Improved roll-ups and access to test case results from Iteration Status page

The Iteration Status page and app have been updated to better support test set, test case, and test case result reporting. These improvements include:
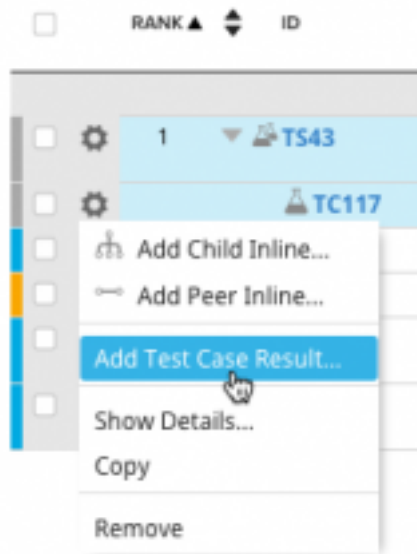

- Test case results are correctly associated with the iteration their test case and test set are in.
- The most recent Last Verdict, Last Build and Last Run values of a test case result roll-up to the test case.

- Quick access to test case results from the Last Build field.

- Quick access to editing a test case result from the list row gear icon.

- One or more test cases can be removed from a test set using the gear icon.
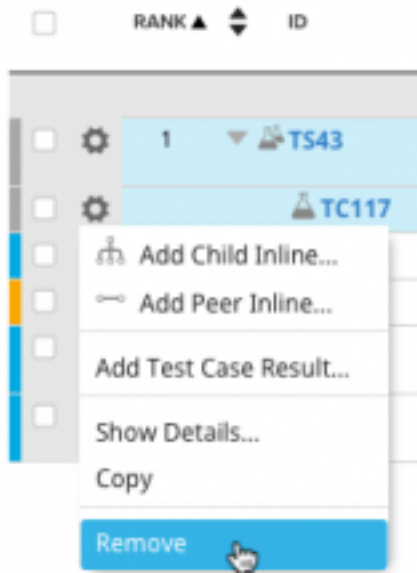

- Defects can be added to test cases that are associated to a test set.
