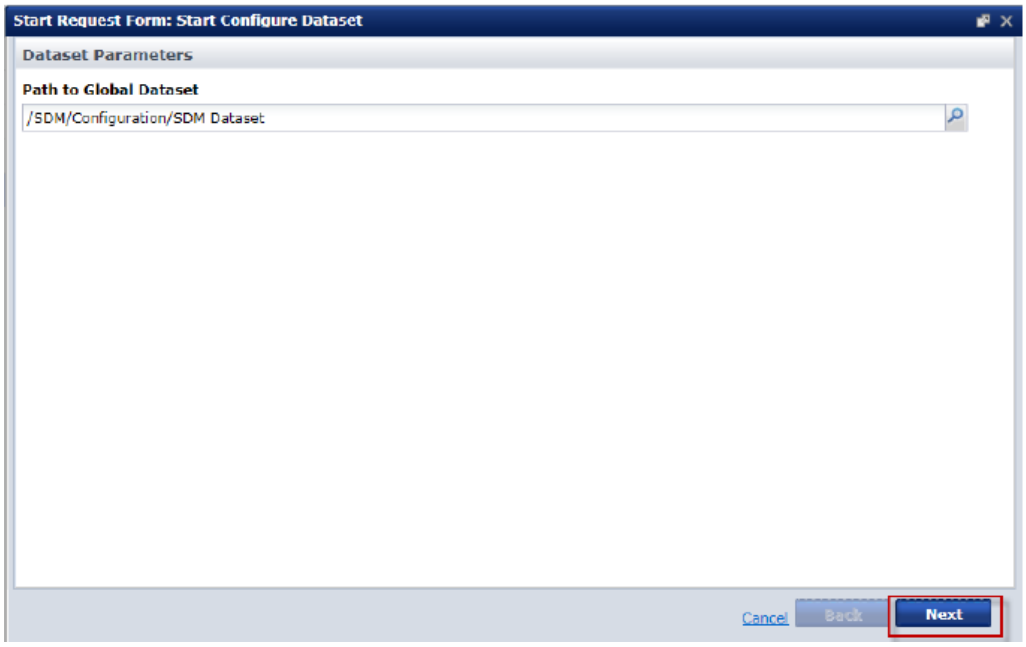
1. In the CA Process Automation Client, navigate back to SDM, Configuration. Here is where the dataset is configured for the sample process definitions. There is an SRF, 'Start Configure Dataset', which instantiates a 'Configure Dataset' Process which initializes the CA SDM Server, CA Process Automation Server, Exception Handling, and also obtains all handles (persid's) for all ticket statuses:



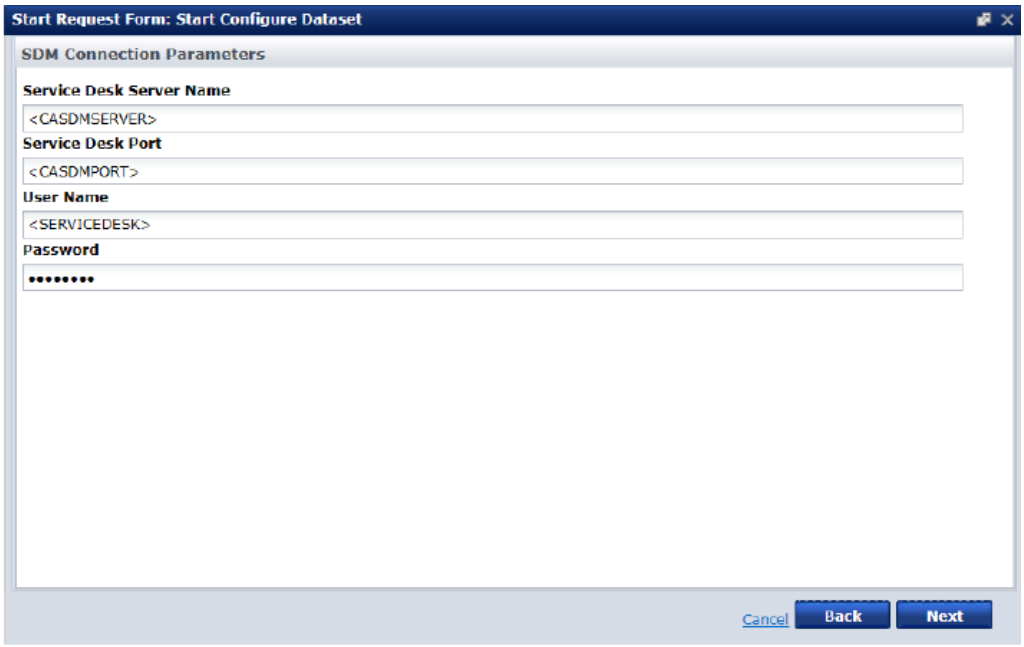
2. Launch the ‘Start Request Form’ for ‘Start Configure Dataset’:



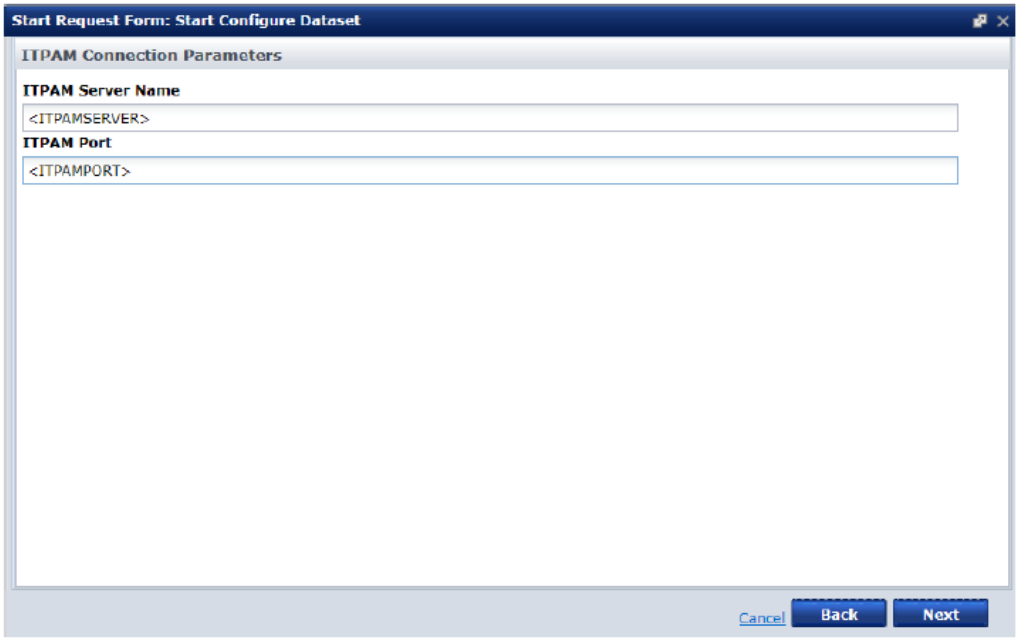
3. Verify the path to the Global Dataset (where all of the following data will be saved for other sample processes to leverage), and hit 'Next'.



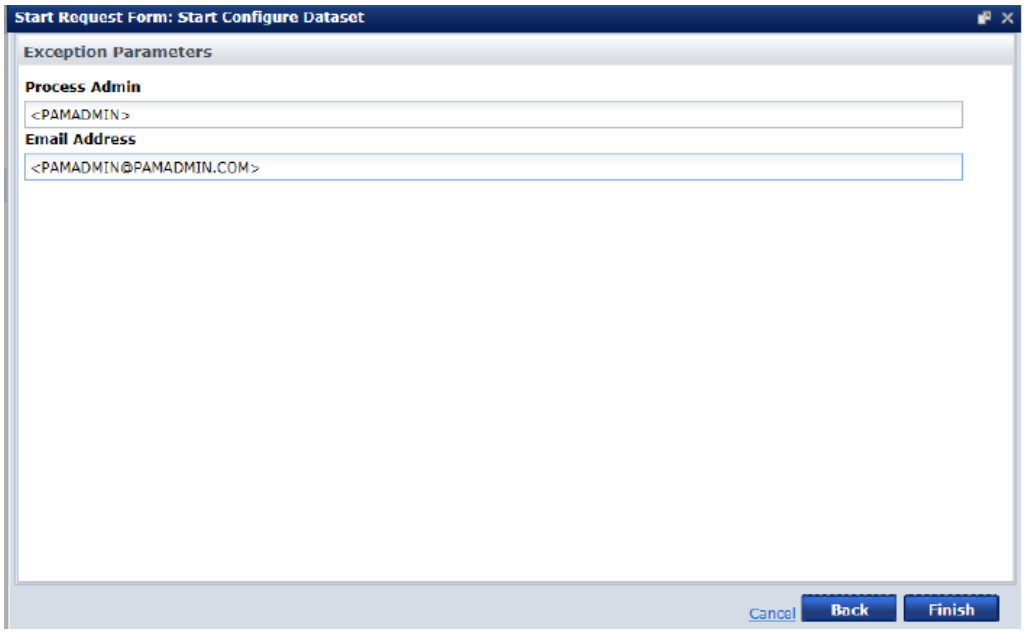
4. Enter in the values for the CA SDM server, port, Administrative Username and Password (replace what is shown here with your own data):



5. Enter in the values for the CA Process Automation server, and port (replace what is shown here with your own data):



6. Enter in the value for Process Admin and an email address (replace what is shown here with your own data):



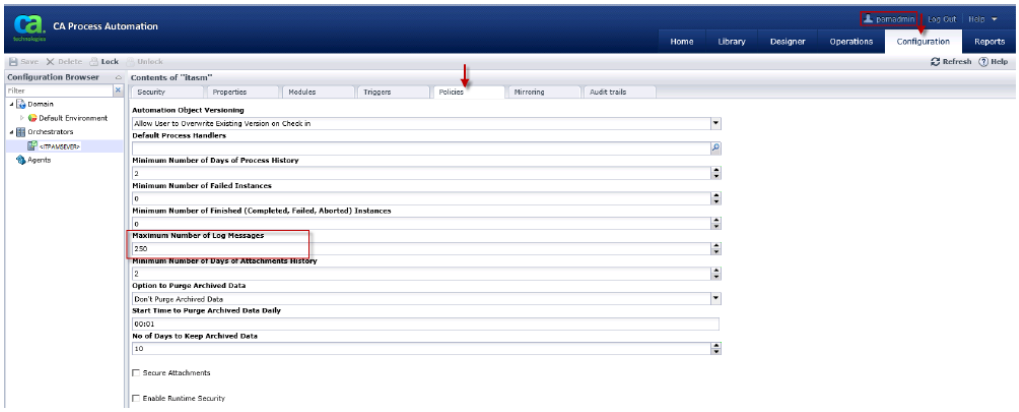
7. Hit Finish. Your CA Process Automation integration settings are now complete. All data resulting from this process definition are saved to the CA SDM Dataset.

Increase 'Maximum Number of Log Messages' in CA Process Automation

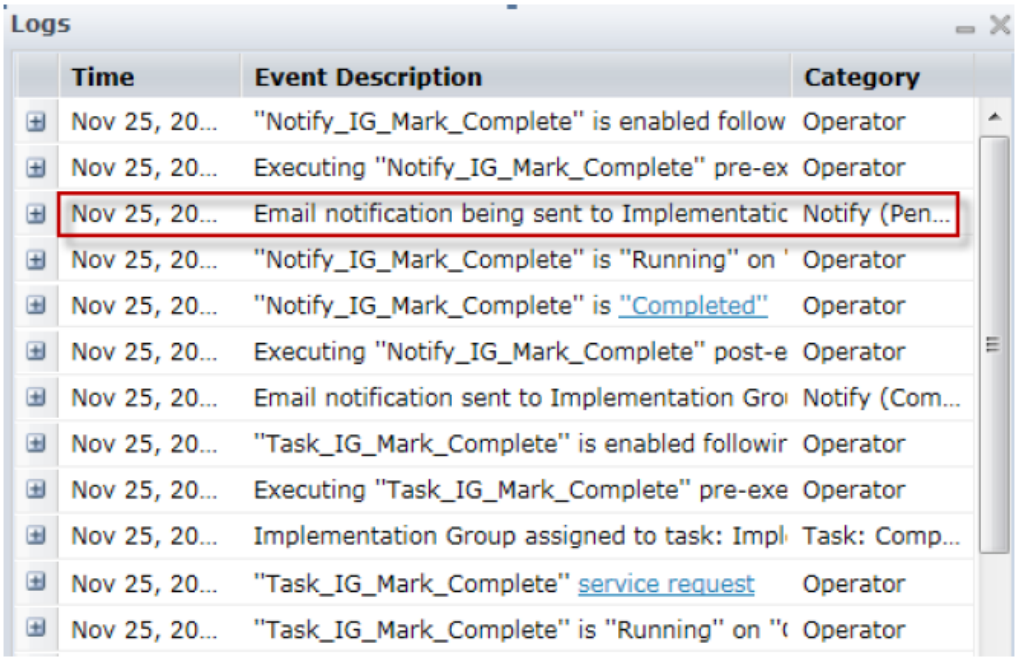
Follow these steps:

1. In the CA Process Automation Client, navigate to Configuration, select your Orchestrator and hit the 'Policies' Tab.

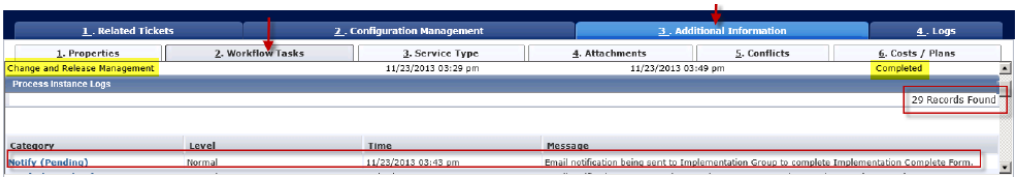
2. Increase 'Maximum number of Log Messages' to 250.



3. This number will ensure that all Process Instance Logs in CA Process Automation...



4. are carried over to the Workflow Tasks Tab in a CA SDM Problem, Request, or Change Order. If you do not increase this number, you will find that the Workflow Tasks Tab will not show the full list of Process Instance Logs, only the last 29 will be saved in cache and displayed:



Verify CA SDM Options Manager Options

Follow these steps:

1. Login to CA SDM by navigating to Start, Programs, CA, Service Desk Manager, Service Desk Web Client.

    a. Login as an Administrator, in our example we will be logging in as the 'ServiceDesk' user.

2. Install CA SDM Options Manager Options for CA IT PAM Workflow :

    a. Navigate to Administration, Options Manager, CA IT PAM Workflow

    b. Verify that all 7 options are installed according to the instructions in CA SDM 12.6 Integrations Greenbook, Volume 2, Chapter on CA Process Automation (https://support.ca.com/irj/portal/anonymous/phpdocs?filePath=0/common/greenbooks.html).

i. All are applicable with the exception of the caextwf_eem_hostname option. This may not be applicable if you are not running EEM in your environment and instead are running Active Director.

c. Assume here that:

i. CAEEMSERVER = Name of your EEM server.
1. Should match what is returned by running 'hostname' in DOS

ii. CAITPAMSERVER = Name of your CA Process Automation server.
1. Should match what is returned by running 'hostname' in DOS

iii. CAITPAMPORT: CA Process Automation Tomcat port

CASDM Options Manager Option	Value
Caextwf_eem_hostname	<CAEEMSERVER>
Caextwf_endpoint	http://<CAITPAMSERVER>:<CAITPAMPORT>/itpam/soap
Caextwf_log_categories For more information, see CA SDM 12.6 Integrations Greenbook, Volume 2, Chapter on CA Process Automation (https://support.ca.com/irj/portal/anonymous/phpdocs?filePath=0/common/greenbooks.html).	Notify (Pending), Notify (Complete), Task: Complete Form (Pending), Task: Complete Form (Complete), Task: Approve/Reject (Pending), Task: Approve/Reject (Complete), Status Change (Pending), Status Change (Complete), Task: Other (Pending), Task: Other (Complete), Closure Code Change (Pending), Closure Code Change (Complete), Create Incident (Pending), Create Incident (Complete), Create Change Order (Pending), Create Change Order (Complete), Process Form Data
Caextwf_processdisplayurl	http://< CAITPAMSERVER>:<ITPAMPORT>/itpam/JNLPRequestProcessor?processType=startUI&roid=
Caextwf_worklist_url	http://< CAITPAMSERVER >:<ITPAMPORT>/itpam?webPage=mytaskfilter&view=tasklist
Caextwf_ws_password	<Encrypted password>
Caextwf_ws_user	Itpamadmin <for an upgraded instance of CA Process Automation, 'pamadmin' on a fresh install

3. Recycle the CA SDM Services for changes to Options Manager Options to take effect.

Troubleshooting: Fields of type Text Area Render Without Word Wrap

Valid on IE 11

Problem:

When executing the CA Process Automation Workflows, it is found that IRF's that have fields of type 'Text Area' render without word wrap on the forms.

Solution:

Currently no solution exists. Visit the CA Process Automation Home Page on support.ca.com (http://support.ca.com) for more information.

CA Process Automation Process Definitions for CA Service Desk Manager

This topic covers steps to import and configure the sample CA SDM CA Process Automation process definitions provided with the Content Pack for ITIL for the current release of CA SDM. Before we get started, let's discuss some of the CA Process Automation content that either is currently available, or has been available with previous versions of CA SDM, and how that content relates to the Content Pack for ITIL for the current release of CA SDM which we are focusing in on in this document.

Other CA Process Automation Content for CA SDM

This section describes additional CA Process Automation Content that either is currently available, or has been available with previous versions of CA SDM, and how that content relates to the Content Pack for ITIL for the CA SDM Release 14.1.

ITIL Content Pack	CA Process Automation Sample Process Defi CA SDM
Available Out-of-box in CA SDM	Yes, with a caveat. The original ITIL Content Pack was shipped with CA Process Automation Process Definitions and documentation, however what we provide out-of-box in the current release of CA SDM is the corresponding documentation only. - The Process Definitions are no longer supported or available for download.	Yes. These have also been referred to as the Out-of-box CA Workflow Samples Converted Process Automation.' The Process Definition available out-of-box in the directory below, they need to be manually imported into CA Automation.

	ITIL Content Pack	CA Process Automation Sample Process Defi CA SDM
Release?		
Where to get it	$NX_ROOT/samples/Sample_ITIL_Content	$NX_ROOT/samples/CA_PAM_Workflows
What it includes	Documentation Only. The original ITIL Content Pack was shipped with Process Definitions and documentation, however what we provide out-of-box in CA SDM 14.1 is the corresponding documentation only. The Process Definitions are no longer supported or available for download.	The following CA Process Automation (Full) I Definitions and corresponding documentatio - Order PC - Problem Analysis - Change Management
Where to check if you have imported this c		Note that this is the same directory that the Process Automation Process Definitions in th Pack for ITIL for CA SDM are imported to, be builds upon and enhanced this content. Mor information on this to follow later in this doc 
	ITIL Content Pack	CA Process Automation Sample Process Defi CA SDM
ontentintoCAProcessAutomation?		
Supported?	No	Yes…but is replaced with the Content Pack f CA SDM.
Replaced with Content Pack for IT	Yes, however note that the Content Pack for ITIL for CA SDM is not related to the ITIL Content Pack.	Yes, builds upon and enhances this content.

ITIL Content Pack	CA Process Automation Sample Process Defi CA SDM
IL fo r C A S D M C A Pr o c es s A ut o m at io n Pr o c es s D ef in iti o n s?	

Prerequisites

This document is meant to be used in addition to the information provided in the CA SDM 12.6 Integrations Greenbook, Volume 2, Chapter on CA Process Automation (https://support.ca.com/irj/portal/anonymous/phpdocs?filePath=0/common/greenbooks.html).

This document assumes that the following applications have been installed and are operational:

- CA EEM 12.0.6.56 and above
- CA SDM 14.1
  - Email is configured and tested for CA SDM outbound email notifications
- CA Process Automation 4.1 SP1 and above

- This document also assumes that CA EEM, CA Service Desk Manager, and CA Process Automation have been integrated according to the instructions provided in the CA SDM 12.6 Integrations Greenbook, Volume 2, Chapter on CA Process Automation (https://support.ca.com/irj/portal/anonymous/phpdocs?filePath=0/common/greenbooks.html)

> **Important!** This document will walk you through importing the CA Process Automation Process Definitions which are available with the 'Content Pack for ITIL for CA SDM 14.1'. In order for these process definitions to run successfully, you must have already installed the 'Content Pack for ITIL for CA SDM', as outlined in Install the ITIL Content for CA Service Desk Manager (see page 4819), which installs schema and HTMPL modifications, as well additional Administrative Data. The process definitions which we will walk though throughout this document rely heavily on this content.

Where to Find Future Updates to the CA SDM CA Process Automation Process Definitions

You can find any available updates on the CA SDM Homepage on support.ca.com (http://support.ca.com), please be sure to check this location regularly.

CA SDM CA Process Automation Process Definitions Defined

Following are the process names:

Process Name	Building Block or Full Process Definition	New with Content Pack for ITIL for CA SDM, Updated, or Existing?	What it does
Close Ticket	Building Block	Existing	Closes a Request, Incident, Problem, Change Order or Issue.
Exception Handling	Building Block	Existing	Exception handling template which can be called from within any CA Process Automation process definition
Get Group Mem and Notify	Building Block	Existing	This building block is passed a group UUID and notify flags as input, and as a result returns a list of all group members, group manager, and notifications to these users dependent upon flags passed.
Template Process	Building Block	Existing	Template which can be used to create your own CA Process Automation Process definition.

Order PC	Full Process Definition	Existing	The goal of this process is to walk through an end user ordering a new PC and the subsequent approval steps in order to fulfill or reject this order. Should be called from a Change Category.
Problem Analysis	Full Process Definition	Existing	The goal of this process is to decide if an RFC/Change should be created for a given Problem. Once the problem assignee has finished researching the problem and has a suggested solution, they will fill out this problem survey and provide a recommendation. The survey should give the approver a good idea of the impact of the problem and if it is necessary to resolve it through Change Management. The idea of Problem Pain/Value Analysis comes from ITIL 2011. Should be called from within a Problem Area.
Request Fulfillment	Full Process Definition	New	The goal of this process is to provide a foundation for Request Fulfillment which aligns to ITIL 2011.
Change and Release Management	Full Process Definition	Updated	This process definition adds Release and Deployment Management to the existing Change Management process included in the 'CA Process Automation Sample Process Definitions for CA SDM'. The goal of this process is to provide a foundation for Change and Release and Deployment Management which aligns to ITIL 2011. Provides the ability to manage a Change Management process for all Standard, Normal or Emergency Changes from the initial Request for Change through to its deployment and Post Implementation Review. It analyzes the 'Type' of Change Order and associated 'Risk' Level to determine what level of approvals are necessary for Change implementation. Should be called from a Change Category.

Note: The difference between a 'full process definition' and a 'building block' is that full process definition can is designed to be attached to a change category or macro directly to be instantiated. A building block is designed to be invoked from within another process definition.

CA SDM CA Process Automation Custom Operators Defined

Following are the process names:

Process Name	New with Content Pack for ITIL for CA SDM, Updated, or Existing?	Process or Soap Operator?	CA SDM Web Service Invoked	Input Parameters	What it does
Attach Change Order to Request	Existing	Soap	attachChangeToRequest	Assignee Handle Request Handle Description	Attaches a Change Order to a Request
Change Status	Existing	Soap	changeStatus	Creator Handle Ticket Handle New Status Code Comments	Updates the status of a ticket
Close Ticket	Existing	Soap	closeTicket	Persid Description	Closes a ticket
Close Ticket & Logout	Existing	Process	Via Close Ticket Process	Ticket Handle Initial Delay Comments Ticket Number	Invokes Close Ticket Process which closes a ticket and logs out CA SDM Web Services
Create Request	Existing	Soap	createRequest	Creator Handle Parent Change Handle Request Type Description Customer Handle Parent Request Handle Template	Creates a new Request/Incident/Problem, dependent upon the 'type' parameter passed.
Exception Handling	Existing	Process	Via Exception Handling Process	Ticket Handle Exception Type Process Name Process ID Node Name Touchpoint Name	Dependent upon the error message received, the exception handler will determine if the system should skip the operation, try and obtain a new Session ID (SID), try the operation again, or notify the System Administrator.

Process Name	New with Content Pack for ITIL for CA SDM, Updated, or Existing?	Process or Soap Operator?	CA SDM Web Service Invoked	Input Parameters	What it does
				Agent Name Error Message Operation Name Fault Response	
Get Assignee Handle	Existing	Soap	doSelect	Ticket Type Ticket Handle	Gets handle of ticket assignee
Get Contact Info	Existing	Soap	getContact	Contact ID	Retrieves attributes of a contact
Get Group Mem and Notify	Existing	Process	Via Get Group Mem and Notify Process	Creator Handle Ticket Handle Group Handle Notify List Message Title Message Body Urgency Internal Only	Invokes the Get Group Mem and Notify Process, which is passed a group UUID and notify flags as input, and as a result returns a list of all group members, group manager, and notifications to these users dependent upon flags passed.
Get Group Members	Existing	Soap	getGroupMemberListValues	Group Handle	Retrieves members of a group.
Get Handle for UserID	Existing	Soap	getGroupMemberListValues	User ID	Retrieves handle for a given user ID.
Get Object Values	Existing	Soap	getObjectValues	Object Handle Attributes	Retrieves all attributes for a Request /Incident/Problem/Change Order. The return is a UDSObject (XML); retrieve data with XPATH.
	Existing	Soap	getRelatedListValues	Object Handle List Name	

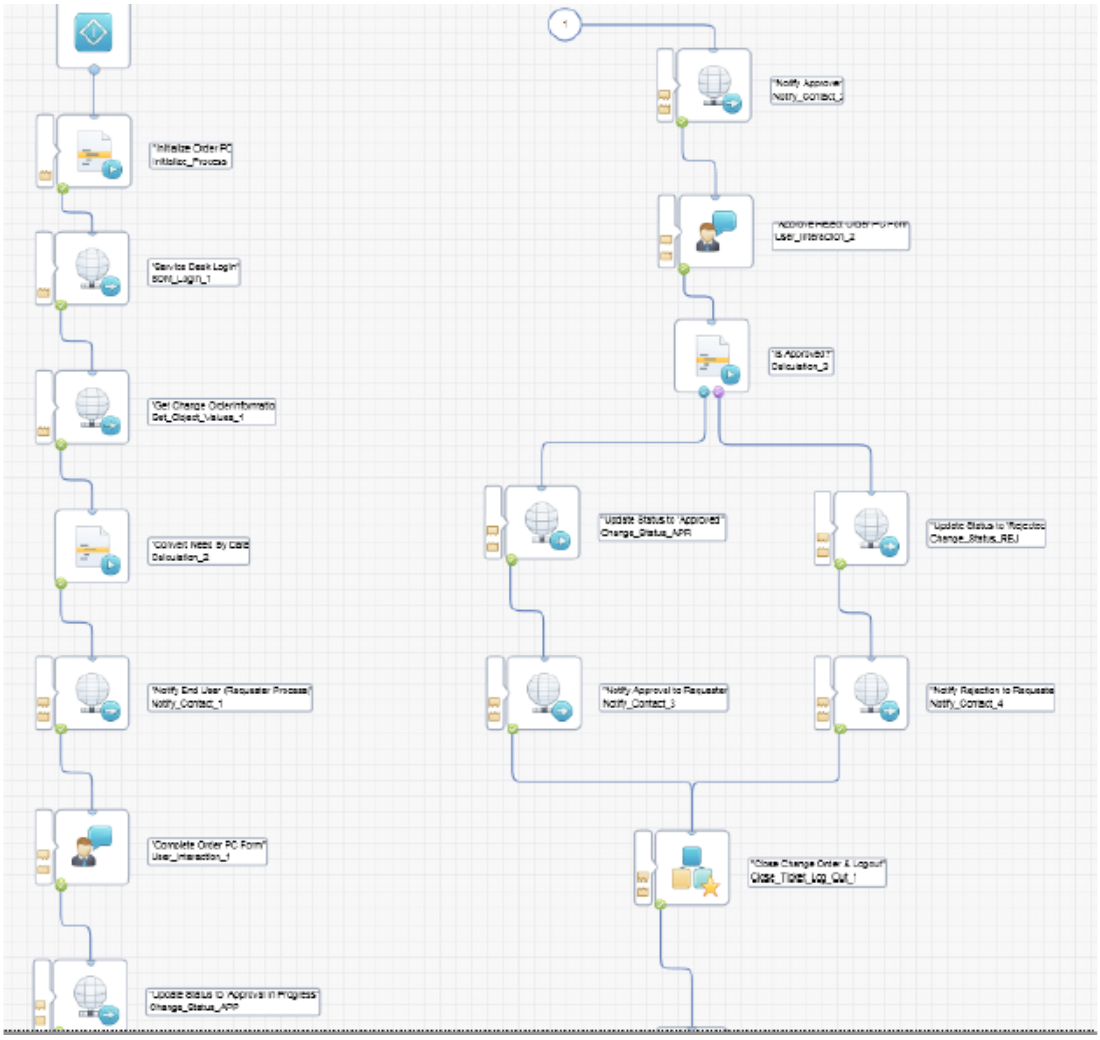
Process Name	New with Content Pack for ITIL for CA SDM, Updated, or Existing?	Process or Soap Operator?	CA SDM Web Service Invoked	Input Parameters	What it does
Get Related List Values					Returns values for lists related to a specific object. The lists must be defined as a QREL or BREL. Use the LREL methods to query LREL types.
Get Status Handle	Existing	Soap	doSelect	Ticket Type New Status Code	Retrieves the handle for a given status code, to be passed to the Update Status Method.
Initialize Process	Existing	Process	Via SDM Dataset		Initializes variables in the SDM Dataset to be used in the sample process definitions.
Link Asset	Existing	Soap	createLrelRelationships	Object Handle Asset Handle	Links an Asset to a Request, Incident, Problem, Change Order or Issue.
Link Request to Change	Existing	Soap	update Object	Request Handle Change Handle	Links a Request/Incident/Problem to a Change Order.
Notify Contact	Existing	Soap	notifyContact	Creator Handle Ticket Handle Contact Handle Message Title Message Body Urgency Internal Only	Sends a notification.
SDM Login	Existing	Soap	login	Soap Request File Soap Response File	Performs a Service Desk Web Service login and returns the SID
SDM Logout	Existing	Soap	Transfer	Creator Handle Ticket Handle Activity Log New	Transfers ownership of a Request, Incident, Problem, Change Order or Issue.

Process Name	New with Content Pack for ITIL for CA SDM, Updated, or Existing?	Process or Soap Operator?	CA SDM Web Service Invoked	Input Parameters	What it does
				Assignee Handle New Group Handle New Organization Handle	
Transfer Ticket	Existing	Soap	Transfer	Creator Handle Ticket Handle Activity Log New Assignee Handle New Group Handle New Organization Handle	Transfers ownership of a Request, Incident, Problem, Change Order or Issue.
Update Object	Existing	Soap	update Object	Ticket Handle Attribute New Value	Update any single attribute in an object. This supports fields that are NOT LREL's such as asset (CI). If you want to update an SREL field like priority ensure to pass the handle (persid).
Update Status & Comment	Existing	Process	Via Update Status	Creator Handle Ticket Handle New Status Code Comments	Updates ticket status and logs a comment in the ticket.

Order PC Workflow

This topic contains the following information

Design View in CA Process Automation



How Configure the Order PC Workflow

There is data which is a pre-requisite for running this Process Definition, which you must manually configure. It is listed in the following table. Note that there is 'Example Data' specified in the middle column of the chart below which indicates the name of the Contacts/Categories, etc that we used as a part of our walk-through, these of course can be changed to Contacts/Categories, etc for your own environment.

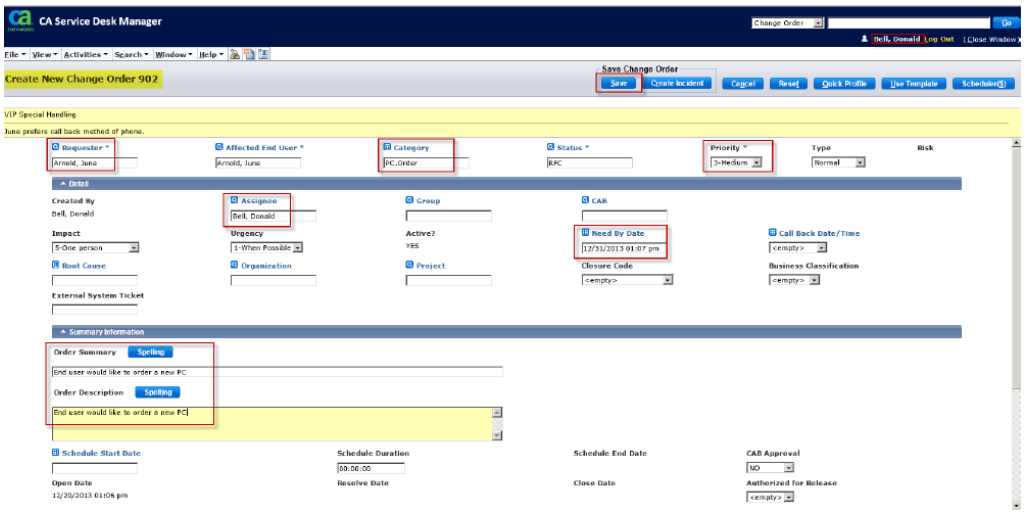
CA SDM Object /Option	Example Data	Notes
Add contact (Employee)	June Arnold	

CA SDM Object /Option	Example Data	Notes
		June will be the end user who requests the PC. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	Donald Bell	Donald will be the Analyst creating the Change Order. He will also be the Approver assigned to the Change Order Category, and thus assigned to the Change Order (through Category_Defaults Option, see below for details) 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	John McCarthy	John will be the approver assigned to the Change Order Category, and thus assigned to the Change Order (through Category_Defaults Option, see below for details) 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Create Change Order Category	PC. Order	This category will have the following values set: 1. Assignee: Donald Bell 2. <in the 'Workflow' Tab> CA IT PAM Process Name: 'Order PC'
Install 'Category_Defaults' Option	Yes	This option needs to be installed so that the information from the PC.Order Change Category is pulled over to the Change Order once it is created. Recycle CA SDM services for changes to take effect.

Order PC Workflow in Action

1. Login to CA SDM as Donald Bell, create a new Change Order, either from scratch or based on an existing Incident.

2. Fill out all of the fields highlighted in red below, also including 'Backout Plan' on the 'Cost /Plans' Tab. (There is a status transition in place such that this field must not be NULL in order for Change Order to move from status 'Approval in Progress' to 'Approved'.) Then hit save.



3. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the requester (June Arnold) to complete the 'Order PC' Form. To complete this task June can either click on the link provided via email, or alternatively, she can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Complete Form (Pending)':

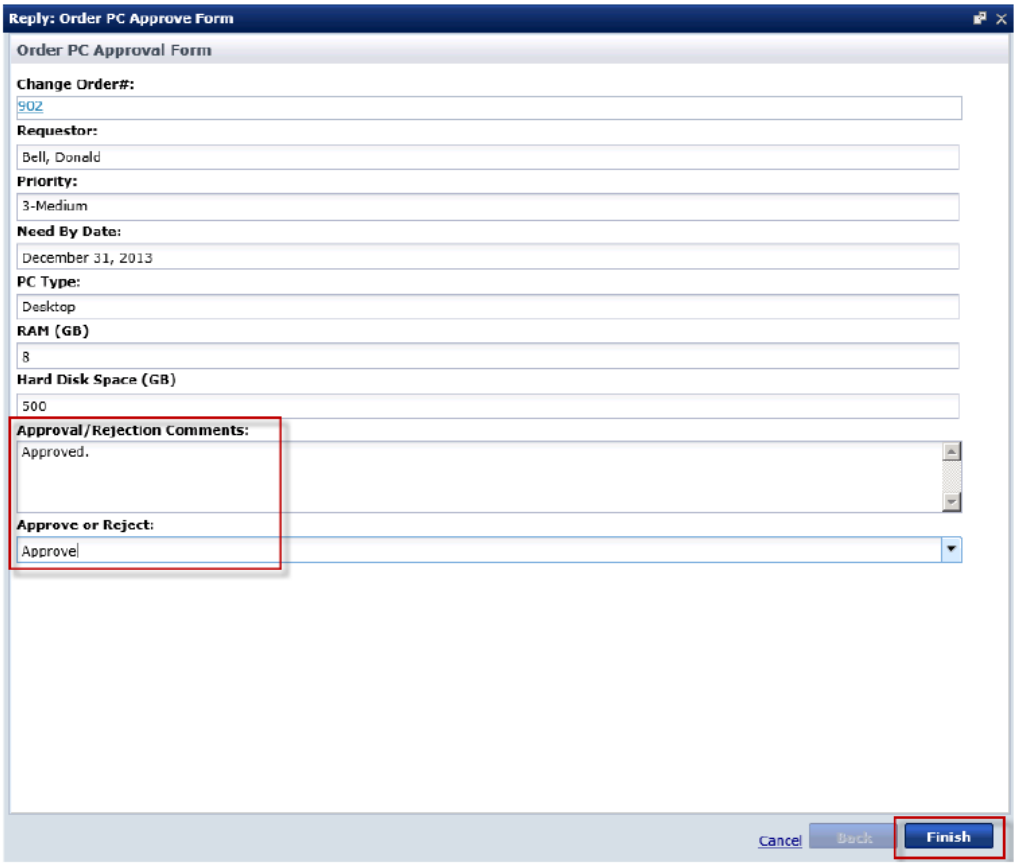
4. Once logged in to CA Process Automation as June, you should see one pending task to 'Complete the 'Order PC Form'. RMC on the task, and select 'Reply':

5. Complete the information in the Order PC Form. Hit 'Finish',

6. Navigate back to the Change Order. The status of the Change Order is now 'Approval in Progress'. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the approver (assignee of the Change Category) to Approve/Reject, which in our case is John McCarthy. To complete this task John can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve /Reject (Pending)':

7. Once logged in as John, you should see one pending task to 'Approve/reject the PC Order'. RMC on the task, and select 'Reply'.

8. All of the information that had been initially filled out by Donald remains in this form for John to review. Either approve, reject, or mark as incomplete. In this example we will be approving this order. Hit finish.



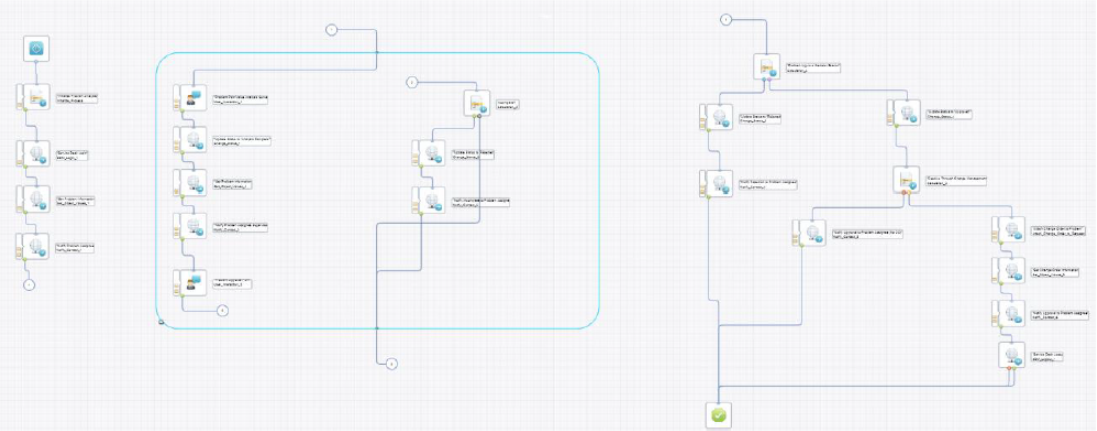
9. Navigate back to the Change Order. The status of the Change is now 'Approved'. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You can see that an email notification has one out to the Requester saying it has been approved.

10. Refresh the Change Order. Scroll further down in the Workflow Tasks. You will see that the status has changed to 'Closed'.

Problem Analysis Workflow

This topic contains the following information:

Design view in CA Process Automation



How to Configure the Problem Analysis Workflow

There is data which is a pre-requisite for running this Process Definition, which you must manually configure. It is listed in the following table. Note that there is 'Example Data' specified in the middle column of the chart below which indicates the name of the Contacts/Problem Areas, etc that we used as a part of our walk-through, these of course can be changed to Contacts/Problem Areas, etc for your own environment.

CA SDM Object /Option	Example Data	Notes
Add contact (Employee)	June Arnold	June will be the end user who creates the initial Incident, that leads to the creation of the Problem. If a Problem is created directly, she will be the end user requesting the problem. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	Donald Bell	Donald will be the Analyst creating/assigned to the Change Order resulting from the Problem. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	Marc Craigie	Marc will be Donald's supervisor, and as such, will be the approver of the Problem. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact

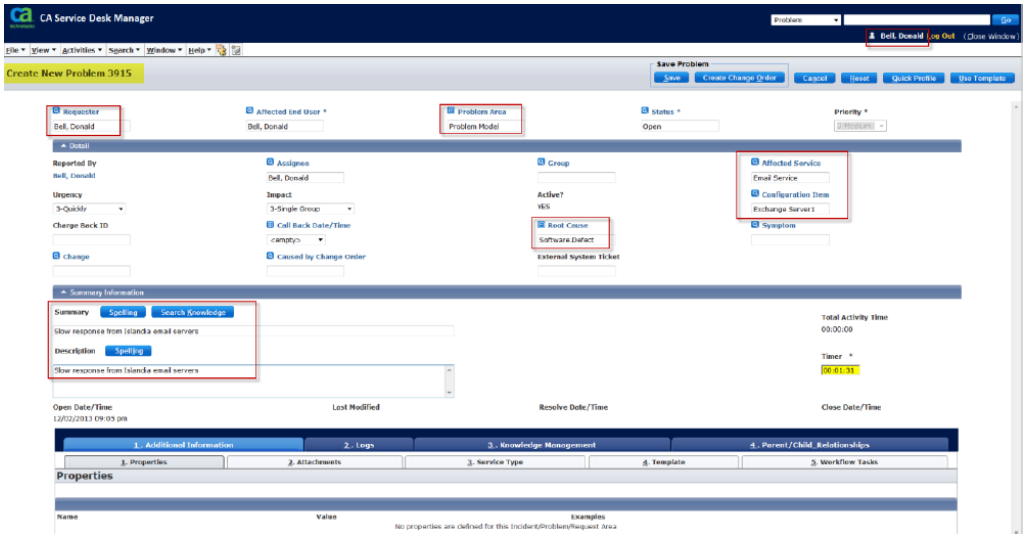
CA SDM Object /Option	Example Data	Notes
		record. 4. Assign Marc as Donald's Supervisor by going to Donald's contact record, and navigating to the Organization Tab, and entering in Marc as Donald's supervisor.
Create Problem Area	Problem Model	This Problem Area will have the following values set: 1. Assignee: Donald Bell 2. <in the 'Workflow' Tab> CA IT PAM Process Name: 'Problem Analysis'
Create CI's	Email Service Exchange Server1	Create two new configuration items (Service Desk Tab->File->New Configuration Item), which we will assign to the Problem as we go through the demo: 1. Email Service 2. Exchange Server
Create root cause	Software Defect	Create a root cause (Administration Tab->Service Desk->Application Data->Codes->Root Cause), which we will assign to the Problem as we go through the demo: 1. Software Defect
Install 'Category_Defaults' Option	Yes	This option needs to be installed so that the information from the 'Problem Model' Problem Area is pulled over to the Problem once it is created. Recycle CA SDM services for changes to take effect.

Problem Analysis Workflow in Action

Follow these steps:

1. Login to CA SDM as Donald Bell, create a new Problem, either from scratch or based on an existing Incident.

2. Fill out all of the fields highlighted in red below, then hit save.



3. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the assignee (Donald Bell) to complete the Problem Pain/Value Analysis Form. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Complete Form (Pending)':

4. Once logged in to CA Process Automation as Donald, you should see one pending task to complete the 'Problem Pain/Value Analysis Survey'. You will also see an 'I' flashing in the lower right hand side of the screen, indicating user interaction is pending. RMC on the task, and select 'Reply':

5. Complete the information in the Problem Analysis Survey. Be sure to respond to the last question 'Should this Problem be resolved through Change Management?' as 'Yes'. Hit 'Finish',

6. Navigate back to the Problem. The status of the Problem is now 'Analysis Complete'. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the assignee (Donald Bell's) supervisor to Approve/Reject , which in our case is Mark Craigie. To complete this task Marc can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve/Reject (Pending)':

7. Once logged in as Marc, you should see one pending task to 'Approve/reject the Problem Pain/ Value Analysis Survey'. RMC on the task, and select 'Reply':

8. All of the information that had been initially filled out by Donald remains in this form for Marc to review. Scroll down to the bottom of the form. Either approve, reject, or mark as incomplete. In this example we will be approving this Problem to be resolved through Change Management. Hit finish, and then 'sign out' of CA Process Automation as Marc.

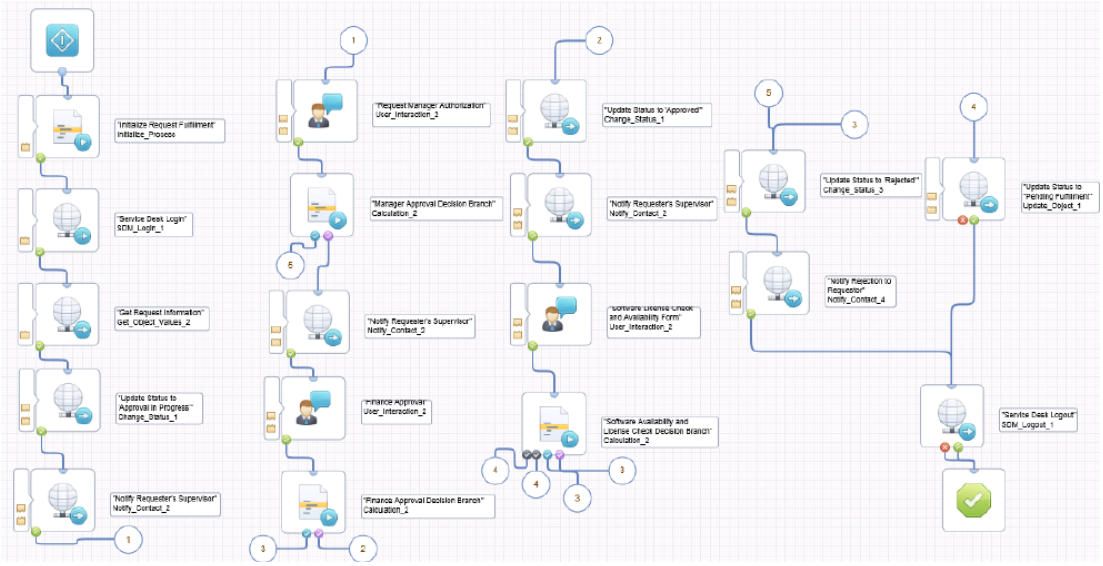
9. Navigate back to the Problem. The status of the Problem is now 'Approved'. Click on the Additional Information Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see that a Change Order has been opened and attached to the Problem, an email notification has gone out to the assignee (Donald Bell) indicating the same.

10. Click on the link for the Change Order to view details.

Request Fulfillment Workflow

This topic contains the following information:

Design View in CA Process Automation



How to configure the Request Fulfillment Workflow

There is data which is a pre-requisite for running this Process Definition, which you must manually configure. It is listed in the following table. Note that there is 'Example Data' specified in the middle column of the chart below which indicates the name of the Contacts/Request Areas, etc that we used as a part of our walk-through, these of course can be changed to Contacts/Request Areas, etc for your own environment.

CA SDM Object /Option	Example Data	Notes
Add contact (Analyst)	June Arnold	June will be the Analyst creating/assigned to the Request. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	Donald Bell	Donald will be June's supervisor, and as such, will be the approver of the Request. 1. Must be defined as a contact in CA SDM as well as CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record. 4. Assign Donald as June's Supervisor by going to June's' contact record, and navigating to the Organization Tab, and entering in Donald as June's supervisor.
Create Request Area	SW	

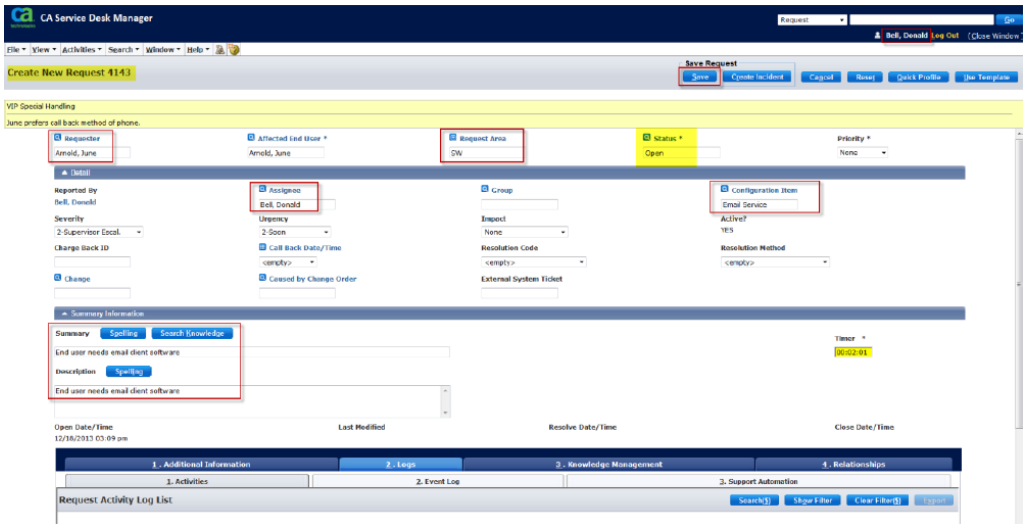
CA SDM Object /Option	Example Data	Notes
		This Request Area will have the following values set: 1. Assignee: June Arnold 2. <in the 'Workflow' Tab> CA IT PAM Process Name: 'Request Fulfillment'
Create CI	Email Service	Create a new configuration item, (Service Desk Tab->File->New Configuration Item), which we will assign to the Problem as we go through the demo. 1. Email Service
Install 'Category_Defaults' Option.	Yes	This option needs to be installed so that the information from the SW Request Area is pulled over to the Request once it is created. Recycle CA SDM services for changes to take effect

Request Fulfillment Workflow in Action

Follow these steps:

1. Login to CA SDM as Donald Bell, create a new Request.

2. Fill out all of the fields highlighted in red below, then hit save.



3. Click on the Relationships tab, then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see the status has changed to 'Approval in Progress'.

4. Continue to scroll through the tasks. You will see a notification has gone out to the approver (Donald Bell) to authorize end user access. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve/Reject (Pending)'.

5. Once logged in to CA Process Automation as Donald, you should see one pending task to complete the 'Request Manager Authorization Form'. RMC on the task, and select 'Reply'.

6. Complete the information in the Request Manager Authorization Form. In this case, approve the request.

7. Navigate back to the Request. Click on the Relationships Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the assignee (June Arnold's) supervisor for Financial Approval, which in our case is Donald Bell. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve/Reject (Pending)'.

8. Once logged in to CA Process Automation as Donald, you should see one pending task to complete the 'Finance Approval Form'. RMC on the task, and select 'Reply'.

9. Complete the information in the Financial Approval Form. In this case, approve the request.

10. Navigate back to the Request. The status of the Request is now 'Approved'. Click on the Relationships Tab, and then drill down to the Workflow Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the requestor (June Arnold's) supervisor (Donald Bell) to confirm license check and availability of software. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve/Reject (Pending)'.

11. Once logged in to CA Process Automation as Donald, you should see one pending task to 'Confirm software license and availability'. RMC on the task, and select 'Reply'.

12. Confirm software license and availability, and hit 'Finish':

13. Navigate back to the Request. The status of the Request is now 'Pending Fulfillment'.

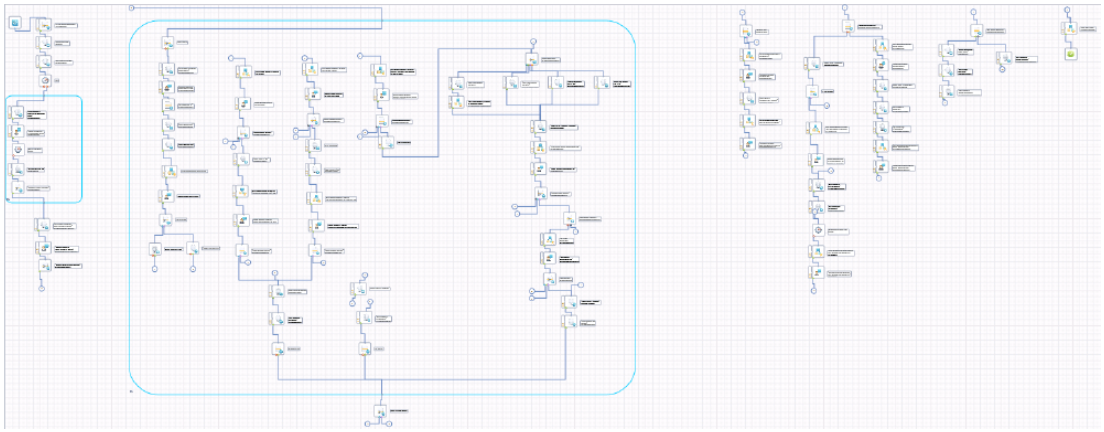
14. The workflow is now complete.

Change and Release Management Workflow

This topic contains the following information:

Important! If you are using only Change Management, and not Release Management, you can leverage this workflow process from a Change Management perspective. The process looks for a user-defined flag indicating whether the Change is a release. If the RFC is solely managing Change, then the process moves from Change Analysis directly to Change Manager and CAB Approvals. If it is a Release, then the process moves from Change Analysis through to Release approvals, then merges with Change at the Change Manager Approvals step. Any task that is specific to RDM only is delimited in the following steps with 'RDM'.

Design View in CA Process Automation



How to configure the Change and Release Management Workflow

The following table lists the prerequisites for running this Process Definition.

> **Note:** Example Data indicates the examples of Contacts or Change Categories. You can change according to your organization.

Note that there is

CA SDM Object/Option	Example Data	Notes
Add contact (Analyst)	Donald Bell	Donald is the Requester of the Change Order and also a member of both the CAB and Implementation Groups. 1. Must be defined as a contact in CA SDM and also in CA EEM, if you are leveraging CA EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)	Kevin Smith	Kevin is a member of both the CAB and Implementation Groups. 1. Must be defined as a contact in CA SDM and also in CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add contact (Analyst)		

CA SDM Object/Option	Example Data	Notes
	John McCarthy	John is a member and manager of both the CAB and Implementation Groups. 1. Must be defined as a contact in CA SDM and also in CA EEM, if you are leveraging EEM for authentication. 2. Must have an email address defined in the CA SDM contact record. 3. Must have a notification method set to 'Email' in the CA SDM contact record.
Add an Implementation Group	Implementation Group	Following is the group that implements the Change Order. 1. Group must be defined in CA SDM and also in CA EEM, if you are leveraging EEM for authentication. 2. When creating this group in EEM, the 'Group Name' in CA SDM must match the 'Principal Name' in EEM.
Add users to Implementation Group	John McCarthy Donald Bell Kevin Smith	1. This group must have more than one member 2. The members must be added to the group in CA SDM, and CA EEM if using EEM for authentication. 3. To add the user to the Group in CA EEM, go to Manage Identities->Users. Run a search. Highlight the user to view details. Navigate to the 'Global Group Membership' box. Under 'Available Global User Groups', search, and highlight the group that you would like to add the user to. Hit the right arrow, so that the group name is populated under 'Selected Global User Groups.'
Make one of the users previously added to the Implementation Group the Manager	John McCarthy	The group must have only one manager, this contact must be defined in CA SDM group record as the manager. This user is the Change Manager. 1. To make a contact a manager in the group record, navigate to the 'Members, Service Contracts, Auto Assignment' Tab, then drill down to 'Members' Tab
Add CAB Group	CAB	The CAB (Change Advisory Board) serves as approval group for the Change Order. This group implements the Change Order. 1. Group must be defined in CA SDM and CA EEM, if you are leveraging EEM for authentication. 2. When creating this group in EEM, the 'Group Name' in CA SDM must match the 'Principal Name' in EEM.
Add users to CAB Group	John McCarthy Donald Bell Kevin Smith	1. This group must have more than one member 2. The members must be added to the group in CA SDM and CA EEM, if using EEM for authentication. 3. To add the user to the Group in CA EEM, go to Manage Identities->Users. Run a search. Highlight the user to view details. Navigate to the 'Global Group Membership' box. Under 'Available Global User Groups', search, and highlight the group that you would like to add the user to. Hit the right arrow, so that the group name is populated under 'Selected Global User Groups.'
Make one of the users previously added to the CAB Group the Manager	John McCarthy	This user is the CAB Manager. 1. The group must have only one manager, this contact must be defined in CA SDM group record as the manager. This user

CA SDM Object/Option	Example Data	Notes
		is the Change Manager. 2. To make a contact a manager in the group record, navigate to the 'Members, Service Contracts, Auto Assignment' Tab, then drill down to 'Members' Tab
Create Change Order Category	Change and Release Mgmt	This Change Category has the following values set: 1. Assignee: John McCarthy 2. Risk Survey: General 3. CAB: CAB 4. Implementation Group: Implementation Group 5. <in the 'Workflow' Tab> CA IT PAM Process Name: 'Change and Release Management'
Create at least two new CI's, that have pre-existing relationships established and Change Orders already opened against them during the same scheduled timeframe.	TIXCHANGE TIXCHANGE Web Application	1. Create at least two new Configuration Items (Service Desk Tab->File->New Configuration Item) which we associate to the Change Order. 2. These CIs must all have relationships established with other CIs, so that a good view of the CA CMDB Visualizer (see page 2613) can be displayed. 3. These CIs must have pre-existing Change Orders opened against them which can be shown as a part of Conflict Analysis. In order for pre-existing Change Orders to appear during Conflict Analysis (see page 2245) step in the Workflow, they must be opened against the same CI, during the same scheduled timeframe.
Install Category_Defaults Option	Yes	This option must be installed so that the information from the Change and Release Model Category is pulled over to the Change Order once it is created. Recycle CA SDM services for changes to take effect
Modify Change Order Status	Check 'Make Change Order Active'	Use Administration, ServiceDesk, Change Orders, Status to check 'Make Change Order Active', so that when a Change Order enters the Backed Out status as a part of this workflow, it remains active.

Change and Release Management Workflow in Action

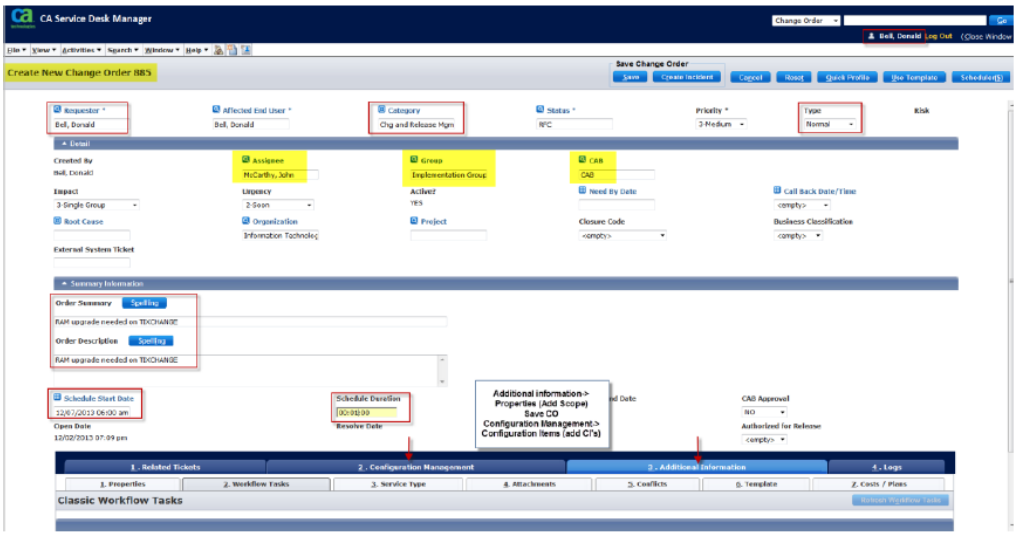
Important! Logic built into many of the IRFs (Interaction Request Forms) such that a response of 'no' when a 'yes' is expected result in an automatic 'rejection' of the Change Order or Release.

Follow these steps:

1. Log in to CA SDM as Donald Bell. Create a Change Order.

2. Fill out all of the highlighted fields including 'Backout Plan' on the 'Cost/Plans' Tab. For the Change Order to move from status 'Approval in Progress' to 'Approved', a status transition ensures that this field must not be NULL.

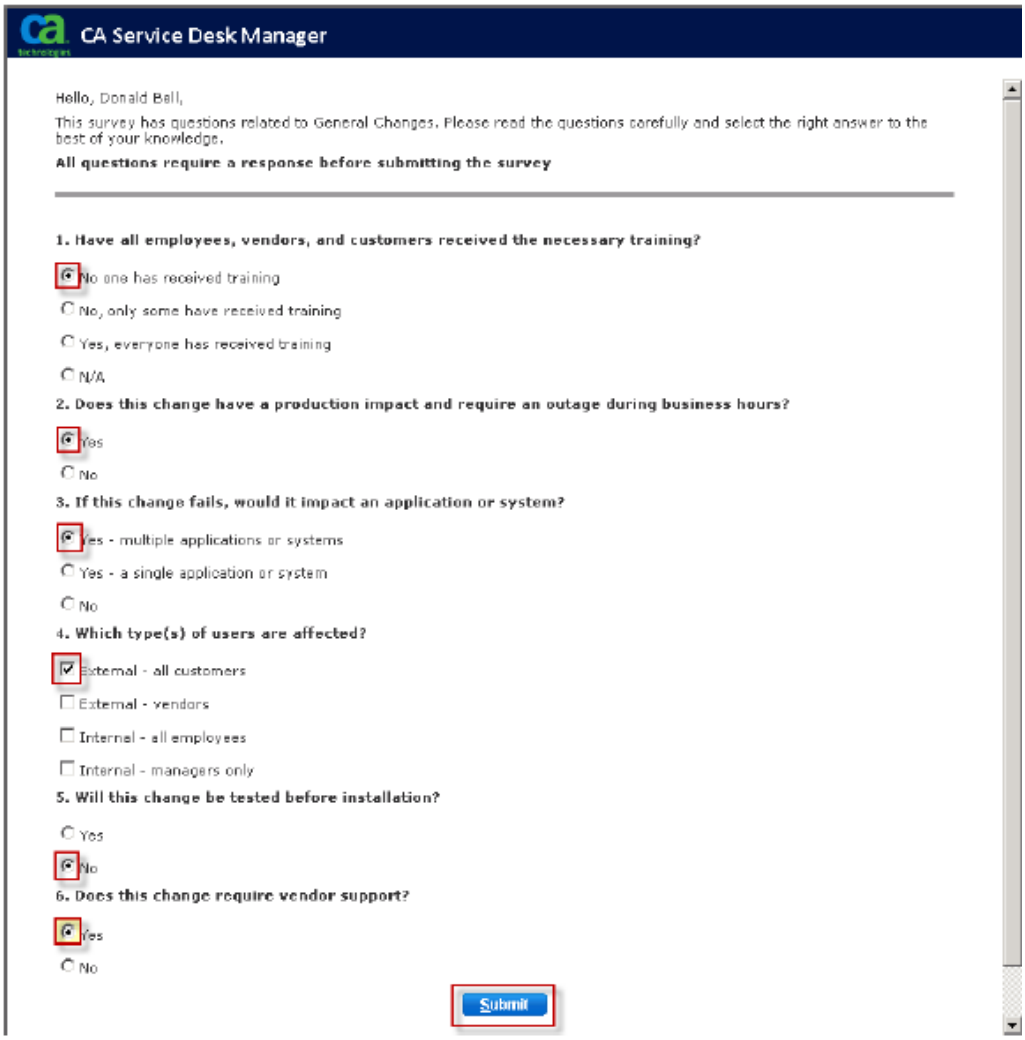
> **Note:** When you select the Category, and tab out of the field, the 'Assignee', 'Implementation Group' and 'CAB' are filled in, because the category_defaults option is turned on. You will not be able to add CI until after you save the Change order.



3. Select Additional Information, Workflow Tasks and scroll down through the tasks.
   You will see a notification has gone out to the requester (Donald Bell) to complete the Risk Assessment Survey. There is currently no Risk value assigned to the Change Order.

4. To complete this task, Donald can either click on the link provided in the email, or can scroll to the next pending task in the Workflow and click on the Task: Other (Pending) hyperlink. Clicking on the hyperlink will automatically log Donald into his tasklist.

5. RMC on the task and then click Reply.
   Donald is prompted to complete the Risk Assessment Survey. He clicks on the Risk Assessment Survey link. The link brings Donald in context to the Risk Assessment Survey. The survey which we have assigned to the Change Category is the default 'General' Risk Survey. Complete the Risk Survey, answering questions in such a way that it will generate high risk:



6. Once the Risk Survey is complete, navigate to CA Process Automation in context of the task and click Finish on the Risk Assessment task. You can remain logged into CA Process Automation as Donald.

7. Navigate back to the Change Order. Select Additional Information, Workflow Tasks and scroll down through the tasks.
   You will see a notification has gone out to the requester (Donald Bell) to complete Impact and Conflict Analysis. To complete this task Donald can either click on the link provided via email or scroll to the next pending task in the Workflow and click on the Task: Other (Pending) hyperlink.

8. Navigate back into CA Process Automation as Donald.
   You will see one pending task for Impact and Conflict Analysis.
   RMC on the task and click reply.

9. Clicking on the link to Impact and Conflict Analysis brings you in context to the Change Order where Impact and Conflict Analysis must be instantiated manually. The first step is to perform Impact Analysis. Impact Analysis will show which CI is impacted if the TIXCHANGE Servers are temporarily down for the RAM upgrade. There are two ways to run Impact Analysis. You can either run it through Impact Explorer which is accessible using the Additional Information,

Configuration Items tab within a Change Order. Or you can use CA CMDB Visualizer. You can filter the Visualizer for Impact Analysis. Once Impact Analysis is complete, the next step is Conflict Analysis, which is also run within context of a Change Order, from Additional Information, Conflicts Tab. Conflict Analysis shows if there are any Change Orders open for the same CI in the same timeframe, thus generating conflict. If there are any conflicts they must be resolved before proceeding further with the Change Order.

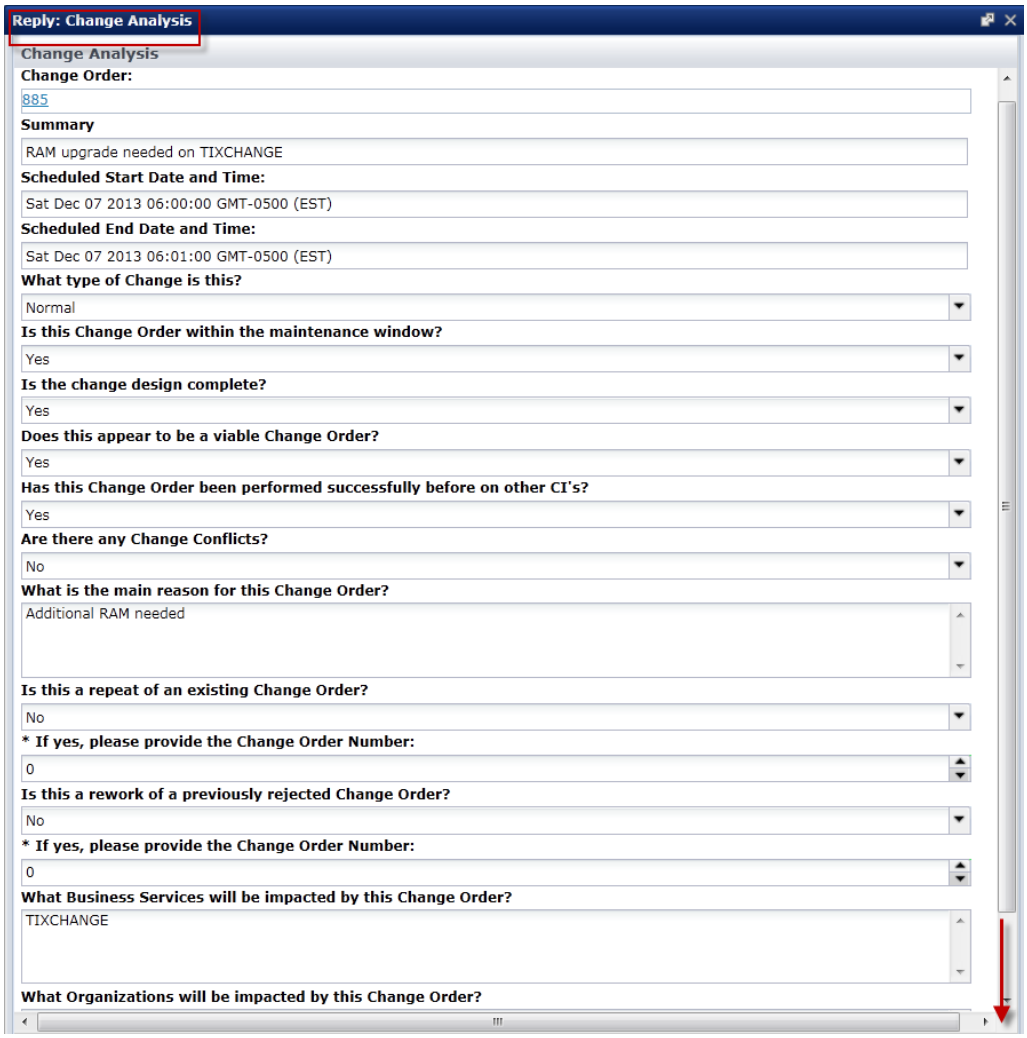
10. Finish the CA Process Automation task. You can remain logged in as Donald Bell.

11. Navigate to the Change Order. Click Additional Information, Workflow Tasks and scroll down through the tasks.
    You will see a notification has gone out to the requester (Donald Bell) to complete Change Analysis. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Complete Form (Pending) hyperlink.

12. Navigate to CA Process Automation as Donald Bell. You will see one pending task for Change Analysis. If any of the form data indicates that any step is not complete or not done, the workflow takes different paths. We assume everything is complete.

13. RMC on the task and click Reply.

14. Complete the information in the Change Analysis form click finish. Following is an example of an IRF where an answer of ‘no’ to questions where a ‘yes’ is expected result in an automatic rejection of the Change Order:



15. Navigate to the Change Order. Select Additional Information and Workflow Tasks.
    You will see that the information from the Change Analysis form has been saved to the Change Order.

16. Scroll down through the tasks.
    You will see a notification has been sent to the Change Manager, Donald Bell. Donald must verify if this Change is going to be a Release. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Approve/Reject (Pending) hyperlink.

17. Navigate to CA Process Automation as Donald Bell.
    You will see one pending task for Release Verification.

18. RMC on the task and click Reply.

19. Donald specifies that this is a Release, and then click Finish. Setting this to 'Yes' guides the user through the Release portion of this process.

    a. Navigate to the Change Order.

The ‘Authorized for Release’ Flag is set to ‘Yes’.

b. Scroll through the tasks.

You will see a notification has been sent to the Change Manager, Donald Bell. Donald must authorize Plan and Build Release. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Complete Form (Pending) hyperlink.

c. Navigate to CA Process Automation as Donald Bell.

You will see one pending task for Authorize Plan and Build Release.

d. RMC on the task and click Reply. Complete the information in the Authorize Plan and Build Release form, scroll down and click finish. If any tasks are ‘Rejected’ or marked ‘Incomplete’, the workflow takes different paths. We will approve all tasks.

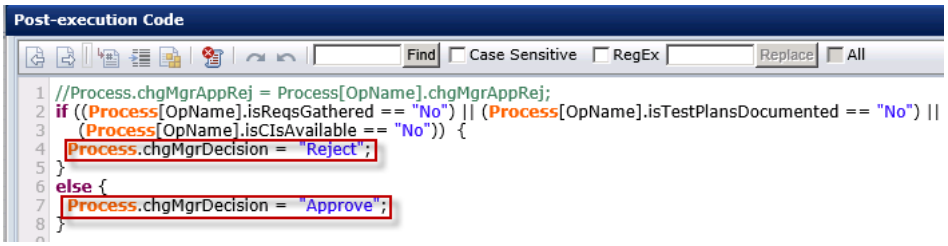
e. Navigate to the Change Order.

The status has changed to ‘Build’.

f. Scroll through the tasks.

You will see a notification has been sent to the Change Manager, Donald Bell. Donald must complete the Release and Deployment Plan and Build form. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Complete Form (Pending) hyperlink.

g. Navigate to CA Process Automation as Donald Bell. You will see one pending task for to complete the Release and Deployment Plan form. RMC on the task and click Reply. Complete the information in the Plan and Build Release form. responding ‘no’ to some of the questions automatically result in the Change Order being rejected. Following is an example of the Operator’s Post Execution Code.



h. Complete the form, scroll down and click finish.

i. Navigate to the Change Order and scroll through the tasks.

You will see a notification has one out to the Change Manager, Donald Bell. Donald must Authorize Build and Test Release. To complete this task Donald can either click on the link provided in the email or can scroll to the next pending task in the Workflow and click on the Task: Complete Form (Pending) hyperlink.

j. Navigate to CA Process Automation as Donald Bell. You will see one pending task to Authorize Build and Test Release. RMC on the task and click Reply. Complete the information in the Build and Test Release form and click finish.

k. Navigate to the Change Order.
The status has changed to 'Test'.

l. Scroll through the tasks.
You will see a notification has one out to the Change Manager, Donald Bell. Donald must complete the Release and Deployment Test form. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Complete Form (Pending) hyperlink.

m. Navigate to CA Process Automation as Donald Bell.
You will see one pending task to complete Release and Deployment Build and Test form.

n. RMC on the task and click Reply. Complete the information in the Release and Deployment Build and Test form and click finish.

o. Navigate to the Change Order and scroll through the tasks.
You will see a notification has one out to the Change Manager, Donald Bell. Donald must authorize checkin of baselined release package into the DML. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Approve/Reject (Pending) hyperlink.

p. Navigate to CA Process Automation as Donald Bell.
You will see one pending task to authorize checkin of baselined release package into DML. RMC on the task and hit 'Reply'. Authorize checkin of baselined release package into DML by SACM, scroll down and hit finish.

20. Navigate to the Change Order. Change Manager and CAB Approval is required as the 'type' and level of 'risk' is associated with the Change. The status has changed to 'Approval in Progress' and the 'CAB Approval' flag is set to yes. Scroll through the tasks.

    You will see a notification has one out to the Change Manager, who is the manager of the Implementation Group, Donald Bell. Donald must approve or reject the Change Order. To complete this task Donald can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Approve/Reject (Pending) hyperlink.

21. Navigate to CA Process Automation as Donald Bell.

    You will see one pending task to approve/reject Change Order.

22. RMC on the task and click Reply.

23. Complete the Approval/Rejection comments. Dependent upon whether the Change Manager Approves, Rejects, or marks the Change Order Incomplete, the Workflow takes different paths. Mark it as 'Approved'.

24. Navigate to the Change Order. Select Additional Information, Workflow Tasks, and scroll down through the tasks. You will see a notification has gone out to the CAB, including the CAB Manager, who incidentally is also Donald Bell. The CAB Manager, Donald, needs to Approve or Reject the Change Order on behalf of the CAB. To complete this task John can either click on the link provided in the email or scroll to the next pending task in the Workflow and click on the Task: Approve/Reject (Pending) hyperlink.

25. As Donald, you see one pending task for CAB Approval. RMC on the task and hit 'Reply'.

26. Complete CAB Date/CAB Chair, and the CAB Approval/Rejection comments. Dependent upon whether the CAB Manager Approves, Rejects, or marks the Change Order Incomplete, the Workflow will take different paths. In this case mark it as 'Approved'.

27. Navigate back to the Change Order. The status of the Change Order is now 'Approved'. Click on the WF Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the Implementation Group, of which John McCarthy is a member. The Implementation Group is now responsible for implementing the RAM upgrade on TIXCHANGE.

28. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Other (Pending)'. As Donald, you will need to click on 'Group Tasks' on the left hand side of the pane since this task of Implementing the Change Order is assigned to the full Implementation Group. RMC on the Implementation task and hit 'Reply'.

29. The link in this task will bring you directly into CA SDM in context of the Change Order. Once the Implementation Group begins the RAM upgrade, Donald can hit Finish to complete the task.

30. Navigate back to the Change Order. The status has changed from 'Approved' to 'Implementation in Progress'. Click on the WF Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to all of the members of the Implementation Group, of which Donald Bell is a member. The Implementation Group is now responsible for confirming the successful implementation of the patches. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Complete Form (Pending)'.

31. As Donald, you will again need to click on 'Group Tasks' on the left hand side of the pane since this task of confirming implementation of the Change Order is assigned to the full Implementation Group. RMC on the Implementation Complete task and hit 'Reply'. Implementation Status as 'Complete' or 'Incomplete' and as a result the Workflow will take different paths. In our case we will mark it as 'Complete'.

32. Navigate back to the Change Order. Navigate back to the Change Order. The status has changed to Deployed.

> **Note:** The workflow will proceed to this step if you answered 'Yes' to Release Verification. Otherwise skip to step 33.

a. Click on the WF Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to the Change Manager, Donald Bell, who needs to update the release number of all records of all Service CI's associated with this Release. To complete this task Donald can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Approve/Reject (Pending)'.

b. As Donald, you will again need to click on 'Group Tasks' on the left hand side of the pane since this task of confirming implementation of the Change Order is assigned to the full Implementation Group. RMC on the Implementation Complete task and hit 'Reply'. Donald updates the release number of all Service CI's associated with the Release.

c. Once complete he can hit 'Finish' on the task.

33. Navigate back to the Change Order. The closure code has been set to 'successful'. Click on the WF Tasks Tab. Scroll down through the tasks. You will see a notification has gone out to all of the members of the Implementation Group, of which Donald Bell is a member. The Implementation Group is now responsible for doing a Post Implementation Review (PIR). To complete this task John can either click on the link provided via email, or alternatively, he can scroll to the next pending task in the Workflow and click on the hyperlink for 'Task: Complete Form (Pending)'.

34. As John, you will again need to click on 'Group Tasks' on the left hand side of the pane since this task of confirming implementation of the Change Order is assigned to the full Implementation Group. RMC on the Post Implementation Review task and hit 'Reply'.

35. Complete the Post Implementation Review Form, and once complete hit 'Finish'.

36. Navigate back to the Change Order. The status of the CO is set to 'Closed' as all steps in the Workflow are now complete and the RAM upgrade was successful.

CA Service Management Reports

This section lists the out-of-the-box CA Business Intelligence reports:

CA Asset Portfolio Management Reports

The following table lists the CA Business Intelligence reports available with CA Asset Portfolio Management:

Report Name	Report Description	Used By Role
	Report of billed assets not matched to any discovery record	

Billed Assets not matched to any discovery record		Administrator
Discovered assets not matched to any owned asset	List of discovered assets not reconciled to any owned asset	Administrator
Discovered assets not processed due to missing or invalid data	This report shows the list of discovered assets not processed because of missing or invalid data	Administrator
Discovered inventory records matched with network discovery data	List of matches between network data and discovery data	Administrator
In-scope owned assets matched to discovery records	Report of in-scope owned assets matched to discovery records	Administrator
In-scope owned assets not matched to discovery records	Report of in-scope owned assets not matched to discovery records	Administrator
Lost Revenue Report	Report identifying potential lost revenue,which includes assets in a non-active status but discovered, as well as assets in an active status, but not billing	Executive, Administrator
Network Discovery Exception Report	List of network discovery records that have not been matched to any corresponding discovered inventory	Administrator
Owned assets matched with discovered assets	Report of owned assets reconciled to discovered assets - either discovered inventory or network discovery or both	Administrator

CA Service Desk Manager Reports

The following table lists the CA Business Intelligence reports available with CA Service Desk Manager:

Report Name	Folder Name (Public Folders > CA Reports > CA Service Management > CA Service Desk)	Report Description	Report Type
Overall Summary	Aggregate	Shows the count of Requests and Change Orders created and closed, between the start and end dates, as well as the average time to close. Also contains a report of the Top5 Request Areas associated with Requests and a report of the Top 5 Categories for Change Orders	Crystal Reports

Asset List	Asset	Shows the Resource Family (Hardware, Software etc.), the type of Asset (keyboard, modem etc.), the serial number for that Asset and a more detailed description of the Asset.	Crystal Reports
Active Change Orders Aging	Change Order\Aging	Shows count of all open Change Orders by the number of weeks open	Crystal Reports
Active Change Orders Aging for Categories		Shows count of open Change Orders by the number of weeks open. User must input a Category name for a search of Change Orders in that Category	Crystal Reports
Active Change Orders Aging for Groups		Shows count of open Change Orders by the number of weeks open. The see results for a specific Group(s), user must select the Group Name(s).	Crystal Reports
Active Change Orders Aging for Priority		Shows count of open Change Orders by the number of weeks open. Adjacent bars break up counts by Priorities.	Crystal Reports
Active Change Orders Aging by Priority for Categories		Shows count of open Change Orders by the number of weeks open. Adjacent bars break up counts by Priorities. User must input Category name for a search of Change Orders in that Category.	Crystal Reports
Active Change Orders Aging by Priority for Groups		Shows count of open Change Orders by the number of weeks open. Adjacent bars break up counts by Priorities. User must input a Group name for a search of Change Orders in that Group.	Crystal Reports
Active Change Orders Aging by		Shows count of open Change Orders by the number of weeks open. Adjacent bars break up counts by Priorities. User must input a Status for a search of Change Orders with that Status.	Crystal

Priority for Status			Reports
Active Change Orders Aging for Status		Shows count of open Change Orders by the number of weeks open. User must input a Status for a search of Change Orders with that Status.	Crystal Reports
All Rejected Change Orders	Change Order\Compliance	Shows total number of Change Orders, number of rejected Change Orders, % of Change Orders rejected during approval phase, group by Change Category, Change Group, for the specified period.	Crystal Reports
Average duration of Change Orders		Shows total number of Change Orders, average duration for Change Order completion, group by Change Category, Change Group, for the specified period.	Crystal Reports
Change Order implementation Cost Details		Shows the associated costs for Change Order for each Change Category, group by Change Group, Change Category, No. of Change Order, Actual Cost and Estimated Cost for all Change Orders, for the specified period.	Crystal Reports
Change Order in Detail		Shows complete details of the Change Order(s).	Crystal Reports
Change Orders by Change Type		Shows total number of completed Change Orders and % of Change Orders for each Change Type, group by Change Group and Change Category for the specified period.	Crystal Reports
Change Orders by Closure Code		Shows total number of Change Orders and % of Change Orders for each Closure Code, group by Change Group and Change Category for the specified period.	Crystal Reports
Change Orders Initiated		Shows total number of Change Orders, Change Orders initiated by Incident /Problem and % of Change Orders initiated by Incident/Problem, group by Change Group and Change Category for the specified period.	Crystal

by Problem /Incident			Reports
Change Orders outside Blackout Window		Shows total number of Change Orders, number of Change Orders scheduled outside Blackout Window and % of Change Orders scheduled outside the Blackout Window, group by Change Group and Change Category for the specified period.	Crystal Reports
Change Orders outside Maintenance Window		Shows total number of Change Orders, number of Change Orders scheduled outside Maintenance Window and % of Change Orders scheduled outside the Maintenance Window, group by Change Group and Change Category for the specified period.	Crystal Reports
Configuration Items Associated to Change Order		Shows Configuration Items, number of associated Change Orders, group by Change Group and Change Category for the specified period.	Crystal Reports
Change Orders Approved and Scheduled for Implementation	Change Order\Forecast	Shows Change Order number, Change Group, Change Category, Priority, Risk Level, Status and Planned Implementation Date of all Change Orders that are approved and planned for implementation.	Crystal Reports
Change Order Waiting for CAB approval		Shows Change Orders waiting for CAB Approval, Change Order number, Change Category, Priority, Risk Level, Status, Planned Implementation Date & Time and number of elapsed days since opened.	Crystal Reports
Analyst Count by Priority of Open Change Orders	Change Order\Resource	Shows open Change Orders counts that are displayed by Analyst assigned to the Change Orders and broken up by Priority.	Crystal Reports
Change Orders by Failed Service Type for Groups		Shows % of each Service Type failure based on the total Service Type failures in one Group, in specific Groups or in ALL Groups.	Crystal Reports

Workflow Tasks Pending		Shows list of Workflow Tasks that are in a Pending Status and the duration (within Workshift hours) that it has been in Pending Status from the time the Workflow Task started.	Crystal Reports
Trend Report by Group	Change Order\Trend	Shows historical data of % of Change Orders for each Closure Code grouped by Change Group for specified Change Groups.	Crystal Reports
Active Change Orders at Weeks End	Change Order\Volume	Shows counts of opened Change Orders for today, 7 days ago, 14 days ago and so for a 5 week period.	Crystal Reports
Change Order Totals by Assignee		Shows total number of Change Orders assigned to each Assignee. A start and end date must be entered. Also, User ID and the analyst(s) last name needs to be specified or ALL for a list of all analysts. Estimate Time and Cost are shown, plus the Total Time and Cost and average Time to Close.	Crystal Reports
Change Orders by Failed Service Type for Change Categories		Shows the % of each Service Type failure based on the total Service Type failures in a particular Change Category, or a group of specific Change Categories, or in ALL Change Categories.	Crystal Reports
Change Orders by Failed Service Type for Statuses		Shows the % of each Service Type failure based on the total Service Type failures in a particular Change Status, or a group of specific Change Statuses, or in ALL Change Statuses.	Crystal Reports
Change Categories Currently Active		Shows count of open Change Orders by Change Category.	Crystal Reports
Total No. of Change Orders implemented		Shows number of Change Orders which are closed in the specific period for each Change Group.	Crystal Reports

Total Volume of Change Orders		Shows counts of both opened and closed Change Orders for today, 7 days ago, 14 days ago and so for about a 5 week period.	Crystal Reports
Total Volume of Change Orders by Interface		Shows counts of both opened and closed Change Orders by interface for today, 7 days ago, 14 days ago and so for about a 5 week period.	Crystal Reports
Workflow Task Aging		Shows a list of Workflow Tasks and duration (within Workshift hours) it took to complete one task to another per Change Order.	Crystal Reports
Properties Values by Property	Change Order\Volume\Properties	Shows a list of Change Order properties based on the open date range selected. The list shows each Property and all the responses to that Property.	Crystal Reports
Change Properties by Category		Shows a list of all Change Order and their Properties with an open date in the selected date range, grouped by Change Category.	Crystal Reports
Mean Time To Acknowledge & Mean Time To Resolve	Incident and Problem Management \Effectiveness	Shows annual trend of mean time to acknowledge (MTTA) and the mean time to resolve (MTTR) requests against the current month and the previous 3 months.	Crystal Reports
SLA Violation	Incident and Problem Management\SLA	Shows annual trend on % of SLA violation against the opened requests volume.	Crystal Reports
Incident Traceability Matrix	Incident and Problem	Shows a list of the Incidents and related Problems and Change Orders. Hyperlink on the Incident number opens a sub-report showing the brief details of the Incidents, Problems and Change Orders.	Crystal Reports

Problem Traceability Matrix	Management \Traceability Matrix	Shows a list of the Problems that have relationships with Incidents and Change Orders. Hyperlink on the Problem number opens a sub-report showing the brief details of the Problems, Incidents and Change Orders.	Crystal Reports
Volume Trend	Incident and Problem Management\Count	Shows annual trend of opened and closed requests based on selected annual trending parameter.	Crystal Reports
Active Issues Aging	Issue\Aging	Shows count of all open Issues by number of weeks open.	Crystal Reports
Active Issues Aging for Priority		Shows count of all open Issues by number of weeks open. Adjacent bars break up counts by Priorities.	Crystal Reports
Active Issues Aging by Priority for Categories		Shows count of all open Issues by number of weeks open. Adjacent bars break up counts by Priorities. User must input a Category name for a search of Issues in that Category.	Crystal Reports
Active Issues Aging by Priority for Groups		Shows count of all open Issues by number of weeks open. Adjacent bars break up counts by Priorities. User must input a Group name for a search of Issues in that Group.	Crystal Reports
Active Issues Aging by Priority for Status		Shows count of all open Issues by number of weeks open. Adjacent bars break up counts by Priorities. User must input a Status.	Crystal Reports
Active Issues Aging for Categories		Shows count of Issues by number of weeks open. User must input a Category name for a search of only Issues in that Category.	Crystal Reports

Active Issues Aging for Groups		Shows count of all open Issues by number of weeks open. User must input a Group(s).	Crystal Reports
Active Issues Aging for Status		Shows count of all open Issues by number of weeks open. User must input a Status.	Crystal Reports
Analyst Count by Priority of Active Issues	Issue\Resource	Shows active Issue counts by Analyst assigned to the Issue and broken up by Priority.	Crystal Reports
Issues by Failed Service Type for Groups		Shows % of each Service Type failure based on the total Service Type failures in one Group, in specific Groups or in ALL Groups.	Crystal Reports
Plan Task Pending		Shows list of Plan Tasks that are in a Pending Status and the duration (within Workshift hours) that is has been in Pending Status from the time the Plan Task started.	Crystal Reports
Active Issues at Weeks End	Issue\Volume	Shows count of opened Issues for today, 7 days ago, 14 days ago, and so on for 5 weeks. Counts are shown on the bars for each week ending date. The opened Issue counts, for each week ending date, include the previous 6 days up to and including the 7th day (week ending date).	Crystal Reports
Issues Categories Currently Active		Shows count of open Issues by Category.	Crystal Reports
Issue Totals		Start and end date must be entered. Analyst(s) last name needs to be specified or ALL for a list of all Analysts. Estimated Time and Cost are shown, plus the Total Time and Cost and average Time to Close.	Crystal Reports

Issues by Failed Service Type for Categories		Shows % of each Service Type failure based on the total Service Type failures in a particular Change Category, or a group of specific Change Categories or in ALL Change Categories.	Crystal Reports
Issues by Failed Service Type for Status		Shows % of each Service Type failure based on the total Service Type failures in a particular Status, or a group of specific Statuses or in ALL Statuses.	Crystal Reports
Plan Task Aging		Shows list of Plan Tasks and the duration (within Workshift hours) it took to complete one task to another, per Change Order.	Crystal Reports
Total Volume of Issues		Shows count of both opened and closed Issues for today, 7 days ago, 14 days ago and so on for about 5 weeks.	Crystal Reports
Total Volume of Issues by Interface		Shows count of both opened and closed Issues by Interface for today, 7 days ago, 14 days ago and so on for about 5 weeks.	Crystal Reports
Issue Properties by Category	Issue\Volume\Properties	Shows list of all Issues and their Properties with an open date in the selected date range, grouped by Category.	Crystal Reports
Issue Property Values		Shows list of all values for each Issue Property with an Issue open date in the selected date range.	Crystal Reports
Service Desk Application-Level Transaction Measurements	Key Performance Indicator	Produces graphs showing a comparison of transaction processing times for a chose system type KPI over a specified period of time.	Web Intelligen

			ce Report
Service Desk Application-Level Transaction Rates of Change		Produces a line graph showing the rate of change for a selected system activity during a selected time frame. Information displayed is derived from data gathered over time by active KPIs of type system.	Web Intelligence Report
Service Desk SQL and Stored Query KPI Values		Produces a line graph showing values collected by a selected KPI over a selected time frame. Information displayed is derived from data gathered over time by active KPIs of type SQL and Stored Query.	Web Intelligence Report
Document Usage by Contact	Knowledge Management\Contact Activity	Shows how Knowledge Documents have been utilized and is sorted by Contact.	Crystal Reports
Searches by Contact		Shows Knowledge Tools searches by Contact.	Crystal Reports
System Usage by Contact		Shows Knowledge Tools session and search information sorted by Contact.	Crystal Reports
User Sessions - Visits to Site		Shows Knowledge Tools session and search information sorted by Contact.	Crystal Reports
		Shows Issues opened without searching Knowledge.	

Users Opening Issues without Searching Knowledge			Crystal Reports
Users Opening Requests without Searching Knowledge		Shows Requests opened without searching Knowledge.	Crystal Reports
Comments by Contact		Shows Comments on Knowledge Documents sorted by Contact.	Crystal Reports
Document FAQ Rating	Knowledge Management\Knowledge Document Effectiveness	Shows Knowledge Documents sorted by FAQ Rating.	Crystal Reports
Comments by Document		Shows Comments sorted by Knowledge Document.	Crystal Reports
Document Ratings		Shows a list and pie chart of Knowledge Document Ratings.	Crystal Reports
Documents Viewed Detail		Shows details about the viewing of a specific Knowledge Document.	Crystal Reports
		Shows Knowledge Documents viewed least frequently.	Crystal

Least Frequently Viewed Documents			Reports
Most Frequently Viewed Documents		Shows Knowledge Documents viewed most frequently.	Crystal Reports
Knowledge Feedback		Shows Knowledge Documents feedback.	Crystal Reports
Knowledge Usage for Issues		Shows information about the number of sessions where users do not open Issues, % of Self Service, the total number of Solutions, the number of Issues opened over a time frame.	Crystal Reports
Knowledge Usage for Requests		Shows information about the number of sessions where users do not open Requests, % of Self Service, the total number of Solutions, the number of Requests opened over a time frame.	Crystal Reports
Poor Votes		Shows a list of Knowledge Documents with a 'Not Helpful at All' rating.	Crystal Reports
Candidate Documents for Retirement	Knowledge Management\Knowledge Document Status	Shows a list of Knowledge Documents that are candidates for retirement.	Crystal Reports
Documents by Status		Shows Knowledge Documents grouped by Status.	Crystal Reports
		Shows Knowledge Documents created via Knowledge Categories or via Submit Knowledge and assigned to the Category Owner.	

Documents Created Via Knowledge Categories		Crystal Reports
Documents Published	Shows Knowledge Documents that have been published.	Crystal Reports
Documents Scheduled for Expiration	Shows Knowledge Documents that are scheduled to expire within the specified time frame.	Crystal Reports
Documents with Inactive Assignees	Shows Knowledge Documents with Inactive Assignees.	Crystal Reports
Documents with Inactive Owners	Shows Knowledge Documents with Inactive Owners.	Crystal Reports
Expired Documents	Shows Knowledge Documents that have expired.	Crystal Reports
Submitted Knowledge	Shows Knowledge Documents submitted via the Submit Knowledge link in the Customer, Employee UI.	Crystal Reports
Unpublished Documents	Shows Knowledge Documents that have been unpublished.	Crystal Reports

Contact FAQ Ratings	Knowledge Management\Knowledge Team Productivity	Shows summary of Knowledge Document FAQ Ratings by Contact.	Crystal Reports
Contact FAQ Ratings Detail		Shows detail of Knowledge Document FAQ Ratings by Contact.	Crystal Reports
Contact Information		Shows a list of all Contacts, with name, login, role, status, email address, last login date and Groups the Contact is a member of.	Crystal Reports
Documents Solving Issues by Contact		Shows Knowledge Documents that have solved Issues.	Crystal Reports
Documents Solving Requests by Contact		Shows Knowledge Documents that have solved Requests.	Crystal Reports
Issues solved by Document		Shows details Knowledge Documents that have solved Issues. Information about the number of Issues that were resolved by Knowledge Document are also listed.	Crystal Reports
Requests solved by Document		Shows details Knowledge Documents that have solved Requests. Information about the number of Requests that were resolved by Knowledge Document are also listed.	Crystal Reports
Knowledge Initiators Detail		Shows details of Knowledge Documents grouped by the Contact who created them.	Crystal Reports

Knowledge Initiators Summary		Shows a summary line for each Contact, how many Knowledge Documents and a % of the total number of Knowledge Documents that were created by the Contact.	Crystal Reports
Noise Words	Knowledge Management\Search Administration	Shows Knowledge Document Noise Words.	Crystal Reports
Synonyms		Shows Knowledge Document Synonyms.	Crystal Reports
Special Terms		Shows Knowledge Document Special Terms.	Crystal Reports
Issues Closed Without Knowledge	Knowledge Management\Search Effectiveness and Usage	Shows list of Issues that have not been resolved by any Knowledge Documents.	Crystal Reports
Requests Closed Without Knowledge		Shows list of Requests that have not been resolved by any Knowledge Documents.	Crystal Reports
Most Frequent Searches		Shows most frequent Knowledge Tools searches.	Crystal Reports
Searches		Shows Knowledge Tools searches for a specific date range, Search Source and Search Type.	Crystal Reports
Requests Avoided		Shows details of Requests avoided.	

			Crystal Reports
Issues Closed with Knowledge		Shows information of Issues closed with Knowledge Documents.	Crystal Reports
Requests Closed with Knowledge		Shows information of Requests closed with Knowledge Documents.	Crystal Reports
Issues Avoided		Shows details of Issues avoided.	Crystal Reports
Knowledge Documents Created from Requests	Knowledge Management\Service Desk Integration	Shows proportion of Requests to generate a Knowledge Document.	Crystal Reports
Documents Solving Requests		Shows Knowledge Documents that have solved Requests.	Crystal Reports
Documents Solving Issues Detail		Shows details of the Issues that have a specific Knowledge Document as a solution.	Crystal Reports
Documents Solving Requests Detail		Shows details of the Requests that have a specific Knowledge Document as a solution.	Crystal Reports
		Shows proportion of Issues to generate a Knowledge Document.	

Knowledge Documents Created from Issues		Crystal Reports
Documents Solving Issues	Shows Knowledge Documents that have solved Issues.	Crystal Reports
Issues Created Based on Knowledge Documents	Shows Issues created when the link "New Issue based on this Document" is selected.	Crystal Reports
Requests Created Based on Knowledge Documents	Shows Requests created when the link "New Request based on this Document" is selected.	Crystal Reports
Time to Issue Resolution	Shows average time to resolve Issues when Knowledge is used or accepted as a solution.	Crystal Reports
Time to Request Resolution	Shows average time to resolve Requests when Knowledge is used or accepted as a solution.	Crystal Reports
Linked Knowledge To Issues	Shows linked Knowledge to Issues.	Crystal Reports
	Shows linked Knowledge to Requests.	Crystal

Linked Knowledge To Requests			Reports
Knowledge Management Metrics	Knowledge Management\System Reports	Shows various Knowledge Management metrics about Searches, Knowledge Life Cycle Management and others.	Crystal Reports
CI Maintenance Windows Conflict	MSP Reports	Shows the CIs that are linked to scheduled change and have conflicting maintenance windows.	Crystal Reports
Created Configuration Items Report		Shows all newly created CIs within the specified date range.	Web Intelligence Report
Deleted Configuration Items Report		Shows all CIs deleted within the specified date range.	Web Intelligence Report
Detailed Incident Source		Shows list of Incidents recorded in order to demonstrate the added value of service.	Web Intelligence Report
Incident Categories		Shows closed Incidents that do not have an associated Service Type.	Web Intelligence

without Service Type Report		ence Report
Incident Resolution Method	Shows Incidents that could have been resolved by lower level support groups for training purposes and to provide additional value to customer service packages.	Web Intelligence Report
Incident Resolution Report	Shows list of all the resolution codes used within the specified time period.	Web Intelligence Report
Incident Source Report	Shows total number of Incident requests by source.	Web Intelligence Report
Incidents by Category	Shows major Incidents for contract purposes, process performance, billing and compliance.	Web Intelligence Report
Incidents by Hardware Model	Shows count of total and closed Incidents associated with a CI by Hardware Model.	Web Intelligen

			ce Report
Incidents without associated Asset or CI		Shows list of Incidents recorded without an associated Asset or CI in order to demonstrate the added value of service.	Web Intelligence Report
Re-Categorized Incidents		Shows Incidents that required re-categorization upon resolution for billing and training purposes.	Crystal Reports
Reassigned Incidents Report		Shows Incidents that required to be re-assigned upon resolution for billing and training purposes.	Crystal Reports
Detail Incident Source	MSP Reports\Dashboards	Multi-tenancy required	Dashboard

Active Requests Aging by Priority for Groups	Request\Aging	Shows count of open Requests by the number of weeks open. Adjacent bars break up counts by Priorities. User must input a Group name for a search of Requests in that Group.	Crystal Reports

Active Requests Aging by Priority for Request Areas		Shows count of open Requests by the number of weeks open. Adjacent bars break up counts by Priorities. User must input a Request Area for a search of Requests in that Request Area.	Crystal Reports
Active Requests Aging by Priority for Status		Shows count of open Requests by the number of weeks open. Adjacent bars break up counts by Priorities. User must input a Status name for a search of Requests in that Status.	Crystal Reports
Active Requests Aging		Shows count of all open Requests by number of weeks open.	Crystal Reports
Active Requests Aging for Groups		Shows count of all open Requests by number of weeks open. User must input a Group Name for a search of only Requests in that Group.	Crystal Reports
Active Requests Aging for Priority		Shows count of open Requests by the number of weeks open. Adjacent bars break up counts by Priorities.	Crystal Reports
Active Requests Aging for Request Areas		Shows count of open Requests by the number of weeks open. User must input a Request Area for a search of Requests in that Request Area.	Crystal Reports
Active Requests Aging for Status		Shows count of open Requests by the number of weeks open. User must input a Status name for a search of Requests in that Status.	Crystal Reports
Volume and Trend	Request\Count	Shows annual trend of opened and closed Requests based on a user selected annual trending parameter.	Crystal Reports

Mean Time To Acknowledge & Mean Time To Resolve	Request\Effectiveness	Shows annual trend of mean time to acknowledge (MTTA) and the mean time to resolve (MTTR) requests against the current month and the previous 3 months.	Crystal Reports
Analyst Count by Priority of Active Requests	Request\Resource	Shows open Request counts by Priority grouped by Analyst.	Crystal Reports
Analyst Summary		Shows the number of Analysts assigned to Requests by Status.	Crystal Reports
Request Aging Detail by Organization and Analyst		Shows detailed summary of all currently opened Requests by Organization and Analyst and the last activity that occurred and by whom. Sorted descending on time open.	
Request List by Analyst		Shows a list of Requests assigned to each Analyst.	Crystal Reports
Violated SLA for Groups		Shows the number of Requests violated by the number of time violated. Requires a start and end date, and Group name for a search of only Requests opened during that date range and assigned to that Group or all Groups.	Crystal Reports
Requests by Failed Service Type for Groups		Shows % of each Service Type failure based on the total Service Type failures on one Group, in certain Groups or in all Groups.	Crystal Reports
SLA Violation	Request\SLA	Shows annual trend on % of SLA violation against the opened requests volume.	Crystal Reports
		Shows a list of active Requests grouped by Analyst.	

Active Request List	Request\Volume		Crystal Reports
Active Requests at Weeks End		Shows count of opened Issues for today, 7 days ago, 14 days ago, and so on for 5 weeks. Counts are shown on the bars for each week ending date. The opened Request counts, for each week ending date, include the previous 6 days up to and including the 7th d	Crystal Reports
Activity of Requests		Shows a list of activities for all Requests, grouped by Request.	Crystal Reports
Analyst List by Organization		Shows a list of Analysts organized by their Organization.	Crystal Reports
Key Organization Summary		Shows detail of all the active Requests by Organization.	Crystal Reports
Open /Closed Call Analysis by Analyst		Shows a count of Requests active at the start date, new Requests entered during the period, Requests closed during the period, the number of active Requests at the end of the period and the change in the number of active Requests over the period.	Crystal Reports
Request Activity Counts by Customer Organization		Shows a count of Request Activities by type, sorted by Customer Organization. The counts are based on Requests that were opened between the Start and End Dates.	Crystal Reports
Request Aging Detail		Shows a detailed summary of all currently opened Requests by Organization and the last Activity that occurred and by whom.	Crystal Reports

Request Areas Currently Active		Shows the count of open Requests by Request Area.	Crystal Reports
Request List		Shows a list of Requests.	Crystal Reports
Request List by Organization		Shows a list of Requests grouped by Customer Organization.	Crystal Reports
Request List by Priority		Shows a list of Requests grouped by Priority.	Crystal Reports
Request List by Request Area		Shows a list of Requests grouped by Request Area.	Crystal Reports
Request Properties by Request Area	Request\Volume\Properties	Shows a list of all Requests and their Properties within the user selected date range, grouped by Request Area.	Crystal Reports
Request Property Values		Shows a list of Request Properties based on the Open Date range selected. The list shows each Property and all the responses to that Property.	Crystal Reports
Not Closed Requests by Priority	Request\Volume\By Customer Location	Shows a count of Requests with no Closed Date by Customer Location. The numbers are further broken down by Priority. Additionally, the report totals the number of Requests active, inactive and with a SLA violation.	Crystal Reports
		Shows a count of Requests with no Close Date and attached Change Orders. The numbers are grouped by Customer Location and Priority.	

Not Closed Requests by Priority with Attached Change Orders			Crystal Reports
Resolved Requests by Priority with Resolved Date		Shows a count of Requests that have been resolved but not yet closed. Requests are listed by Customer Location and Priority.	Crystal Reports
Analyst Logins	Support Automation	Shows detailed information for each analyst login.	Crystal Reports
Analyst Metrics		Shows summary information for each analyst, including KPI metrics. Data is for all sessions completed during the analyst login session where the login itself occurred in the date range.	Crystal Reports
Assistance Sessions		Shows detailed report of all assistance sessions.	Crystal Reports
Assistance Sessions Metrics		Shows summary data of the assistance sessions conducted by the help desk.	Crystal Reports
Tool Usage Summary		Shows summary information about which tools are being used for assistance sessions. For each tool, the number of session it was used in is shown, with the number sub-totaled by ticket category and with a grand total.	Crystal Reports
Queue Entries		Shows detailed metrics information for each queue entry.	Crystal

			Reports
Queue Entry Metrics		Shows summary data by queue about the queue entries.	Crystal Reports
Automated Task Execution		Shows detail information for each automated task (script) execution.	Crystal Reports
Automated Task Summary		Shows a summary for each script showing the number of times it has been executed and the status of those executions.	Crystal Reports
Active Queued End Users		Shows real time information about end users, placed in support queues.	Crystal Reports
Active Assistance Sessions		Shows real time data of currently active assistance sessions.	Crystal Reports
Survey Detail	Survey	Shows details of a given Survey name (or ALL) that lists the specifics of each Survey completed. It will look very similar to the actual Survey, but filled in with the Customer choices and comments.	Crystal Reports
Survey Summary		Shows a summary of a given Survey name (or ALL) that lists the % and counts of responses for each answer, per question, based on the total number of responses for this Survey.	Crystal Reports
Survey Summary with Comments		Shows a summary of a given Survey name (or ALL) that lists the % and counts of responses for each answer, per question, based on the total number of responses for this Survey. Includes Customer comments.	Crystal

			Reports
CI Maintenance Windows	CMDB	Shows the CIs that are linked to multiple services and have multiple maintenance windows.	Crystal Reports
CIs Added in Time Range Report		Shows a list of CIs added during the specified date range and for specified tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs by MDR Report		Shows a list of all CIs for a specific Management Data Repository (MDR) name or grouped by all MDRs for the specific tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs by Owner Report		Shows all the CIs for a specific Owner last name grouped by all Owners for the specific tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs by Tenant Report		Shows all the CIs for a specific Tenant name grouped by all Tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs Change Anomaly Report		Shows a list of all CIs to which changes have been made during the specified date range and tenant.	Crystal Reports
CIs Details Report		Shows a list of CIs for a specific Location or grouped by all Locations for the specific tenants. The report lets you view the related CI Name, Family, Class, and Responsible Organization. Can also view the assets if there are no CIs.	Crystal Reports
CIs Related to		Shows a list of all the CIs along with the Incident and the Problem count for specified tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal

Incidents and Problem Report			Reports
CIs Relationship Changes Report		Shows a list of all CIs for which the relationships have been changed or deleted for the specified date range and for the specified tenant.	Crystal Reports
CIs Scheduled Changes Report		Shows a list of all the CIs along with the related Change Orders and the RFC Scheduling details for specified tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs Updated in Time Range Report		Shows a list of all the updated/modified CIs for the specified date range and for the specific tenant(s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
CIs With Change Orders Report		Shows a list of all CIs with the Change Order counts for the specified tenant (s). The report lets you view the related CI Name, Family, Class, Responsible Organization and Location.	Crystal Reports
All Change Impact Report	CMDB\SQL Server (These Reports will work on SQL Server only)	Shows a list of CIs which have a direct relationship with the specified CI for the specified tenants. Lets you view the CIs according to Family, Relation Type, CI Class, Responsible Organization and Location. Can view active and inactive CIs.	Crystal Reports
CIs Relationships Report		Shows a list of all the Dependent and Provider CIs for the specified tenants. Lets you view the CIs according to Family, Relation Type, CI Class, Responsible Organization and Location. Can view active	Crystal Reports
CIs Root Cause Analysis Report		Shows a list of all CIs that have been modified during the specified date range and have a direct or indirect relationship with the specified CI for the specified tenants. The report lets you view the CIs according to the user who modified the CI and the Relationship Type. You can also view the Dependent and Provider CIs for the specified CI, along with the old and new values.	Crystal Reports
All Change Impact Report		Shows a list of CIs which have a direct relationship with the specified CI for the specified tenants. Lets you view the CIs according to Family, Relation Type, CI Class, Responsible Organization and Location. Can view active and inactive CIs.	Crystal

	CMDB\Oracle (These Reports will work on Oracle Only)		Reports
CIs Relationships Report		Shows a list of all the Dependent and Provider CIs for the specified tenants. Lets you view the CIs according to Family, Relation Type, CI Class, Responsible Organization and Location. Can view active	Crystal Reports
CIs Root Cause Analysis Report		Shows a list of all CIs that have been modified during the specified date range and have a direct or indirect relationship with the specified CI for the specified tenants. The report lets you view the CIs according to the user who modified the CI and the Relationship Type. You can also view the Dependent and Provider CIs for the specified CI, along with the old and new values.	Crystal Reports
CACF Overview	CMDB\Configuration Audit & Control Facility	Shows the CACF overview within the selected time period. The report lets you view the number of Incidents that CACF created, Detected Rogue changes, Prevented Rogue changes, Variances detected, Variances prevented and Variances allowed.	Crystal Reports
CACF Policy Efficiency summary		Shows the efficiency summary of the selected policies according to the modification, activation, and deactivation dates of these policies. The report lets you view the Policy deactivation date, Policy description, number of Incidents that Policy created, rogue changes or inserts, rogue changes prevented, variances detected, variances prevented and variances allowed by the selected policies.	Crystal Reports
Change verification trending information		Shows the trends of the change verification for the selected time period. The report lets you view the number of Change Orders requiring manual verification, variances allowed by Policy, variances prevented by Policy, rogue changes and verified change specifications.	Crystal Reports
Number of Change Orders for the time period		Shows the number of Change Orders within the selected time period. The report displays the number of Change Orders with or without the Change Specifications, Change Orders where all Change Specifications were closed automatically, Change Orders where at least one Change Specification needed manual intervention and Change Orders with no associated CIs. The reports let you view the Change Orders according to the selected Categories, Assignees, Change Organizations, Requestors, Priorities, CIs, CI Classes, Contact Names, CI Locations and CI Service Organizations.	Crystal Reports
Number of CIs for the time period		Shows the number of different CIs within the selected time period. The report displays the CIs with Rogue Changes, CIs with Variances, CIs with Unverifiable Changes and CIs with verified Change Specifications. The report lets you view the CIs according to the selected CI Classes, CI Locations, Contact Names and CI Service Organizations.	Crystal Reports
		This dashboard provides insight into metrics surrounding productivity of Groups of Teams that address the request and incident demand coming from business users.	

Operational Effectiveness	CA Service Management\Scheduled Dashboard	
Service Demand - Incidents		This dashboard provides insight into incident demand from business users to IT, and supports analysis of data through various time-periods, location, tenant or service.
Operational Effectiveness	CA Service Management\View on Demand Dashboard	This dashboard provides insight into metrics surrounding productivity of Groups of Teams that address the request and incident demand coming from business users.
Service Demand - Incidents		This dashboard provides insight into incident demand from business users to IT, and supports analysis of data through various time-periods, location, tenant or service.

CA Service Catalog Reports

The following table lists the CA Business Intelligence Reports available with CA Service Catalog:

Report Name	Folder Name (Public Folders > CA Reports > CA Service Management > CA Service Catalog)	Report Description
User Requests	User Reports	Provides the details of the requests raised, approved or fulfilled by a specific user between the specific periods of time.
Account Details	Admin Reports	Shows the accounts in a BU and the details of those accounts
Adjustment Details		Provides the details of the various adjustments provided to a tenant.
Invoice Details		Provides the details of the invoices raised for a particular business unit / tenant.
Ongoing Subscription to Services		Provides the details of the active subscriptions for a user.
Payment Details		Provides the details of the payments posted to various accounts for the chosen tenant.
Request Fulfillment Details		Shows time taken to Approve, Fulfill and Complete all requests which fall within the specified date range. This Report will have the requests that are already completed.
		Report providing the details of the assets associated with various requests.

Requests - Assets Association	
Requests - Change Orders - CI Associations	Provides the details of the Change Orders and the CIs associated with the requests for a Business Unit and can be further limited to the specified User in that BU.
Requests in Specified State For More Than Threshold Duration	Provides the list of orders from tenants that have been in the specified state for more than specified duration.
Requests Overview	Provides the details of the requests by period,tenant and status.
Service Catalog for a Tenant	Provides the Catalog of various services available for the Tenant users.
Service Level Agreement Report	Report of defined service request SLAs and their associated metrics. This report acts as a tool for monitoring all SLAs for a particular tenant. ''#/#'' is defined as ''# out of #''.
Service Options Not Requested	Provides the details of the offerings that haven't been ordered by the users of the chosen tenant in the specified period of time.
Service Request Fulfilment Report	High-level report detailing service request fulfillment, including average fulfillment times. This report provides a high-level review of Service Request Fulfillment activity.''#/#'' is defined as ''# out of #''.
Service Request Lifecycle Expectations Report	Report to track and monitor end-to-end expectations of service requests within a specified date range. This report acts as a tool for viewing SLA compliance of a complete Service Request from an overarching "end-to-end" perspective, as well as broken down into its constituent components. ''#/#'' is defined as ''# out of #''.
Services - Assets Association	Report providing the Services/Service Options associated with the Asset types.
Services - CMDB Associations	Provides the associations of Services with CMDB CI's.
Services Becoming Unavailable	Provides the details for the services that are becoming unavailable in the selected time frame.
Service Usage	Report detailing the usage of various services and service options by the tenants. This report provides a tool for monitoring and determining the number of times a service / service option is used by the users.
	This report provides the details of the requests for the specified service offerings that are in various stages of the service life cycle.

Service Usage - Open Requests		
Tenant Hierarchy Information		Provides a hierarchical view of the tenants in a MSP installation.
Tenant User Information		Provides the details of the users belonging to a specific tenant and their roles in the respective tenant.
Tenant's Services Consumption		Provides the details of the costs and services consumed by the tenant between specific periods of time.
Users Requests		Provides the details of the requests raised, approved or fulfilled by a specific user between the specific periods of time.
Violated SLA Report		Report of violated service request SLAs. This report acts as a tool for monitoring and determining which SLAs have not been met. ''# /#'' is defined as ''# out of #''.
Service Level Agreement Report (CSV Export)	Admin Reports\Flat File Reports	Report of defined service request SLAs and their associated metrics. This report acts as a tool for monitoring all SLAs for a particular tenant. ''#/#'' is defined as ''# out of #''.
Service Request Fulfillment Report (CSV Export)		High-level report detailing service request fulfillment, including average fulfillment times. This report provides a high-level review of Service Request Fulfillment activity.''#/#'' is defined as ''# out of #''.
Service Request Lifecycle Expectations Report (CSV Export)		Report to track and monitor end-to-end expectations of service requests within a specified date range.This report acts as a tool for viewing SLA compliance of a complete Service Request from an overarching “end-to-end” perspective, as well as broken down into its constituent components. ''#/#'' is defined as ''# out of #''.
Violated SLA Report (CSV Export)		Report of violated service request SLAs. This report acts as a tool for monitoring and determining which SLAs have not been met. ''# /#'' is defined as ''# out of #''.
Request Details Report	Admin Reports\Dashboard Reports	
Request Details Report by MonthYear		
Request Details Report by Service		

Option, Service Name and Status		
Request Details Report by Tenant		
Service Level Agreement Dashboard		Report of defined service request SLAs that are defined from Submitted to Completed State and their associated metrics. This report acts as a tool for monitoring all SLAs for a particular tenant.
Service Request Fulfillment Dashboard		High-level report detailing service request fulfillment, including average fulfillment times. This report provides a high-level review of Service Request Fulfillment activity.
Service Request Lifecycle Expectations Dashboard		Report to track and monitor end-to-end expectations of service requests within a specified date range. This report acts as a tool for viewing SLA compliance of a complete Service Request from an overarching “end-to-end” perspective, as well as broken down into its constituent components.
SLA Dashboard by SLA		Report of service request SLAs. This report acts as a tool for monitoring and determining the SLA Compliances for each tenant.
SLA Dashboard by Tenant		Report of service request SLAs. This report acts as a tool for monitoring and determining SLA compliances for the tenant.
SLA Detail Report		Report of defined service request SLAs that are defined from Submitted to Completed State and their associated metrics. This report acts as a tool for monitoring all SLAs for a particular tenant.
SLCM Admin Dashboard		
Violated SLA Dashboard		Report of defined service request SLAs that are defined from Submitted to Completed State and their associated metrics. This report acts as a tool for monitoring all SLAs for a particular tenant.
Violated SLA Dashboard by SLA		Report of violated service request SLAs. This report acts as a tool for monitoring and determining which SLAs have not been met.
Violated SLA Dashboard by Tenant		Report of violated service request SLAs. This report acts as a tool for monitoring and determining which SLAs have not been met.
Service Demand - Requests	CA Service Management\Scheduled Dashboard	This dashboard provides insight into request demand from business users to IT, and supports analysis of data through various time-periods, location, tenant or service.
Service Demand - Requests	CA Service Management\View on Demand Dashboard	This dashboard provides insight into request demand from business users to IT, and supports analysis of data through various time-periods, location, tenant or service.

Connect

Connect with the CA Service Management community using the following links:

Pre-Built CA Process Automation Workflows

This section provides the steps required to integrate the pre-built CA Process Automation workflows with CA Service Catalog. It is assumed that each CA Service Management product in the solution has been appropriately installed in a certified architecture.

Ensure that the following products are installed before you proceed with the integration:

- CA EEM
- CA Process Automation
- CA Service Catalog
- Java Runtime Environment is

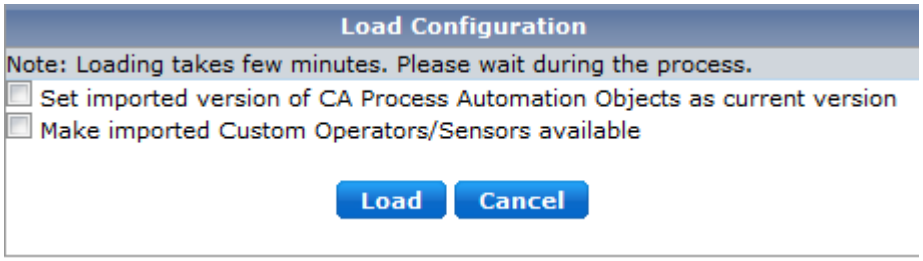
Important! Take a back up of the custom process files before you upgrade with the latest CA Process Automation Content files.

Follow these steps:

Step 1 - Load Pre-Built CA Process Automation Workflows for CA Service Catalog

Follow these steps:

1. Log in to CA Service Catalog as the Service Delivery Administrator (spadmin)
2. Click **Administration**, **Configuration**.
3. Click the link for CA Service Desk and edit each property with the appropriate value.
4. Click **Test**. If you do not receive a “Connection Test is Successful” message, modify your settings again.
5. Click the link for the CA Process Automation option.
6. Edit each property with the appropriate value, and then click **Test**.
   If you do not receive a “Connection Test is Successful” message, modify your settings again.
7. Click **Load** and select both check boxes that appear.



Load Configuration

8. Click **Load** button.
9. Click **Configure**, once the load completes.

Step 2 - Configure the pre-built CA Process Automation Workflows for CA Service Catalog

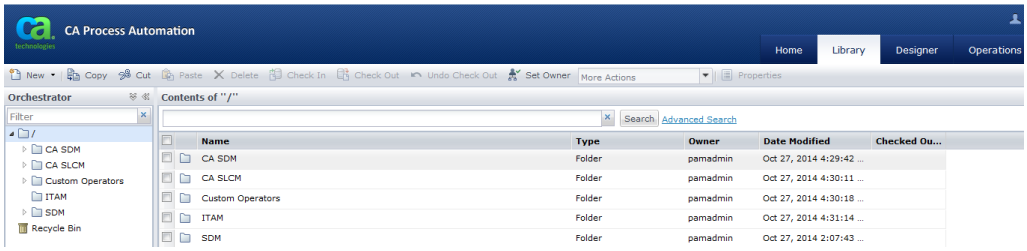
1. Log in to CA Service Catalog as the Service Delivery Administrator (spadmin).

2. Click **Administration**, **Configuration**.

3. Go to **CA Process Automation** section, and then click the **Launch** button to initiate CA Process Automation.

4. Enter the CA Process Automation Administrator username and password, and click **Log in**.

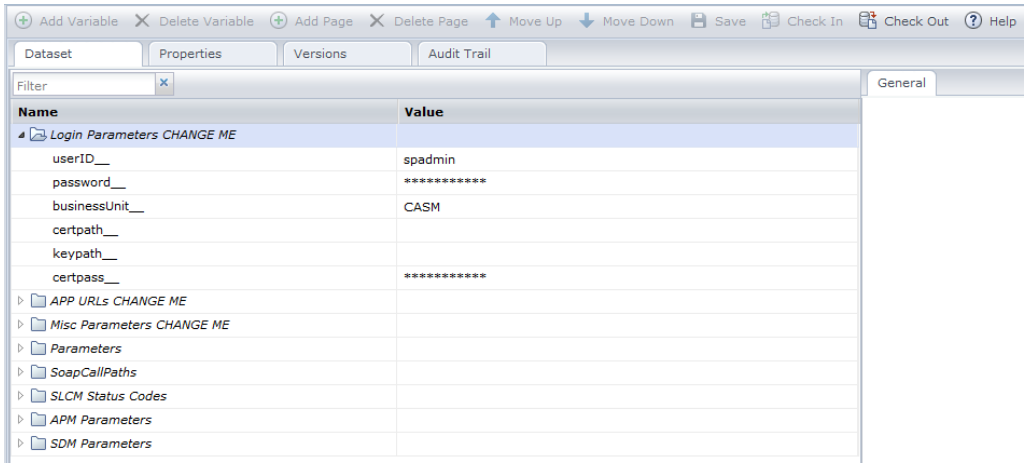
5. Click the **Library** tab.
   The following screen appears:



Library

6. Click the CA SLCM folder to open it.

7. Double-click SLCM_GlobalDataset.



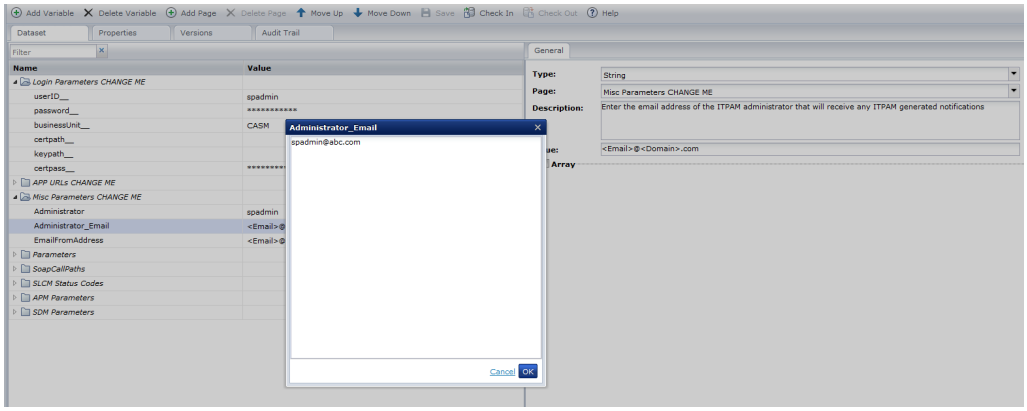
Login Parameters

8. Click the Checkout icon  in the SLCM_GlobalDataset screen.
   In the Login Parameters Value Definition screen, provide the Service Delivery Administrator user ID, password, and business Unit from the CA Service Catalog installation.

9. Click the CA SLCM folder to open it.

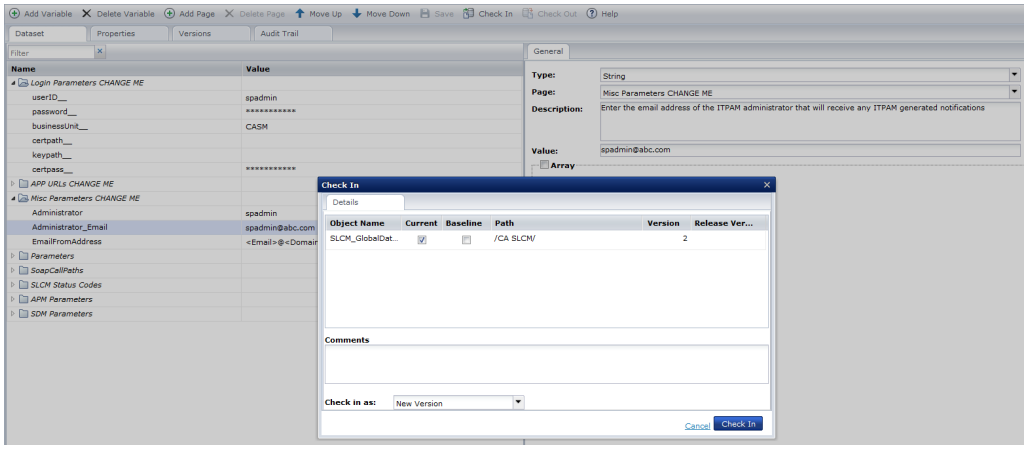
10. Double-click SLCM_GlobalDataset.

11. Click the Misc Parameters CHANGE ME section and modify the Administrator_Email and EmailFromAddress.



Misc Parameters

12. Click the **Save** icon, then click the **Check in** icon.
The following screen appears:



Check In Details

13. Enter any appropriate check-in comments and click OK.

14. Follow steps 4-8 for the SDM_GlobalDataset located in the CA SDM folder. Note that Administrator_Email and EmailFromAddress is located in the Parameters section.

15. Expand the CA SDM folder and click the SRF folder.

16. Right click the Service_Publishing Start Request Form and select Properties.

17. Click the **Tags** tab, then the **Edit** button.

18. Click in the text area and type chgcat then click **Save**.

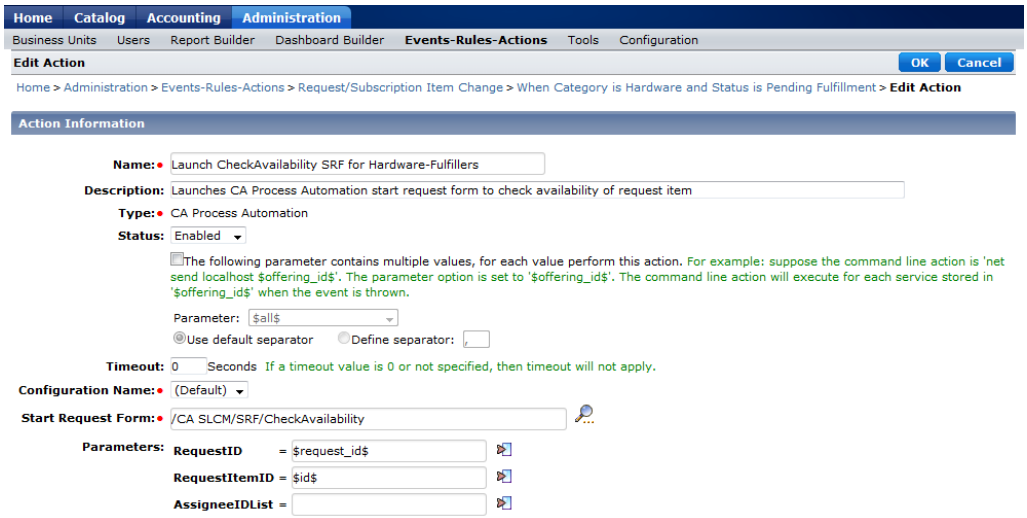
19. Follow steps 12-14 for the HWSW_FilledFromInventory Start Request Form.

20. Click the Configuration Browser tab
21. Click the Modules tab and double click the CA Service Desk Module.
22. Right-click and select Lock.
23. Update the Service Desk WebService URL, Service Desk Administrator User ID (ServiceDesk), and the Service Desk Administrator password. Click Apply.
24. Click the Modules tab again and double click the Alert Module.
25. Update the SMTP Server for Outgoing e-mail and the From Address for Outgoing e-mail. Click Apply.
26. Right-click and select Unlock. Click Ok to the confirmation popup.
27. Close CA Process Automation.

Step 3 - Copy and Modify Actions

Follow these steps:

1. Log into CA Service Catalog as an administrator.
2. Click **Administration**, **Events-Rules-Actions**.
3. Click **Request/Subscription Item Change**.
4. Click on the **When Category is Hardware and Status is Pending Fulfillment** rule.
5. Click the Copy icon for the **Launch CheckAvailability SRF for Hardware** action.
6. Type in the name **Launch CheckAvailability SRF for Hardware–Fulfillers Group** and click **OK**.
7. Check the action **Launch CheckAvailability SRF for Hardware** and click the Disable button.
8. Click the Edit icon for the **Launch CheckAvailability SRF for Hardware–Fulfillers Group** action.
9. Select Enabled from the **Status** drop-down box in the Action Information section.



Action Information

10. Type in Fulfillers in the text field for AssigneeIDList.
11. Click the **OK** button to save your changes.
12. Click the **Done** button.
13. Repeat Steps 1-12 for the all additional rules and actions.

Use the following table as a reference to add additional rules and actions:

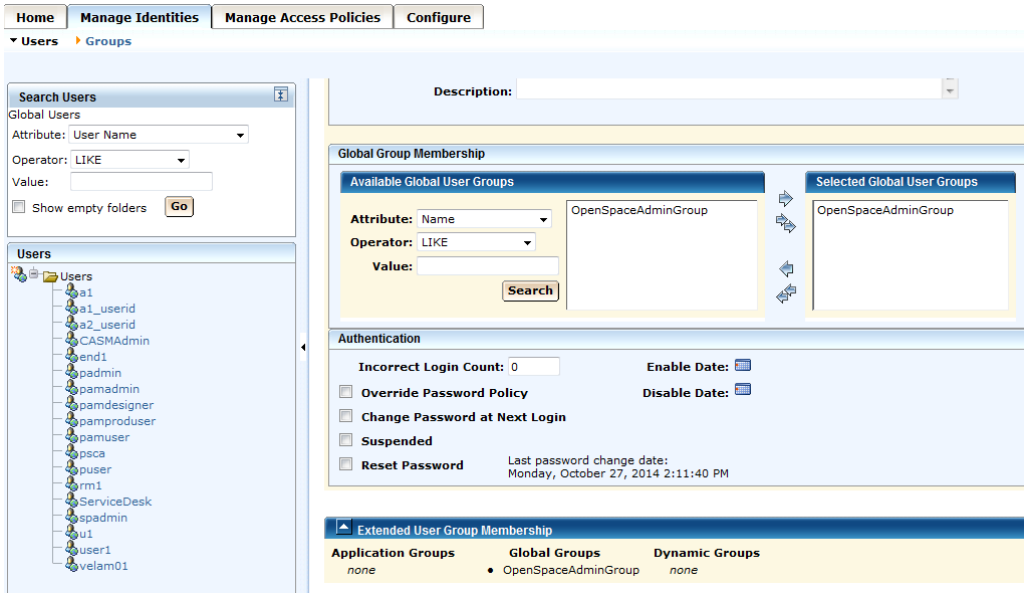
Rule Name	Action to Copy and Disable	New Enabled Action Name	How to Modify the Action
When Category is Software and Status is Pending Fulfillment	Launch CheckAvailability SRF for Software Availability	Launch CheckAvailability SRF for Software Availability–Fulfillers Group	AssigneeIDList = Fulfillers
When Category is Hardware and Status is Not Filled From Inventory	Launch SLCM_Fulfillment SRF	Launch SLCM_Fulfillment SRF–Procurement Group	AssigneeIDList = Procurement
When Category is Software and Status is Not Filled From Inventory	Launch SLCM_Fulfillment SRF	Launch SLCM_Fulfillment SRF–Procurement Group	AssigneeIDList = Procurement
When Category is Hardware and Status is Filled From Inventory	Launch HWSWFilledFromInv_SDM SRF	Launch HWSWFilledFromInv_SDM SRF–Change Analyst	AssigneeIDList = <SDM change analyst user id> SDM_Category = <tenanted category, ex. SLCM.HWFFI-A>
When Category is Software and Status is Filled From Inventory	Launch HWSWFilledFromInv_SDM SRF	Launch HWSWFilledFromInv_SDM SRF–Change Analyst	AssigneeIDList = <SDM change analyst user id>

Rule Name	Action to Copy and Disable	New Enabled Action Name	How to Modify the Action
			SDM_Category = <tenanted category, ex. SLCM.HWFFI-A>
When Category is Hardware and Status is Received or Order Cancelled	Launch Hardware CheckAvailability SRF	Launch Hardware CheckAvailability SRF–Fulfillers Group	AssigneeIDList = Fulfillers
When Category is Software and Status is Received or Order Cancelled	Launch CheckAvailability SRF for Software	Launch CheckAvailability SRF for Software–Fulfillers Group	AssigneeIDList = Fulfillers

Step 4 - Add Members to User Defined Group

Follow these steps:

1. Click **Manage Identities** tab, click the **Users** link in the CA EEM GUI.
2. Enter appropriate search criteria in the **Search Users** section, and click the Go button.
   Users appear in the Users section.
3. Select the user to add to the EEM group in the Users folder.
   The user details appear.
4. Search for the available global user groups in the Global Group Membership section.
5. Select the group(s) in the Global Group Membership section, to which the user must be added and move the selected groups into the **Selected Global User Groups** multi-select box.



Global Group Membership

6. Click **Save**.

7. Repeat steps 2 - 5 for each user that requires group membership.

Step 5 - Configure CA Service Desk Manager

Follow these steps to configure CA Service Desk Manager:

Step 5a - Configure Options Manager

You first configure the Options Manager in CA Service Desk Manager.

Follow these steps:

1. Log into the CA Service Desk Manager as a privileged user. For example, ServiceDesk

2. Click the **Administration** tab and navigate to **Options Manager**. Edit the following:

Sub Node	Options to Configure	Option Value / Action
CA Process Automation Workflow	caextwf_eem_hostname	CA EEM Server host name. Click Install.
	caextwf_endpoint	URL of the load balancer for the CA Process Automation server. Click Install.
	caextwf_log_categories	Enter **Process**. Click Install.
	caextwf_processdisplay_url	Replace <default hostname>: <port number> portion of the URL in the Option Value (in front of the "/itpam/JNLP") with the actual host name and port number of the load balancer for CA Process Automation server. Click Install.
	caextwf_worklist_url	Replace <default hostname>: <port number> portion of the URL in the Option Value (in front of the /itpam?webPage") with the actual host name and port number of the load balancer for CA Process Automation server. Click Install
	caextwf_ws_password	itpamadmin user's password in the Option Value field. Click Install.
	caextwf_ws_user	itpamadmin username in the Option Value field. Click Install.

Sub Node	Options to Configure	Option Value / Action
Change Order Manager	Category Defaults	Click Install.
Security	eiam_hostname	CA EEM Server host name. Click Install.
	Use_eiam_authentication	Click Install.

3. Close the CA Service Desk Manager GUI.
4. Restart the CA Service Desk Manager service.

Step 5b - Configure Web Screen Painter

You configure the Web Screen Painter now.

Follow these steps:

1. Open the Web Screen Painter and log in as a privileged user. For example, ServiceDesk
2. Open the Schema Designer and navigate to chg (Change Order).
3. Click **Add Column**.
4. Type usmrequestid in the pop up.
5. Click OK and set the Field Type to INTEGER.
6. Repeat steps 1-5 for usmrequestitemid, and then click the **Save** button.
7. Navigate to chgcat (Change Category).
8. Click **Add Column** and type implementors in the popup.
9. Click **OK** and set the Field Type to SREL. Then set the SRel Table to grp (Group Contacts).
10. Repeat steps 8 and 9 for change_manager.
11. Click Save and Publish. Then select **Yes** to the next 2 popups.
12. Stop the Service Desk services.
13. Run pdm_publish on the Service Desk server.
14. Start the Service Desk Manager services.
15. Open the Web Screen Painter and log in as a privileged user (e.g. ServiceDesk)

16. Click the **Open** icon.
17. Navigate to the detail_chgcat.htmpl file.
18. Click **Open**.
19. Right click the second row that has the field “Self-Service Include” and select Insert Row.
20. Right click the added row and select Insert Lookup.
21. Double-click the newly created field, click the Attribute row and select zchange_manager.
22. Repeat steps 20 and 21 for the Implementers field.
23. Click **File** and select **Save**.
24. Click **File** and select **Publish** and accept all confirmation popups.
25. Type pdm_webcache from a command prompt on the Service Desk server.

Step 5c - Add CA Service Desk Manager Groups

Use the following table to configure CA Service Desk Manager Groups:

Group Name	Group Manager	Group Members
Change Manager Group		*
IT Asset Management		*
Catalog Administrators		*

*Each group must contain at least one contact. Configure the contact as follows:

- Access type must be Analyst.
- Valid email address.
- Must exist in CA EEM.
- Belong to ITPAMUsers group within CA EEM.
- Select Email for all the Notification Methods.

Follow these steps to configure the CA Service Desk Manager Groups:

1. Open the CA Service Desk Manager and log in as a privileged user. For example, ServiceDesk
2. Click the **Administration** tab and navigate to **Security and Role Management**, **Groups**.
3. Click the **Create New** button.
4. Type Change Manager Group in the Group Name field.

5. Click the **Members** tab and click **Update Members** to add users to this group.
6. Repeat steps 3-5 for each group in the table above.

Step 5d - Add Status

Follow these steps:

1. Open CA Service Desk Manager and log in as a privileged user. For example, ServiceDesk
2. Click the **Administration** tab and navigate to **Service Desk**, **Change Orders**, **Status**.
3. Click the **Create New** button.
4. Type Complete in the Symbol field.
5. Type COMP in the Code field.
6. Click the **Save** button.
7. Click the **Update Transitions** button and check the following Statuses:
   - Cancelled
   - Closed
   - Customer Hold
   - Implementation in progress
   - Vendor Hold
   - Verification in progress
8. Click **Save**.

Step 5e - Add Change Categories

Use the following table to configure CA Service Desk Manager Change Categories:

Symbol	Code	Groups	Workflow SRF
SLCM.Hardware Filled From Inventory	SLCM. HWFFI	**Group**: IT Asset Manager	HWSW_FilledFromInventory
SLCM.Software Filled From Inventory	SLCM. SWFFI	**Group**: IT Asset Manager	HWSW_FilledFromInventory
SLCM.Service Publishing	SLCM. CN0	**Group**: IT Asset Manager **Change Manager**: Change Manager Group **Implementers**: Catalog Administrators	Service_Publishing

Follow these steps:

1. Open the CA Service Desk Manager and log in as a privileged user. For example, ServiceDesk
2. Click the **Administration** tab and navigate to **Service Desk**, **Change Orders**, **Categories**.
3. Click the **Create New** button.
4. Type SLCM.Hardware Filled From Inventory in the Symbol field.
5. Type SLCM.HWFFI in the Code field.
6. Select IT Asset Manager in the Group field.
7. Click the 2. Workflow tab.
8. Click the **Use CA IT PAM** button.
9. Choose **HWSW_FilledFromInventory Start Request** Form.
10. Click the **Save** button.
11. Repeat steps 3-10 for each change category in the table above.

Third-Party License Acknowledgments

This section contains all third-party software license agreements for applications that are included as part of the current release of CA Service Management. All third-party software has been used in accordance with the terms and conditions for use, reproduction, and distribution as defined by the applicable license agreements.

The following license agreements are available as an attachment:

CA SDM Connector Glossary

The following list contains concepts and terms that are useful if you are integrating a CA Catalyst Connector with CA Catalyst.

- **Connectors**
  Connectors are the links from products that consume data from external products, referred to in this document as domain managers. Each connector retrieves information from its domain manager and transmits the information through the connector framework to the consuming product for visualization and analysis. Connectors can also enact inbound operations on data in the source domain manager, such as object creation.

- **USM**
  The *Unified Service Model* (USM) is a schema of common object types and properties to which data from all connectors is converted. The USM schema enables data analysis from all domain managers on a common interface with identical formatting.

- **Configuration Items (CIs)**
  Configuration items (CIs) represent IT elements that the domain manager manages. Each CI belongs to a *type* (defined in the USM schema) such as ComputerSystem, Database, Process, BinaryRelationship, and so on.
  Connectors transform managed objects from domain managers to adhere to the USM schema and import the objects to the consuming products as CIs.

- **Services**
  Services represent discrete business functions that can contain configuration items that multiple domain managers manage. For example, a payroll service contains an Active Directory database managed by which the Microsoft SCOM manages, user store manages by security product, batch

jobs managed by mainframe product, router managed by network product, applications managed by application management product, and so on. You can do the following actions in consuming products, such as CA SOI:

- Detect the root cause of service degradation quickly and navigate to the appropriate product to resolve problems
- Model services based on imported CIs or import existing service models from integrated products to construct a comprehensive and service-centric model of your enterprise

- **Alerts**
  Alerts are the CA SOI mechanism for reporting fault conditions and service degradation. *Infrastructure alerts* are fault conditions originally reported by one of the domain managers (such as a CA NSM event or CA Spectrum alarm). An alert is associated with a corresponding CI and associated alert severities determine CI condition, and ultimately, service impact. *Service alerts* are conditions generated by CA Spectrum SA based on analysis of a modeled service. Service alerts result when the condition of one or more CIs combines to impact the overall quality or risk level associated with the service.

- **Outbound from connector operations**
  Outbound from connector operations are operations that a connector invokes to import data from domain managers into consuming products such as CA Catalyst and CA Spectrum SA. All connectors support outbound operations.

- **Inbound to connector operations**
  Inbound to connector operations invoke changes to the domain manager data store as a result of changes to the imported data in the consuming product. For example, CI reconciliation in CA Catalyst can change the values of CI properties. Connectors that support inbound operations can then enact that change in the source domain manager so that its data matches the reconciled data. Or if a CI is deleted in a domain manager that CA Catalyst defines as a source of truth, connectors that support inbound operations can delete the CI in other domain managers with a record of that CI.

- **ServiceDeskManagerConnector.conf**
  ServiceDeskManagerConnector.conf file is the configuration file for CA Catalyst Container r3.1 and r3.2. This file stores the configuration information (node and module information) needed for the CA Catalyst server and other peers. CA SDM Connector r2.5 framework does not have the ServiceDeskManagerConnector.conf file.

- **ServiceDeskManagerConnector.xml**
  ServiceDeskManagerConnector.xml is the configuration file for CA SDM Connector r3.1 and r3.2. For CA SDM Connector r2.5, the equivalent configuration file is ServiceDeskManager_<ComputerName>.xml where ComputerName is the name of the computer server where the CA SDM Connector resides. These files contain the configuration properties to help the connector operations. For example, toggling the Use Transaction Work Area, changing the configured username and password, excluding CI or relationship types, and so on.

- **USM-CMDB.xml**
  USM-CMDB.xml file contains the mapping information of the USM entities and CMDB families. Based upon this mapping the CA SDM Connector performs necessary actions.
  Example: The ServiceDeskObject.xml object lists the attributes to query while querying the CIs from CMDB. This information helps the CA SDM Connector to query CMDB with only those attributes which are mapped to USM attributes rather than querying all the attributes.

- **ServiceDeskManager_policy.xml**
  ServiceDeskManager_policy.xml file contains the outbound USM transformation policy information which transforms the incoming CIs from CMDB to USM entity.

- **ServiceDeskManager_policy.en**
  ServiceDeskManager_policy.en is the localization file for outbound policy. Change this file information to map with new values of CMDB families or attributes if you want to support CA SDM in a language other than English.

- **ServiceDeskManager_policySB.xml**
  ServiceDeskManager_policySB.xml file contains the inbound transformation policy information which transforms the incoming USM entity to CMDB CI before providing it to the CA SDM Connector.

- **ServiceDeskManager_policySB.en**
  ServiceDeskManager_policySB.en is the localization file for inbound policy. Change this file information to map with new values of CMDB families or attributes if you want to support CA SDM in a language other than English.
