What This is About...

- Encyclopedia functions overview
- Details of the encyclopedia functions
- Administration guide
- Technical design of the encyclopedias
- Common functions tips
- Encyclopedia queries

Encyclopedia Functions

- Provides a storage mechanism for models
 - A repository for model objects and associations
- Is implemented as a database and logic
- Provides access and management functions
 - Provides secured shared access to objects
 - Provides versioning and migration functions
 - Provides reports on models and encyclopedia objects

Encyclopedia Functions

- Model Checkin and Checkout (Subsetting)
- Adoption
- Migration
- Model Management (copy, delete, ...)
- Reporting (comparison, conflicts, validation...)
- User Administration and Access

First, What is a Model?

- The basis of Advantage Gen development
- A set of specifications that describe a part of the “real world”
- A set of interrelated diagrams that support all phases of development
- A representation of business requirements
 - Data
 - Activities
 - User interface
 - Application navigation

Model Evolution

Planning and Analysis

Design and Construction

Implementation

Advantage Gen provides:

- A set of layered diagrams used to specify business requirements
- Techniques for populating the diagrams
- An integrated development environment

What is an Encyclopedia?

- Advantage Gen provides two types of encyclopedias
 - Host Encyclopedia for the IBM MVS mainframe
 - Access through TSO panels
 - Uses DB2 for repository database
 - Client/Server Encyclopedia for open systems
 - Access through GUI clients in a distributed processing environment
 - Uses Oracle or SQL Server for repository database

Encyclopedias in Development

Host Encyclopedia

Client Server Encyclopedias

Message
Dispatcher

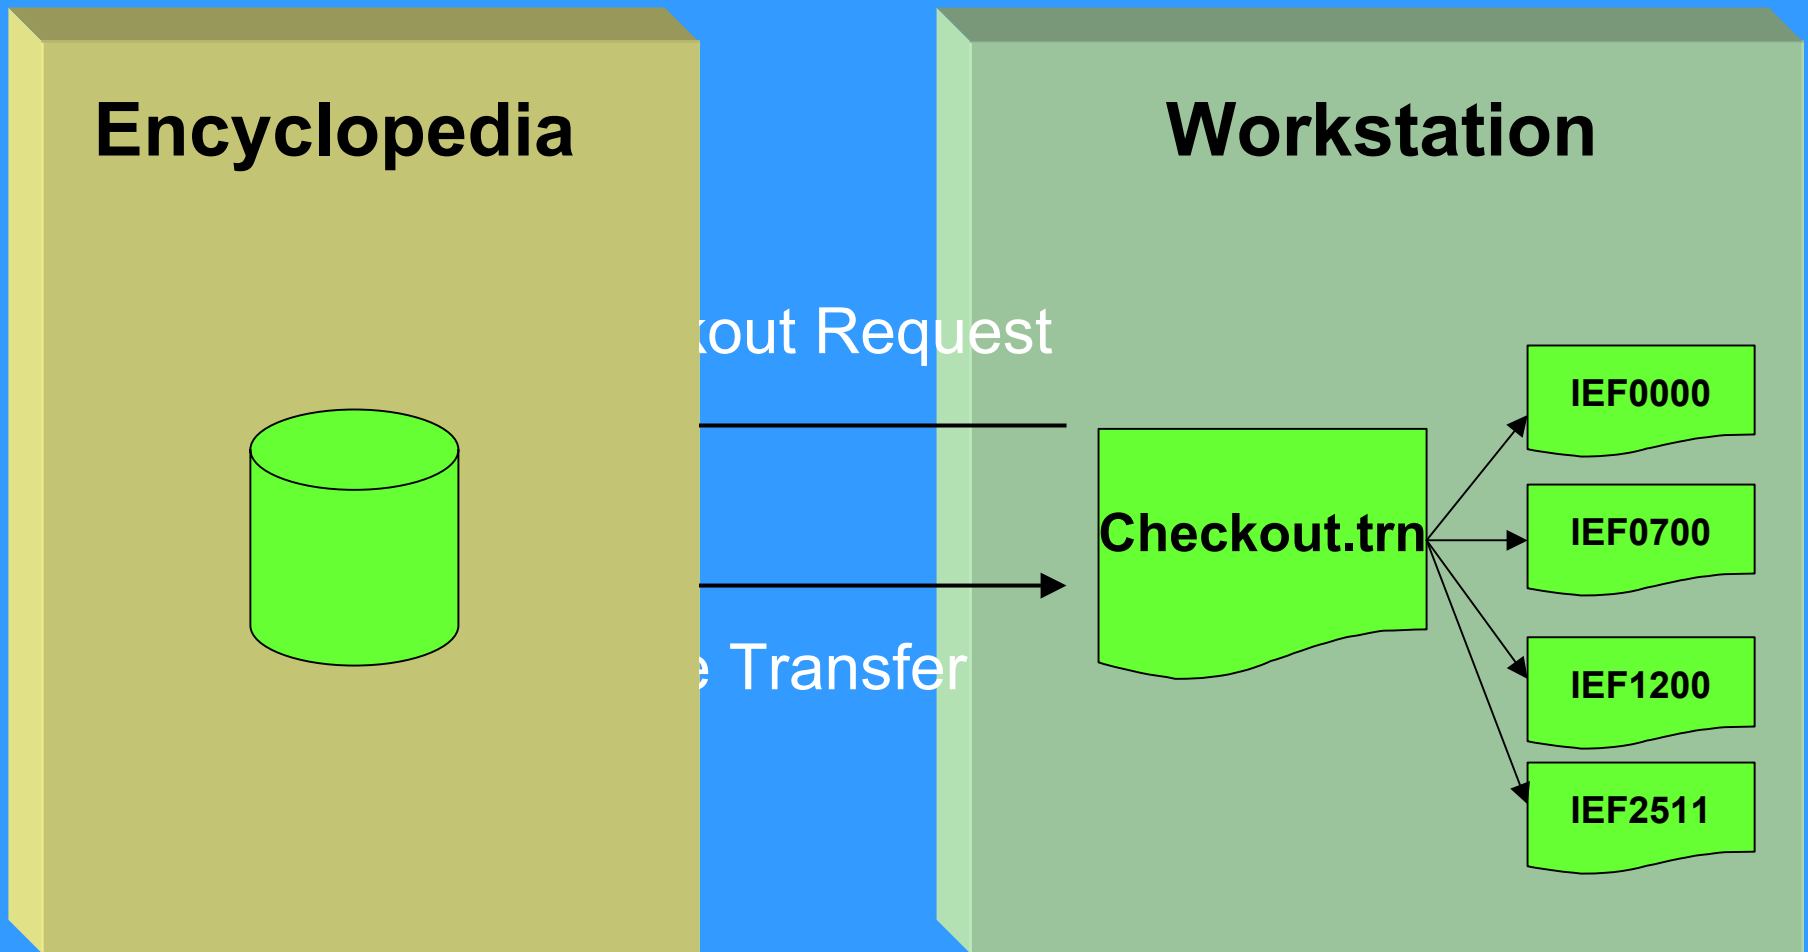

Model Checkin and Checkout

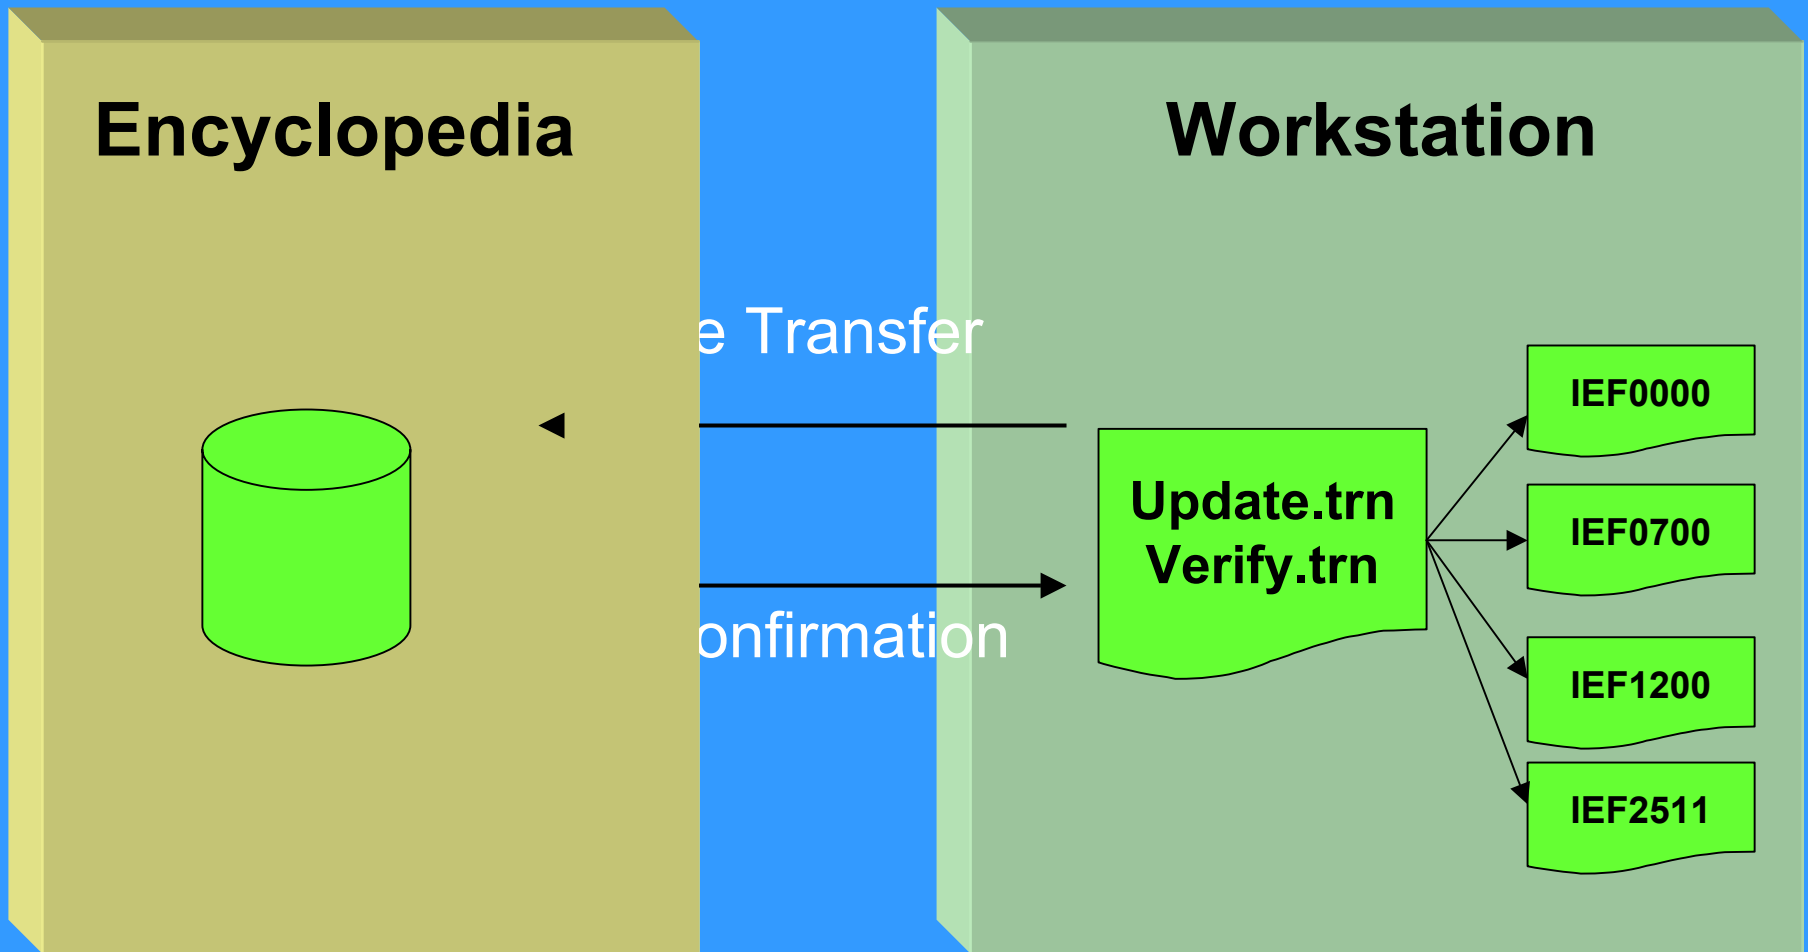

- Checking Out
 - Transfer of model (or subset) from an encyclopedia to a development workstation
 - Security and current checked out status verified
- Checking In
 - Transfer of model (or subset) from a development workstation to an encyclopedia
 - Security and current checked out status verified

Checkout Process

Checkin Process

Checkin Details

- With Checkin
 - The encyclopedia is updated with any changes made to the model on the development workstation
 - The active copy of the model (or subset) is returned to the encyclopedia
- Without Checkin
 - The encyclopedia is updated with any changes made to the model on the development workstation
 - The active copy of the model (or subset) is maintained on the workstation

Subsetting

- Subsetting allows multiple developers to work on the same model simultaneously
- Subsetting allows objects to be shared among members of the development team
- Security is applied to a subset in the same manner as to models
- Subsets are checked in and out in the same manner as models

Subsetting

- A subset is a named set of model objects

Version Control

- A set of tools and techniques that allow the maintenance of multiple versions of a model or object and promote sharing of objects between models
 - Move changes from a development model to a testing model
 - Move common objects from a shared model to a specific project model
 - Typically a shared responsibility of the model creator and the encyclopedia administrator

Adoption

- Adoption is the process of establishing common ancestry between objects in different models
- Ancestry is the basis on which objects are shared across models

Adoption

- Select the Adopter model as the source
 - The model with the correct original object IDs
 - Assure that you have at least read only rights to the model
- Select the Adoptee model as the destination
 - The model with the incorrect original object IDs
 - Assure that the adoptee model is checked in and you have migrate to rights on the model
- Select the objects to adopt
 - Choose either all objects or select them from the list
- Proceed with the adoption
- Examine the adoption results

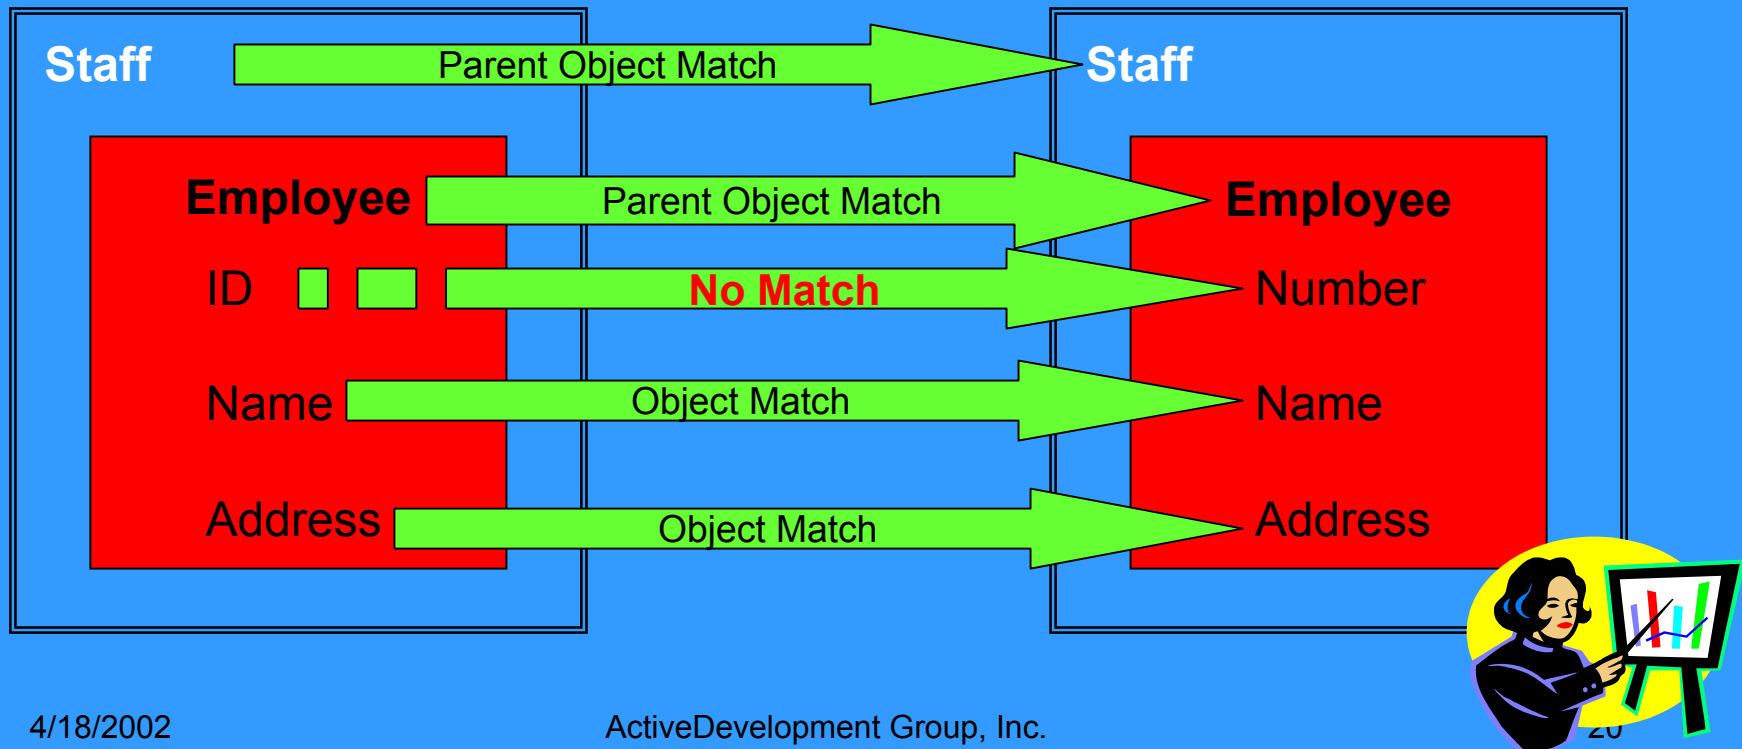

Trial Adoption

- The trial adoption proceeds exactly like the adoption and generates an identical adoption report
 - This is a good technique to verify that the adoption will be successful
- At the end of the process the trial adoption rolls back any changes to the encyclopedia database

Adoption Rules

- Objects are adopted based on object name and type, as well as parent original object id

Migration

- The process of copying new or changed objects from one model to another
 - It is critical that common ancestry be established to prevent new copies of the changed objects from being created

Migration Process

- Select the source model
 - The model with the current objects
 - Assure that you have at least read only rights to the model and that the desired objects are current in the encyclopedia
- Select the destination model
 - Assure that you have at migrate to rights to the model and that it is checked in to the encyclopedia
- Select the objects to migrate
- Proceed with the migration
- Examine the migration results

Trial Migration

- The trial migration proceeds exactly like the migration and generates an identical migration report
 - This is a good technique to verify that the migration will be successful
- At the end of the process the trial migration rolls back any changes to the encyclopedia database

Model Management

- Model Management has two primary purposes
 - To leverage corporate Advantage Gen knowledge by starting new development with infrastructure and pre-existing elements
 - To maintain version control of developed applications

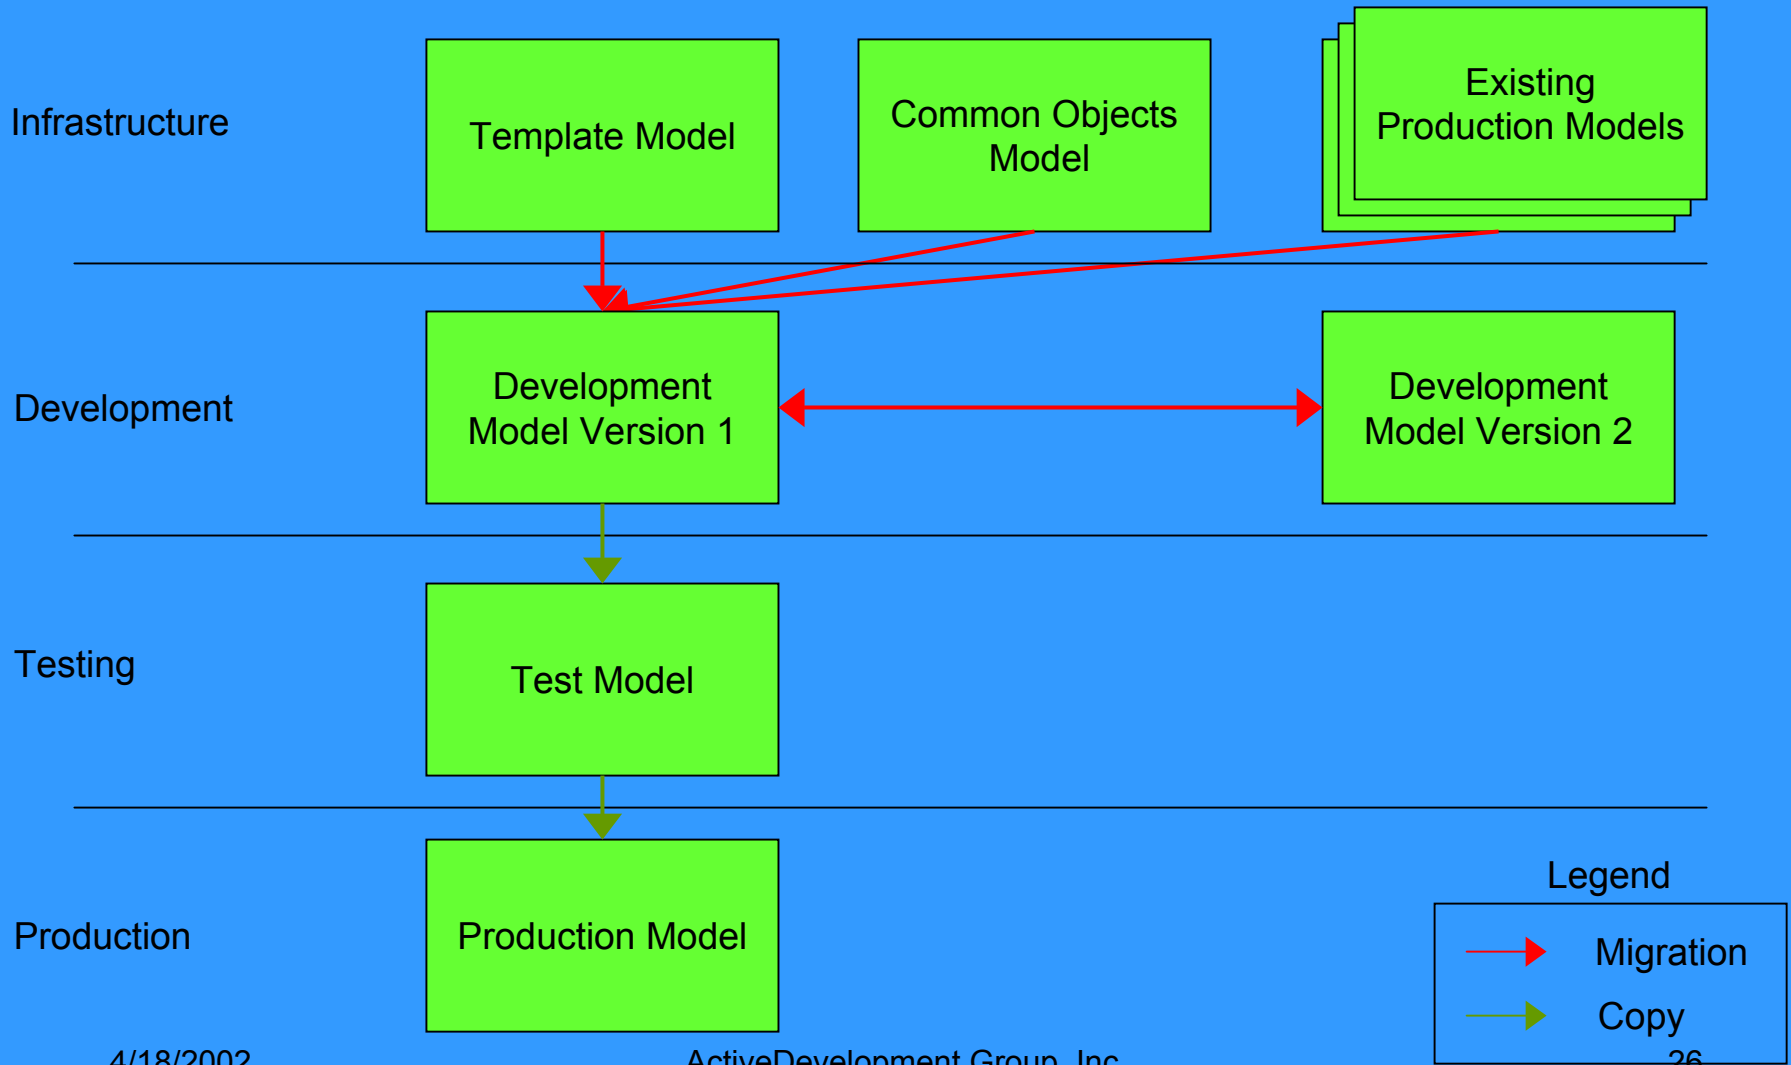

Model Management

- It is unusual to start a new project with an empty model
 - Development templates speed the development process by providing a starting point for application development
 - Re-used components prevent the re-development of pre-existing logic

Model Management Strategy

Reporting

- The Encyclopedia provides a variety of reports to assist in development and development coordination
- The Host Encyclopedia includes many different reports
- The Public Interface provides a mechanism by which users can query the Encyclopedia

User Administration

- Developers
 - Primary interactions with the encyclopedia include checkin, checkout, subset creation
- Model Owners
 - Primary interactions are similar to developers with the added responsibility of granting model level access to other users
- Encyclopedia Administrators
 - Grants access to the encyclopedias, authorizes model owners, removes inactive models, etc.

User Access & Privileges

- Access privileges are assigned either to an individual or group of users
 - Users are granted access to the encyclopedia
 - Users are granted access to models
- Access is either explicitly granted or inherited
 - i.e. The encyclopedia administrator inherits all of the rights of the model and subset owners

Encyclopedia Groups

- A group contains encyclopedia users
 - A user can belong to more than one group
 - Any encyclopedia user can create a group
 - An encyclopedia administrator or model owner can assign access privileges to a group

Technical Design

- A set of processes that interact with a relational database
- The database is a meta-model composed of three parts
 - Data tables (store objects, object properties, subset definitions, checkout status and associations)
 - Schema tables (store constants and types)
 - Public interface

Primary Data Tables

* Host

Schema Tables

SOBJ

Object Types

SASC

Association Types

SPRP

Property Types

For a specific release

The schema manages what is valid for objects, their associations and properties, for an Advantage Gen release.

Public Interface & APIs

- Consists of “views” defined at the DBMS level
- Provides a friendlier interface to a model’s contents
- Can be accessed by user-created queries and application interfaces
- API consists of read-only and update application interfaces

Common Functions Tips

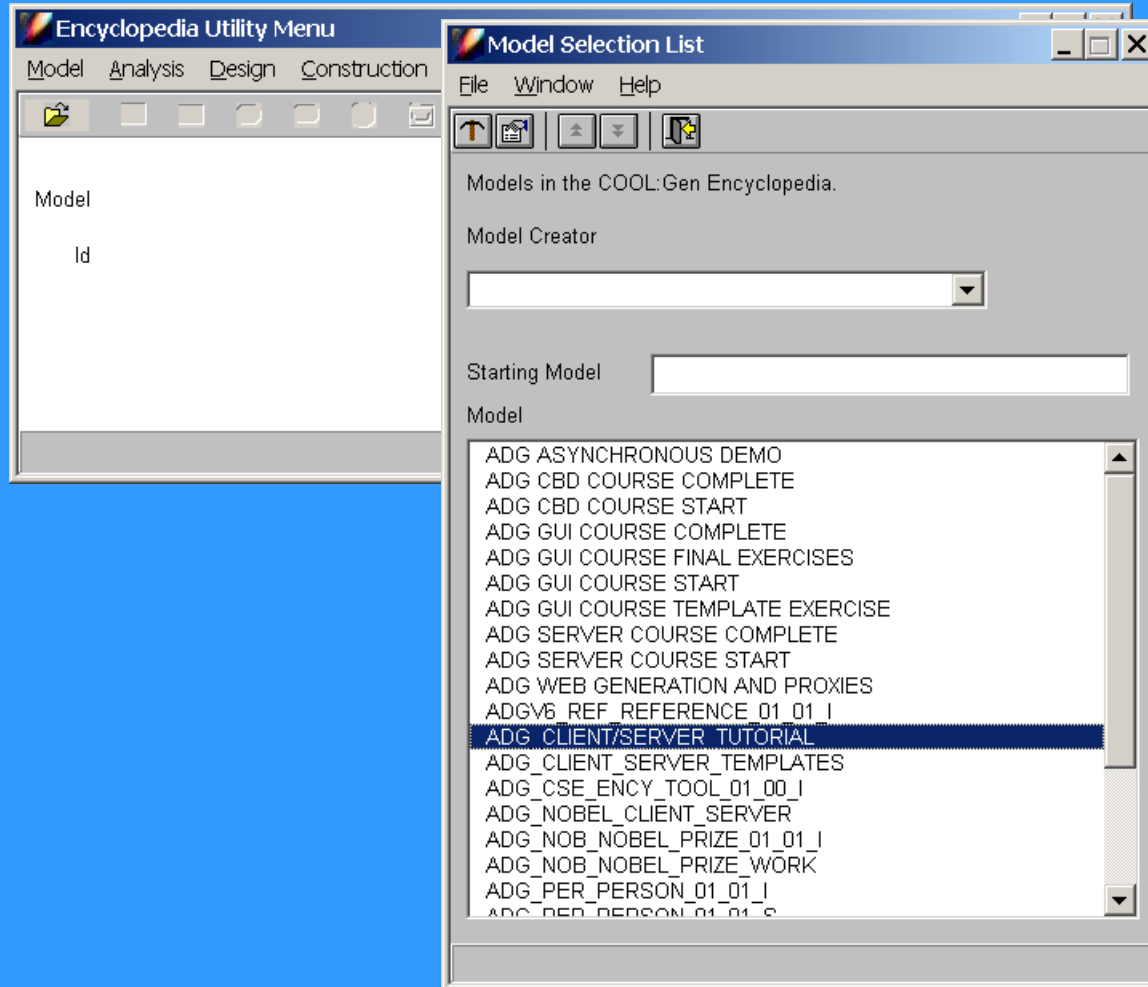

- Coordinate version control activities across teams
- Limit migrations to small sets of objects
- Perform migrations at a time when conflicts with development activities will be minimized
- Break up the development work so developers do not encounter conflicts with team members
- Use small, task-oriented subsets in concurrent development

Common Functions Tips

- Schedule regular encyclopedia database reorganization
- Monitor encyclopedia for accumulation of unneeded models
- Develop a software reuse strategy
