## Solution Summary

Behavior Analytics for PAM enhances security for your most critical systems by implementing protections similar to those used by credit cards to detect and prevent fraud.

We're super charging PAM to enable continuous monitoring, detection of malicious activities, automatic mitigations, and sophisticated tools for understanding PAM user activities.

## Key Features

- Enables automated detection, alerting, and mitigation for critical threats including compromised PAM credentials, untrusted but privileged contractors, and malicious insiders.
- Deploys as single virtual machine, requiring no special skill or machine learning expertise.
- Compelling user experience with human understandable risk and insights regarding PAM activities and users
