Background

- Challenge:
 - Low cost, available performance testing tools for the IM solution are usually limited to the low end spectrum of functionality
 - CLI (Command Line)
 - Bulk Loader Client (blc) for top tier (Web Application) testing of create, modify, delete user objects only.
 - etautil / ldapsearch (imps version) for the mid-tier (Provisioning Server) testing of create, modify, reset passwords, delete, to the GU and endpoint accounts.
 - High cost performance testing tools for project, required customers to own or purchase HP Loadrunner or similar vendor tools.
 - Usually owned and executed by specialized business units at customer site
 - Required future scheduling to occur. Limited ad-hoc testing
 - No proactive testing available or limited.
- The use of Apache Jmeter is an amazing mid-spectrum solution that provide non-invasive performance testing
 - Benefits:
 - Open Source License
 - No install required; just extract and run from workstation/desktop
 - Low learning curve [less than 2 hours to learn & use]
 - No agents required to be deployed for majority of test plans
 - May use the included "PerfMon" Server Agent to view disk I/O CPU, Network utilization
 - Easy to share test plans
 - Use of a built-in HTTP proxy recorder to auto-build test plans
- This deck focus on the use of Jmeter and LDAP(S) protocol used by the mid-tier & data tier component of IM.
 - Mid-Tier: Provisioning Server & its Connector Servers (JCS/CCS); Data Tier: IMCD (IM Corporate User Store/Directory) & IMPD (Prov. Directory)
 - Only the query operation is defined in the example labs. This single operation will quickly define where bottlenecks may exist with a configuration settings for a Connector, or perhaps load-balancing operations, and if there are issues with the endpoints.

Goals

- Use Apache Jmeter as independent testing / validation tool for a “performance feedback” process & proactively identify any provisioning bottle-neck challenges for a production “Go-Live”
- Pre-create definitions to the four (4) primary X500/LDAP instances for the CA Identity Management solution.
 - Only one (1) of the four (4) IMPD DSA are represented.
 - IMCD = IM Corporate Directory/Userstore
 - The primary IM userstore, used by the top tier of the solution, for user profiles & IM group objects.
 - May be CA Directory or other LDAP/X.500 vendor
 - May be Flat or Hierarchal, typically InetOrg schema [Open for customization] with one (1) structural class [minimal] & one (1) auxiliary class [optional]
 - IMPS = IM Provisioning Server
 - This userstore is the IM mid-tier component / service for normalizing user data and providing a connector framework to manage various endpoint userstores.
 - May use either the IMPS Manager GUI, Jxplorer, IMPS_HOME\bin\etutil, and IMPS_HOME\bin\ldapsearch to manage.
 - IMPD = IM Provisioning Directory
 - The supporting CA Directory (x500) for IMPS. Has predefined schema to support various endpoint userstores; and custom userstores.
 - Referential integrity is maintained by the IMPS Service. Do not make any changes to this directory via Jxplorer or any other tool to avoid data corruption. Queries are fine.
 - IMPS Router = IM Provisioning Server Router DSA
 - A component of CA Directory that provides software routing, load-balancing, and failover to the IMPD tier.
- Four (4) examples of Jmeter output reports or results have been pre-defined.
- A fifth definition has been added to directly query endpoint accounts that have been previously explored.
 - Note1: The IMPS connectors will redirect any explored account from the Provisioning Server to the actual endpoint, if the account exists & the “pointer object” has been created from a prior IMPS explore operation.
 - Note2: The IMPS explore operation may per OU or per endpoint account. To focus on a single endpoint account, use the IMPS\bin\ldapsearch.exe binary to ensure that the search criteria is focus on the single account.

Monitor network connections with netstat to the Directory Servers from workstation/desktop

```
Every 2.0s: netstat -an | grep 41389 | wc -l
```

2

```
Every 2.0s: netstat -an | grep 41389 | wc -l
```

140

```
Every 2.0s: netstat -an | grep 41389 | wc -l
```

324

```
Every 2.0s: netstat -an | grep 41389 | wc -l
```

426

Example where # of threads are set to 500 over 60 seconds ramp up time.

Note: Always run Jmeter test suite from a desktop/workstation to ensure network latency is captured. If Jmeter is run directly on the server (IMPS), then results will be lower and may skew expectations during remote connection performance.

Export of the IM Jmeter Test Lab

1. Save to disk (XML file with jmx extension)
2. Open / Load with Latest Jmeter
 - a. <http://jmeter.apache.org/> (Require Java 1.6+)
3. Update the configuration entry with variables & ports for your servers.
4. Test with current settings
5. Review and adjust settings for other tests
6. Add to for delete/modify/creation operations

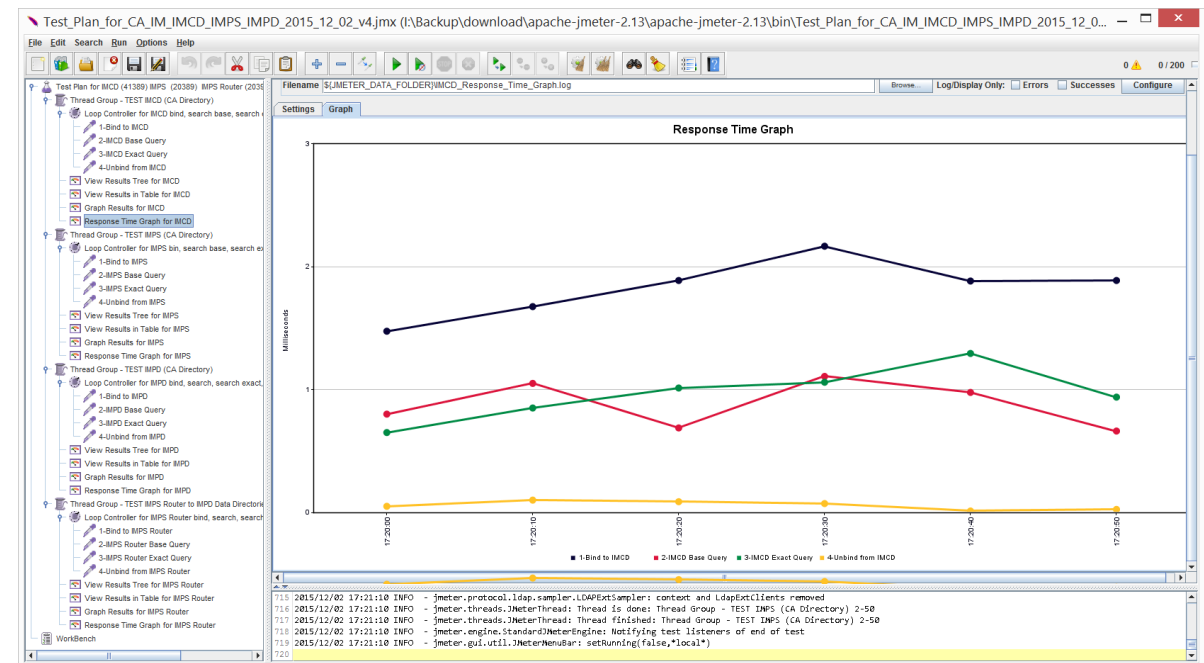

jmx

Scalability Validation: Use Jmeter for testing Password Resets

1. Install Apache Jmeter & Jxplorer on the IMPS (Provisioning Server)
2. Use Jxplorer to connect to the IMPS 20389 and select the DN attribute of an “Explored” Endpoint Account (EA)
 - a. This “pointer object” will ONLY be created after an initial Explore operation to the endpoint. When this object is select (via IMPS 20389), the IMPS services will query the CCS/JCS connector for the endpoint; and pull back or update the endpoint account.
3. Open Apache Jmeter & Create a Test Plan with two (2) sections
 - a. SECTION ONE: Password Reset via IMPS & Connectors to managed endpoints
 - a. Step 01: Bind to IMPS Service (IMPS Host + 20389/20390) with Admin Account (etaadmin/idmadmin)
 - b. Step 02: Exact LDAP query : Query EA [Copy from Jxplorer]
 - i. eTADSAccountName=BugsBunny,eTADSCoName=Users,eTADSDirectoryName=TEST,eTNamespaceName=ActiveDirectory,dc=im,dc=eta
 - a) Format: eTXXXAccountName where XXX = ADS, ACC, AS4, DB2, DBZ, ETC, FND, KRB, LND, N16, NIS, ORA, PLS, RAC, RSA, SAP Exceptions: EIAM and DYN (all CX connectors)
 - b) Other exceptions: eTACFLid=BugsBunny,eTLIDContainerName= [alternative format: eTACFLid, eTTSSAcid, eTSBLUser, eTSQLLogin, eTPPSUser]
 - ii. eTDYNAccount=BugsBunny,eTDYNContainerName= {all CX connectors}
 - c. Step 03: Exact Account LDAP update: Update userPassword [Copy from Jxplorer]
 - d. Step 04: Unbind from IMPS Service
 - b. SECTION TWO: Password Reset directly to userstores
4. Ramp up testing from 1-50 users over 60 seconds.
5. Monitor Output
 - a. Create four (4) reports

May also use other tools, e.g. HP Load Runner, for same performance/ scalability validation

To view all endpoint objects Names/Classes without installing or using Jxplorer: **IMPS_HOME\bin\dumpptt.exe -f -of c:\temp\imps-dumpptt.txt**

Example of User Store Tuning for IMPD

Measure user store search performance [Use Apache Jmeter, CA Directory DxSoak CLI, or other performance monitoring tools]

For optimum performance, CA Identity Manager policy evaluation searches should complete within **10-20 milliseconds**. To ensure that CA Identity Manager can consistently complete these searches in the recommended time, consider testing search performance under multiple load conditions. You can also use this measurement to determine when a user store reaches its physical limits and additional servers are required for load balancing.

Index attributes

Index each attribute that is used in a role policy or identity policy. Indexing attributes can provide significant performance improvements. Note: For information about indexing attributes, see the documentation for the LDAP directory or relational database that contains the user store.

Within the CA Directory solution: DXHOME\dxserver\config\servers\hostname-{main,co,inc,notify}-impd.dxi files [validate these entries exist in ALL four (4) DSAs]

```
set cache-index = all-attributes;  
set lookup-cache = true;
```

Cache LDAP Binds

In CA Identity Manager, all directory LDAP binds are executed by the proxy user defined on the CA Identity Manager Directory object. For each connection, the same LDAP bind occurs for this same user repeatedly. If you are using an LDAP directory as a user store, configure the directory to cache LDAP binds (or sessions), if the directory supports it.

Within the CA Directory solution: DXHOME\dxserver\config\settings\impd.dxc [append to end to end of single file, referenced by all four (4) IMPD DSAs]

```
set password-storage = sha-512;  
set prune-oc-parents = true; {Removes redundant superior object classes when new entries are created.}
```

```
### IMPD Performance Tokens ###  
### set mimic-netscape-for-siteminder = true;  
set concurrent-bind-user = <dc etadb><eTNamespaceName CommonObjects><eTDSAContainerName DSAs>;
```

Enable user store caches

When CA Identity Manager evaluates the policy decisions for a user, that information is stored in an authorization cache. When the cached information expires, CA Identity Manager evaluates all policies for that user again. To improve performance of user store searches in subsequent policy rule evaluations, enable the user store to cache searched data, if your user store supports it.

Within the CA Directory solution: DXHOME\dxserver\config\servers\hostname-{main,co,inc,notify}-impd.dxi files [validate these entries exist in ALL four (4) DSAs]

```
set cache-index = all-attributes;  
set lookup-cache = true;
```
